Multicollinearity is a situation where some or all of the independent variables are strongly correlated, to detect the presence or absence of multicollinearity in the regression model, which can be seen from the value of the variance inflation factor (VIF) and Tolerance. These two measures show which independent variables are explained by the other independent variables. The limit of VIF is 10 and the value of tolerance is 0.1. If the VIF value is greater than 10 and the tolerance value is less than 0.1, then multicollinearity occurs. (Ghozali, 2016)

*F. Multiple Linear Regression Analysis*

Multiple linear regression analysis is used by researchers when researchers intend to predict how fluctuating independent variables as predictors are manipulated. If this analysis is used to determine the relationship between two or more independent variables and the dependent variable, either jointly or partially (Sugiyono, 2016). In general, the form of the regression equation obtained using multiple linear regression analysis refers to (Sugiyono, 2016) with the following formula:

$$Y = a + b_1X_1 + b_2X_2 + \dots + b_nX_n$$

Information:

Y: Dependent/bound variable (Company Value)

X1: First Independent/Independent Variable (Profitability)

X2: Second Independent/Independent Variable (Investment Decision)

X3: Third Independent/Independent Variable (Dividend Policy)

a: Constant Number (Y value if  $X_1, X_2, \dots, X_n = 0$ )

b: Regression coefficient of independent variables (increase/decrease value)

#### G. Hypothesis Test

According to Sugiyono (2015) that: "The hypothesis is a temporary answer to the research problem formulation, where the problem formulation is stated in the form of a question sentence". The null hypothesis ( $H_0$ ) is not affected and the alternative hypothesis ( $H_a$ ) shows an impact between the independent variable and the dependent variable. The design of this research hypothesis testing is to test whether there is an influence between the independent variable, namely investment decisions (X) on the dependent variable, namely firm value (Y).

#### H. Simultaneous Test (F Test)

The F statistical test basically shows whether all the independent variables included in the model have a joint effect on the dependent or dependent variable. By using SPSS, if the significant value of the calculated F result is  $> 0.05$ , then the hypothesis ( $H_3$ ) is accepted which means there is an effect and vice versa (Ghozali, 2016). To test the effect of simultaneous investment decisions (X) on firm value (Y), the test is carried out using the F statistical test with steps referring to Ghozali (2016:154) as follows:

- a. Determine the overall hypothesis between Profitability,
  - Investment Decisions and Dividend Policy on Firm Value. The statistical hypotheses of this study are:
  - $H_0 =$  There is no influence between Profitability, Investment Decision and Dividend Policy on Firm Value
  - $H_a \neq$  There is an influence between Profitability, Investment Decision and Dividend Policy on Firm Value
- b. Determine the significance value ( $k-1$ ), to find out the area of the F rejection table.
- c. The calculated F results are compared with the F table with the following criteria:
  - a) Reject  $H_0$  if  $F_{count} > F_{table}$  at 5% alpha for a positive coefficient
  - b) Reject  $H_0$  if  $F_{count} < F_{table}$  at 5% alpha for negative coefficients.
  - c) Reject  $H_0$  if the value of  $F - sign < S 0.05$ .

$H_0$  is rejected if  $F_{count} > F_{table}$  ( $\alpha = 0.05$ ).

#### I. Partial Test (T Test)

According to Ghozali (2016) the partial t test is used to determine the effect of each independent variable on the dependent variable. By using SPSS, the hypothesis ( $H_1, H_2$ ) is accepted if the significant value of the t-count  $< 0.05$  and vice versa.

To test whether there is a relationship between the independent variables (X) having an impact on the dependent variable (Y), further testing will be carried out using the t statistical test with steps referring to Ghozali (2016) as follows:

1. Determine the partial hypothesis between Profitability and Firm Value. The statistical hypotheses of this study are:  
 Determine the partial hypothesis between Investment Decisions on Firm Value. The statistical hypotheses of this study are:  
 $H_0 =$  There is no influence between Investment Decisions on Company Value  
 $H_a \neq$  There is an influence between Investment Decisions on Company Value
2. Determine the level of significance  
 Determined by 5% of the degrees of freedom ( $dk = n - k - 1$ ), to determine the t table as the boundary of the acceptance and rejection of the hypothesis. The significance level used is 0.05 or 5% because it is

considered sufficient to represent the relationship between the variables studied and is a significance level commonly used in research status.

3. Then conclusions are made regarding whether the hypothesis is accepted or not after being compared between t count and t table with the following criteria:
    - a) Reject H<sub>0</sub> if t count > t table at 5% alpha for a positive coefficient.
    - b) Reject H<sub>0</sub> if t count < t table at 5% alpha for negative coefficients.
    - c) Reject H<sub>0</sub> if the value of t – sign < S 0.05.
- Coefficient of Determination (R<sup>2</sup>)

Ghozali (2016) suggests that the value of the coefficient of determination is between zero and one. A small R<sup>2</sup> value means that the ability of the independent variables in explaining the variation of the dependent variable is very limited. Values that are close to one independent variable provide almost all the information needed to predict the variation of the dependent variable.

*J. Research Sites*

The research location is a place or area where the research is carried out and is used as a unit of observation in research. The location of this research was conducted at the IDX (Indonesian Stock Exchange) having its address at Indonesia Stock Exchange Building Tower 1 on Jalan Jendral Sudirman Kav. 52-53 Jakarta 12190 Indonesia.

IV. RESULT/FINDING

The profitability ratio shows the company's ability to earn profits. One of the ratios used to determine the company's ability to generate profits is return on equity (ROE). According to Jumingan (2014) that: "The level of return on equity (ROE) has a positive relationship with stock prices so that the greater the return on equity (ROE), the greater the market price, which means it gives a positive signal to shareholders which causes an increase in firm value. ". To find out the return on equity (ROE) can be calculated using the formula according to Jumingan (2014) as follows:

$$Return\ On\ Equity\ (ROE) = \frac{\text{profit after tax}}{\text{owner equity}}$$

As for knowing the profitability measured using return on equity (ROE) in manufacturing companies listed on the Indonesia Stock Exchange in 2013-2020, it is presented in table 4. as follows:

Table 4. Return On Equity (ROE) for manufacturing companies listed on the Indonesia Stock Exchange in 2013-2020.

No.	Code of Company	Return On Equity (ROE) (%)								Average
		2013	2014	2015	2016	2017	2018	2019	2020	
1	INDF	8,9	12,4	8,6	11,9	11	9,9	10,9	11,1	10,59
2	MYOR	26,8	24,5	24,1	22,1	22,1	20,6	20,6	18,6	22,99
Average		17,85	18,45	16,35	17,00	16,55	15,25	15,75	14,85	16,51

Source: [www.idx.co.id](http://www.idx.co.id) data reprocessed 2022

For more details regarding the return on equity (ROE) of manufacturing companies listed on the Indonesia Stock Exchange in 2013-2020, see graph 4.8 below:

Figure 8. Chart of the average return on equity (ROE) of manufacturing companies listed on the Indonesia Stock Exchange 2013-2020

Based on table 4.2 and figure 4.8, it can be seen that the average return on equity (ROE) has changed from year to year, this is because:

The average return on equity (ROE) in 2013 was 17.85%, then increased in 2014 to 18.45%. This is because the profitability of PT Indofood Sukses Makmur Tbk has increased, this is because the net profit of PT Indofood Sukses Makmur Tbk has increased, but the profitability of PT. Mayora actually experienced a decline this was due to the declining net profit performance which was triggered by a loss in foreign exchange from the previous period.

In 2015 the average return on equity (ROE) decreased to 16.35%. This is because the profitability of the two companies, namely PT. Indofood Sukses Makmur Tbk and PT Mayora Indah Tbk experienced a decline. Decreasing profitability at PT. Indofood due to net profit decreased. But precisely at PT. Mayora's net income has increased, this is because the company's equity has increased.

In 2016 the average return on equity (ROE) has increased again to 17%, this is due to the profitability of PT. Indofood Sukses Makmur Tbk has increased because the net profit obtained has increased but profitability at PT. Mayora Indah Tbk experienced a decrease but the net profit obtained increased this was due to the increase in equity.

In 2017 the average return on equity (ROE) decreased to 16.55%, this was due to the profitability of PT. Indofood Sukses Makmur Tbk experienced a decline, this was caused by a declining net profit. Profitability value at PT. Mayora is the same as the previous year.

In 2018 the average return on equity (ROE) decreased again to 15.25%. This is due to a decrease in the value of profitability at PT. Indofood Sukses Makmur Tbk due to the decrease in net profit. But the profitability of PT. Mayora Indah Tbk experienced a decrease while the net profit earned actually increased this was due to an increase in equity.

In 2019, the average return on equity (ROE) increased to 15.75%. This is because of the increase in the value of profitability at PT. Indofood Sukses Makmur Tbk due to increased profits and profitability at PT. Mayora Indah Tbk has the same value as the previous year.

In 2020 the average return on equity (ROE) has decreased to 14.85%, this is due to a decrease in the value of profitability at PT. Mayora Indah Tbk caused by equity which experienced a significant increase from the previous year but net income increased. But PT. Indofood Sukses Makmur Tbk experienced an increase due to an increase in net profit.

Based on the explanation above, it can be concluded that manufacturing companies for the last 8 years have fluctuated increases and decreases every year, where the increase in return on equity (ROE) is due to the company's net income increasing so that profits increase, so the company is able to maximize the return on equity to generate profits. net, which means the company can satisfy the interests of shareholders. According to Brigham (2010) that: "The greater the company's ability to earn good profits, the greater the interest of investors in the company's shares". Meanwhile, the decrease in return on equity (ROE) was due to a decrease in the level of net income obtained by the company.

The value of the company is the investor's view of the company. This is related to stock prices. So that one of the considerations of investors in deciding investment is the value of the company where the investor will inject capital.

According to Suffah & Riduwan (2016) that: "The higher the stock price, the higher the value of the company". In this study, firm value was measured using price to book value (PBV). The higher the price to book value ratio, the more successful the company is in creating value for shareholders. To find out the price to book value (PBV) can be calculated using the formula according to Harmono (2014) as follows:

$$Price\ to\ book\ value\ (PBV) = \frac{\text{price per share}}{\text{company book value}}$$

As for knowing the value of the company measured using Price to Book Value (PBV) in manufacturing companies listed on the Indonesia Stock Exchange in 2013-2020, it is presented in table 4.4 as follows:

Table 5. Price to Book Value (PBV) for manufacturing companies listed on the Indonesia Stock Exchange in 2013-2020.

No	Code of Company	Price to Book Value (PBV) (X)								Average
		2013	2014	2015	2016	2017	2018	2019	2020	
1	INDF	1,5	1,4	1	1,5	1,3	1,1	1,2	0,77	1,25
2	MYOR	0,20	0,21	4,8	5,7	7,1	6,8	4,4	5,3	4,51
Average		0,855	0,805	2,9	3,6	4,2	3,95	2,8	3	2.76375

Source: www.idx.co.id data reprocessed 2022

For more details regarding the price to book value (PBV) of manufacturing companies listed on the Indonesia Stock Exchange in 2013-2020, see the chart 4.10 below:

Figure 10. Chart of Average Price to Book Value (PBV) of Manufacturing Companies Listed on the Indonesia Stock Exchange 2013-2020

Based on table 4.4 and figure 4.10, it can be seen that the average price to book value (PBV) has changed from year to year, this is because:

The average price to book value (PBV) in 2013 was 0.85 times and then decreased in 2014 to 0.80 times. This is because the price to book value (PBV) at PT indofood Sukses Makmur Tbk has decreased but the results of the company's share price and book value have both increased so that the result of the percentage distribution between stock price and book value has decreased from the previous year and PT Mayora Indah Tbk has increased but the price per share has decreased.

In 2015, the average price to book value (PBV) increased to 2.9 times. This is because the price to book value (PBV) at PT Mayora Indah Tbk has increased due to the increase in stock prices, but the price to book value (PBV) at PT. Indofood Sukses Makmur Tbk experienced a decline due to the decline in stock prices.

In 2016 the average price to book value (PBV) has increased again to 3.6 times, this is because the price to book value (PBV) in the two companies, namely PT. Indofood Sukses Makmur Tbk has increased. Increase in PT. Indofood caused by rising stock prices. But the increase in PT. Mayora Indah Tbk's stock price and book value actually decreased.

In 2017 the average price to book value (PBV) has increased again to 4.2 times, this is because the price to book value (PBV) at PT. Mayora Indah Tbk experienced an increase due to the increase in its share price, but the price to book value (PBV) at PT. Indofood Sukses Makmur Tbk experienced a decline due to the decline in stock prices.

In 2018 the average price to book value (PBV) decreased to 3.95 times. This is due to a decrease in the price to book value (PBV) at PT. Indofood Sukses Makmur Tbk caused by the decline in stock prices. But the decrease in PT. Mayora Indah Tbk actually increased the stock price and book value of the company.

In 2019, the average price to book value (PBV) decreased again to 2.8 times. This is due to a decrease in the price to book value (PBV) at PT. Mayora Indah Tbk caused by the stock price has decreased. At PT. Indofood experienced this increase due to the increase in the price per share.

In 2020 the average price to book value (PBV) has increased to 3 times, this is due to an increase in price to book value (PBV) at PT. Mayora Indah Tbk caused by the stock price has increased. However, the price to book value (PBV) of PT Indofood Sukses Makmur Tbk experienced a decline due to the declining stock price.

Based on the explanation above, it can be concluded that manufacturing companies for the last 8 years have fluctuated increases and decreases every year, where the increase in price to book value (PBV) is due to the company's stock price increasing so that profits increase, so the company is able to maximize the return on equity to generate net income, which means the company can satisfy the interests of shareholders, which means that the value of the company will increase, while the decrease in price to book value (PBV) is due to a decrease in stock prices which causes the value of the company to decrease.

## V. DISCUSSION

### A. Descriptive Statistics

Descriptive statistics can be seen from the average value (mean), standard deviation, maximum value and minimum value to provide an overview of a data.

Table 6. Descriptive Statistical Analysis

	N	Minimu m	Maximu m	Mean	Std. Deviation
ROE	16	11.0	268.0	158.875	74.0260
PBV	16	1.0	77.0	33.750	25.2837
Valid N (listwise)	16				

Source: SPSS Version 20 output, processed 2022.

Based on table 4.5 descriptive statistical explanation, namely Return on equity (ROE) shows a minimum value of 11, namely PT. Indofood Sukses Makmur Tbk. The maximum value of 26.8 is PT. Mayora Indah Tbk. Has a mean value of 158.875 and a standard deviation of 74.0260. This means that the mean is greater than the standard deviation, thus identifying that the results are good in generating company profits. And for Price to Book Value (PBV) shows a minimum value of 1, namely PT. Indofood Sukses Makmur Tbk. The maximum value of 7.1 is PT. Mayora Indah Tbk. It has a mean value of 27.062 and a standard deviation of 25.0106. This means that the mean is greater than the standard deviation, thus identifying a good result in firm value.

### B. Normality Test

According to Ghozali (2016) that: "The normality test with graphs can be misleading if you are not careful visually it looks normal, but statistically it can be otherwise". Therefore, it is recommended that in addition to

the graphical test, the Kolmogorov Smirnov (K-S) non-parametric statistical test is equipped with a statistical test which can be seen in table 4.6 as follows:

Table 7. Normality Test Results

- a. Test distribution is Normal.
- b. Calculated from data.

Source: SPSS Version 20 output, processed 2022.

The results of the normality test, it can be seen from table 4.6 that the Kolmogorov-Smirnov value shows that the Return Of Equity (ROE) is 0.883 where this result shows that the above results are significant, namely  $0.883 > 0.05$ , this indicates that the regression model meets the assumption of normality.

C. Autocorrelation Test

Run Test is used to see if residual data occurs randomly or not, with a significance of 0.05. if  $> 0.05$  then the regression equation is free from autocorrelation problems (Ghozali, 2016). The results of the Run Test test analysis can be seen in table 4.7 as follows:

Table 8. Autocorrelation Test Results

Runs Test	
	Unstandardized Residual
Test Value <sup>a</sup>	-3.25801
Cases < Test Value	8
Cases $\geq$ Test Value	8
Total Cases	16
Number of Runs	6
Z	-1.294
Asymp. Sig. (2-tailed)	.196

a. Median

Source: SPSS Version 20 output, processed 2022.

Based on table 4.7 above, the Asymp value is obtained. Sig. (2-tailed) of 0.196 or 19.6% greater than the specified significance value of 0.05. So it can be concluded that there is no autocorrelation so that it meets a good regression model.

D. Heteroscedasticity Test

For the heteroscedasticity test with a scatterplot graph, which can be seen in the following figure:

Fig 2. Scatterplot Graphic Drawing (Source: SPSS Output Version 23, processed 2022)

Based on the picture above, it can be seen that there is no clear pattern, with the points spreading above and below the number 0 on the Y axis. It can be concluded from the scatterplot graph that there is no heteroscedasticity in this research model.

#### E. Multicollinearity Test

Based on the results of data processing with the help of SPSS statistical software version 20, the following results were obtained:

Table 9. Multicollinearity Test Results

Coefficients <sup>a</sup>							
Model	Unstandardized Coefficients		Standardized Coefficients	t	Sig.	Collinearity Statistics	
	B	Std. Error	Beta			Tolerance	VIF
1 (Constant)	7.604	13.942		.545	.594		
ROE	.165	.080	.482	2.057	.059	1.000	1.000

a. Dependent Variable: PBV

Source: SPSS Version 20 output, processed 2022.

Based on table 4.8 above, it can be seen that the tolerance value of variable X is profitability (ROE) 1,000. So it can be seen that the tolerance value of the independent variable above has a variable value of  $> 0.10$ . Furthermore, in the results, the value of the VIF above to meet the requirements is less than 10. In profitability (ROE) it has a result of  $1,000 < 10$ . So the VIF results for the independent variables have results that are less than 10. Based on the results of the multicollinearity test above, it can be concluded that the research this does not occur multicollinearity.

#### F. Multiple Linear Analysis

The following are the results of multiple linear regression analysis in table 4.9 below:

Table 10. Multiple Linear Regression Analysis

Coefficients <sup>a</sup>					
Model	Unstandardized Coefficients		Standardized Coefficients	t	Sig.
	B	Std. Error	Beta		
1 (Constant)	7.604	13.942		.545	.594
ROE	.165	.080	.482	2.057	.059

a. Dependent Variable: PBV

Source: SPSS Version 20 output, processed 2022.

The constant value with the regression coefficient in table 4.9 can be explained as follows:

- The constant value is 7.604. This means that if the profitability (ROE) as X the value is 0, then the firm value (PBV) as Y is 7.604.
- The coefficient of the variable X profitability (ROE) is positive, which is 0.165. This means that profitability (ROE) has a positive influence on firm value (PBV), if there is an increase in profitability (ROE) of 1 time, it will be accompanied by an increase in firm value (PBV) of 0.165.

#### G. F Uji Test

The value of the Fcount results can be found using the statistical software SPSS version 20 which is presented in table 4.10 as follows:

Table 11. F Uji test

ANOVA <sup>a</sup>		Sum of Squares	Df	Mean Square	F	Sig.
1	Regression	2226.256	1	2226.256	4.233	.059 <sup>b</sup>
	Residual	7362.744	14	525.910		
	Total	9589.000	15			

a. Dependent Variable: PBV

b. Predictors: (Constant), ROE

Source: SPSS Version 20 output, processed 2022.

The results of the above calculation, the hypothesis in this study states Profitability, jointly affects the value of the company.

#### H. T Uji Test

The value of the t-count results can be found using the statistical software SPSS version 20 which is presented in table 4.11 as follows:

Table 12. T Uji test

Coefficients <sup>a</sup>		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	7.604	13.942		.545	.594
	ROE	.165	.080	.482	2.057	.059

a. Dependent Variable: PBV

Source: SPSS Version 20 output, processed 2022.

Based on the results of the partial test (t test) in table 4.11 above, the t value for the independent variable is obtained. So as to produce a hypothesis, namely the results of the calculation of Profitability which is proxied by Return on Equity (ROE) with a partial test, it is obtained that tcount is 0.545 and ttable is 2.057 with a significance of 0.059. Because tcount is smaller than ttable, namely ( $0.545 < 2.057$ ) where the significance value is above 0.05 ( $0.545 > 0.05$ ). So it can be concluded that the profitability variable partially has no significant effect on firm value.

#### I. Coefficient of Determination Test (R<sup>2</sup>)

The results of the determination coefficient test can be seen from the Adjusted R Square value presented in table 4.12 as follows:

Table 13.R2 . test  
Model Summary<sup>b</sup>

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.482 <sup>a</sup>	.232	.177	22.9327

a. Predictors: (Constant), ROE

b. Dependent Variable: PBV

Source: SPSS Version 20 output, processed 2022.

Based on table 4.12 above, it is known that the amount of Adjusted R Square is 0.232 or 23.2%. This shows that the percentage contribution of the influence of all independent variables (Profitability, Investment Decisions and Dividend Policy) on the dependent variable (Company Value) is 23.2% while the rest is 76.8% ( $100\% - 23.2\% = 76.8\%$ ) is influenced or explained by other variables not included in this study such as funding decisions, company external factors such as: inflation rates, currency exchange rates, economic growth, politics and market psychology.

#### V. CONCLUSION AND RECOMMENDATION

Based on the results of research and discussion of the effect of profitability on firm value in manufacturing companies listed on the Indonesia Stock Exchange, the conclusions that can be drawn are partially (t-test) in

table 4.11 above, then the t-value is obtained for the independent variable. So as to produce a hypothesis, namely the results of the calculation of Profitability which is proxied by Return on Equity (ROE) with a partial test, it is obtained that tcount is 0.545 and ttable is 2.057 with a significance of 0.059. Because tcount is smaller than ttable, namely ( $0.545 < 2.057$ ) where the significance value is above 0.05 ( $0.545 > 0.05$ ). So it can be concluded that the profitability variable partially has no significant effect on firm value.

Profitability has no effect on firm value because investors pay more attention to prospects, risks and commodities. The reason is that profitability does not affect firm value because profitability is not the only indicator that investors pay attention to in investing. The results of this study are in line with the results of research conducted by Lambu (2019) that: "Profitability partially has no significant effect on firm value".

After the authors provide conclusions from the results of research on the effect of profitability on firm value in manufacturing companies listed on the Indonesia Stock Exchange, the authors will give some suggestions as follows:

- a. For further researchers, there are still many factors that are not discussed in this study. Therefore, it is advisable to add or use other indicators that can affect the value of the company and conduct research on different company sectors and enlarge the population, not just one sector in order to obtain conclusions that may be different so as to add insight to researchers and readers.
- b. For companies, the research results are expected to provide a broad perspective so that the company's value can be optimal. It is expected that the company can improve higher profitability to reduce costs and increase sales.
- c. For investors who will invest, the results of this study are expected to be useful as a basis for consideration in investing which must still pay attention to profitability, and firm value and pay attention to other indicators as considerations in making investments such as liquidity level, company size, and ratios. related to investment. Investors are also expected to be more careful in choosing a company as a place to invest and must also be able to pay attention to what factors are the company's weaknesses.

#### ACKNOWLEDGEMENT

Praise be to Allah swt. For the blessings and guidance that the writer has received while carrying out this research, the writer realizes that the completion of this journal can be accomplished thanks to the help and guidance of various parties. Therefore, on this occasion the author would like to thank;

- a. Dr. H. Abdussy Syakur Amin, M.Eng as Chancellor of Garut University;
- b. Dr. Wati Susilawati, SE., M.Si as the Dean of the Faculty of Economics, University of Garut;
- c. Mochamad Romdhon, SE., M.Sc., MCE as Head of the Accounting Study Program S1 Faculty of Economics, University of Garut;
- d. The committee involved in the preparation of this research.

## E-Filing and Tax Revenue: a Role of Digital Tax Socialization

Rifki Abdul Malik<sup>1</sup>, Dendy Syaiful Akbar<sup>2</sup>, Iyus Yustini<sup>3</sup> and Thomas Aditya Ramdani<sup>4</sup>  
<sup>1,2,3,4</sup>Affiliation: Fakultas Ekonomi, Universitas Galuh, Ciamis, Indonesia

### Abstract

*This study aims to analyze the effect of the use of e-filing on the tax revenue by including the role of digital tax socialization to strengthen both relationships. The new contribution of this study is to combine literature e-filing, digital tax socialization, and tax revenue previously examined separately. For analysis, we use Moderated Regression Analysis (MRA) which was built through cross-sectional data for 7 years on the tax authorities in the regions. The study results show that e-filing has a positive effect on tax revenue. Subsequent results provide evidence that digital tax socialization can strengthen the positive effect of e-filing on tax revenue. In this study, we found that digital tax socialization directly has a negative relationship with tax revenue. The results of our study support the commitment of various countries to carry out tax reforms in a modern direction.*

*Keywords: e-filing; digital tax socialization; tax revenue; tax authority*

---

### I. INTRODUCTION

Tax is placed at the top position as the main source of revenue in increasing a country's cash (Mawejje & Sebudde, 2019; Langer & Korzhenevych, 2018; Oz-Yalaman, 2019), therefore taxes are a means of mobilizing resources derived from the economic activities of the community to finance infrastructure development and state expenditures (Lin & Jia, 2019; Mawejje, 2019; Prichard, Salardi, & Segal, 2018). It is undeniable that taxes can be said to be the greatest supports of a country revenue (Larasati & Binekas, 2019; Suárez Serrato & Zidar, 2018).

Tax collection and tax law enforcement are difficult to enforce in various countries (Tiefenbach & Kohlbacher, 2015; Vilaça, 2012; Sivadasan & Slemrod, 2008). Thus, the increase in tax revenue is a major concern for policymakers, so that they can directly increase revenue by considering the determinants of tax revenue (Schafferer, Yeh, Chen, Lee, & Hsieh, 2018; Andreoni, 2019). Many ways can be done by policymakers and tax managers to determine the strategy as an effort to increase tax revenue (Gnangnon, 2016; Mardan & Stimmelmayer, 2018; Doerrenberg, 2015).

Various changes to tax management have been made through various mechanisms (Ikhsan, Trialdi, & Syahrial, 2005; Li, Xiong, & Xie, 2018; Elena, 2015). Policymakers and tax managers in various countries have carried out various reforms tax, one of which is utilizing information technology and databases (Agrawal & Wildasin, 2019; Olivares, 2017; Fu, Xue, Xu, & Yang, 2019). The challenge of digital disruption in the economy is made an opportunity through the responsiveness of the tax authority to improve the tax technology infrastructure (Javed, Saqib, Razaq, & Saeed, 2018; Moscoso Boedo, 2018). Increasing the effectiveness and efficiency of tax services is expected to have a positive impact on state revenue from the tax (Zeida, 2019; Ghiaie, Auclair, & Noah Ndela Ntsama, 2019; Ilzetzki, 2018). In addition, the tax authorities help and guide taxpayers to provide facilities tax services (Andreas & Savitri, 2015; Savitri & Musfaldy, 2016).

The presence of technology always provides convenience for daily life, including the use of tax services (Javed et al., 2018; Ikhsan et al., 2005; Olivares, 2017) Social media such as Facebook, Twitter, Instagram and YouTube can be used as information media by tax authorities in various countries to help socialize taxation programs and regulations, meaning to remind taxpayers about the importance of paying taxes (Herawati, Tabroni, & Lusiana, 2018; Wibisono, 2019; Alstadsæter, Kopczuk, & Telle, 2019) If the awareness of taxpayers in reporting their taxes is increased, then the taxpayer compliance ratio will increase so that it affects the state revenue from the tax sector (Andreas & Savitri, 2015; Suprayogo & Hasymi, 2018; Agustini & Widhiyani, 2019).

Tax reform continues to be pursued in every country in the world, with the aim of increasing state revenue from taxes, which in turn will have an impact on improving domestic economic conditions (Benczúr, Katay, & Kiss, 2018; Shi, Tang, & Yu, 2015). Tax reform in developed countries, such as the United States will have an impact not only on the domestic economy but will have an impact a global (IMF, 2018). Meanwhile, the international community has recognized the need urgent for developing countries to expand fiscal space,

including increasing tax revenues to meet the needs of development sustainable (Fjeldstad, 2014; Mawejje & Sebudde, 2019).

The Indonesian government changed the tax revenue target for 2021, from the previous Rp1,176.3 trillion to Rp1,142.5 trillion. This figure is equivalent to 92.9% of the 2021 State Budget target of IDR 1,229.6 trillion. This means that in 2021 there will be a tax shortfall of IDR 87.1 trillion (CNBC Indonesia, 2021). This condition shows that tax reform has not yet shown maximum results. This condition is undeniable due to the pandemic that disrupts global and domestic economic conditions.

Awareness of taxpayers in Indonesia in meeting their obligations is still low, both for reporting notification letters and paying taxes (Cindy & Yenni, 2013; Prawiranegara, 2013). This condition also makes state revenue not optimal, because the largest state revenue comes from taxes (Lado & Budiantara, 2018; Masruri, 2018). If revenue can exceed that portion, development in Indonesia can be more optimal and create justice for all levels of society (Pratiwi, Suryani, & Kurnia, 2018; Pranata & Supadmi, 2018).

Tax authorities in Indonesia have carried out tax reforms, one of which is improving taxation services by developing tax administration modern and information technology (Ismail, Gasim, & Amalo, 2018; Rumina, Balandina, & Bannova, 2015; Bastani, Giebe, & Miao, 2019). One form of the modern administration of taxation is *e-filing*, which is the way the reporting is done taxpayer online and in real-time via the official site tax authority (Suherman, Almunawwaroh, & Marlina, 2015; Nurlaela, 2017; Erawati & Ratnasari, 2018). This system is intended to make taxpayers easy to do their tax reporting (Lado & Budiantara, 2018; Ismail et al., 2018).

However, this method raises new problems, namely, there are still many taxpayers who lack the knowledge and ability to operate an-based system online, so that socialization is needed to convey how to use the system (Ismail et al., 2018; Agustini & Widhiyani, 2019; Putri & Putri, 2019). The tax authorities in Indonesia have implemented various tax socialization programs, both manually and online. The development of information technology is used by tax authorities to promote taxation, such as the submission of taxation rules, taxation sanctions, the role of tax on development, procedures for using administration systems modern tax, and other taxation information (Gagné, Hovelaque, & Mechouar, 2019; He & Wang, 2017; Rumina et al., 2015). Currently, the tax authority in Indonesia uses social media to socialize about taxes, such as Twitter, Facebook, YouTube, and Instagram.

This study builds on a variety of literature on taxation (eg, Putri & Putri, 2019; Agustini & Widhiyani, 2019; Andreas & Savitri, 2015; Ilzetzki, 2018; Gnanon, 2016; Bastani et al., 2019; Rumina et al., 2015), especially regarding digital tax services, tax socialization, and tax revenue. Digital tax services will make it easier for taxpayers to report their obligations (Elvionita, 2018; Siahaan & Halimatusyadiah, 2018; Nurlaela, 2017). With the development of digital tax services, it is expected that taxpayers will fulfill their obligations so that state revenue from the tax sector increases (Agrawal & Wildasin, 2019; Foros, Kind, & Wyndham, 2019; Mardan & Stimmelmayer, 2018). In addition, taxation socialization has a role to introduce the mechanism of tax services digital to the public, so that the public as taxpayers will understand it (Andreas & Savitri, 2015; Savitri & Musfaldy, 2016; Herawati et al., 2018). Currently, socialization tax can be done through social media to provide information effectively and efficiently, so that people will be aware of paying taxes that have an impact on increasing tax revenues (Palupi & Herianti, 2017; Yücedoğru, Boz, Öner, Saygı, & Dibek, 2018).

There are many papers in the literature discussing tax revenue determinants different in each country (eg, Swanepoel & Schoeman, 2002; Castro & Camarillo, 2014; Fazlurahman & Kustiawan, 2016; Suárez Serrato & Zidar, 2018; Langer & Korzhenevych, 2018). Unlike the previous literature, this study investigates how the ease of digital tax services through *e-filing* on tax revenues is determined by the amount of digital tax socialization conducted by the tax authorities. In other words, this study seeks to introduce the extent to which digital tax socialization is able to strengthen the impact of digital tax services in an effort to increase revenue tax.

Then the new contribution of this study, namely concerning the relationship between literature digital tax service and separate digital tax socialization regarding tax revenue. To our knowledge, the use of the digital tax socialization variable is the first in the taxation literature, and this is the first study to document the effect of digital tax service on tax revenue that depends on digital tax socialization. We built data cross-sectional from various data sources for 7 years, from 2014 to 2021. In this study, we conducted an analysis using *Moderated Regression Analysis* (MRA).

This study aims to analyze the extent to which digital tax socialization is able to strengthen the effect of digital tax services through *e-filing* on tax revenue. This study was conducted to the tax authorities in one area

in Indonesia, namely Ciamis Regency, West Java Province. This paper continues as follows. In the next section, we describe our literature review and hypothesis. The third section identifies data sources, explains variables and discusses empirical approaches. The fourth section reports the results of our empirical analysis, and the fifth section summarizes the conclusions drawn from this study.

## II. LITERATURE REVIEW

### A. *E-filing*

*E-filing* is a way to submit tax obligations online and in real-time through several sites, among which can be accessed on the tax authority and other institutions designated (Putri & Putri, 2019; Pranata & Supadmi, 2018; Erawati & Ratnasari, 2018). The online-based service is intended for taxpayers who will submit income tax and corporate tax (Nurlaela, 2017; Agustini & Widhiyani, 2019). The benefits of using *e-filing* include 1) making it easy for taxpayers to report their obligations anytime and anywhere; 2) taxpayers do not need to queue to report their obligations at the tax office; 3) minimize errors in reporting tax (Suherman et al., 2015; Ismail et al., 2018).

Current taxpayers can utilize tax services *online* and in *real-time* whenever and wherever, so there is no need print report forms to manually and receipts (Suprayogo & Hasymi, 2018; Lado & Budiantara, 2018). This system is one of the innovations made by the tax authority so that taxpayers can report their obligations quickly, anytime and anywhere (Kurniawan, Aprianto, & Ines, 2018; Setiawan, Kurniawan, & Payamta, 2018). Taxpayers see that the system *e-filing* provides benefits for themselves, thereby increasing taxpayer awareness to pay taxes (Erawati & Ratnasari, 2018; Pranata & Supadmi, 2018).

### B. *Digital Tax Socialization*

One way that tax authorities can do to increase awareness taxpayer is through socialization to provide information about taxation to the public (Herawati et al., 2018; Ismail et al., 2018; Andreas & Savitri, 2015). Socialization is the learning of values, norms, and patterns of behavior, which are expected by the group as a form of reform so that it becomes an effective organization. So the efforts made by the tax authorities in providing information about taxes can be done through socialization (Herawati et al., 2018; Savitri & Musfialdy, 2016).

One way that can be done in taxation socialization is by utilizing information technology (Aryati & Putritanti, 2016; Aryati, 2016). Information technology is the media used to process data, including processing, obtaining, compiling, storing, manipulating data in various ways to produce quality information, namely information that is relevant, accurate and timely (Agrawal & Wildasin, 2019; Moscoso Boedo, 2018; Foros et al., 2019). Information technology is used for personal, business, government, and information strategy for decision making (Suryani, 2019; Mansor, Mohamed, Ling, & Kasim, 2016; Silaen, 2015).

The tax authority website in Indonesia is a medium for delivering information in cyberspace where taxpayers can access current and actual taxation data that is public anytime and anywhere quickly and easily. Social media such as Facebook, Twitter, Instagram, and YouTube are used by tax authorities as a tool that can be used to interact with taxpayers. The development of information technology is a potential for tax authorities to interact with taxpayers without face to face (Palupi & Herianti, 2017; Herawati et al., 2018; He & Wang, 2017).

### C. *Tax Revenue*

Tax is state income that comes from the people as citizens of a country. The income comes from people who meet the requirements to be subject to tax and can be categorized as a tax object (Larasati & Binekas, 2019; Suárez Serrato & Zidar, 2018). Tax revenue should be maximized because it will affect the income state (Gnangnon, 2016; Mardan & Stimmelmayer, 2018) Tax is the biggest revenue from total state revenue (Doerrenberg, 2015; Pratiwi et al., 2018).

The tax has a very large and increasingly dependable role to support government development and spending (Stoilova, 2017; Zhang & Li, 2011). One indicator of the success of tax reform is the increase in revenue state from the tax sector, which in turn will affect tax economic growth (Adkisson & Mohammed, 2014; Fazlurahman & Kustiawan, 2016). In various countries in the world, tax is the main concern by considering the factors determining tax income (Swanepoel & Schoeman, 2002; Benczúr et al., 2018). Various efforts were made by the tax authority to determine the strategy as an effort to increase tax revenue (Ghiaie et al., 2019; Pratiwi et al., 2018).

#### D. Hypothesis

In this section, we discuss how digital tax socialization can strengthen the effect of digital tax services through *e-filing* on tax revenue. The explanation of this relationship is evident in the theoretical foundation and empirical analysis of the literature on the practice of using *e-filing*, digital tax socialization, and revenue tax previously examined separately. Several studies provide clues about how digital tax socialization can strengthen the effect of *e-filing* on tax revenue.

To improve services, tax authorities in Indonesia reformed tax administration through *e-filing* online-based (Suprayogo & Hasymi, 2018; Suherman et al., 2015). The use of *e-filing* by taxpayers can facilitate reporting of their obligations, so reporting is much faster, more convenient, and can be done anywhere and anytime by taxpayers (Lado & Budiantara, 2018; Nurlaela, 2017). With the ease of tax services, taxpayers can report anytime and anywhere without having to come to the tax office (Erawati & Ratnasari, 2018; Agustini & Widhiyani, 2019). Taxpayers find *e-filing* useful and form a positive attitude for them so that it will increase taxpayer awareness to pay taxes which further increases state revenue from the tax sector (Putri & Putri, 2019; Setiawan et al., 2018). From the statement, the first hypothesis to be tested are as follows:

H1: *e-filing* positive effect on tax revenues.

Digital tax services through *e-filing* by tax authorities in Indonesia pose new problems for some taxpayers. Not all taxpayers have more knowledge and capability in using *e-filing*, so the socialization of the use of *e-filing* must be carried out by the tax authority (Kurniawan et al., 2018; Aryati & Putritanti, 2016). The development of information technology can be utilized by the tax authority to provide an understanding to taxpayers about the use of *e-filing* (Suryani, 2019; Siahaan & Halimatusyadiah, 2018). Social media is one that is used by authorities tax in Indonesia to provide information about taxation, such as *Twitter*, *Instagram*, *Facebook*, and *YouTube*.

The media can not only be used to provide information about the use of *e-filing* but can also be used to provide information on taxation rules, tax sanctions, the role of taxes in development and other taxation information (Herawati et al., 2018; Elvionita, 2018; Princesses & Princesses, 2019). So that the digital tax socialization expected to be able to strengthen the positive impact of *e-filing* on tax revenue. From that statement, the second hypothesis to be tested are as follows:

H2: digital tax socialization reinforces the positive effect of *e-filing* on tax revenue.

### III. RESEARCH METHODOLOGY

#### A. Research Design

To test the hypothesis, we use *Moderated Regression Analysis* (MRA) to find out whether digital socialization is able to strengthen the positive influence of the use of *e-filing* on tax revenue. This study is based on assumptions in the discussion about developing hypotheses that explain that massive socialization through digital media can strengthen the positive influence of the use of *e-filing* on tax revenue. Conversely, socialization that is not done massively can hamper tax revenues.

Data on digital tax socialization is measured by the frequency of socialization through social media from the tax authority. Then the data regarding the use of *e-filing* is measured by the number of uses of taxpayers in reporting their obligations. Furthermore, data on tax revenue measured by the achievement of the realization of the target (annual %). All data, both regarding digital tax socialization, *e-filing*, and tax revenue are obtained from the tax authorities in Ciamis Regency, namely KPP Pratama Ciamis in 2014-2021.

#### B. Data

Data sources used and how the measurement of each variable will be discussed in this section. The type of data in this study was obtained from secondary data collected from KPP Pratama Ciamis as a tax authority, regarding *E-Filing*, *Digital Tax Socialization* and *Tax Revenue* from 2014-2021. The dependent variable in this study is tax revenue measured by the performance of realization of target (annual%) generated by KPP Pratama Ciamis from 2014-2021, which reports the percentage of achievement of the realization of the target that has been determined every year, with a high percentage indicating that the realization of high tax revenue and vice versa.

Furthermore, the use of *e-filing* is measured by the number of taxpayers uses in reporting their obligations. This data is taken from the report on the recording system of digital tax service (*E-Filing*) at KPP Pratama Ciamis

in 2014-2021. The higher number of taxpayers who use *e-filing* shows that the system is effectively applied as modern tax service, and vice versa. Then to measure digital tax socialization, we use the frequency of tax information dissemination using social media by KPP Pratama Ciamis in 2014-2021. This data is taken from the public relations department of the tax authority.

The higher frequency of delivery of taxation information on social media shows that the performance of tax authorities is better in promoting taxation to the public, including information about the use of *e-filing* to taxpayers. Conversely, the lower frequency of submission of taxation information shows that the performance of tax authorities is getting worse in socializing taxation to the public. The types of taxes, taxpayers and observed tax revenues are income tax and corporate tax, with the reason that *e-filing* is used for these taxes. Data sources and descriptions variable can be seen in the following table.

Table 1: Data Sources and Description of the Variables

Variable	Definition	Year	Source
<i>E-Filing</i>	How to submit tax obligations online and in real-time through several sites, among which can be accessed on the tax authority and other designated agencies.	2014-2021	KPP Pratama Ciamis
<i>Digital Tax Socialization</i>	Submission of tax information through social media by the tax authority.	2014-2021	KPP Pratama Ciamis
<i>Tax Revenue</i>	Tax revenue is state income derived from taxes.	2014-2021	KPP Pratama Ciamis

### C. Empirical Approach

In this study, we use the *Moderated Regression Analysis* (MRA) to empirically examine the extent to which digital tax socialization is able to strengthen the influence positive of *e-filing* on tax revenue. To enable comparisons with studies previous, we ran the following 2 models.

$$\text{TaxRevenue} = a + bE\text{-Filing} + e \quad (1)$$

$$\text{TaxRevenue} = a + b1E\text{-Filing} + b2\text{DigitalTaxSocialization} + b3E\text{-Filing}.\text{DigitalTaxSocialization} + e \quad (2)$$

The first model illustrates the relationship between *E-Filing* and *Tax Revenue*. If the number of users *E-Filing* gets higher, it will be followed by a higher *Tax Revenue*. The second model illustrates the relationship between *E-Filing*, *Tax Revenue*, and *Digital Tax Socialization* as moderating variables. If the frequency of *Digital Tax Socialization* gets higher, it will strengthen the impact of *E-Filing* on the increase in *Tax Revenue*.

## IV. RESULT/ FINDING

Description of *e-filing*, digital tax socialization, and tax revenue can be seen in Table 2 below.

Table 2: Descriptive Statistics

	N	Minimum	Maximum	Mean	Std. Deviation
<i>E-Filing</i>	5	7880.00	8314.00	8060.00	163.78492
<i>Digital Tax Socialization</i>	5	202.00	231.00	217.60	12.13672
<i>Tax Revenue</i>	5	77.11	92.01	83.50	6.37966
Valid N (listwise)	5				

Source: data processed

*E-Filing* has a minimum score of 7880, a maximum score of 8314, a standard deviation of 163.78492, and the score of a mean of 8060. The mean score shows that during 2014-2021 *E-Filing* was used by as many as 8060 taxpayers in Ciamis Regency to report their obligations. Furthermore, *Digital Tax Socialization* has a minimum score of 202, the maximum score of 231, a standard deviation of 12.13672, and a mean score of 217.60. The mean score explains that from 2014-2021 the tax authorities in Ciamis Regency provided tax information to the public 217.60 times through social media. Whereas *Tax Revenue* has a minimum score of 77.11, a maximum score of 92.01, a standard deviation of 6.37966, and a mean score of 83.50. The mean score

shows that from 2014- 2021 the realization of tax revenue did not always reach the target, which was only 83.50%. The first step in testing the hypothesis is testing the model (1), which is to find out the relationship between *E-Filing* and *Tax Revenue*. The results of the analysis in this step can be seen in the following tables.

Table 3: Model Summary

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.890 <sup>a</sup>	.792	.722	3.36167

a. Predictors: (Constant), *E-Filing*

Source: data processed

Adjusted R Square generated a score of 0.722 shows that *E-Filing* has effected an of 72.2% on *Tax Revenue*, while the remaining 27.8% (100-72.2) is influenced by other factors not examined in this study. First we conclude that *e-filing* a positive effect on revenues. Tax *e-filing* makes it easy for taxpayers to report their obligations so that taxpayers will obey pay their obligations which causes increased state revenue from taxes. Second, our conclusion of the analysis provides evidence that digital tax socialization is able to strengthen the positive influence of *e-filing* on tax revenue. To find out whether this model (1) is suitable to be used to discuss the relationship between *E-Filing* and *Tax Revenue*, the results can be seen in the following table 4.

Table 4: Anovab

Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	128.898	1	128.898	11.406	.043a
	Residual	33.902	3	11.301		
	Total	162.800	4			

a. Predictors: (Constant), *E-Filing*

b. Dependent Variable: Tax Revenue

Source: data processed

From table 4 you can see the F Sig. of 0.043 is smaller than  $\alpha = 0.05$ , meaning that the model (1) is suitable to be used to explain the relationship between *E-Filing* and *Tax Revenue* in this study. Furthermore, to determine the significance of the effect of *E-Filing* on *Tax Revenue*, it can be seen from the following table 5.

Table 5: Coefficientsa

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	-196.153	82.729		-2.371	.098
	<i>E-Filing</i>	.035	.010	.890	3.377	.043

a. Dependent Variable: Tax Revenue

Source: data processed

The results of this analysis indicate that *E-Filing* has a positive and significant effect on *Tax Revenue*. The statement was proven from the beta unstandardized coefficients which were positive at 0.035 with a significance level of 0.043 less than  $\alpha = 0.05$ . This means that the higher of taxpayer's number who report their obligations through *E-Filing*, the higher the *Tax Revenue*, so this condition shows that the hypothesis first is accepted.

The second step in testing the hypothesis is testing model (2), which is to determine the extent to which *Digital Tax Socialization* is able to strengthen the positive influence of *E-Filing* on *Tax Revenue*. The results of the analysis in this step can be seen in the following table 6.

Table 6: Model Summary

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.998a	.997	.994	.50527

a. Predictors: (Constant), *E-Filing*, *Digital Tax Socialization*, *Digital Tax Socialization*

Source: data processed

Table 6 provides information that after the existence of *Digital Tax Socialization* further strengthens the positive influence of *E-Filing* on *Tax Revenue*. This statement is proven by an increase in the *Adjusted R Square*

score of 0.272 (0.994-0.722) or an increase of 27.2% (see tables 3 and 6). More and more tax authorities convey tax information to the public through social media, including information on the use of *e-filing*, causing taxpayers to understand the use of *e-filing* and immediately report their obligations, which in turn will increase tax revenue. To find out whether this model (2) is suitable to be used to discuss the relationship between *E-Filing*, *Digital Tax Socialization*, and *Tax Revenue*, the results can be seen in the following table 7.

Table 7: Anovab

Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	162.289	2	81.145	317.847	.003a
	Residual	.511	2	.255		
	Total	162.800	4			

a. Predictors: (Constant), E-Filing.DigitalTaxSocialization, DigitalTaxSocialization

b. Dependent Variable: Tax Revenue

Source: data processed

From table 7 you can see the F Sig. of 0.003 smaller than  $\alpha = 0.05$ , meaning that model (2) is suitable to be used to explain the relationship between *E-Filing*, *Digital Tax Socialization*, and *Tax Revenue* in this study. Furthermore, to find out the significance of *Digital Tax Socialization* in strengthening the positive influence of *E-Filing* on *Tax Revenue*, it can be seen from the following table 8.

Table 8: Coefficientsa

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	5.285	6.664		.793	.511
	DigitalTaxSocialization	-.185	.107	-.352	-1.737	.225
	E-Filing.DigitalTaxSocialization	6.736	.000	1.342	6.613	.022

a. Dependent Variable: Tax Revenue

Source: data processed

The results of this analysis indicate that *Digital Tax Socialization* is able to strengthen the positive influence of *E-Filing* on *Tax Revenue*. This statement was proven from the beta unstandardized coefficients which were positive at 6.736 with a significance level of 0.022 less than  $\alpha = 0.05$ . This means that the more often the tax authority submits information taxation to the public through social media (*Digital Tax Socialization*), the stronger the effect of *E-Filing* on *Tax Revenue*, so this condition shows that the second hypothesis is accepted.

From the results of our analysis we find that *Digital Tax Socialization* is related directly to *Tax Revenue* without any interaction, the result is negative. These results are evidenced from the beta unstandardized coefficients which are -0.185 with a level significance of 0.225 greater than  $\alpha = 0.05$ . This means that *Digital Tax Socialization* has a negative but not significant effect on *Tax Revenue* because it is suspected that not all taxpayers use social media, so they do not receive tax information submitted by the tax authority.

## V. DISCUSSION

In the taxation literature, especially the study of socialization tax, we did not find many studies focused on digital tax socialization.

Several studies have shown that massive tax socialization can increase tax revenue (eg, Silaen, 2015; Palupi & Herianti, 2017; Agustini & Widhiyani, 2019), but other studies also provide evidence that tax socialization has no effect on tax revenue (eg, Syriac, 2019; Siahaan & Halimatusyadiah, 2018; Putri & Putri, 2019). Likewise, there is evidence to support that *e-filing* can increase tax revenue (eg, Nurlaela, 2017; Ismail et al., 2018; Pranata & Supadmi, 2018), but other studies provide evidence to the contrary (eg, Suherman et al., 2015). Most of the studies that deal with *e-filing* are related to taxpayer compliance, but we are of the view that if taxpayers obediently pay taxes then it will increase state income from taxes.

The results of our study make several contributions to the literature. First, we extend two separate literature strands to date on the relationship between digital tax socialization, *e-filing*, and tax revenue. For this purpose,

when put together in a model without interaction terms, we prove that the digital tax socialization massive can increase the use of *e-filing* that resulted in increased tax revenue.

Second, our study is the first to use digital tax socialization in the tax literature. Tax socialization in the previous study was not focused on digital tax socialization. Third, we use measurements different regarding *e-filing* and digital tax socialization from previous studies. Another study measured both of them using primary data through questionnaires or interviews, but we used secondary data obtained directly from the authorities tax with whom we collaborated in data collection.

Fourth, we found that partially digital tax socialization represented by the frequency of submission of taxation information through social media had a negative no significant effect on tax revenue. This result provides new knowledge about the direct impact of digital tax socialization on tax revenue, which is suspected that not all taxpayers use social media, so not all of them get tax information from the tax authorities. These results might be different if examined in other regions or between countries.

Fifth, the results of this study have practical implications for tax authorities everywhere, to pay attention to service quality by always reforming the tax administration in a modern direction in providing the best service and making it easier for taxpayers to report their obligations. Finally, this research supports the commitment of various countries in continuing to carry out tax reforms in order to increase tax revenue in an effort to achieve economic growth targets (IMF, 2019).

## VI. CONCLUSION AND RECOMMENDATION

First, we conclude that *e-filing* a positive effect on revenues. Tax *e-filing* makes it easy for taxpayers to report their obligations so that taxpayers will obey pay their obligations which causes increased state revenue from taxes. Second, our conclusion of the analysis provides evidence that digital tax socialization is able to strengthen the positive influence of *e-filing* on tax revenue. More and more tax authorities convey tax information to the public through social media, including information on the use of *e-filing*, causing taxpayers to understand the use of *e-filing* and immediately report their obligations, which in turn will increase tax revenue. The results of this study, we find that tax socialization digital directly has a negative relationship with tax revenue. It is suspected that not all taxpayers use social media, so not all taxpayers obtain taxation information, including information about *e-filing*.

However, this study is only conducted on tax authorities in one region, so the study is next recommended to conduct research in various regions or in various countries, to expand the results. Furthermore, our study does not include compliance factors taxpayers, which in many previous studies directly related to *e-filing* and tax socialization, so subsequent studies are recommended to include taxpayer obedience elements and other elements to enable mixed results.

## ACKNOWLEDGEMENT

This study was funded by the Fakultas Ekonomi Universitas Galuh. We would like to thank all leaders at Universitas Galuh for their support and guidance so that this study can be completed on time.

## Predicting The Occurrence of Top Rated Freelancers In Freelance Marketplace Using The Random Forest Algorithm

Muhammad Iqbal<sup>1</sup> and Mone Stepanus Andrias<sup>2</sup>

<sup>1,2</sup>Faculty of Economics and Business, Management Department, University of Indonesia, UI, Jakarta, Indonesia

### Abstract

*This study aims to analyze which factors are most important in predicting high-quality freelancer. The crisis and the covid pandemic forced companies to make cost efficiency so that recruiting online freelancers was a solution that could be considered. Recruiting freelancers online is quite easy, you just enter the freelance marketplace website, then choose the freelancer and job you want, then submit an offer. However, freelancers also have different quality. companies need to hire high-quality but low-cost freelancers for cost efficiency. This means, companies need to recruit freelancers who have top rated quality but are not yet top rated. In contrast to previous studies, the author uses the Top Rated variable as the dependent which reflects the high-quality and analyzes it using the Random Forest and Logistic Regression algorithms. The dataset contains 5,825 sample sizes downloaded from Kaggle.com, this is because Kaggle.com provides a complete dataset and is commonly used by machine learning researchers in the world. From previous research, Similar-Job-Experience and Past-Rating are the most important factors that reflect quality. Meanwhile, in this study, the attributes of totalRevenue, BilledAssignments, and totalHourlyJobs respectively become the most important variables that successfully predicting 30 Top Rated freelancers in the future. This finding should be useful for companies to be consider these factors in recruiting freelancers. To the author's knowledge, there is still limited research that discusses the criteria for freelancers using machine learning.*

*Keywords—freelancer, logistic regression, random forest, predict, pandemic*

---

### I. INTRODUCTION

The increasingly rampant Covid-19 pandemic has made many companies and MSMEs stop operating. This causes many companies to lay off workers and makes more and more unemployed people need income to survive. Freelancing is a workable solution for people to earn an income. This can also be used by companies to recruit freelancers in the context of cost efficiency. Compared to hiring or outsourcing, companies can also find it easier to use online workforce platforms to find, hire, supervise and pay workers on a project basis (Tubaro et al, Vallas & Schor, 2020). This condition is commonly referred to as the Online Gig-Economy which is a freelance labor market consisting of platform-mediated work carried out via the internet (Horton et al, 2018).

In early 2021, project demand increased by 90% globally compared to mid-2016 (Online Labor Index, 2020). In Indonesia, number of freelancers increased by 26% or 4.32 million people as of August 2020 compared to the previous period. Currently, there are 33.34 million people recorded as freelancers in Indonesia (Badan Pusat Statistik, 2020). The next challenge for companies is how to choose the right criteria for freelancers. Companies need to make a selection of 101 freelancers such as skills, relevant experience, cultural suitability, availability and cost (Jon Younger et al, 2016). On several online freelancing platforms, there is usually a special term for high-rated freelancers known as Top Workers (Projects.co.id, 2020) or Top Rated freelancers (Fiverr & Upwork, 2020). However, even though it makes it easier, in fact top freelancers have high prices and infrequent service availability, so they cannot be the only consideration for recruiting.

Finding out the criteria for freelancers is very important for companies. Study that analyzing the criteria for freelancers has been carried out by several researchers. First, the study about finding the determinant factors in gig workers, especially online teachers using PLS-SEM by Alif et al (2020). Second, study about aggregating and classifying gig workers in the Online Gig Economy using Automatic Text Classifier (ATC). Third, study about determinant factors in gig workers using Systematic Literature Review by Yudho et al (2020). Forth, perform a factor analysis that can improve the performance of freelancers using Ordinary Least Squares (OLS) Regression by Barlage et al (2019) and fifth, analyzing the criteria for freelancers who reflecting good quality using Random Forest by Abhinav et al, (2017).

However, this study should be especially useful two sides. First, for users of online freelance platforms to be able to understand and maximize the important factors of a quality freelancer. Second, for companies to make these factors as criteria in recruiting freelancers online. To find out which factors reflect a quality freelancer, I'm

here using the logistic regression and random forest algorithm. Random Forest is considered the best predictor in identifying the most important factors for becoming a freelancer (Abhinav et al, 2017). Random Forest and Logistic Regression are the best predictor that can predict the most important factor of employee turnover (Hossain et al, 2020) (Pratt et al, 2021). From several studies that have been carried out related to freelancers, study conducted by (Abhinav et al, 2017) shows that similar Job Experience and Past Rating are the most important factors to predict potential freelancers. Study (Barlage et al, 2019) shows that Professional Motivation and Project Engagement are the most important factors in maximizing the potential of freelancers.

Although there are several examples of studies assessing the characteristics of freelancers, in general, there are many limitations of studies in determining criteria and predicting potential freelancers. Also, this study can complement the existing literature, this study will use the Logistic Regression and Random Forest algorithm to see the best predictor to identify the important factors and predict potential freelancers of the online freelancer platform. Author choosing the random forest algorithm and logistic regression is based on several things, first is previous research. Regarding previous research, random forest has proven to have advantages in analyzing data such as freelancers (Abhinav et al, 2017) so that it becomes algorithms to be used. As for logistic regression, this algorithm is proven to be the highest accuracy with the AUC metric on employee data (Pratt et al, 2021) since freelancers have some of the same characteristics as employees. Second, random forest (RF) and logistic regression (GLM) are machine learning classification methods that are conceptually different, where the RF concept is more of a variable that is assessed using votes from a decision tree, while GLM is more of a linear method to see the relationship between input variables and output.

The purpose of this study is to analyze using machine learning what factors are the most important of the 24 attributes in predicting the existence of potential freelancers in the future. Where these potential freelancers can be used as recommendations in recruiting for companies.

## II. LITERATURE REVIEW

### A. *Related Work*

Several studies analyzing the criteria for freelancers or gig workers have been carried out by several researchers. First, research by Alif et al (2020), about finding the determinant factors in Gig Worker especially online teachers using PLS-SEM where as a result, the Trust factor contributes to people's intentions through Perceived Risk and Perceived Usefulness variables. On the other hand, increasing public perception of the benefits of technology can be done mainly by platform providers. Research by Yudho et al (2020) on the aggregation and classification of workers in the Online Gig Economy using the Automatic Text Classifier (ATC), the result is that Indonesian gig workers have experienced significant growth with most of them selling services in the creative and multimedia fields. Barlage et al (2019) conducted an analysis of factors that can improve freelancer performance using Ordinary Least Squares (OLS) Regression, the result of which is that the majority of respondents feel motivated while 18% are not. Abhinav et al (2017) analyzed the criteria for freelancers that reflect good quality using Random Forest, which resulted in Similar Job experience and Past Rating being the most important factors to become a good freelancer.

In addition to research from Abhinav et al (2017) which uses machine learning, namely Random Forest (RF) in analyzing the criteria for freelancers, the following recent studies also use machine learning in their analysis, but in slightly different proxies. Research from Pratt et al (2021) which analyzes what are the most important criteria that show signs of employee attrition, where in this study, Pratt uses several classification machine learning algorithms to compare. As a result, Random Forest has the highest value in accuracy, while Logistic Regression (GLM) has the highest value in terms of Area Under ROC Curve (AUC). Meanwhile, another study from Gomez et al (2021) analyzed what the most important criteria were in assessing the feasibility of online sellers on Amazon so that their products could be displayed in the buy-box. In the study, Gomez also compared various types of machine learning algorithms. As a result, Random Forest became the most accurate algorithm in terms of F1 values. Related to important variables, Pratt et al (2021) produce monthly income, ages, daily rate, working years, monthly rate and hourly rate variables as the most important variables measured using Gini importance. Meanwhile, in Gomez et al's (2021) research, it produced a full-filled profile, opinions, product rating, and product stock variables as important variables which were also measured using Gini importance.

## III. RESEARCH METHODOLOGY

### A. *Research Design*

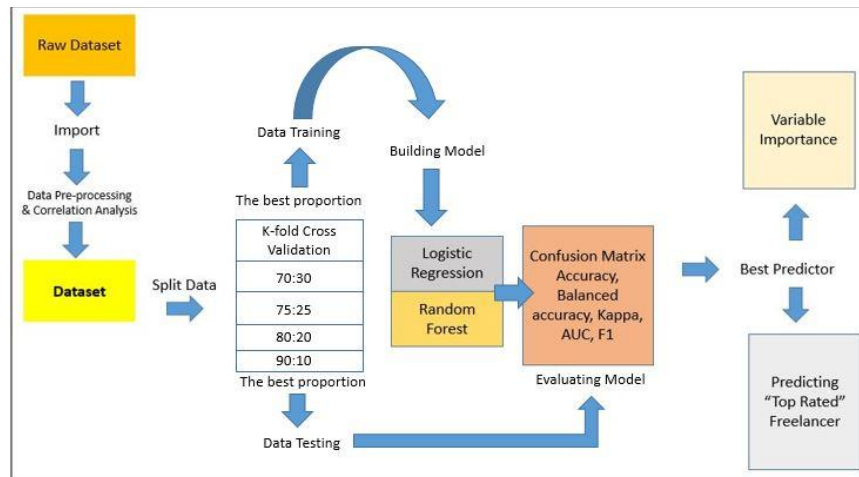

Fig. 1. Research Design (Author, 2022)

There are several activities that will be carried out in this research, namely:

1. Download the Dataset.

The first step is to get the raw dataset. In this stage, the author downloads the dataset available on Kaggle.com which is in .csv format which will then be used in the analysis.

2. Import Data

The next step is to import the dataset into the R Studio software. This process uses the syntax in the R Studio script by writing "read.csv" so that this dataset appears and is ready to be processed.

3. Data Preprocessing and Correlation Analysis

In this case the author will perform several steps in the pre-processing stage, first, Data Cleaning to delete data if there is missing data, Data Transformation to perform transformation if there is categorical data and make it numerical. Next is the correlation table analysis, where the author also removes several attributes that have a very high correlation with other attributes. The next step is to do data reduction by detecting outliers and then removing them if there are outliers that are too unequal with other data sets. The last is to normalize the data to adjust the parameters for each attribute if the scale of each attribute is far from one another. Normalization is carried out using the coefficient of variation method, where this is a method for making a measure of relative variability which states the dispersion of data values around the mean. The limit values for the coefficient of variation, lower and upper limits are reached when all variable values are equal (minimum) and all values except one are zero (maximum). The coefficient of variation can be misleading if there is a minus value with a mean close to zero. (Santos et al, 2021).

4. Data Split

After the data is ready for use, the writer will then divide the data. The author split the data by trying several portions such as 80:20, 90:10, 75:25 and 70:30 using K-fold Cross Validation. After that, it is then seen which portion produces the highest accuracy and value. The author divides this data to avoid underfitting and overfitting data and to see the accuracy and performance of each classifier algorithm to be tested, the Logistic Regression and Random Forest.

5. Apply Model

Next, the author will create a model for each algorithm. For the GLM algorithm, the author will create a model using Cross Validation for GLM and also the GLM's "Logit" function, where the model with the best accuracy will be compared its performance with the Random Forest algorithm. Meanwhile, Random Forest will be created without using cross validation. This is because each tree built by RF uses a different bootstrap sample from the original data and also the bagging process of RF for model formation from training data also automatically prevents overfitting. So that the use of cross validation is no longer needed for RF.

6. Model Evaluation

Logistic Regression and Random Forest's performance and accuracy will be measured using 5 approaches, using CM Accuration, Balanced Accuration, F-measurement, Kappa and Area Under the ROC Curve (AUC) also count how many variable important that appeared on each model. The results with the best accuracy and performance will then be used to find the most important attributes and make predictions.

#### 7. Variable Importance

The estimated importance of predictor variables is identified to see the most relevant features or attributes that will most determine whether a freelancer at freelance marketplace will be worthy of a Top Rated title in the future. The most accurate algorithm will be used to train a model with complete data using the importance and varimp functions of the caret package on R. This function will measure the aggregate effect of the predictor attributes on the model and return a value for each attribute.

#### 8. Recommended Freelancer

This is a step taken to predict which freelancers will then be able to get the Top Rated title on freelance marketplace based on important attributes that have appeared previously using a selected algorithm. The selected freelancers are freelancers who previously did not have Top Rated status but were eventually predicted to be Top Rated.

### B. Data Collection

The data collection method used in this research is by downloading secondary data from Kaggle.com. The selected secondary data is the dataset of online freelancers from the freelance marketplace site which is still active in 2021. The dataset used is profile data from service sellers at freelance marketplace with a sample size of 5,824 with a total initial attribute of 76 attributes. This dataset is also limited to service sellers originating from the United States (USA).

### C. Operational Definition Variable

The dataset used in this study is a freelancer dataset downloaded from kaggle. Kaggle is an open source website that provides various data for free. The context of the freelancer data used here is online freelancers or sellers who sell digital services on the freelance marketplace platform. This dataset also contains various text data such as: account number, country of origin, short name and profile description. Then it contains date data such as the date freelancer joined the platform. Also contains numerical data such as: total revenue, total feedbacks and total hourly jobs. Last, contains categorical data such as: recommended status and top rated status. This variable is very helpful for the author's research where the author predicts that there are freelancers who will be top rated as seen from the top rated variable as a response, and numerical and categorical variables as predictors.

Dataset contains 76 attributes, which 26 attributes do not have complete or homogeneous data and 26 other attributes are string or do not contain clear information. The attribute used as the response or dependent variable is the topRatedStatus attribute, which is the status of a service seller or freelancer who meets the requirements and changes status to Top Rated on the freelance marketplace platform. Meanwhile, predictor or independent variables we use here are numeric or categorical variables, while variables that are string or contain user id will not be included in the data analysis. Author does not use textual or string data to the model, because textual data does not always contain clear information and not all freelancers have complete textual data in this dataset, thereby reducing the risk of bias. Below is a table of attributes that will be used in the study, with one attribute being the response variable and the other 23 being predictor variables as shown in table 1.

Table 1. Operational Definition Variable

Variable	Definition	Role
topRatedStatus	Top Rated Status of Seller	Dependent
hourlyRate	Rate per hour	Independent
avgFeedbackScore	Average feedback score from buyer	Independent
totalHoursBilled	Total hours of project billed	Independent
totalFeedbacks	Total feedbacks from buyer	Independent
totalPortfolioItems	Total portfolio uploaded	Independent
recentAvgFeedbackScore	Recent average feedback score	Independent
recentTotalFeedbacks	Recent total feedbacks from buyer	Independent

recentHoursBilled	Recent hours project billed	Independent
isRecommended	Recommended status of seller	Independent
totalActualHoursBilled	Total actual hours billed	Independent
billedAssignments	Billed assignments of seller	Independent
totalRevenue	Total revenue of seller	Independent
combinedTotalRevenue	Combined total revenue of seller	Independent
totalHourlyJobs	Total hourly for all jobs	Independent
curAssignments	Total current assignments	Independent
combinedTotalEarnings	Combined total seller earnings	Independent
combinedRecentEarnings	Combined recent seller earnings	Independent
combinedAverageRecentEarnings	Combined average recent seller earnings	Independent
combinedAverageRecentCharge	Combined average recent seller charge	Independent
memberSince	Seller start to be seller	Independent
topTalentGroup	Top talent status of Seller	Independent
topRatedStatusEx	Top Rated status ex of seller	Independent

---

Author's preparation (2022)

#### D. Analytical Technique and Tools

Data analysis technique for predictive analysis in this research is using machine learning. Machine learning is the scientific study of algorithms and statistical models with the help of computer systems that perform certain tasks. (Chalal & Gulia, 2019).

The machine learning function used in this research is supervised learning with the classification method. Supervised learning is Machine Learning's task to learn a function that maps input to output based on a sample of input-output pairs. While classification refers to predictive modeling, where class labels are predicted. Mathematically, it maps the function (f) of the input (x) and output (y) variables as targets, labels or categories. (Sarker, 2021).

The author uses R Studio tools to perform machine learning functions, where R Studio is an Integrated Development Environment (IDE) for the R programming language that contains a console, a syntax highlighting editor that supports direct code execution and tools for planning, narrating, debugging, and workplace management (Rstudio, 2022). In addition, the author also uses tools such as Microsoft Excel to make data visualization and manual calculations.

## IV. RESULT / FINDING

Result section presents the results of the study. Research results can be supplemented with tables, graphs (pictures), and / or charts.

### A. Data Representation

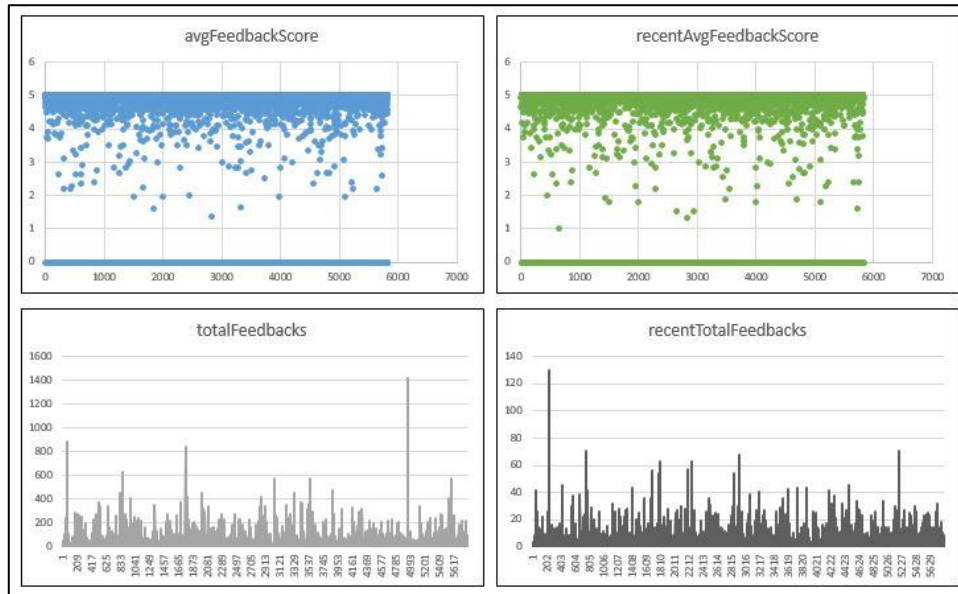

Fig. 2. Feedback Data Representation (Author's Preparation, 2022)

From Figure 2 above, it can be seen that for the avgFeedbackScore variable means the average feedback value, the data distribution is mostly 0 or never gets any feedback at all. But the majority of data distribution occurs in the range of 4.5 to 5, where quite a lot of freelancers get high feedback. For recentAvgFeedbackScore, has a distribution similar to avgFeedbackScore, this is because recentAvgFeedbackScore is a sample of avgFeedbackScore in the last year. For totalFeedbacks, the majority are in the range of 0 to 200, very few have more than 400 feedbacks and only one has more than 1,400 feedbacks. RecentTotalFeedbacks, the data distribution pattern is almost the same because it is a sample taken from the totalFeedbacks variable for the last year.

Fig. 3. Billed Data Representation (Author's Preparation, 2022)

From Figure 3 above, it can be seen that for the billedAssignment variable, the distribution of data is in the range of 0-200 jobs, only a few touch the number 500 or above. This is a sign that the demand for work for freelancers is not so much in the majority, so the opportunity to become a freelancer is still wide open. For the recentHoursbilled variable, the distribution is mostly around the 500 hours mark, although there are also many data that touch the 1,000-1,500 hour mark. The assumption that comes from this variable is similar to the billedAssignment variable, but the recentHoursbilled variable justifies the number of work bills in hours or 60 minutes in the last year. The variables totalHoursBilled and totalActualHoursBilled have almost the same distribution, namely the total number of billed work hours. The distribution of data is mostly around the 5,000 hours mark although there are also many that touch the number around 10,000 to 15,000 hours. In addition, there are also those whose total bills are above 25,000 hours, and are believed to be freelancers who have been on this platform for a long time and have long and consistent work bills.

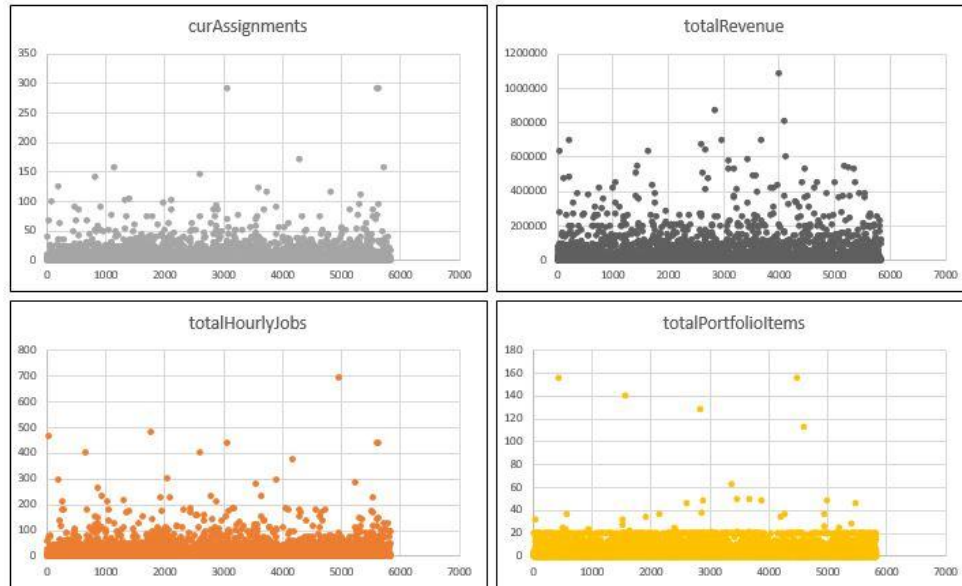

Fig. 4. Total Data Representation (Author’s Preparation, 2022)

From figure 4, it can be seen that for the curAssignments variable, namely the number of tasks that have been completed in the last year, the distribution of data is large in the range of 0 to 50 tasks. Even so, there are some freelancers who have completed more than 100 tasks and there are almost 300 tasks that have been completed in the last year. For the totalRevenue variable, the lot is spread out in the range of 0 to \$200,000. This pattern is similar to the curAssignments variable, which is widely distributed at the bottom, this is directly proportional to the fact that the higher the task completion rate, the higher the total income received by a freelancer. For the totalHourlyJobs variable, the data spreads around 0 to 100. For the totalPortfolioItems variable, which is the total portfolio uploaded on the online marketplace platform, the data distribution is in the range of 0 to 20 portfolios. The more portfolios, the more creative freelancers are considered and have a diverse selection of digital products or services or master many skills that make their portfolios large.

Fig. 5. Categorical Data Representation (Author’s Preparation, 2022)

For categorical attributes, is Recommended variable has an unequal distribution. And also categorical variable topRatedStatus, there are several categories but the data distribution is mostly in the "not\_eligible" category where the category that is not eligible to be Top Rated is the most for this variable. From the data representation above, it is clear that the average distribution of the data is not normally distributed according to Gaussian law.

B. Data Preprocessing

Jumlah.tahun	topTalentGroup	topRatedStatusEx
5	not_eligible	top_rated
2	not_eligible	not_eligible
4	not_eligible	not_eligible
2	not_eligible	not_eligible
2	top_rated_plus	top_rated
2	not_eligible	eligible
3	not_eligible	hipo_agency_only
6	not_eligible	not_eligible
4	not_eligible	top_rated
3	not_eligible	top_rated
5	not_eligible	not_eligible
6	not_eligible	top_rated

Jumlah.tahun	topRatedStatusEx
5	top_rated
2	not_eligible
4	not_eligible
2	not_eligible
2	top_rated
2	eligible
3	hipo_agency_only
6	not_eligible
4	top_rated
3	top_rated
5	not_eligible
6	top_rated

Fig. 6. Top Talent Removal Result (Author's Preparation, 2022)

Previously there were 76 attributes that had been reduced using Microsoft Excel to 24 attributes that were considered feasible to be used in the initial analysis. Of the 24 attributes, the topTalentGroup attribute was removed (check figure 6) because it was considered to provide the same information as the topRatedStatus response attribute.

```

There is missing data
> #check for missing data
> sum(is.na(dataupwork23))
[1] 2935

Deleting missing data
> #remove for missing data
upworkcleaned <- na.omit(dataupwork23)

Missing data has gone
> sum(is.na(upworkcleaned))
[1] 0
    
```

Fig. 7. Removing Missing Data (Author's Preparation, 2022)

Furthermore, the authors also checked for missing values on the remaining 23 attributes and there were 2,935 missing data. The author then deletes the missing data so that there are no more missing values or missing data values. The dataset which previously contained 5,824 data is now reduced to 5,236 rows of data.

isRecommended	topRatedStatus	topRatedStatusEx
FALSE	top_rated	top_rated
FALSE	not_eligible	not_eligible
FALSE	not_eligible	not_eligible
FALSE	not_eligible	not_eligible
FALSE	top_rated	top_rated
FALSE	eligible	eligible
FALSE	hipo_agency_only	hipo_agency_only
FALSE	not_eligible	not_eligible
FALSE	top_rated	top_rated
FALSE	top_rated	top_rated
FALSE	not_eligible	not_eligible
FALSE	top_rated	top_rated

isRecommended	topRatedStatus	topRatedStatusEx
0	1	1
0	0	0
0	0	0
0	0	0
0	1	1
0	1	1
0	0	0
0	0	0
0	1	1
0	1	1
0	0	0
0	1	1

Fig. 8. Transforming Categorical Variable Data into Binary (Author's Preparation, 2022)

Based on figure 8, the isRecommended attribute has changed the value from the "FALSE" and "TRUE" categories to 0 and 1, respectively, because the more a freelancer is recommended, the higher the value the categories should have. For the topRatedStatus and topRatedStatusEx attributes, the values for the categories "hipo", "hipo\_agency\_only", "hipo\_inactive", "hipo\_eligible", "not\_eligible", and "tr\_inactive" became 0 while the categories "tr\_agency\_only", "eligible" and "top\_rated" became 1. This is because the "eligible" category the author considers a freelancer who meets the requirements to be Top Rated and is considered equivalent to a freelancer from the "top\_rated" category.

Fig. 9. Correlation Table (Author’s Preparation, 2022)

From the correlation table in figure 9, there are several attributes that are perfectly and highly correlated with other attributes. totalHoursBilled attribute has a correlation of 1 (one) with the totalActualHoursBilled, topRatedStatus with topRatedStatusEx, combinedTotalRevenue with combinedTotalEarnings, combinedRecentEarnings attribute correlates 0.99 with combinedRecentCharge, combinedAverageRecentEarnings attribute correlates 0.97 with combinedAverageRecentCharge, billedAssignments attribute correlates 0.96 with totalFeedbacks, combinedRecentEarnings correlates 0.81 with combinedTotalEarnings, combinedTotalEarnings attribute correlates 0.8 with combinedRecentCharge. The Author will then discard 8 attributes, topRatedStatusEx, totalHoursBilled, totalFeedbacks, combinedRecentEarnings, combinedRecentCharge, combinedTotalEarnings, combinedAverageRecentCharge and combinedTotalRevenue.

Fig. 10. Outliers (Author’s Preparation, 2022)

From Figure 10 above, it can be seen that the totalRevenue attribute has the most visible outliers, while the combinedAverageRecentEarnings and totalActualHoursBilled attributes show the outliers that are not that far apart. Overall the data has outliers. The author then selects data that has high outliers so that the dataset which previously amounted to 5,236 is reduced to 4,042.

Fig. 11. Outliers (Author’s Preparation, 2022)

Figure 11 is the result of the dataset after normalizing the data normalization. It can be seen that each attribute has relative variation value because I using coefficient of variation and this applies to all attributes so that the parameter distance for each attribute tends to be smaller.

C. Data Split

Based on the previous chapter, the author will try to experiment with sharing data with various proportions, where the results are as follows:

Proportion	Accuracy	Kappa
70:30	0.681	0.0693
75:25	0.692	0.0774
80:20	0.696	0.0851
90:10	0.693	0.0821

Author's preparation (2022)

Based on table 2, it can be seen that the proportion with the highest accuracy and Kappa value is if the proportion of data is divided into 80:20 which outperforms other proportions. Furthermore, the data will be split with a proportion of 80% for training data and 20% for testing data.

D. Model Evaluation

Measures	CV	Logit
Akurasi	0.7005	0.7030
Precision	0.7098	0.7042
Recall	0.9644	0.9893
F1	0.8177	0.8227
AUC	0.529	0.640
Balanced Accuracy	0.5291	0.5171
Kappa	0.0761	0.0464

Author's preparation (2022)

Based on table 3, It can be seen that the accuracy of the GLM model formed by Logit has a higher number of sizes than Cross Validation, so that the Logit model will be compared with Random Forest.

Fig. 12. Confusion Matrix Between GLM and RF (Author’s Preparation, 2022)

From Figure 12, the Confusion Matrix is shown for the Logistic Regression (GLM) and Random Forest algorithms, respectively. In GLM's prediction, there are 557 people correctly predicted to be freelancers who do not deserve Top Rated status, and 11 people correctly predicted to be freelancers with Top Rated status. For the Random Forest algorithm, as many as 481 people were correctly predicted not eligible to be Top Rated with 222 people eligible to be Top Rated.

Fig. 13. AUC Comparison (Author’s Preparation, 2022)

Table 4. Overall Model Comparison

Performance	Logistic Regression (GLM)	Random Forest (RF)
Accuracy	0.7030	<b>0.8700</b>
Kappa	0.0464	<b>0.7104</b>
F1	0.8227	<b>0.9016</b>
Balanced Acc	0.5171	<b>0.8513</b>
AUC	0.640	<b>0.976</b>

Author's preparation (2022)

From table 4 above, it can be seen that the Random Forest model and algorithm are the most accurate for the Confusion Matrix Acc, Kappa, F1, Balanced Acc and AUC methods. This clearly shows the power of RF over GLM, because RF is superior in all aspects. The use of these 5 metrics is also used with the aim of choosing an algorithm that has more accuracy so that the number of metrics used is odd. If special conditions occur, for example, these two algorithms excel in 2 metrics and have the same value in 1 metric, then the next comparison is the algorithm's value in all metrics. If the results are still the same, then the next comparison is the number of important variables that are predicted, where the algorithm with the number of important variables is considered more accurate. If the number is still the same, then the last thing to do is compare the coefficient of variation. The smaller of coefficient of variation will be considered more accurate. Furthermore, the Random Forest algorithm and model will be used to identify important attributes and predict which freelancers will be Top Rated.

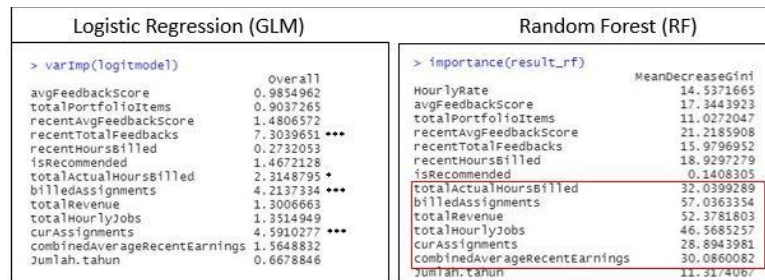

Fig. 14. Variable Important Model Comparison (Author’s Preparation, 2022)

From Figure 14, it can be seen that GLM has at least four important variables, that are recentTotalFeedbacks, curAssignments, billedAssignments and totalActualHoursBilled. While RF has more important variables. With an average Gini value of 25.5, there are six important variables, namely billedAssignments, totalRevenue, totalHourlyJobs, totalActualHoursBilled, combinedAverageRecentEarnings and curAssignments.

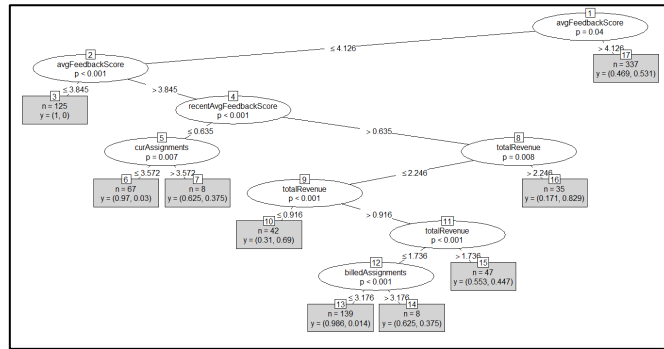

Fig. 15. Random Forest Tree Plot (Author’s Preparation, 2022)

Next is the decision tree plot on the RF model, which can be seen in Figure 15, this plot uses testing data that is used to measure the performance of the model. In Figure 20, it is explained that if the avgFeedbackScore variable at node 1 is less than equal to 4.126, the decision will switch to node 2 with p = 0.001. However, if the avgFeedbackScore variable at node 1 is actually worth more than 4.126, then the decision will immediately switch to node 17 with a response variable value between 0.469 and 0.531 and so on.

E. Variable Importance

To identify the variables that are important in predicting whether someone deserves to be a Top Rated freelancer or not, the author uses the Mean Decrease Gini (MDG) to determine the most important variable.

Fig. 16. Gini’s Variable Importance (Author’s Preparation, 2022)

From Figure 16 above, it can be seen that the 14 predictor variables have got their respective importance numbers. The most important variable to predict the occurrence of Top Rated Freelancers is totalRevenue with a value of 348.8, then billedAssignments with 240.6, totalHourlyJobs with 170.8, curAssignments with 160.8, totalActualHoursBilled with 146.5 and combinedAverageRecentEarnings with 125.5.

F. Recommended Freelancer

Based on the model that has been formed using training data, the Random Forest model was created to apply the classification, here the author uses all data 100%, totaling 4,043 lines in making predictions. The following are freelancers who were previously not Top Rated, but are predicted to become Top Rated in the future based on the Random Forest model. The following is a list of freelancers with the value of each important variable, names and profile have been hidden and changed to freelancer\_1 to freelancer\_30 due to privacy concerns.

Table 5. List of Potential Freelancer and The Importance Factor in Freelance Marketplace Platform

Freelancer	totalRevenue	billedAssignment	totalHourlyJobs	totalActualHoursBilled	curAssignments	combined
Freelancer_1	5113	45	11	88	3	239
Freelancer_2	2988	10	15	87	5	126
Freelancer_3	7539	13	6	443	7	585
Freelancer_4	8670	21	7	143	2	402
Freelancer_5	11834	24	19	159	11	493
Freelancer_6	12931	199	43	110	38	66
Freelancer_7	4710	22	4	160	5	214
Freelancer_8	17966	20	14	145	3	641

## V. DISCUSSION

Data representation is carried out to take a closer look at how the distribution of data for each variable, both numerical and categorical, so that we can see the characteristics of the data held. In this study, the data that is the response is topRatedStatus, where this variable contains 68% of freelancers who are not eligible to be Top Rated while about 31% are eligible, this is also seen in the split data distribution. The percentage of response attribute data is similar to the research by Pratt et al (2021), where their main attribute, namely satisfaction, provides information that as many as 69% of employees are satisfied and 31% are not satisfied. The difference is, Pratt et al (2021) represent demographic attributes such as age and education although there are also some attributes in common with author studies such as HourlyRate, Income and TotalHours.

In data pre-processing, the point is how the author performs data reduction, namely removing unnecessary attributes, data cleaning, which is removing data that has missing values, data transformation, namely transforming data to a certain scale (normalization) and data exploration, namely looking for outliers and eliminating them so that The resulting data is good enough for further processing. The research by Khera et al (2019) also carried out the same pre-processing stage, the difference is that Khera uses a standard deviation to select outliers where the autor uses selection using Quarters 1 and 3 to reduce data with the highest outliers so that the resulting image is shown in figure 14. Meanwhile research by Pratt et al (2021) only performs data reduction to remove unimportant attributes and missing values as well as data transformation to convert categorical data into numerical data.

In the model evaluation stage, it was previously explained that overall, the 5 Confusion Matrix evaluation methods Acc, Kappa, F1, Balanced Acc and AUC Mean (table 4) methods showed that Random Forest was the most accurate algorithm than Logistic Regression. These 5 (five) methods were also chosen to see how accurate they are from various sides, so as to convince the reader that comparisons are made through many methods that can contain more information. The number of model evaluation methods here is more complete than the research conducted by Dubey et al (2017) which only uses the F-measure for the evaluation model, and Gomez et al (2022) which only uses the Fmeasure, Kappa and Balance Accuracy. There is a slight difference where there are several studies that use methods that are not used by the author as in the study by Gao et al (2018) which used Recall, and Pratt et al (2021) which used Accuracy Standard Deviation and Area Under Curve (AUC) Standard Deviation. But in essence, there is no limit to how many methods should be used for model evaluation, so that some methods depend on the wishes of the author who feels what evaluation model is suitable for the algorithm being compared or just to see which algorithm is better if each algorithm has a tight competition for accuracy.

At the critical variable selection stage, the author uses Gini Importance or Mean Decrease Gini (MDG), the reason being that in MDG, the variable of importance is determined based on the contribution of each variable

to the homogeneity of nodes generated in a decision tree in Random Forest so this is considered better than Mean Decrease Accuracy (MDA). Several studies also use the MDGs to determine the importance of variables, such as the research of Dubey et al (2017) and Pratt et al (2021). Determination of the importance variable in this study uses the Mean where the average Gini value of each attribute becomes the limit whether the variable is considered important or not. The average value of 123.92 was obtained so that 6 variables with values above the average, namely totalRevenue billedAssignments, totalHourlyJobs, curAssignments, totalActualHoursBilled and combinedAverageRecentEarnings were chosen to be important variables for analysis and describe the real response attributes. A similar thing also happened to the research of Pratt et al (2021) where Income is the most important attribute and slightly different from Dubey et al (2017) where Job Experience is the most important attribute where this attribute is slightly similar to the TotalHourlyJob attribute which is ranked 3rd. most important.

At this stage of selecting which freelancers are recommended, it produces 30 people where they are users who initially do not deserve to be top rated but are predicted to be top rated based on the Random Forest model, but the author does not give a rating to these 30 freelancers. In contrast to the research by Dubey et al (2017) which ranked the top 3 most recommended freelancers. From the values in table 5, several types of freelancers can be drawn. Freelancer\_6, Freelancer\_9 and Freelancer\_11, in general they are freelancers who have the most advantages, especially for billedAssignments and totalHourlyJobs. This type of freelancer is a freelancer who has a type of work with a long duration of time, such as Freelancer\_6 who is voice over, Freelancer\_9 who is an apparel product manager and Freelancer\_11 who is a video editor and is trusted to work on large projects. However, they have a small combinedAverageRecentEarnings value. This is one of the reasons why they get a high demand for work for long-term projects because the prices can be quite cheap.

For Freelancer\_13 and Freelancer\_18, they are freelancer types who do not have many advantages, but have advantages in the totalActualHoursBilled and combinedAverageRecentEarnings variables and have disadvantages in the billedAssignments and totalHourlyJobs variables. This indicates that this type of freelancer is a freelancer who, in terms of duration, gets a large demand and also they get high profits because the price installed is also quite high. However, high prices make the number of requests per job small and also the total duration of time to complete the work is also short so this is not the type of long-term worker. This is because Freelancer\_18 is a data entry that does not require much time and analysis.

For Freelancer\_5, Freelancer\_24, Freelancer\_26, and Freelancer\_27, they are the average freelancer type. Especially for Freelancer\_24 and Freelancer\_26, the advantage they have is the totalRevenue variable. This type of freelancer is a freelancer who has been selling their services and products in the freelance marketplace for a long time, but their performance is not so prominent as they have been operating for more than 7 years. While Freelancer\_5 and Freelancer\_27 can be said to have neither advantages nor disadvantages, all important variables here are of sufficient value on average, but they are considered to be consistently operating.

Next are Freelancer\_7, Freelancer\_12, Freelancer\_16, Freelancer\_17 and Freelancer\_22. They are freelancers who can be said to be under performed in terms of the value of the important variables they have. Especially for Freelancer\_7 and Freelancer\_12, they have deficiencies in all variables except the curAssignment variable whose value is in the average. This means that these two freelancers are quite productive by completing many projects, despite the little income and demand that comes to them.

## VI. CONCLUSION AND RECOMMENDATION

In this study, the author emphasized that recruiting freelancers could be an effective solution for companies in cost efficiency if they knew which freelancers had the potential to be recruited. Random Forest is by far a better predictor than Logistic Regression when it comes to predicting potential freelancers. Potential freelancers themselves are identical to freelancers who have a lot of income and demand for assignments that pile up because they are considered capable of doing tasks so that they get big pay even though the age factor is also important based on previous research. However, this study has a drawback, namely the unavailability of demographic attributes such as age and education so that it can produce different and more complete results. This research can also be developed in the future by increasing the number of algorithms that are compared and determining the ranking for each potential or recommended freelancer. Furthermore, this research is also expected to be a reference for companies in recruiting freelancers and also the results of this research can complement the theory about the criteria for potential freelancers for further research.

## **Analysis Of The Influence Of The Number Of Seeds, Labor, And Land Area On Increasing Rice Production To Fulfill The Community's Food Bars Klaten District**

<sup>1</sup>Tesauna Ajeng Nur Hanifah and <sup>2</sup>Maulidyah Indira Hasmarini

<sup>1,2</sup>Universitas Muhammdiyah Surakarta

### **Abstract**

*The basic food needs of most Indonesians prioritize rice as the main staple of daily life in terms of staple food. The availability of rice needs for rice must be endeavored in such a way that it is always sufficient to ensure the availability of staple food for the community by prioritizing quality rice production and meeting the quantity of community needs. This study aims to be able to analyze various factors of rice production using the dependent variable, namely rice production and the independent variables, namely the number of seeds, labor, and land area to increase rice production in order to meet the food barns of the people of Klaten Regency by using the Error Correction Models ( ECM) is based on the last 20 years of research, namely 2001 - 2021. Data were obtained from the Central Statistics Agency (BPS), and the Central Java Provincial Agriculture Office and several supporting references related to this research. Based on the results of the study and the regression model of the ECM, it can be concluded that the variables that have a significant influence in this study are the variable area of land and the labor variable, while the variable that does not have a significant influence is the variable number of seeds. The number of seeds is a variable that does not have a significant effect even though seeds should have a major influence on rice growth, but the variables used in this study only determine the quantity of the number of seeds, while the actual need is thought to be the main factor affecting rice, namely the type of seed that is produced. used in rice production. Future research is expected to make further research on the type of seed used for rice as the main factor affecting rice production.*

*Keywords—ECM, Labor, Land Area, Number of Seeds, Rice Production.*

---

### **I. INTRODUCTION**

The availability of rice is the most important commodity that is needed by the Indonesian people as the main staple food that they rely on, so as a result of that the availability of rice commodities must absolutely be prepared and it is the big responsibility of the government in order to prepare the supply of food consumption in order to prepare for a surge in consumption. community food (Mariyani, 2017). Another factor that is influenced by the rice commodity is not only as food, but can also be used as a parameter of stability to the economy of the people in Indonesia, when the distribution of rice to the community is hampered, problems that arise will have an impact on inflation and social conflicts in the community (Prasmatiwi, 2017).

The availability of staple foods has a very high potential and becomes one of the strategic values that rice is considered quite important for the survival of the community, so it is necessary for the government to ensure the availability of rice to become the main factor in people's food and it is hoped that rice distribution will be evenly distributed because if food availability is lower than needs will lead to economic instability (Rejekiningrum, 2013).

The community's basic food needs will always be the number one priority for the government in supporting the main food ingredients. As a result, the rice production process must always be considered every year because the demand for rice to become community food will continue to increase along with the growth in the number of existing people, it takes several very structured planning from the government to be able to prepare basic food needs (Rohman, 2017).

Rice is a core commodity in people's lives, especially in Klaten Regency, if rice production is not sufficient then rice production as food will also not be fulfilled properly so that it can cause problems with the price of other basic commodities and will rely on imported products to fulfill food ingredients in Klaten Regency (Claudia Afrilia, 2014). Rice is one of the leading commodities among the people of Klaten Regency, this is characterized by cultivation that still has the potential to be redeveloped considering the large area of land and abundant water sources (Sunjaya, 2016).

Rice commodities can be used as a reference when assessing the welfare of the community as well as in assessing the socio-political conditions that exist in the community. Almost all Indonesian people consume rice every day, causing the value of rice commodities to food has a very strategic value in controlling the lives of some people in this country. Another factor that is influenced by the rice commodity is not only as food, but can also be used as a parameter of stability to the economy of the people in Indonesia, when the distribution of rice to the community is hampered, problems that arise will have an impact on inflation and social conflicts in the community (Prasmatiwi, 2017). availability of rice is the most important commodity that is needed by the Indonesian people as the main staple food that they rely on, so as a result of that the availability of rice commodities must absolutely be prepared and it is the big responsibility of the government in order to prepare the supply of food consumption in order to prepare for a surge in consumption. community food (Mariyani, 2017). Consumption of rice which is quite high is an important thing to pay attention to for the procurement and availability of lowland rice which can be processed into sufficient food ingredients. Rice is a core commodity in people's lives, especially in Klaten Regency, if rice production is not sufficient then rice production as food will also not be fulfilled properly so that it can cause problems with the price of other basic commodities and will rely on imported products to fulfill food ingredients in Klaten Regency (Claudia Afrilia, 2014).

In Nedi's research (2015), on "The level of rice farming in Grobogan Regency, Central Java Province" discusses the linkage of rice commodity farming based on the high demand for rice food. The purpose of Nedi's research is to determine the amount of production costs, revenue, demand and B/C Ratio of rice farming in Grobogan Regency, Central Java Province. In this research on rice commodity farming, it provides an overview of the acceptance of rice to the production produced by rice farmers, and the income obtained based on the results of market demand related to staple foods. The results of this study state that the factors of production together have a significant effect on production with a 95% confidence level. The most significant production factor is the planting area with the highest multiple linear regression coefficient (0.560). Meanwhile, the use of production factors such as planting area, SP36 fertilizer and pesticides has not yet reached the highest economic efficiency. Meanwhile, labor and urea fertilizer are not efficient.

In Falatehan's research (2017), on "Factors Affecting Rice Production with the System of Rice Intensification" discusses the superiority of rice production using the System of Rice Intensification (SRI) system by surveying 2 areas in West Java, namely Subang and Karawang. The purpose of this study is to analyze the factors that affect production using the SRI system. The results of the study found that the production function analysis showed that the dummy SRI variable had an important role in increasing production for SRI farmers, but all SRI production factors were not significant. Both SRI and non-SRI showed a decrease in yield on the production technology scale. This implies that both systems show a decrease in average costs in the long run. The findings of this study are used as the basis for policy formulation and development of SRI agriculture in Indonesia.

In Rosyadi s research (2012), on "The level of household food security in underdeveloped villages" discusses household food security based on the demand for rice from the community by comparing the results of rice production. The results obtained from the research process, namely the need for household food in the research area is very high compared to the results of rice production. The average yield obtained from food demand is 78% and for rice production, it is only around 60%, although there has been an increase in production but still cannot meet household food in the research area so that the fulfillment of food needs in the research area is very low in terms of aspects. continuation can cause other problems that are thought to be quite serious in the research area. Based on the results obtained, there are limitations to the research, namely the research conducted is only limited to identifying food security, not being able to find out what factors affect household food security in the research area; and (3) The research results have not described how to formulate a food security management model to address household vulnerability to food in the research area

Based on previous research, it was found that the problems discussed were regarding demand, food security against rice availability, and system development that could affect production factors. In previous studies it has been mentioned that rice production has various factors that can affect the rise or fall of rice production results, with this research it is possible to examine the factors of rice production using the number of seeds, labor and land area variables. Related to the novelty of this study compared to research that has been done, namely the proof that the importance of land area and labor on rice production, and the number of seeds without knowing the type and quality of rice seeds can affect or not in the process of rice production takes place.

This study will provide a more detailed novelty aspect related to the variables of land area, labor, and the number of seeds that have a significant and valid relationship in the rice production process in Klaten

Regency using data for the last 20 years starting from 2001 - 2021. Data involving The 20-year time series is thought to be able to provide more detailed outcomes related to factors that affect rice production.

## II. LITERATURE REVIEW

Rice production in Indonesia fluctuates every year. Now the average farmer has migrated from rice farmers to plantation or industrial farmers which according to them the level of welfare of farmers due to farming and plantation business far has a fairly commensurate advantage compared to rice farming (Marlina, 2017). Rice is the most important commodity for the public which has a primary need and strategic value in the economic, environmental, as well as social and political fields. This is what makes solid commodities have strategic value so that rice becomes the focus of government attention in meeting its availability as food or as a material for balancing social and political conditions. (Rachman, 2011).

The potential for resources in agriculture is very large as well as as a supporter of national income which tends to have a large value, which is also influenced by the number of people who depend on the agricultural sector for their life by placing their food needs or basic needs on rice (Pratama, 2019). The level of production of a country is determined by the number of workers and labor activities of a country. If the number of workers is small, then automatically the number of goods produced is also small and if the number of workers is large, the number of goods produced will also be large (Cahyani, 2019).

Workers are categorized as people who are in school, working, looking for work, taking care of the household and not working aged 15 to 64 years (Murdiantoro, 2011). Labor has an important role in economic growth, because basically labor is needed in every economic activity to produce an item. If the number of workers is small, then automatically the number of goods produced is also small and if the number of workers is large, the number of goods produced will also be large (Drennan, 2011).

Land area will affect the Indonesian economy starting from the farming sector, a very specific relationship when the production process has been declared harvested on a land area that ranges from one hectare per farmer, the income that farmers will find will increase, the availability of food as food or export material will increase. more available than rice fields that have a land area of less than one hectare (Suwarno, 2010). The influence of land area is not only on the level of efficiency of farming, but also has an impact on efforts to transfer and apply technology in agricultural development. If land ownership is more in boxes with a narrow area of control, agricultural development efforts will be difficult to carry out (Lyu, 2019).

Seedling is a young plant that has the potential to be a determining factor in plant growth and the quality of plant yields after growing (Marwah, 2014). Seedlings are used as an alleged factor that can affect corn production because seeds are included in the stages of the rice planting process in the early days. The nursery process from previous research (Hafidh, 2012) has a significant relationship with the quality of the seeds selected based on the needs of the rice harvest in the future, but in this study, the number of nurseries used is based on land area. One of the efforts to get the expected results, the use of seeds must be understood by most farmers by using an intensification program so that they can apply appropriate production technology and the use of efficient and profitable production facilities, including the technology of using the number of seeds per clump (Hafidh, 2012).

## III. RESEARCH METHODOLOGY

The research method that will be used in the research process is a quantitative research process that uses the basic analysis of each variable that has an influence on the process that can affect rice production in Klaten Regency. The data processing process in this study uses the Error Correction Model (ECM) regression analysis method. The researcher uses the Error Correction Model (ECM) analysis method as an analytical tool for data processing in this study. The reason for using this method is that the ECM method can describe a fairly dynamic model in the economic process that is quite related to the research time series both in certain time periods. Based on the form of the econometric formula as follows:

$$\Delta PP_t = \gamma_0 + \gamma_1 \Delta TK_t + \gamma_2 \Delta LL_t + \gamma_3 \Delta BT_t + \varepsilon_t$$

Description :

$\gamma$  : Independent regression constant

$\Delta$  : Result differentiating variable

$\varepsilon_t$	: Error Element
t	: Years
PP	: Rice production in year t (tons)
TK	: Labor (life)
BT	: Seeds (grams)
LL	: Land Area (hectare)

In this study using data from all sub-districts located in Klaten Regency based on data taken including data on rice production, land area, labor, and number of seeds with the research year for the last 20 years which was determined from 2001 - 2021. The type of data used is secondary data that uses a time series method with a time limit of the last 20 years, starting from 2001 to 2021. The data collected can be obtained from the Central Statistics Agency (BPS) which includes data on Indonesian farmers, data on agricultural land area Indonesia, and data on Indonesian food crops. In this study, essential data will be obtained, namely the size of the agricultural land, the labor of rice farmers and the number of seeds used. The data is taken from the official website of the Central Statistics Agency (BPS) and other sources are obtained from literature studies in the form of scientific journals and e-books.

Organic Rice Production is the result of the amount of effort made by organic rice farmers to obtain as much organic rice production as possible. In this study the yield of rice or rice production is denoted as PP in tons (tons). The data was obtained from the Central Statistics Agency (BPS) and the data was taken online through the bps website, namely <https://www.bps.go.id/>.

The workforce in this study are organic farmers who work in the fields to produce an organic rice production. In this study, the number of workers or farm laborers is denoted as TK in percentage units (%). Data is taken online through the bps website, namely <https://www.bps.go.id/>.

Agricultural land is land that is intended or suitable to be used as agricultural land for farmers to be able to produce food crops and livestock. Agricultural land is the main resource to be able to manage food crops or agricultural activities. In this study, the total area of land is denoted as LL in hectares (Ha). Data is taken online through the bps website, namely <https://www.bps.go.id/>.

#### IV. RESULT/FINDING

In this study, an analysis of the factors that influence corn production was carried out to find out that land area, productivity, seeds, and labor were carried out in the 2012 – 2017 research year. Based on maize production data in 2012 – 2017 with research data from 10 districts and 6 cities in province of Central Java. The estimation results from this study involve factors of seed, labor, and land area which are suspected as a tool to determine the effect of rice production. The method of processing time series data for a period of 20 years is the ECM method with the following economic model :

$$\Delta PP_t = \gamma_0 + \gamma_1 \Delta TK_t + \gamma_2 \Delta LL_t + \gamma_3 \Delta BT_t + \varepsilon_t$$

Description :

$\gamma$	= Independent regression constant
$\Delta$	= Result differentiating variable
$\varepsilon_t$	= Error Element
t	= Years
PP	= Rice production in year t (tons)
TK	= Labor (life)
BT	= Seeds (grams)

LL = Land Area (hectare)

The estimation results using the ECM regression method used the classical assumption test consisting of normality test, heteroscedasticity test, and autocorrelation test. Based on all the classical assumption tests determined by the parameters of the hypothesis. Before passing the Error Correction Model (ECM) Approach test process, all the data needed to go through the classical assumption test. The estimation results from each normality test, autocorrelation test, and heteroscedasticity test will be defined by a diagnostic test as follows :

*Normality Test Hypothesis*

H0 > 0.1 means that it can be continued to the autocorrelation test on each variable

HA < 0.1 means that it cannot be continued to the autocorrelation test on each variable

Table 1. Normalities Test Estimation Results

Std. Dev	3997.105	Prob.	0,64261
Skewness	0,500849	Jarque Bera	0.88443
Kurtosis	2,662687		

Probability (0.64261) > 0.1, so that there is normality in this model. then the autocorrelation test can be continued on each variable to obtain a probability value based on the standard assumption of less than 0.1.

*Autocorrelation Test Hypothesis*

H0 > 0.1 means that the model does not occur autocorrelation

HA < 0.1 means that there is no autocorrelation in the model

**Table 2**

Breusch-Godfrey Serial Correlation LM Test:

F-statistic	0.587751	Prob. F(1,12)	0.4758
Obs*R-squared	0.849452	Prob. Chi-Square(1)	0.3784

Prob. Chi-Square 0.3784 > 0.1 So that in the model there is no autocorrelation because the standard autocorrelation for each variable is not more than 0.1, it can be concluded that the data from the variables of land area, seeds, and labor do not experience autocorrelation.

*Heteroscedasticity Test Hypothesis*

H0 > 0.1 means that the model does not occur heteroscedasticity

HA < 0.1 means that the model has heteroscedasticity

Table 3. Heteroscedasticity Test Estimation Results

Heteroskedasticity Test: Breusch-Pagan-Godfrey

F-statistic	0.970112	Prob. F(5,13)	0.4457
Obs*R-squared	5.109921	Prob. Chi-Square(5)	0.3754

Scaled explained SS                      2.097288                      Prob. Chi-Square(5)                      0.8906

Obs\*R-squared (5.1099) > 0.1, so that in the model there is no heteroscedasticity. The standard for determining the existence of heteroscedasticity with a value of more than 0.1 but in the results of existing data research, the value of the R-square has exceeded 0.1, it can be said that the data of all independent variables on the dependent variable does not occur heteroscedasticity.

Table 4. Classic Assumption Test Hypothesis Results

Num	Aspect Test	Hipotesis	Probability	Description
1	Normality test	H0	0,64261	Accepted
2	Autocorrelation Test	H0	0.3784	Accepted
3	Heteroscedasticity Test	H0	5,1099	Accepted

Source: data processed by researchers

Based on the classical assumption test, it can be concluded that the data in this study can be stated to have no autocorrelation and pass the normality test. The data contained in this study can be processed using the Error Correction Model (ECM) approach.

Table 5. ECM Estimation Results

Variable	Coefficient	Std. Error	t-Statistic	Prob.
D(LL)	4.632247	0.744573	4.186467	0.0023
D(BT)	62.23869	39.12951	1.774502	0.1277
D(TK)	0.338582	0.097571	3.965822	0.0429
ECT(-1)	-0.412758	0.495798	-1.646889	0.0457
C	362.2772	1183.232	0.312750	0.6904
R-squared	0.967562	Mean dependent var		9618.758
Adjusted R-squared	0.966295	S.D. dependent var		67366.74

F-statistic	674.4252	Durbin-Watson stat		1.654880
Prob(F-statistic)	0.000000			

Source: data processed by researchers

Based on the results of data processing using the ECM approach, it produces F-statistics and produces the probabilities of all variables that have an influence on rice production in Klaten Regency. The results that have been obtained in the ECM data processing will be concluded by using the research hypotheses of the F Test and T Test.

Table 6. ECM Estimation Results

$$\Delta PP_t = 362.2772 + \gamma_1 0.338582_t + \gamma_2 4.632247_t + \gamma_3 62.23869_t + \varepsilon_t$$

(0.0429)(0.0023)                      (0.1277)

$R^2 = 0.966295$ ; S.E. Regression = 4823.185; F-Statistic = 674.4252; Prob = 0.000000

Note: Significant  $\alpha = 0.10$ ; Significant  $\alpha = 0.10$ ; Significant  $\alpha = 0.10$ . Numbers in brackets are statistical probabilities.

Based on the results of the analysis showed that the probability of ECT (-1) was obtained at  $0.0457 < 0.1$  so that this model provides the view that the variables that have an influential relationship are land area (LL) and labor (TK) with a probability of 0.0023 and 0.0429, while the seed variable (BT) has no significant effect with a probability of 0.1277 exceeding the probability of = 0.10. The estimation results of Error Correction Models (ECM) will be reprocessed with the F Test and T Test.

*Hypothesis F Test*

Testing with the F test is one of the factors. Decision making criteria is carried out by making the following hypothesis:

H0 : Stimulant significant effect

HA : No significant effect simultaneously

The f test can produce a statistical probability value  $< (0,1)$  then H0 is accepted, if the statistical probability value is  $> (0,1)$  then H0 is rejected.

Table 7. The description of Test F

Aspect	Probability	Description
Prob (F-statistic)	0.0000	Accepted

Source: data processed by researchers

Based on the results of the analysis of the F test, the F test has a Prob (F-statistic) value of  $0.0000 < 0.1$ , then H0 is accepted. It can be interpreted that there is a significant effect, but only on the variable labor (TK) and the variable area of land (LL) simultaneously while the variable number of seeds (BT) has no significant effect on the variable rice production (PP).

*Hypothesis T Test*

Testing with the t test is one of the factors. Decision making criteria is carried out by making the following hypothesis:

H0 : Stimulant significant effect

HA : No significant effect simultaneously

The t-test can produce a statistical probability value  $< (0,1)$  then H0 is accepted, if the statistical probability value is  $> (0,1)$  then H0 is rejected.

Table 8. The description of T Test

Variable	Hypothesis	Probability	Description
TK related PP	H0	0.0429	Accepted
LL related PP	H0	0.0023	Accepted
BT related PP	HA	0.1277	Rejected

Source: data processed by researchers

Based on the results of the t-test analysis, it shows that the land area has a prob of  $0.0023 < 0.1$  then H0 is accepted and the workforce has a prob of TK (0.0429)  $< 0.1$  then H0, so that between the variables of labor (TK) and area (LL) has a significant effect on rice production (PP) in the long term.

Based on the results of the analysis showed that the probability of ECT (-1) was obtained at  $0.0457 < 0.1$  so that this model provides the view that the variables that have an influential relationship are land area (LL) and labor (TK) with a probability of 0.0023 and 0.0429, while the seed variable (BT) has no significant effect with a probability result of 0.1277 exceeding the expected probability.

The estimation results obtained using the Error Correction Models (ECM) approach method show that the seed variable has no significant effect on rice production in Indonesia in 2001-2021. Seedlings are the forerunner to plants so that they can grow to produce and produce, but in research This seed does not have a significant relationship with rice production, but seeds should have a relationship with rice production. Seedlings can be recognized as related if rice research is not only mentioned in general terms, but must be mentioned with the acquisition of the type of seed used. This is in accordance with the results of Marlina's research (2017) "factors that affect Ciherang rice production based on the number of seeds per hole and the age of rice". In this study it was stated that the linkage of seeds to rice production would not be affected by the number of perforated seeds or the age of rice, but seeds could have an effect when the type of seed was defined in detail and a comparison was made between the quality results of the type of seed to be used in production activities.

The land area variable has a fairly close relationship with the labor variable in the rice production process in Klaten Regency in 2001 - 2021. This is in accordance with the results of Mahananto's research (2016) "Factors that affect rice production in Nogosari District, Boyolali". The influence of land area has a very real influence based on the number of hectares used by farmers in rice production activities, to obtain maximum profits and yields, it is necessary to enlarge the land for rice production. The use of land area can provide benefits and can produce more production results depending on farmers who choose the area of arable land with large or small land areas. If in the long-term estimation the yield of rice production is not in accordance with the predetermined harvest target, it is necessary to re-observe the amount of land used for rice production activities in Klaten Regency 2001-2021.

The labor variable has a significant influence on rice production in Klaten Regency 2001 - 2021. This is in accordance with the results of Elsa's research (2020) "Factors that affect rice production in Deli Serdang Regency". The workforce has a fairly important role in production activities as a direct executor of the production process in all sectors of goods and services. If in the long-term estimation the yield of rice production is not in accordance with the predetermined harvest target, it is necessary to re-observe the number of workers used in rice production activities in Klaten Regency 2001-2021.

The yield and quality of rice production will depend on the workforce who takes care of the production process if there is a decrease in quality and quality results for rice production can occur due to the lack of labor for rice production activities with land use that is not proportional to the number of workers.

## V. CONCLUSIONS AND LIMITATION

### A. *Conclusions*

Rice production in Klaten Regency every year will increase and decrease in the number of rice yields due to the influence of land area and labor on activities during rice production. This study provides views to farmers or readers in order to gain an understanding of the factors that are tied to rice production when experiencing increases and decreases in corn production. Based on the results of research on the effect of rice production in Klaten Regency in the last 20 years from 2001 to 2021, it is driven by factors of land area, and labor, while in practice rice seed production activities can be relied upon as a factor that affects rice production when considering the type and quality of rice seeds used. If you only pay attention to the number of seeds used in rice production activities, the seeds will not have a significant effect on the results obtained in the rice harvesting process.

There is a conclusion that can be used as a reference, namely the production results have a relationship with the independent variables, namely labor (TK) and land area (LL) there is a significant effect on rice production (PP) in the long term. And there are also variables that do not have a significant relationship, namely variable number of seeds (BT). In this study, it was stated that the linkage of seeds to rice production would not be affected only by the number of perforated seeds and the age of the rice, but the seeds could have an effect when the type of seed was defined in detail and a comparison was made between the quality results of the type of seed to be used in production activities. The variable that is closely related to rice production is land area. The process of rice production is influenced by land area because the main factor of production is the land used based on the amount of hectares. In obtaining maximum profits and yields, it is necessary to enlarge the arable land for rice production. The use of land area can provide benefits and can produce more production results depending on farmers who choose the area of arable land with large or small land areas. The yield and quality of rice production will depend on the workforce who takes care of the production process if there is a decrease in quality

and quality results for rice production can occur due to the lack of labor for rice production activities with land use that is not proportional to the number of workers.

### B. Limitation

It is hoped that future researchers can examine other factors that intersect as other rice production factors outside of seeds, labor and land area, so that they can be more clearly ascertained about rice production factors so that they can become strong literature as material for the study of rice production for readers. It is hoped that all farmers, in the process of producing rice, need several significant factors that need to be considered in detail in the rice production process. In this study, it has been proven that with the presence of seeds in rice planting, it is not immediately certain that the number of seeds in the production process is not a major problem. However, more observations are needed regarding the factors involved in detail to provide conclusions that affect the decrease and increase of certain factors.

## The Influence Of Discount Prices And Store Attempt On Consumer Behavior In Purchase Decisions At Pt Alfaria Trijaya Tbk (Alfamart)

Anisa Lisara<sup>1</sup>, Dani Usmar<sup>2</sup> and Nurlela<sup>3</sup>  
<sup>1,2,3</sup>Galuh University

### Abstract

*Along with the growth of the retail business in Indonesia, the competition faced by PT. Sumber Alfaria Trijaya Tbk (Alfamart). This article is researched with the aim of analyzing the effect of the discount variable, and the Store Atmosphere on the endogenous variable, namely Purchase Decision. This article examines the exogenous (exogenous) variable, namely the discount variable, and the Store Atmosphere which has an influence on the endogenous variable, namely Purchase Decision. The analysis technique in this research is multiple regression analysis. The sample in this study was 100 consumers obtained through accidental sampling technique. The results of this study indicate that price discounts, and Store Atmosphere have an effect on impulse buying. Discounts have an effect on Purchase Decisions of 2,158. The company provides discount programs and promotions that are expected to increase consumer buying interest so that consumers will continue to shop at Alfamart. Store Atmosphere has a significant effect on Purchase Decisions of 2,223. Layout, condition of the room, arrangement of goods display can be a good opportunity for Alfamart to influence consumers to decide to make a purchase at Alfamart.*

*Keyword— Price Discount; Store Atmosphere; Purcuse Decision; Alfamart.*

---

### I. INTRODUCTION

Increasing population growth and consumption patterns that are classified as consumptive are increasingly growing the interest of providers of goods and services, especially in the modern retail business. The presence of the modern retail industry basically takes advantage of people's shopping patterns, especially the upper middle class who do not want to be jostled in traditional markets which are usually not neatly arranged and the environment or store atmosphere is not comfortable. With an increasingly advanced era and technology growing rapidly making the modern retail business grow from time to time, this is related to consumer behavior in buying an item, wanting a low price, good quality, a comfortable place and other conveniences that are widely available in Indonesia. offered by modern retail business players such as Alfamart, judging by the 2019 data on the Alfamart official website, it says there are around 14,300 outlets operating after 20 years of Alfamart spreading its wings in Indonesia, this reason makes producers and providers of goods and services increasingly competing to attract the attention of consumers. One is with innovation in technology, Alfamart is trying to provide the best service during the COVID-19 pandemic. In 2019, the launching of Alfagift was carried out by Alfamart, which is an application from Alfamart that allows users to always be up-to-date on promotions and get special offers that are only available in the application, related to regulations on mobility restrictions during the pandemic by the government in order to break the chain. the spread of the virus by limiting mobility makes Alfamart provide messaging services between purchases above Rp. 35,000 using the Alfagift application or orders via WhatsApp and telephone, of course with several other offers in the form of discounts and product bonuses, in the Alfagift application consumers can make non-cash transactions, payment can be made by transfer from a bank that has collaborated or with a digital wallet, with this it is hoped that it will make it easier for consumers to shop, so there is no need to go out of the house with a high risk during the pandemic, the strategy adopted by Alfamart is to pick up the ball, besides that the promo price is also one way to attract consumer interest. Price is only one part of the marketing mix, therefore the price needs to be conditioned and support each other with other marketing mixes, namely product, distribution, and promotion.

Discounts or price discounts have several indicators, namely price reductions, new product discounts, discounts on products that are not selling well, discounts for certain moments, price compensation and lighting quantity discounts, space layout, and product arrangement on merchandise shelves that are organized and attract consumers. Store Atmosphere Indicator includes *instore* or in-store which includes lighting, air conditioning, room layout, displays and cleaning. The outside of the shop or *outstore* includes signage, parking space, environmental design.

The store atmosphere variable has no effect on purchasing decisions at *cafe Little Wings Bandung* [1], while Zain's research (2016) concludes that the store atmosphere variable has a significant effect on purchasing decisions at KFC Taman Square Bogor.

Based on the description above, a gap appears from the results of the research, the discounted variable has no effect on purchasing decisions at Matahari *Department Store* Malang Big Market. [2] Meanwhile, Emor's research (2015) concludes that the price discount variable has a significant effect on consumer purchasing decisions at Alfamidi Tanjung Batu. [3]

PT. Sumber Alfaria Trijaya Tbk (Alfamart) is one of the businesses engaged in the retail sector in Indonesia. Alfamart sells a variety of daily necessities ranging from snacks, instant foods, beverages, instant kitchen ingredients, home and body cleaning needs and many more. This minimarket which was established in 1999 has a building area of 200 square meters with operating hours from 7 am to 10 pm from Monday to Sunday. PT. Sumber Alfaria Trijaya Tbk (Alfamart) is not the only retail minimarket business in Indonesia.

There is a reason the author chose the object of research at PT. Sumber Alfaria Trijaya Tbk (Alfamart) because PT. Sumber Alfaria Trijaya Tbk (Alfamart) is the first pioneer of modern retail stores since June 27, 1999. Based on the results of field observations, the authors found advantages that are a plus for PT. Sumber Alfaria Trijaya Tbk (Alfamart) to be the object of research compared to other minimarkets in the same city, namely promotional activities carried out by PT. Sumber Alfaria Trijaya Tbk (Alfamart) is more varied and with the distribution of brochures in every resident's house by shop assistants, the inside of the store is spacious for the size of a minimarket so as to facilitate the flow of consumer shopping

Every month Alfamart which is a subsidiary of PT. Sumber Alfaria Trijaya Tbk (Alfamart) provides three types of discounts, including (1) Monthly Discounts (2) Super-Saving Discounts (3) Exciting Price Discounts An increase in the right and comfortable atmosphere of the store can attract visitors to find out what is being traded in the store. the. The atmosphere of the store can be created starting from the aspect. This study aims to determine the effect of price discounts and store atmosphere on purchasing decisions at PT. Sumber Alfaria Trijaya Tbk (Alfamart).

## II. LITERATURE REVIEW

### A. *Discounts Definition of Discounts*

Discount promotion offers several advantages including: it can trigger consumers to buy in large quantities, anticipate competitors' promotions, and support large volumes of trade." [4]. Price discount, is the savings offered to consumers from the normal price of a product [5]. A rebate is a rebate that a seller gives to a buyer because of the price of a certain activity, and the buyer is attractive to the seller. Consumers are interested in getting a fair price [6].

### B. *Types of Discounts*

Types of Discounts According to McCarthy and Pereaault (2014) Discounts are divided into several types, namely: [7]

- a. *Quantity Discount*: Price discounts offered to attract consumers to make purchases in large quantities;
- b. *Seasonal Discount*: Price discounts offered to attract buyers at certain times and to keep inventory earlier than necessary at this time;
- c. *Cash Discount*: Price reductions to buyers to encourage them to pay bills early;
- d. *Functional Discount*: Discounts made to members of the trading channel with predefined terms and functions.

Discounts are price reductions given by the company within a certain period and to increase sales of a product. [8]

Indicator:

- a. Price Discount;
- b. Brand;
- c. Customer service;
- d. Buying decision.

The store atmosphere aims to provide comfort to consumers and can be the main attraction for consumers. In addition, to make consumers comfortable in choosing the type of product to be purchased. Store atmosphere is the atmosphere in the store that creates a certain feeling in the customer resulting from the use of interior design elements such as lighting, sound system, air conditioning system, and service. Besides that it's the same as the definition of a shop atmosphere[9].

Another understanding according to J.Paul Peter and Jerry C.Olson translated by Damos (2014) Store atmosphere is a very important physical characteristic for any retail business. -long time in the store and indirectly stimulate consumers to make purchases [10].

*C. Store Atmosphere Elements*

The four elements of store atmosphere, which are summarized:

- a. Shop Design: Store Design includes: Store front, Entrance, Shop face, Layout and Ambience
- b. Store Planning, including:
- c. Room layout
- d. Space Allocation
- e. Visual Communication
- f. Setting Merchandise [11]

According to Alma (2013), Store Atmosphere is a store atmosphere that includes interior, exterior, layout, and interior appearance that can attract consumers and generate interest to buy.

Indicators:

- a. Shop Front
- b. Interior Display
- c. Interior View
- d. Store Layout [12]

*D. Buying Decision*

Purchasing decision is a process where consumers recognize the problem, seek information about a particular product or brand and evaluate how well each alternative can solve the problem, which then leads to a purchase decision [13]. Purchasing decisions as follows: "Purchase decisions are part of consumer behavior consumer behavior, namely the study of how individuals, groups, and organizations choose, buy, use, and how goods, services, ideas or experiences to satisfy their needs and desires" [14]

*E. Purchasing Decision Making Process*

A. Kotler and Keller (2016) mention five buying decision-making processes, which are essentially:

- a. Recognition of Needs
- b. Information Search
- c. Evaluation of various alternatives
- d. Buying decision
- e. Post-purchase behavior [15]

Citra (2016) in his research says that the relationship between social media and the purchasing decision process is social media as a promotional tool that makes it easier for consumers to see products easily through pictures and product descriptions to find out product information, choose, and evaluate products [16]. Mowen & Minor (2010) definition of impulsiveness (impulse buying) is an act of buying that is done without choosing a previous problem or buying intention that was formed before entering the store.

Indicators:

- a. Purchase Spontaneity
- b. Not Considering Consequences
- c. A sudden urge to buy
- d. Can't Refuse [17]

### III. RESEARCH METHODOLOGY

This type of research is descriptive research with a quantitative approach. The independent variables used in this study are the discounted variable (X1) and the store atmosphere variable (X2) and the dependent variable is the purchase decision (Y). The population used in this study is Alfamart consumers for a week on March 25-31 2022, totaling 100 people.

The sampling technique used is non-probability sampling with a purposive sampling approach. Purposive sampling is a sampling method that is carried out by selecting subjects based on specific criteria set by researchers, namely the consumers of Alfamart Center.

In this study the number of population is unknown. Determination of the sample using the formula Moe (Margin of error) as follows:

$$n = \frac{Z^2}{4 (\text{Moe})^2}$$

$$n = \frac{(1.96)^2}{4 (10\%)^2}$$

$$n = \frac{3,8416}{4}$$

$$n = 96.04$$

Thus, the magnitude of the calculation of the size of the number of respondents who will be sampled in this study is 96.04 or rounded up to 100 respondents. [18]

The criteria determined are:

- a. Gender male or female
- b. Age 15-60 years
- c. Central Alfamart Consumers

The author tested the instrument before distributing the questionnaire, testing the research instrument was carried out by distributing the research instrument to 20 respondents, then testing the validity and reliability of the instrument. The instrument is declared valid or meets the requirements if the coefficient price  $r_{hitung} \geq r_{tabel}$ , while the research instrument is declared reliable if it has a value of *Alpha Cronbach* 0.60 or 60%.

After the instrument was declared valid and reliable, data analysis was carried out using classical assumption analysis tests, multiple linear regression and hypothesis testing of research data.

#### IV.RESULT / FINDING

##### A. Validity Test

Table 1. X1 . Data Validity Test Results

Items	Correlation Value Product Moment (rcount)	rtable	Information
1	0.702	0.3	Valid
2	0.638		Valid
3	0.541		Valid
4	0.719		Valid
5	0.482		Valid
6	0.729		Valid
7	0.622		Valid
8	0.541		Valid

Based on the table above, it is known that the Discounted Price (X1) variable contains 8 statement items with valid overall validity test results. Furthermore, Table 2 provides the results of the questionnaire validity test for the Store Atmosphere variable (X2).

Table 2. X2 Data Validity Test Results

Items	Correlation Value Product Moment (rcount)	rtable	Information
1	0.596	0.3	Valid
2	0.693		Valid
3	0.646		Valid
4	0.542		Valid
5	0.561		Valid
6	0.379		Valid
7	0.510		Valid
8	0.320		Valid

Based on Table 2 above, it is known that the Store Atmosphere variable (X2) has 8 items with valid overall validity test results. Furthermore, Table 3 provides the results of the validity of the questionnaire for the Purchasing Decision variable (Y).

Table 3. Y . Data Validity Test Results

Items	Correlation Value Product Moment (rcount)	rtable	Information
1	0.341	0.3	Valid
2	0.363		Valid
3	0600		Valid
4	0.563		Valid
5	0.644		Valid
6	0.652		Valid
7	0.354		Valid
8	0.327		Valid

Based on Table 3 above, it is known that the Purchase Decision variable (Y) has 8 items with valid overall validity test results.

### B. Reliability Test

Table 4. Data Reliability Test Results

Variable	Cronbach's Alpha	Number of Items	rtable
Discounted Price (X1)	75.2%	8	60%
Store Atmosphere (X2)	71.6%	8	60%

Decision Purchase (Y)	69.6%	8	60%
-----------------------	-------	---	-----

Based on Table 4 above, it is known that the Cronbach Alpha coefficient obtained from the test results for the Discounted Price (X1) and Store Atmosphere (X2) and Purchase Decision (Y) rtable variables, so the conclusion from the reliability test of the three variables on the instrument research is declared reliable.

## V. DISCUSSION

### B. Data Analysis Method

Table 5. Regression Test Results

Test Type	Test results	Conclusion
t test	The results of the partial significance test or t test, namely the discounted variable affect the purchasing decision variable with 2.158 and a significance value of 0.033 0.05, so it means that the price discount variable has an effect on purchasing decisions. The second independent variable, namely the atmosphere of the store affects the purchasing decision variable with a value of 2.223, with a significance of 0.029 0.05, it can be interpreted that the atmosphere of the store affects purchasing decisions.	Discounts affect the Decision Purchase
		Store atmosphere affects decisions Purchase
F Uji test	Simultaneous significance test or F test in this study obtained 8.174 with a significance of 0.001, so with a significance value of 0.001 less than 0.05 that the variable price discount and store atmosphere simultaneously affect the decision purchase	Discounts and store atmosphere have a simultaneous influence on purchasing decisions

Source: Data processed by the author (2022)

Based on the description of the table above, it is stated that the results of the analysis state that regardless of the classical assumptions, then continued with multiple linear regression analysis testing which aims to determine the effect of price discounts, store atmosphere on purchasing decisions (Y). Data analysis was carried out with the help of SPSS version 23 program. The presentation of multiple linear regression analysis is explained as follows:

The results of the regression analysis are known by the regression equation below:

$$Y = 17.484 + 0.205x_1 + 0.221X_2 + e$$

Information :

- Y = Decision Purchase
- X1 = Discounts
- X2 = Store Atmosphere
- E = Error

Based on the above equation, the following explanation can be presented:

- a. The constant 17,484 marked (+) means that if the price discount and store atmosphere = 0 (no change) so that the value of the purchasing decision variable is 17,484 which if the price discount and store atmosphere does not change so that purchasing decisions at Alfamart continue to occur due to the influence of variables other than X1 and X2 such as product quality, service, store image, price and so on.
- b. The X1 regression coefficient of 0.205 is (+) which means that the greater the discount given, the higher the purchasing decisions of Alfamart consumers.
- c. The X2 coefficient of 0.221 is (+) which means the better the store atmosphere, the better Alfamart consumer purchasing decisions.

### C. Coefficient of Determination (R<sup>2</sup>)

The results of the coefficient of determination in this study were 0.146, which means that purchasing decisions for Alfamart consumers are influenced by price discounts and store atmosphere as much as 14.6% and the remaining 85.4% is influenced by factors outside the research variables.

## VI. CONCLUSION AND RECOMMENDATION

### D. ACKNOWLEDGEMENT

#### A. *The Effect Of Price Discounts On Purchasing Decisions At Alfamart*

Based on the results of the analysis, it is known that the price discount variable partially has a positive and significant effect on the purchasing decision variable at Alfamart, thus accepting the first hypothesis. The results of this study strengthen the theory of Hermawan (2012) explaining that the existence of giving discounts to consumers as a reward often leads to large purchases. [19]

The results of this study also strengthen previous research by Rumangkang (2014) concluding that price discounts have a significant positive effect on purchasing decisions [20]. Emor and Soegoto (2015) conclude that price discounts have a significant positive effect on purchasing decisions [21]. Ndari (2015) concludes that price discounts have a significant positive effect on purchasing decisions. [22]

Based on the test results, it is known that the condition of the price discount variable is stated to be strong, which means that the results of the respondents regarding the statement of the discounted variable answer mostly agree. This means that the discount at Alfamart is declared good and in accordance with the wishes of consumers

#### B. *The Influence Of Store Atmosphere On Purchasing Decisions At Alfamart*

Based on the results of the analysis, it is stated that the store atmosphere variable partially has a positive and significant effect on the purchasing decision variables at Alfamart. Kotler and Keller (2015) explain that the atmosphere of the store not only affects purchasing decisions, but the atmosphere of the store will also increase consumer purchases because of the convenience they feel when shopping. This shows that the research results are mutually reinforcing with the theory. Syahputra and Supriyatin (2015) concluded that store atmosphere had a significant positive effect on purchasing decisions [23].

The condition of the store atmosphere variable based on the test results is stated to be very strong, which means that the results of the respondents regarding the store atmosphere variable statement mostly answered strongly agree. Based on this explanation, the condition of the store atmosphere variable is categorized as high, which means that the store atmosphere is stated to be good and in accordance with the wishes of the buyer.

#### C. *The Effect Of Price Discounts And Store Atmosphere Simultaneously On Purchasing Decisions At Alfamart*

Based on the analysis, the results of the price discount variable and store atmosphere simultaneously affect purchasing decisions. This finding explains that the variable categories of discounts and store atmosphere are related. The results show that the store atmosphere variable has a greater effect on purchasing decisions at Alfamart, this is because when consumers shop at modern retail stores, the store atmosphere becomes a consideration for consumers to feel comfortable and the discounted prices given are the main attraction for consumers in shopping at Alfamart.

The results of the research analysis also strengthen the previous research of Warahma and Mudiantono (2017) that price discounts and store atmosphere have a significant effect on purchasing decisions. So that in this study price discounts and store atmosphere have a significant simultaneous effect on purchasing decisions at Alfamart. The results of this study strengthen the theory of Dalihade (2014) explaining that when a visitor decides to buy a product, the main factor is the existence of a price discount that can attract the attention of consumers to encourage potential consumers to buy the products offered and if the store can fulfill their wishes and provide convenience for visitors, visitors will directly rate good for the shop [24].

## Performance Improvement Of Sepiring Geprek Msme Through Human Resources Management And Improvement Of B2B Promotion Media

Juniar Rijatama<sup>1</sup>

### Abstract

*Small and Medium Enterprises (MSMEs), as one of the elements of economic growth, occupy a strategic position to accelerate the economy. Sepiring Geprek is one of the MSMEs engaged in food and beverage. Similar to other MSMEs, Sepiring Geprek also expects growth accompanied by good company management. To support this, Sepiring Geprek must prepare human resources management and increase marketing activities. By doing these, it is hoped that Sepiring Geprek can continue to grow and become one of the MSMEs that dominate the crushed (geprek) chicken market. The business coaching program is expected to catalyst MSMEs to achieve predetermined targets and desires. There are two Business Coaching programs that the author will carry out in helping MSMEs; first, by increasing the HR management program. It is expected that MSMEs will have a good HR management system and management in the future. Second, maximize marketing activities by increasing brand awareness and company profile. The two programs are expected to support MSMEs in improving the quality of their business.*

*Keywords—Business Coaching; HR Management; Marketing; MSMEs; Crushed (Geprek) Chicken.*

---

### I. INTRODUCTION

Indonesia's current economic development is a tangible form of the development of MSMEs in Indonesia. MSMEs or Micro, Small, and Medium Enterprises are businesses run by individuals, households, or small business entities. According to BPS (Central Statistics Agency) data, in 2020, the number of registered MSMEs in Indonesia reached around 64.2 million MSMEs, this number increased by around 10 million MSMEs over the last 10 year period (BPS.co.id). MSMEs in Indonesia is one of the industries that have a large impact on Indonesia's GDP (Gross Domestic Product). Based on BPS data in 2019, the total GDP of MSMEs contributed to the national economy (GDP) of 61.1%, and the remaining 38.9% was contributed by large business actors. The results of the development of MSMEs in Indonesia have an impact on the economy as a whole, which in 2020, employment managed to absorb around 120 million Indonesian workers (kontan.c.id).

The occurrence of a prolonged pandemic has become a new challenge for MSMEs to be able to continue to compete in this fierce competition. An effective and efficient strategy is needed to support business activities that are following current consumer and market conditions, especially those activities that are closely related to the current pandemic conditions, namely food. Through the concept of HR management and also the management of the marketing system, it is hoped that it can catalyst MSMEs in facing today's competition. Good HR management, of course, will improve the company's performance which in the future will affect the increase in other factors (Dessler and Huat, 2009). On the other hand, the management of the marketing system can also effectively increase the market share and brand awareness of the product itself (Kotler, 2004), besides that MSMEs must focus on how MSMEs can provide a brand image by creating a strong brand, loyalty, and brand equity to support its business activities. (Clow and Baack, 2016)

The business coaching carried out by the author is a process of implementing things needed by MSMEs to improve their business activities. In the business coaching process this time, the author tries to improve human resources management and maximize the marketing process. The management of human resources is essential because humans are the business drivers to keep it under predetermined standards (Kianto, A., Sáenz, J., & Aramburu, N., 2017). In addition, the marketing process also has a vital role in ensuring that the sales process and relationships with consumers can run well (Woodproof, PJ, Deitz, GD Howie, KM, & Evans, RD, 2019). It is hoped that with this business coaching activity, MSMEs can improve business systems, especially those related to HR activities and marketing activities. It is also expected that MSMEs can become companies that can develop and become market leaders in their business competition.

### II. LITERATURE REVIEW

#### A. *Micro, Small And Medium-Sized Enterprises (MSMES)*

Micro, small and medium-sized enterprises (MSMEs) are essential for local economic development, playing a central role in economic growth (Gherghina et al., 2020). MSMEs generally exhibit a flexible approach towards technical shifts, better adaptability to customer requirements, and their organisational structure allows quick decision-making (Gherghina et al., 2020).

The growing role of MSMEs is expected to be balanced with the quality of MSMEs themselves, starting from HR management, marketing management, and financial management. It is hoped that MSMEs will continue to grow and have a good impact on economic development. Moreover, competition is another crucial factor that must be considered. Therefore, this program is expected to be a good catalyst for developing MSMEs and the economy itself.

#### *B. Human Resource*

Good human resource management can be the success of an MSME, such as achieving sales targets and increasing the market share of the company's products. Internal factors are no less critical to making the MSMEs run well and achieve the MSMEs' goals. A very vital internal factor is HR (Human Resources). With good HR management, of course, the company's performance will increase, affecting other factors. Several stages must be carried out correctly so that HR in MSMEs can work optimally and productively, including carrying out employee recruitment, employee training, employee assessments, and employee compensation (Dessler and Huat, 2009)

There are five stages in employee recruitment (Dessler and Huat, 20017), including planning & forecasting, recruiting, completing application forms, selecting, and interviewing. MSMEs must first determine what position they want to fill and what kind of candidate they want to look for in the planning stage. After completing the planning stage, MSMEs must then forecast how many people they want to recruit.

The next stage is recruiting, where MSMEs start looking for the specified candidates, fill in data from the candidates, select candidates who meet predetermined criteria, and the last is to conduct interviews with well-screened candidates. After successfully recruiting, the training stage is the second thing that MSMEs must do. The training aims to prepare prospective employees before engaging directly in operating business activities (Dessler and Huat, 2009).

The next stage is training, and this stage requires employees to be ready to work and carry out business activities according to MSME standards. However, to ensure that employees carry out business operational activities and procedures following the training that has been provided, companies must carry out an assessment process for employees (Dessler and Huat, 2009). There are several stages and methods of assessment. There are three stages to conducting an evaluation: defining the job and its standards, measuring employees' performance, and finally, providing feedback to employees.

The final stage is that MSMEs can determine compensation, bonuses, and promotions for employees who have good performance and achieve the specified targets. By carrying out the stages of HR management planning correctly and adequately according to the explanation above, MSMEs will be able to maximize HR within the company so that employee performance will increase, making it easier for the company.

#### *C. Marketing Process*

Marketing is a social and managerial process by which individuals and groups obtain what they need and want through creating, offering, and exchanging products of value with others (Kotler, 2004). In business implementation, the marketing department is one of the departments that can determine the direction of a company, especially in carrying out promotions for maximum sales. To achieve good sales, MSMEs must apply several marketing methods, including determining STDP (Segmenting, Targeting, Differentiation, and Positioning), Marketing Mix, and Brand Management.

The target market must of course be reviewed properly, in conducting a review of MSMEs, the STDP and VALS (Values and Lifestyles) theory will be carried out. The theory of determining the target market through the STDP theory is expected that the products offered can directly match the prospective consumers who buy them and the VALS theory is used to determine the psychographic side of the target market (Clow and Baack, 2016). Then for the Marketing Mix, it can be interpreted as an integrated and integrated marketing method used by marketers for brand awareness, increasing profits, and reaching and getting consumers. In analyzing the Marketing Mix there are several aspects, namely aspects of Place (Place), Price (Price), Promotion (Promotion), Product (Product), which is symbolized by 4P. Next is Brand Management theory, this theory requires companies to understand the overall brand image and individual brand strengths that aim to make strong connections with consumers. In this material, MSMEs must focus on how MSMEs can provide a good image by creating a strong brand, brand loyalty, and good brand equity (Clow and Baack, 2016).

#### *D. Brand Awareness*

The ultimate goal of most businesses is to increase sales and income. Ideally, you want to attract new customers to your products and encourage repeat purchases. Brand awareness refers to how aware customers and potential customers are of your business and its products. Within a week after its introduction, surveys found that more than 90% of US consumers had heard about the iPhone as a result of advertising and news reports. This is exceptionally high brand awareness. Ultimately, achieving successful brand awareness means that your brand is

well known and is easily recognizable. Brand awareness is crucial to differentiating your product from other similar products and competitors.

### III. RESEARCH METHODOLOGY

Business coaching is a case study qualitative research process, to ensure that the business coaching process can be carried out properly, the authors carry out several stages, the following are the stages carried out in the business coaching process.

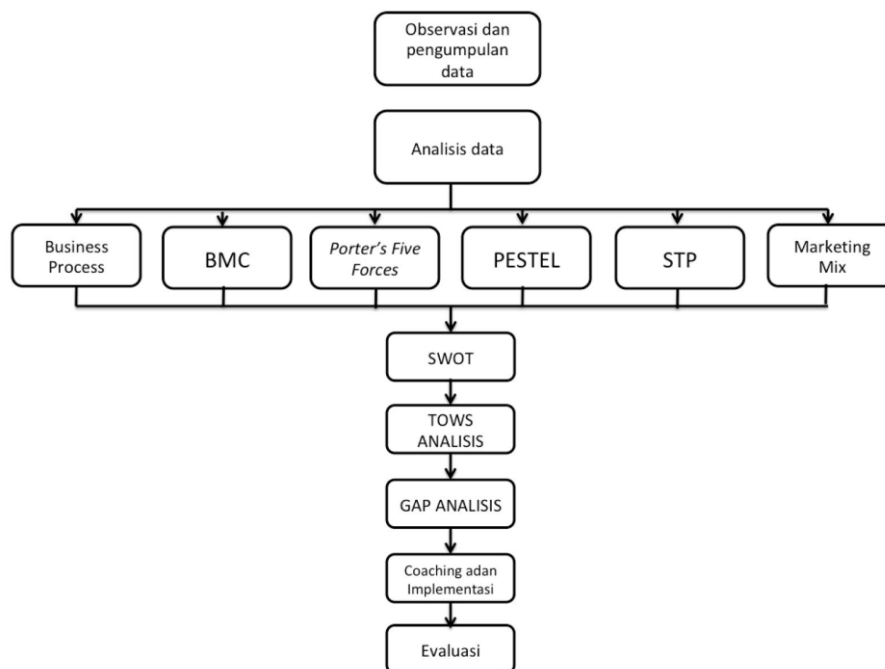

Fig 1. Business Coaching Process

Business Coaching is a series of research processes using qualitative methods. The data collection process is carried out by the author to determine the state of the business and the business environment that SMEs live, to facilitate the data collection process the author uses 2 data collection approaches, namely:

#### A. Primary Data

Primary data is data obtained directly by the author through interactions with owners, employees, partners, business competitors, and consumers. There are 2 methods used to obtain primary data,

#### b. Observation

Observation is a systematic observation and recording of the elements that appear in a symptom of the research process (Widyoko2014: 46). Observations were made by the author to find out the general description of the business activities of Sepiring Geprek SMEs. The first stage the author sees and observes how the food market in the South Tangerang area, from these results the author gets data in the form of substitute products and also how the competition in the related industry is. In the second stage, the authors observe and map out the competitors who are directly related to the MSME business process. From the observation process, the author knows how the service system is carried out by competitors, price comparisons with competitors, the food variance offered, and the length of service from each of these MSMEs.

#### c. Interview

According to Cooper & Schinder (2014) Open interviews are interviews where researchers can ask unstructured questions so that the object of the interview can develop answers so that information can be dug deeper in order to get quality data. The process of interviewing the author to several parties related to business processes.

1. Owner

The author's first interview with the owner, this interview is intended to find out the problems that occur from the owner's point of view, it is hoped that the results of this interview will find a major problem that is useful for the author to carry out this program. In addition, the authors hope that from this interview, they will know the expectations of this program.

2. Employees

The second interview was conducted with employees, employees are the main assets that carry out all MSME activities, therefore it is important to know the opinion from the employee's point of view. The author looks for problems from the point of view of employees who have not previously appeared, it is hoped that in the future MSMEs will know the problems they are facing and know what expectations are expected in the future from working in related MSMEs.

3. Partner

The current era encourages every company to have good relations with partners, therefore maintaining good relations with partners is one of the keys to success in managing business activities. The author conducts interviews with partners to find out the problems they face and what expectations are expected from being an MSME partner

4. Consumer

The last interview conducted is an interview with consumers, customer satisfaction is the ultimate goal of every transaction made by MSMEs. From this, the authors find out what problems consumers face, what experiences they have experienced, and what expectations are expected in the selling process of Sepiring Geprek.

The following is a summary of the respondent's profile in the interview process that has been carried out.

After analyse the process of business, next step I analyse the target of the UMKM,

*d. Segmenting*

A plate of Geprek has done a mapping in segmenting. Segmenting means the company groups the types of consumers based on similar criteria. In this mapping, the writer carried out mapping to 3 parts, namely demographic, geographic, and psychographic. Sepiring Geprel segmented based on observations of the geprek chicken market, especially in the Pamulang area, South Tangerang. Based on interviews with informants, the Sepiring Geprek segmentation map can be seen in the following table:

<b>Behaviour</b>	<b>Age</b>	15-20 Tahun	20-35 Tahun	35-45 Tahun	>45 Tahun
	<b>Gender</b>	Laki-Laki		Perempuan	
	<b>Occupation</b>	Siswa	Mahasiswa	Buruh/ Karyawan	Wiraswasta
	<b>Income</b>	< 700.000	700.000 – 1000.000	1000.000 – 1.500.000	1.500.000 – 3.000.000
		3.000.000 – 5.000.000		5.000.000 +	
<b>Geographic</b>	<b>Region</b>	Tangerang Selatan		Kota Tangerang Selatan	
	<b>Density</b>	Desa	Kecamatan	Kota	
<b>Psycho-graphic</b>	<b>Gaya Hidup</b>	Urban	Semi urban	Rural	
	<b>Aktivitas</b>	Aktif beraktivitas		Tidak aktif beraktivitas	
	<b>Values Lifestyle Benefit and</b>	Strivers	Experiencer	Survivors	Thinkers
		Believers	Innovator	Makers	Achievers

Fig 2. STP

#### e. Target

The result of doing segmenting, companies do targeting to determine which consumers will be selected. The table above shows the target of the segmentation that has been determined. the demographic segment shows that Sepiring Geprek is targeting segments aged 20-35 years, while for gender itself the main targets of Sepiring Geprek are women and men because the majority of people who buy geprek chicken are men and women who look for food for their own needs and housewives who buy food for a small family. The jobs that the company targets are women and men who act as students, housewives, employees, and entrepreneurs. The last demographic segment is income, for the income target, Sepiring Geprek selects everyone who has income.

Geographic segmentation, for its own regional distribution, Sepiring Geprek targets the South Tangerang area, especially Pamulang, the company chose this area because the owner comes from the area and has experience and knowledge of the potential in the area. In density, a plate of city geprek.

The last segmentation is psychographic where the company targets urban and semi-urban lifestyles, for the level of consumer activity the company targets all consumers who are active or not active because every time people need to eat will always be needed. The last psychographic is VALS which is used to find out the values and lifestyles as well as people's consumption. From the implication, VALS psychographics are divided into eight types, namely strivers, believers, survivors, innovators, experiencers, makers, thinkers, and achievers (Kotler and Armstrong). Makers represent consumers with low resources and motivated by self-expression. They are practical people who value independence. They focus on family, work, and physical recreation. They have little interest in the wider world. As consumers, they value practical and functional products.

*f. Positioning*

The last stage is positioning, Seporong Geprek determines the company's position in the geprek chicken market in the Pamulan area as follows:

- a. A varied menu of Indonesian chili sauce.
- b. Indonesian geprek chicken with high standards, halal, and using quality products.
- c. Following and adapting to the latest trends in culinary conditions in Indonesia.
- d. Economical.

Then, to analyse the eksternal factor, porter analysis used by the author, here the porter analysis. Based on the results of the theoretical analysis, these factors in the Geprek Sepiring Geprek Chicken Industry are summarized in the following table:

Table 1. *Five Porter' Analytics*

No.	Porter's Five Forces	Analisis
1	Competitive Rivalry	High
2	Bergaining Power of Supplier	Low
3	Bergaining Power of Buyer	Moderate to High
4	Threat of Subtitution	High
5	Threat of New Entry	High

It can be seen from the conclusion of the analysis that the geprek chicken industry in the Sepiring Geprek sales area shows stiff competition. It is proven by the number of companies entering and leaving and also high competition. Sepiring Geprek must continue to innovate and have a strategy to continue to maintain the company's existence in the market.

## IV. RESULT/FINDING

This study answered the following question, How does HR management affect service delivery and how important is the company profile. Those question came from the results of discussions and observations of researchers on the business process of MSME Roti Doti. Researcher devided several category indicators from gap analysis and rank the priority things to be solve base on weights valuation that MSMEs applied .

Table 2. Pareto Analysis

No	Gap	Score	Weight	Contribution	Distribution	Accumulation
1.	SDM Management	8	10	80	36,03%	36,03%
2.	Company Profile	8	8	64	28,88%	64,91%
3.	Improvement Brand Awarness	5	8	40	18,02	82,93%
4.	Inventory Management	5	4	20	9%	91,93%
5.	Financial report	4	3	12	5%	96,93%
6.	Vision	3	2	6	2,7%	100,00%
				222	100%	

Fig 3. Pareto Analysis

V. DISCUSSION

Author analys the condition of the MSME.

Nama Restoran	Sepiring geprek	Ayam Geprek Juara	Ayam Geprek Master	Ayam Geprek Gold Chick	Ayam Keprabon	Geprek Bensu	Ayam Geprek Koplo
Variansi	20an menu	20an menu	15an menu	25an menu	15an menu	30an menu	20an menu

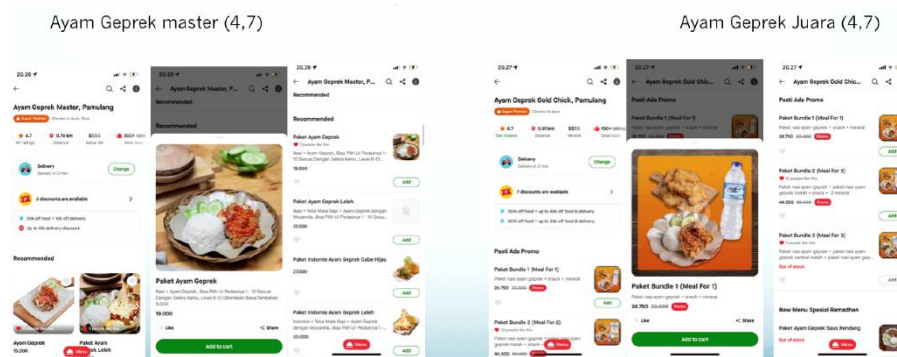

Fig 4. Variance of menu

Nama Restoran	Sepiring geprek	Ayam Geprek Juara	Ayam Geprek Master	Ayam Geprek Gold Chick	Ayam Keprabon	Geprek Bensu	Ayam Geprek Koplo
Lama Pelayanan	21-24 menit	14 menit	13 menit	16-18 menit	11-13 menit	11-13 menit	24 menit

Picture 4. Price of menu

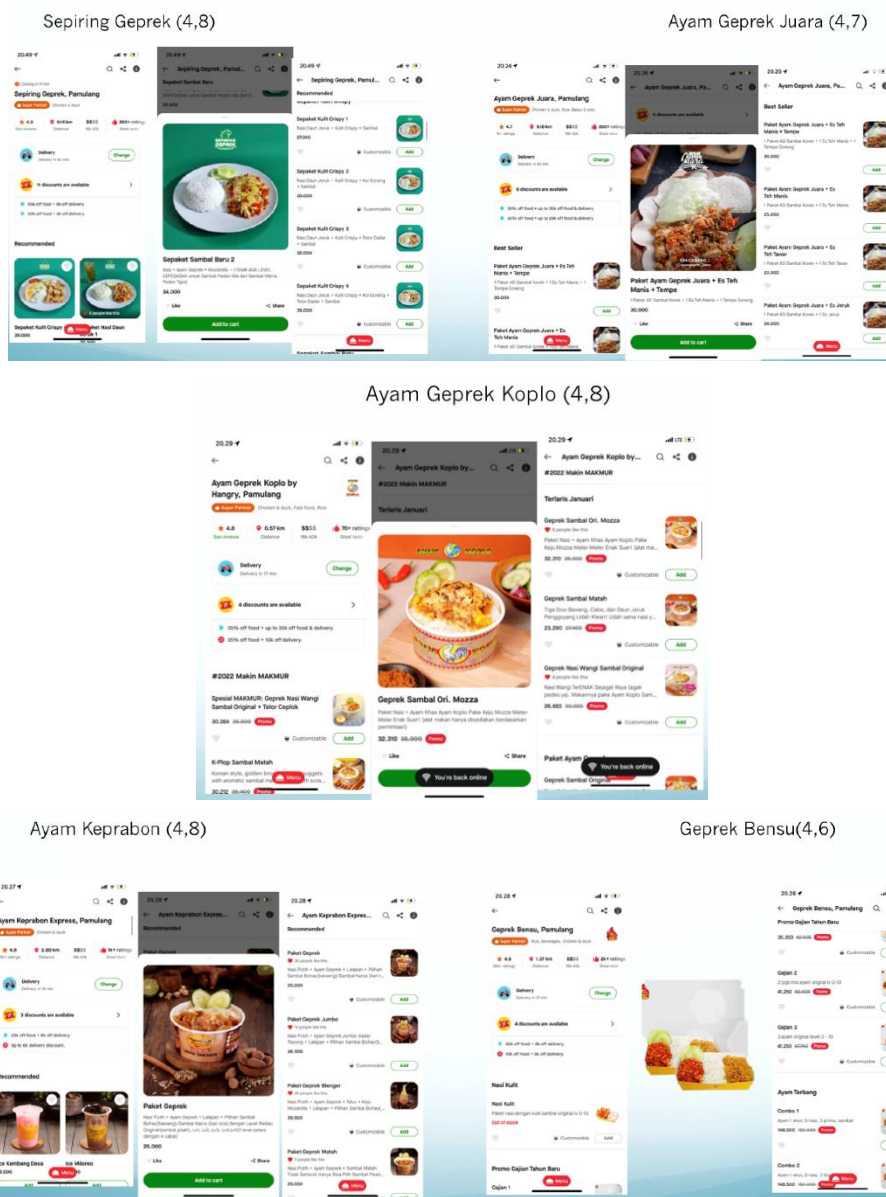

A. Product Taste and Rating

Taste is one of the most important elements in the world of food, therefore every product must be able to maintain the quality of taste in order to meet consumer satisfaction. From the results of the following observations are details of the online food rating of each product.

Rating observation results show that Sepiring Geprek has the highest rating compared to its competitors with a rating of 4.8. This rating shows that the quality of food provided to consumers has met the expectations of consumers. However, after further investigation, there are still consumers who feel that the product is not optimal, such as less foreign, less spicy, and too sweet. So the focus of the author and MSMEs to maintain satisfaction is

to maintain a stable taste compared to fulfilling the wishes of each consumer because the authors and MSMEs agree that taste has their own standards.

Rating observation results show that Sepiring Geprek has the highest rating compared to its competitors with a rating of 4.8. This rating shows that the quality of food provided to consumers has met the expectations of consumers. However, after further investigation, there are still consumers who feel that the product is not optimal, such as less foreign, less spicy, and too sweet. So the focus of the author and MSMEs to maintain satisfaction is to maintain a stable taste compared to fulfilling the wishes of each consumer because the authors and MSMEs agree that taste has their own standards.

**B. Long of Service**

The results of further observations that become the material for analysis and discussion of the author is the time of service. Service time is one of the important elements that the author discusses because based on observations, a plate of Geprek has a relatively longer service time compared to its competitors. The following is a breakdown of the length of service time for each product.

Nama Restoran	Sepiring geprek	Ayam Geprek Juara	Ayam Geprek Master	Ayam Geprek Gold Chick	Ayam Keprabon	Geprek Benu	Ayam Geprek Koplo
Lama Pelayanan	21-24 menit	14 menit	13 menit	16-18 menit	11-13 menit	11-13 menit	24 menit

Based on the results of observations of long service times at MSMEs in a plate of Geprek because there are several process gaps that have not been maximized, some materials are made suddenly, and there are no SOPs and clear division of tasks. More details will be discussed in the results of the next meeting.

#### VI. CONCLUSION AND RECOMMENDATIONS

Along with the observation process until the completion of the improvements made, many things are still being improved so that the quality of service can improve which will have an impact on improving performance and also increasing the turnover obtained. all parties involved must be able to contribute in carrying out the planned improvements.

Overall, the author has succeeded in speeding up the service time to 17 minutes, an increase of about 25%. besides that the author has succeeded in making a company profile that has been applied. This company profile is the general information that Sepiring Geprek is trying to give to consumers. It is hoped that with a company profile, consumers who want to know further information about franchises, event orders, invitation orders, or other event orders can be fulfilled by Sepiring Geprek. The company profile also mentions additional information such as various product variations, chili variations, and MSME contacts, which are expected to provide more product information for consumers. In addition, the existence of this company profile is expected to increase brand awareness in the eyes of consumers that Sepiring Geprek is not just ordinary geprek chicken. Here are some views that are in the company profile that has been created.

## The Effect of Investment Decisions on Firm Value in Manufacturing Companies Listed on The Indonesia Stock Exchange

A.Dida Farida Latipatul Hamdah<sup>1</sup>, B.Lina Kustika<sup>2</sup>, C.Erik Kartiko<sup>3</sup>  
<sup>1,2,3,4</sup>Garut University, Garut, Indonesia

### **Abstract**

*This study discusses the effect of investment decisions on firm value in manufacturing companies. Santoso (2018) states that investment decisions have a positive and significant effect on firm value. This contradicts the view expressed by Untu (2016) that simultaneous investment decisions have no significant effect on firm value. The population of this study are manufacturing companies in the food and beverage industry sub-sector which are listed on the Indonesia Stock Exchange with a total of 26 companies. The sampling technique used was non-probability sampling with a purposive sampling approach. The research uses quantitative methods. Data collection techniques are documentation, literature study, and internet studies. Data processing using SPSS Version 20.0 application. The results of the study reveal that investment decisions have no significant effect on firm value. This identifies that changes that occur in the ratio of investment decisions have no effect on firm value. The ineffectiveness of investment decisions is due to future uncertainty factors, in the form of changes in technology, socio-economic conditions, government policies. The results of this study are in line with the results of research conducted by Sari & Jufrizen (2019) that: "Partially prove that investment decisions have no significant effect on firm value". For investors, this is a matter of consideration and information that investing must pay attention to investment decisions and company value.*

*Keywords— Investment Decisions; Firm Value.*

---

### I. INTRODUCTION

In the era of industrialization, every company is required to improve its competitiveness. Santoso (2018) states that increasing competition in both the domestic and international markets requires companies to be able to maintain or gain competitive advantage by giving full attention to the company's operational and financial activities. Every establishment of a company must have a clear goal, namely short-term and long-term goals. According to Oemar (2016), the short-term goal of the company is to maximize the profit on existing resources, while the long-term goal of the company is to maximize the value of the company.

The value of the company will show the prosperity of shareholders, the high value of the company shows the prosperity of high shareholders. Company value is the success of management in managing the company. Purwitasari (2015) explains that the value of the company reflects the market response to the company. If the company maximizes its performance and has good prospects then the value of the company is good, investors will be willing to buy shares even if they pay more. The prosperity of shareholders is often seen from the high value of the company, so maximizing the prosperity of shareholders can be done by maximizing the value of the company (Saleh, 2017).

According to Purwitasari (2015) if the company is able to make the right investment decisions, the company's assets will produce optimal performance, this will give a positive signal for investors so that it will increase stock prices and increase company value. If the company is not able to display a good signal about the value of the company, the value of the company will be below its true value. Because basically every company always shows potential investors that their company is the right one to invest in (Nani Rohaeni, 2017).

Thus, with the achievement of these objectives, the company is expected to be able to manage good management to analyze financial statements. According to (Puspitaningtyas, 2015) financial statements are the most important means for investors to know the company's development periodically. Good quality financial reports can help investors to measure value and performance. Santoso (2018) states that investment decisions have a positive and significant effect on firm value. This contradicts the view expressed by Untu (2016) which states that simultaneous investment decisions have no significant effect on the value of the company. With the

inconsistency of theory and research results as well as existing phenomena, this research is intended to conduct further research on the problems above.

Based on the above background, the authors are interested in conducting a research entitled "The Effect of Investment Decisions on Firm Value in Manufacturing Companies Listed on The Indonesia Stock Exchange." This study aims to determine the effect of investment decisions on firm value in manufacturing companies listed on the Indonesia Stock Exchange.

## II. LITERATURE REVIEW

### A. *Investation Decision*

According to (Sudana, 2011) states that: "Investment decisions are financial decisions about assets that must be purchased by the company". Then according to (Sutrisno, 2012) "Investment decisions are a matter of how financial managers must allocate funds into forms of investment that will be able to bring profits in the future".

### B. *Investation*

Investment is "delaying current consumption to be used in efficient production for a certain period of time" (Jogiyanto, 2013). Meanwhile (Tandelilin, 2010) "Investment is a commitment to a number of funds or other resources carried out at this time, with the aim of obtaining a number of benefits in the future".

### C. *Measuring Investment Decisions*

(Sutrisno, 2012) states that: "Price earnings ratio measures how big the comparison is between the company's stock price and the profits to be obtained by shareholders". Price earnings ratio looks at the stock market price relative to earnings.

According to (Tandelilin, 2010) that the formula for calculating the Price Earnings Ratio (PER) of a stock is to divide the company's share price against earnings per share. Mathematically, the formula for calculating PER is as follows:

$$\text{Price Earning Ratio (PER)} = \frac{\text{Stock Price}}{\text{Earnings per Share}}$$

### D. *The Value of the Company*

According to (Harmono, 2014): "Corporate value is the company's performance which is reflected by the stock price formed by the demand and supply of the capital market which reflects the public's assessment of the company's performance".

### E. *Factors Affecting Firm Value*

Company valuation is influenced by several factors. The basic concept of corporate valuation used is: the value is determined in a certain period, the value must be determined at a fair price, the valuation is not influenced by certain groups. In general, many methods and techniques have been developed in company valuation, according to (Michell Suharli, 2006). among others are:

- a. Profit approach
- b. Cash flow approach, including the discounted cash flow method,
- c. Dividend approach, including dividend growth method,
- d. Asset approach, including asset valuation method,
- e. Stock price approach,
- f. Economic value added approach.

### F. *Firm Value Measurement Method*

(Sudana, 2011) explains that: "The Valuation Ratio is a ratio related to the performance appraisal of company shares that have been traded in the capital market (go public)". Firm value can be measured by a ratio called the valuation ratio. The valuation ratio becomes information for the public so that people are interested in buying shares at a higher price than the book value.

According to (Sudana, 2011) there is an assessment ratio as follows:

1. Price Earnings Ratio (PER)

This ratio is to measure how big the comparison between the company's stock price and the profits earned by the shareholders.

2. Tobin's Q

Tobin's Q is calculated by comparing the ratio of the market value of the company's stock to the book value of the company's equity.

3. Price to Book Value (PBV)

This ratio describes how much the market appreciates the book value of a company's shares. The higher the Price to Book Value (PBV) means the market believes in the company's prospects.

In this study, the valuation ratio used is Price to Book Value (PBV) because this ratio is widely used in investment decision making.

G. Price to Book Value (PBV)

According to (Harmono, 2014) states "A high price book value reflects a high share price compared to the book value per share. The higher the share price, the more successful the company is in creating value for shareholders. Measurement of price to book value (PBV) according to (Harmono, 2014) can be calculated as follows:

$$Price\ to\ book\ value\ (PBV) = \frac{price\ per\ share}{Stock\ Book\ Value}$$

Price book value is widely used in making investment decisions. There are several advantages of price to book value, namely it is a stable and simple measure that can be compared with market prices. The factors that influence the value of the company include investment decisions. Investment decisions in this study are proxied by Price Earnings Ratio (PER) to determine investment decisions. The reason is because the Price Earnings Ratio (PER) will make it easier and help analysts and investors in stock valuation and can help to consider which stocks can provide big profits for the investment they are going to do.

According to (Sugiyanto, 2008) that: "Price Earnings Ratio (PER) is the ratio obtained from the market price of ordinary shares divided by company profits". A high Price Earnings Ratio (PER) indicates a good company investment and good company growth prospects so that investors will be interested. High demand for shares will make investors appreciate the value of shares greater than the value recorded on the company's balance sheet, so that the value of the company is also high. Thus, investment decisions have a positive influence on firm value.

Based on the description described above, the framework of thought in this research can be described in Figure 2.1 below:

Fig 2. Research Paradigm

Based on the literature review, previous research and the framework described above, the hypotheses that can be proposed in this study are as follows:

H: Investment decisions affect the value of manufacturing companies listed on the Indonesia Stock Exchange.

III. RESEARCH METHODOLOGY

Descriptive method is used in this study with quantitative approach analysis, namely the results of the research conducted emphasizing the analysis of numerical data (numbers), this research method will be able to determine the significant influence between the variables studied, so that it will produce clear conclusions about the object. study. The classification of research variables based on the relationship between variables as follows:

1. Independent Variable

(Sugiyono, 2015) states that: "Independent (free) variables are variables that influence or cause changes or the emergence of the dependent (bound) variable". The independent variable in this study is the investment decision (X) as measured by the Price Earnings Ratio (PER).

## 2. Dependent Variable

According to (Sugiyono, 2015) "The dependent variable (bound) is a variable that is influenced or that becomes a result, because of the independent variable". The dependent variable in this study is firm value (Y) as measured by Price to Book Value (PBV).

The operationalization of this research variable is contained in table 3.1 as follows:

Table 1. Variable Operations

Variable	Dimension	Indicator	Scala
Investment Decisions (X) Sutrisno (2012:14)	<i>Price Earning Ratio (PER)</i>	<ul style="list-style-type: none"> <li>• Price per Share</li> <li>• Earnings per Share</li> </ul>	Ratio
Firm Value (Y) Harmono (2014:114)	<i>Price to Book Value (PBV)</i>	<ul style="list-style-type: none"> <li>• Price per Share</li> <li>• Company Book Value</li> </ul>	Ratio

### A. Population and Sample

The population in this study is a manufacturing company in the food and beverage industry sub-sector which is listed on the Indonesia Stock Exchange with a total of 26 companies. Because there are limitations in conducting research, a sample will be taken from the entire existing population.

Sampling technique is a sampling technique used to determine the sample to be used in research, there are various techniques for sampling that will be used (Sugiyono, 2015). In this study, the author uses a sampling technique, namely non-probability sampling with a purposive sampling approach.

The criteria to be used in this study are as follows:

Table 2. Sampling Criteria

Sampling Criteria	Total
Manufacturing companies listed on the Indonesia Stock Exchange (IDX) in the food and beverage sub-sector during 2013 – 2020.	26
Manufacturing companies in the food and beverage sub-sector on the Indonesia Stock Exchange (IDX) that did not publish complete and consecutive annual reports during 2013 – 2020.	0
Food and beverage sub-sector manufacturing companies that did not distribute dividends during 2013-2020	(16)
Manufacturing companies in the food and beverage sub-sector on the Indonesia Stock Exchange (IDX) that do not have complete financial data to calculate the variables in the study during 2013 – 2020.	(8)
Total target population	2
Target Population sampled Total sample (2 companies x 8 years)	16

Of the 26 manufacturing companies in the food and beverage sub-sector listed on the Indonesia Stock Exchange, after purposive sampling, 2 companies that meet the criteria are as follows:

Table 3. The list of food and beverage sub-sector manufacturing companies listed on the Indonesia Stock Exchange used in this study

No.	Kode Emiten	Nama Perusahaan

1	INDF	PT. Indofood Sukses Makmur Tbk
2	MYOR	PT. Mayora Indah Tbk

### B. *Data Types and Sources*

It was stated by (Sugiyono, 2015) that: "Quantitative data is data in the form of numbers, or quantitative data that is numbered". Quantitative data is data expressed by numbers, showing the value of the variable. In this study, the quantitative data is the result of the calculation of investment decisions, namely price earnings ratio (PER) and firm value, namely price to book value (PBV). This study uses secondary data in the form of the company's financial statements PT Indofood Sukses Makmur Tbk and PT. Mayora Indah Tbk obtained by downloading the company's financial statement data from the websites [www.bursaEfekIndonesia.co.id](http://www.bursaEfekIndonesia.co.id) and [www.idx.co.id](http://www.idx.co.id). which is the website of the Indonesia Stock Exchange.

### C. *Data Collection Technique*

Data collection techniques are the most strategic steps in research, because the main purpose of research is to obtain data (Sugiyono, 2015).

The data collection techniques and materials in the study were carried out by:

- a. Documentation Research
- b. Research Library
- c. Internet Research

### D. *Techniques of Analysis and Design of Hypothesis Testing*

#### *Data Analysis Technique*

The data analysis technique used is statistical test using multiple linear regression with the help of SPSS version 22 application.

#### *Descriptive Statistics*

The descriptive statistics used include: mean, minimum, maximum, and standard deviation. The mean is the sum of the values of all data divided by the number of times, the minimum is the smallest value from a series of observations, the maximum is the largest value from a series of observations, and the standard deviation is the root of the sum of the squares of the difference between the data values and the average divided by the number of data.

#### *Classic Assumption Test*

The classical assumption test is used to see whether there are deviations in the regression model, so it is necessary to carry out an examination using the normality test, autocorrelation test, heteroscedasticity test, and multicollinearity test.

#### *Normality Test*

According to (Ghozali, 2016) the data normality test is the first step that must be done for any multivariate analysis. If there is normality, then the residuals will be normally and independently distributed. In this study, the normality test used the Kolmogorov Smirnov method. If the result of the significance number (Sig) is less than - .05 then the data is not normally distributed. In this study the technique that can be used to see the normality of the data is by looking at the Normality Probability Plot Graph and the Kolmogorov Smirnov One Sample Test.

#### *Autocorrelation Test*

The autocorrelation test aims to test whether in the linear regression model there is a correlation between the confounding error in period t and the confounding error in period t-1 (previous). If there is a correlation, it is called an autocorrelation problem. (Ghozali, 2016).

#### *Heteroscedasticity Test*

Heteroscedasticity test is to test whether in the regression model there is an inequality of variance from the residual of one observation to another observation. If the variance of the residuals from one observation to another remains, it is called homoscedasticity and if it is different it is called heteroscedasticity. A good regression model is one

with homoscedasticity or no heteroscedasticity. If the p value > 0.05 is not significant, it means that there is no heteroscedasticity, meaning that the regression model passes the heteroscedasticity test. (Ghozali, 2016).

#### *Multicollinearity Test*

Multicollinearity test aims to test whether the regression model found a correlation between the independent variables (Independent). According to (Ghozali, 2016) that: "A good regression model should not have a correlation between the independent variables".

#### *Multiple Linear Regression Analysis*

According to (Sugiyono, 2017) that: "Multiple linear regression analysis is used by researchers, if the researcher predicts how the ups and downs of the dependent variable (criteria), if two or more independent variables as predictor factors increase and decrease in value (manipulated)".

In general, the form of the regression equation obtained by using multiple linear regression analysis refers to (Sugiyono, 2016: 277) with the following formula:

$$Y = a + b_1X_1 + b_2X_2 + \dots + b_nX_n$$

Information:

Y: Dependent/bound variable (Company Value)

X1: First Independent/Independent Variable (Profitability)

X2: Second Independent/Independent Variable (Investment Decision)

X3: Third Independent/Independent Variable (Dividend Policy)

a: Constant Number (Y value if X1,X2,.....Xn = 0)

b: Regression coefficient of independent variables (increase/decrease value)

#### *Hypothesis test*

By taking into account the characteristics of the variables to be tested in this study, the statistical test to be used is through the calculation of regression and correlation analysis to obtain conclusions. According to (Sugiyono, 2015) the hypothesis is a temporary answer to the research problem formulation, where the problem formulation is stated in the form of a question sentence. The null hypothesis (H0) is not affected and the alternative hypothesis (Ha) shows an impact between the independent variable and the dependent variable. The design of this research hypothesis testing is to test whether there is an influence between the independent variable, namely investment decisions (X) on the dependent variable, namely firm value (Y).

#### *Partial Test (T Test)*

Partial t test was used to determine the effect of each independent variable on the dependent variable. By using SPSS, the hypothesis (H1,H2) is accepted if the significant value of the t-count <0.05 and vice versa (Ghozali, 2016).

To test whether there is a relationship between the independent variables (X) having an impact on the dependent variable (Y), then the test will be carried out using the t statistical test with steps referring to (Ghozali, 2016) as follows:

Determine the partial hypothesis between Investment Decisions on Firm Value. The statistical hypotheses of this study are:

Determine the partial hypothesis between Investment Decisions on Firm Value. The statistical hypotheses of this study are:

H0 = There is no influence between Investment Decisions on Company Value

Ha # There is an influence between Investment Decisions on Company Value

#### *Determine The Level Of Significance*

Determined by 5% of the degrees of freedom (dk) = n – k – 1, to determine the t table as the boundary of the acceptance and rejection of the hypothesis. The significance level used is 0.05 or 5% because it is considered sufficient to represent the relationship between the variables studied and is a significance level commonly used in research status. Then conclusions are made regarding whether the hypothesis is accepted or not after being compared between t count and t table with the following criteria:

- a. Reject H0 if t count > t table at 5% alpha for a positive coefficient.
- b. Reject H0 if t count < t table at 5% alpha for negative coefficients.
- c. Reject H0 if the value of t – sign < S 0.05.

*Coefficient of Determination (R<sup>2</sup>)*

The coefficient of determination (R<sup>2</sup>) is to measure how far the model's ability to explain the variation of the dependent variable. The value of the coefficient of determination is between zero and one. (Ghozali, 2016).

*Research Sites*

The research location is on the IDX (Indonesian Stock Exchange) with its address at Indonesia Stock Exchange Building Tower 1 on Jalan Jendral Sudirman Kav. 52-53 Jakarta 12190 Indonesia.

IV. RESULT/FINDING

One of the ratios used to determine the ratio of investment decisions is the price earnings ratio (PER). By knowing the size of the Price Earnings Ratio of a company, investors can estimate the position of a stock relative to other stocks, so that the stock is worth buying or not. According to (Tandelilin, 2010), to find out the Price Earnings Ratio (PER) can be calculated using the following formula:

$$Price\ Earning\ Ratio\ (PER) = \frac{Stock\ Market\ Price}{Earnings\ per\ Share}$$

As for knowing investment decisions measured using the Price Earnings Ratio (PER) in manufacturing companies listed on the Indonesia Stock Exchange in 2013-2020, it is presented in table 4.1 as follows:

Table 4. Price Earnings Ratio (PER) in manufacturing companies listed on the Indonesia Stock Exchange in 2013-2020

No.	Code Company	Price Earning Ratio (PER) (X)								Average
		2013	2014	2015	2016	2017	2018	2019	2020	
1	INDF	16,9	11,5	11,6	13,3	12,5	11,1	11,6	7,1	11,95
2	MYOR	7,1	7,4	20	25	32	33	21	28	21,68
Average		12	9,45	15,8	19,15	22,25	22,05	16,3	17,55	16,82

Source: www.idx.co.id data reprocessed 2022

For more details regarding the price earnings ratio (PER) in manufacturing companies listed on the Indonesia Stock Exchange in 2013-2020 can be seen through the following chart 4.1:

Fig 4. Chart of Average Price Earnings Ratio (PER) in manufacturing companies listed on the Indonesia Stock Exchange 2013-2020

Based on table 4.1 and figure 4.1, it can be seen that the average Price Earnings Ratio (PER) from year to year has changed, this is due to:

In 2013 the average Price Earnings Ratio (PER) was 12 times and then decreased in 2014 to 9.45 times, this is due to a decrease in Price Earnings Ratio (PER) at PT. Indofood Sukses Makmur Tbk has a price value per share and earnings per share actually increased so that the result of the division between price per share and earnings per share decreased, but PT. Mayora Indah Tbk experienced an increase in Price Earnings Ratio (PER) caused by the value of the price per share and earnings per share both decreased. so that the result of the percentage division between price per share and earnings per share increases.

The average Price Earnings Ratio (PER) in 2015 has increased to 15.8 times, this is due to an increase in Price Earnings Ratio (PER) at PT. Indofood Sukses Makmur Tbk due to the decline in the price per share and earnings per share. So that the result of the percentage division between price per share and earnings per share increases. But the cause of PT. Mayora Indah Tbk experienced an increase due to the increase in the price per share.

The average Price Earnings Ratio (PER) in 2016 has increased again to 19.15 times, this is because the Price Earnings Ratio (PER) at PT. Indofood Sukses Makmur Tbk and PT. Mayora Indah Tbk has increased. Improvement in PT. Indofood was caused by an increase in earnings per share, but at PT. Mayora's price per share decreased and earnings per share also decreased. In 2017 the average Price Earnings Ratio (PER) has increased again to 22.25 times, this is due to an increase in Price Earnings Ratio (PER) at PT. Mayora Indah Tbk caused by increased earnings per share, but PT. Indofood Sukses Makmur Tbk experienced a decline due to declining earnings per share. In 2018 the average Price Earnings Ratio (PER) decreased to 22.05 times. This is due to a decrease in Price Earnings Ratio (PER) at PT. Indofood Sukses Makmur Tbk caused by declining earnings per share, but the Price Earnings Ratio (PER) at PT. Mayora Indah Tbk experienced an increase caused by increased earnings per share.

The average Price Earnings Ratio (PER) in 2019 has decreased again to 16.3 times. This is due to a decrease in the value of the Price Earnings Ratio (PER) at PT. Mayora Indah Tbk caused by the declining share price, but the Price Earnings Ratio (PER) at PT. Indofood Sukses Makmur Tbk experienced an increase due to the increase in earnings per share.

In 2020 the average Price Earnings Ratio (PER) has increased to 17.55 times, this is due to an increase in Price Earnings Ratio (PER) at PT. Mayora Indah Tbk caused by the increase in earnings per share, but the Price Earnings Ratio (PER) at PT. Indofood Sukses Makmur Tbk experienced a decline due to the declining stock market price.

Based on the explanation above, it can be concluded that manufacturing companies for the last 8 years have fluctuated increases and decreases every year, where the increase in Price Earnings Ratio (PER) is due to the increase in earnings per share, so that the company is able to maximize the return on equity to generate net income, which means the company can satisfy the interests of shareholders, while the decrease in Price Earnings Ratio (PER) is due to the decrease in the level of earnings per share obtained by the company on the company's invested capital. This is in line with the opinion of Ramadhani et al., (2019) that: "If the company is able to book large profits, investors will be attracted to its shares because the projected profit for the current year is likely to rise, and vice versa".

According to (Suffah & Riduwan, 2016) states that: "The higher the stock price, the higher the value of the company". In this study, firm value was measured using Price To Book Value (PBV). The higher the Price To Book Value ratio, the more successful the company is in creating value for shareholders. To find out Price to Book Value (PBV) can be calculated using the formula according to (Harmono, 2014) as follows:

$$Price\ to\ book\ value\ (PBV) = \frac{\text{price per share}}{\text{company book value}}$$

As for knowing the value of the company measured using Price to Book Value (PBV) in manufacturing companies listed on the Indonesia Stock Exchange in 2013-2020, it is presented in table 4.2 as follows:

Table 5. Price to Book Value (PBV) for manufacturing companies listed on the Indonesia Stock Exchange in 2013-2020

No	Code Company	Price to Book Value (PBV) (X)								Average
		2013	2014	2015	2016	2017	2018	2019	2020	
1	INDF	1,5	1,4	1	1,5	1,3	1,1	1,2	0,77	1,25
2	MYOR	0,20	0,21	4,8	5,7	7,1	6,8	4,4	5,3	4,51
Average		0,855	0,805	2,9	3,6	4,2	3,95	2,8	3	2.76375

Source: www.idx.co.id data reprocessed 2022

For more details regarding Price to Book Value (PBV) in manufacturing companies listed on the Indonesia Stock Exchange in 2013-2020, see the chart 4.10 below:

Fig 5. Chart of Average Price to Book Value (PBV) of Manufacturing Companies Listed on the Indonesia Stock Exchange 2013-2020

Based on table 4.2 and figure 4.2, it can be seen that the average Price To Book Value (PBV) has changed from year to year, this is because:

In 2013 the average Price To Book Value (PBV) was 0.85 times and then decreased in 2014 to 0.80 times. This is because the Price To Book Value (PBV) at PT Indofood Sukses Makmur Tbk has decreased but in fact the results of the share price and book value of the company both have increased so that the result of the percentage distribution between stock price and book value has decreased from the previous year and PT Mayora Indah Tbk has increased but the price per share has decreased.

The average price to book value (PBV) in 2015 increased to 2.9 times. This is because the Price To Book Value (PBV) at PT Mayora Indah Tbk has increased due to the increase in stock prices, but the Price To Book Value (PBV) at PT. Indofood Sukses Makmur Tbk experienced a decline due to the decline in stock prices.

In 2016 the average Price To Book Value (PBV) has increased again to 3.6 times, this is because the Price To Book Value (PBV) in the two companies, namely PT. Indofood Sukses Makmur Tbk has increased. Increase in PT. Indofood caused by rising stock prices. But the increase in PT. Mayora Indah Tbk's stock price and book value actually decreased.

The average Price To Book Value (PBV) in 2017 has increased again to 4.2 times, this is because Price To Book Value (PBV) at PT. Mayora Indah Tbk experienced an increase due to the increase in its share price, but Price To Book Value (PBV) at PT. Indofood Sukses Makmur Tbk experienced a decline due to the decline in stock prices.

In 2018, the average Price To Book Value (PBV) decreased to 3.95 times. This is due to a decrease in the value of Price To Book Value (PBV) at PT. Indofood Sukses Makmur Tbk caused by the decline in stock prices. But the decrease in PT. Mayora Indah Tbk actually increased the stock price and book value of the company.

In 2019, the average Price To Book Value (PBV) decreased again to 2.8 times. This is due to a decrease in the value of Price To Book Value (PBV) at PT. Mayora Indah Tbk caused by the stock price has decreased. At PT. Indofood experienced this increase due to the increase in the price per share.

The average Price To Book Value (PBV) in 2020 has increased to 3 times, this is due to an increase in Price To Book Value (PBV) at PT. Mayora Indah Tbk caused by the stock price has increased. But the Price To Book Value (PBV) of PT Indofood Sukses Makmur Tbk experienced a decline due to the declining stock price.

Based on the explanation above, it can be concluded that manufacturing companies for the last 8 years have fluctuated increases and decreases every year, where the increase in Price To Book Value (PBV) is due to the company's stock price increasing so that profits increase, so that the company is able to maximize the return on equity to generate net income, which means the company can satisfy the interests of shareholders, which means that the value of the company will increase, while the decrease in Price To Book Value (PBV) is due to a decrease in stock prices which causes the value of the company to decrease. According to (Brigham, 2018) that: "If the value of the company is higher, the greater the level of prosperity of the shareholders, so that the company is said to have achieved one of its goals, and vice versa".

V. DISCUSSION

A. Data Analysis

Descriptive statistics can be seen from the average value (mean), standard deviation, maximum value and minimum value to provide an overview of a data. The variable used in this study investment decisions as independent variables and firm value as the dependent variable.

Table 6. Descriptive Statistical Analysis

	N	Minimum	Maximum	Mean	Std. Deviation
PER	16	20.0	169.0	78.750	48.3246
PBV	16	1.0	77.0	33.750	25.2837
Valid N (listwise)	16				

Source: SPSS Version 20 output, processed 2022.

Based on table 4.3 above, the results of descriptive statistics on investment decision variables as independent variables as measured by Price Earnings Ratio (PER) and firm value as measured by Price To Book Value (PBV) are as follows:

1. Price Earnings Ratio (PER) shows a minimum value of 20, namely PT. Mayora Indah Tbk. The maximum value of 16.9 is PT. Indofood Sukses Makmur Tbk. It has a mean value of 78.750 and a standard deviation of 48.3246. This means that the mean is greater than the standard deviation, thus identifying a good result in generating earnings per share.
2. Price to Book Value (PBV) shows a minimum value of 1, namely PT. Indofood Sukses Makmur Tbk. The maximum value of 7.7 is PT. Mayora Indah Tbk. Has a mean value of 33.750 and a standard deviation of 25.2837. This means that the mean is greater than the standard deviation, thus identifying a good result in firm value.

Based on the results of descriptive statistics, it shows that compared to the standard deviation, all variables produce a larger average. This means that the data has a fairly good quality, because the standard deviation value is smaller than the average value which indicates that the standard error of the variable is low.

B. Classic Assumption Test

The following is a normal P-Plot image in the normality test, which can be seen in Figure 4.3 as follows:

Figure 5. Normality Test of Data with Normal P-Plot (Source: SPSS Version 20 Output Results, processed 2022)

The Kolmogorov Smirnov (K-S) non-parametric statistical test is equipped with a statistical test which can be seen in table 4.4 as follows:

Table 7. Normality Test Results  
One-Sample Kolmogorov-Smirnov Test

		Unstandardized Residual
N		16
Normal Parameters <sup>a,b</sup>	Mean	0E-7
	Std. Deviation	15.84669914

Most Extreme Differences	Absolute	.166
	Positive	.166
	Negative	-.134
Kolmogorov-Smirnov Z		.663
Asymp. Sig. (2-tailed)		.771

a. Test distribution is Normal.  
 b. Calculated from data.

Source: SPSS Version 20 output, processed 2022.

The results of the normality test, it can be seen from table 4.4 that the Kolmogorov-Smirnov value shows that the Price Earnings Ratio (PER) and Price to Book Value (PBV) are 0.200 where this result shows that the above results are significant, namely  $0.771 > 0.05$ . regression meets the assumption of normality.

**C. Autocorrelation Test**

The results of the Run Test test analysis can be seen in table 4.5 as follows:

Table 8. Autocorrelation Test Results

Runs Test	
	Unstandardized Residual
Test Value <sup>a</sup>	-3.43276
Cases < Test Value	8
Cases >= Test Value	8
Total Cases	16
Number of Runs	9
Z	.000
Asymp. Sig. (2-tailed)	1.000

a. Median

Source: SPSS Version 20 output, processed 2022

Based on table 4.5 above, the Asymp value is obtained. Sig. (2-tailed) of 1,000 or 10% greater than the specified significance value of 0.05. So it can be concluded that there is no autocorrelation so that it meets a good regression model.

**D. Heteroscedasticity Test**

For the heteroscedasticity test with a scatterplot graph which can be seen in Figure 4.5 as follows:

Fig 6. Scatterplot Graph (Source: SPSS Version 20 output, processed 2022)

Based on Figure 4.5, it can be seen that there is no clear pattern, with the points spreading above and below the number 0 on the Y axis. It can be concluded from the scatterplot graph that there is no heteroscedasticity in this research model.

### E. Multicollinearity Test

The criteria for the value of Tolerance and the amount of Variance Inflation Factor (VIF), are (Ghozali, 2016):

1. If the Tolerance value  $> 0.10$  or VIF value  $< 10$ , then the level of collinearity can be tolerated or there are no symptoms of multicollinearity.
2. If the Tolerance value is  $< 0.10$  or the VIF value is  $> 10$ , then the level of collinearity cannot be tolerated and multicollinearity symptoms occur.

Based on the results of data processing with the help of SPSS statistical software version 23, the following results were obtained:

Table 9. Multicollinearity Test Results

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.	Collinearity Statistics	
		B	Std. Error	Beta			Tolerance	VIF
1	(Constant)	65.856	8.028		8.203	.000		
	PER	-.408	.088	-.779	-4.652	.000	1.000	1.000

a. Dependent Variable: PBV

Source: SPSS Version 20 output, processed 2022

Based on table 4.6 above, it can be seen that the tolerance value of the three variables is investment decision (PER) X 1,000. So it can be seen that the tolerance value of all the independent variables above has a variable value of  $> 0.10$ . Furthermore, the value of the VIF above to meet the requirements is less than 10. In the investment decision (PER) X has a yield of  $1,000 < 10$ . So the VIF results for the independent variables have results less than 10. Based on the results of the multicollinearity test above, it can be concluded that this study does not occur multicollinearity.

### F. Multiple Linear Regression Analysis

Technique of multiple linear regression analysis was chosen to be used because the multiple regression technique can conclude directly about the effect of each independent variable which is used partially and simultaneously.

Table 10. Multiple Linear Regression Analysis

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	65.856	8.028		8.203	.000
	PER	-.408	.088	-.779	-4.652	.000

a. Dependent Variable: PBV

Source: SPSS Version 20 output, processed 2022

Based on table 4.7 multiple linear regression equation, what is read is the value in column B, the first row shows the constant ( $\alpha$ ) and the next row shows the coefficient of the independent variable.

Based on table 4.7 the regression model used is as follows:

$$Y = a + b_1X_1 + b_2X_2$$

$$Y = 65,856 + (-0,408X)$$

The constant value with the regression coefficient in table 4.7 can be explained as follows:

- a. The constant value is 65.856. This means that if the investment decision (PER) as X is 0, then the firm value (PBV) as Y is 65.856.
- b. The variable coefficient (X) of investment decisions (PER) is negative, which is -0.408. This means that investment decisions (PER) have a negative effect on firm value (PBV), if there is an increase in

investment decisions (PER) by 1 unit, it will be accompanied by a decrease in firm value (PBV) of -0.408.

G. Hypothesis Test

Partial Test (t Test)

Partial testing aims to determine the magnitude of the influence of each independent variable individually (partial) on the dependent variable. Partial testing is done by looking for tcount and comparing with t-table with a significant level of = 0.05. The hypothesis in this partial test is that if tcount < ttable then H0 is accepted and Ha is rejected, which means that individually (partial) each independent variable does not affect firm value. And, if tcount > ttable then H0 is rejected and Ha is accepted, which means that each independent variable affects firm value (Ghozali, 2016:97). T-table is calculated by:  $t(n-k)$  then  $t\text{-table} = t(0.05; 14) = 2.145$ . Where n is the number of data and k the number of independent variables. The value of the t-count results can be found using the statistical software SPSS version 20 which is presented in table 4.8 as follows:

Table 11. Partial Test Results (t Test)

Coefficients <sup>a</sup>						
Model		Unstandardized Coefficients		Standardized Coefficients	T	Sig.
		B	Std. Error	Beta		
1	(Constant)	65.856	8.028		8.203	.000
	PER	-.408	.088	-.779	-4.652	.000

a. Dependent Variable: PBV

Source: SPSS Version 20 output, processed 2022

Based on the partial test results (t-test) in table 4.8 above, the t-value for each independent variable is obtained. So as to produce the following hypothesis:

From the results of the calculation of investment decisions proxied by the Price Earnings Ratio (PER) with a partial test, it is obtained that tcount is -4.652 and ttable is 2.145 with a significance of 0.000. Because tcount is smaller than ttable, namely  $(-4.652 < 2.145)$  where the significance value is  $0.000 > 0.05$ . So it can be concluded that the investment decision variable partially has no significant effect on firm value.

Coefficient of Determination Testing (R2)

The results of the determination coefficient test can be seen from the Adjusted R Square value which is presented in table 4.9 as follows:

Table 12. Coefficient of Determination Test Results (R2)

Model Summary <sup>b</sup>				
Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.779 <sup>a</sup>	.607	.579	16.4029

a. Predictors: (Constant), PER

b. Dependent Variable: PBV

Source: SPSS Version 20 output, processed 2022

Based on table 4.9, it is known that the amount of Adjusted R Square is 0.579 or 57.9%. This shows that the percentage contribution of the influence of all independent variables (Investment Decisions) to the dependent variable (Company Value) is 57.9% while the remaining 42.1% ( $100\% - 57.9\% = 42.1\%$ ) is influenced or explained by other variables not included in this study such as funding decisions, company external factors such as: inflation rates, currency exchange rates, economic growth, politics and market psychology.

The Effect of Investment Decisions on Firm Value in manufacturing companies listed on the Indonesia Stock Exchange

Based on table 4.8 partially obtained t value of -4.652 with a significance of 0.000. Investment decisions have no partial effect on firm value, because tcount  $-4.652 < t\text{table } 2.145$  and significant at  $0.000 < 0.05$ .

This identifies that changes that occur in the ratio of investment decisions have no effect on firm value. The ineffectiveness of investment decisions is due to the uncertainty factor in the future, the uncertainty is in the form of changes in technology, socio-economic conditions and government policies. This is also because investment decisions are more related to factors other than company value, such as profit-taking by investors when stock prices increase or decrease, due to uncertainty in economic and political conditions, as well as sentiment from the stock market itself. Because investment decisions are the expectations or expectations of investors on the performance of a company expressed in ratios. The results of this study are in line with the results of research conducted by Sari & Jufrizen (2019) that: "Partially proves that investment decisions have no significant effect on firm value".

## VI. CONCLUSION AND RECOMMENDATION

Based on the results of the study, the conclusion that can be drawn is that investment decisions have no partial effect on firm value in manufacturing companies listed on the Indonesia Stock Exchange. In addition, the author will provide some suggestions as follows:

- a. For further researchers, this research is only limited to the level of profit by using investment decision indicators as factors that affect firm value. There are still many factors that have not been discussed in this study.
- b. For investors, it is hoped that it will be useful as material for consideration and provide information that in investing, they must pay attention to investment decisions and company value and pay attention to other indicators as considerations in making investments such as liquidity level, company size, and ratios related to investment. .
- c. For the company, it is expected to provide a broad perspective so that the company's value can be optimal. Then the company to maintain investment decisions and company value in the company. In addition, companies can increase sales and invest in profitable projects that are expected to gain the trust of internal and external parties.

## ACKNOWLEDGEMENT

Praise be to Allah swt. For the blessings and guidance that the writer has received while carrying out this research, the writer realizes that the completion of this journal can be accomplished thanks to the help and guidance of various parties. Therefore, on this occasion the author would like to thank;

- a. Dr. H. Abdussy Syakur Amin, M.Eng as Chancellor of Garut University;
- b. Dr. Wati Susilawati, SE., M.Si as the Dean of the Faculty of Economics, University of Garut;
- c. Mochamad Romdhon, SE., M.Sc., MCE as Head of the Accounting Study Program S1 Faculty of Economics, University of Garut;
- d. The committee involved in the preparation of this research.

The author hopes that this research can provide benefits as well as a reference for all parties. Criticisms and suggestions that are constructive are expected for the progress of the authors in the future.

## Analysis of the Economic Potential of the Base Sector Using the Location Quotient to Improve Industrial Competitiveness in Ciamis Regency

Nurdiana Mulyatini<sup>1</sup>, Yusup Iskandar<sup>2</sup> and Erna Rozalina<sup>3</sup>

<sup>1,2,3</sup>Management Study Program, Faculty of Economics, Galuh University, Ciamis, Indonesia

### Abstract

*The Location Quotient (LQ) method is used in the primary economic model as a first step to understanding the sector of activity that triggers regional economic growth. This research is based on the problem of income inequality caused by differences in the potential of human resources, infrastructure, and the possibility of natural resources, which hurt economic stability. This study differs from previous research, which attempts to provide a conclusion from the sectors identified as strategic sectors and industrial competitiveness by taking into account the availability of raw materials both in terms of land and productivity, as well as the condition of the existing industry which is made from strategic sector commodities that previously had not been developed. Carried out by other studies. The research method used is a descriptive analysis that seeks to answer problems by collecting, classifying, and analyzing data that aims to create an objective picture of a situation by identifying only commodities based on business fields taken from Gross Regional Domestic Product (GRDP) according to Constant Prices. The results showed that Ciamis Regency has a base sector that was selected based on the results of Location Quotient with the calculation results obtained that the LQ value > 1. Based on the results of the study, it can be concluded that the selected business field as the base sector has met local needs so that it can be developed into a business field and superior products that have a high selling value, and the primary sector business fields will provide added value to increase the competitiveness of the industry.*

*Keywords— Economic Base Sector; Location Quotient; GRDP; Industrial Competitiveness*

### I. INTRODUCTION

Economic growth is one of the critical indicators in analyzing economic development in a country or region. Increased economic growth and equitable income distribution are needed to improve people's welfare. However, rapid economic growth will lead to inequality in income distribution because there is a difference in income between people or areas that are developed and places that are lagging. The more significant the income gap, the greater the variation in income distribution that causes income disparities. (Indrawati, 2021). The natural fluctuations in the economic growth of a region from year to year will be seen in the Gross Regional Domestic Product (GRDP), i.e., positive growth will indicate an increase in the economy; on the contrary, if it is negative, it will show a decline in the economy. Gross Regional Domestic Product (GRDP) is a macroeconomic indicator that can be used to see the level of success of a region's economic development. For this reason, economic development planning should emphasize development policies based on regional peculiarities and optimize the potential of human resources, institutions, and local/regional natural resources, as well as the development of industrial growth centers that will be the prime movers. mover) that will bring progress or improvement to the surrounding area. (Nugraheny, 2016)

Based on data from the Central Statistics Agency for Ciamis Regency, GRDP based on constant 2010 prices, the value of GRDP in Ciamis 2021 has increased, from 21.97 trillion rupiahs in 2020 to 22.77 trillion rupiahs in 2021. The GDP growth rate is based on constant price in 2020, which is -0.14 percent, with the highest contribution from the information and communication sector at 32.81 percent. Realizing the economic growth rate in 2021, Ciamis Regency recorded a realization of 3.66% (YoY), occupying the 2nd (two) highest position among cities/regencies in East Priangan, with a 1.50% share of West Java's economic growth. As a result, West Java's economic growth in 2021 was recorded at 3.74% (YoY), higher than 2020, which experienced a contraction of -2.56% (YoY). Meanwhile, Gross Regional Domestic Product (GDP) based on current prices in the third quarter of 2021 reached Rp. 555.06 trillion, and based on constant prices in 2010, it reached Rp. 377.54 trillion.

Below is the Gross Regional Domestic Product Growth Rate of Ciamis Regency based on Constant Prices by Business Field, as follows:

Table 1. Growth Rate of Ciamis Regency's Gross Regional Domestic Product based on Constant Prices by Business Field in 2017-2021

Business Fields		2017	2018	2019	2020	2021
1.	A. Agriculture, Forestry, and Fisheries	2.21	1.67	2.87	1.47	3.82
2.	B. Mining and Quarrying	0.13	2.99	-2.55	0.57	8.44
3.	C. Processing Industry	5.18	7.14	5.06	-1.63	4.35
4.	D. Electricity and Gas Procurement	2.07	8.77	4.64	2.51	11.19
5.	E. Water Supply, Waste Treatment, Waste and Recycling	7.12	9.90	9.47	9.72	9.79
6.	F. Construction	7.23	9.25	6.24	-7.41	6.45

17.	R, S, T, U. Other services	9.63	6.71	7.15	-2.24	0.80
Gross Regional Domestic Product		5.21	5.31	5.38	-0.14	3.66

Source: Central Bureau of Statistics Ciamis Regency, 2022

Acceleration of economic growth in the Ciamis Regency, there are fifteen business fields except for two categories of business fields, namely Provision of Accommodation and Food and Drink as well as Government Administration, Defense, and Mandatory Social Security which experienced a decline in production. The highest economic growth in 2021 was achieved by the Electricity and Gas Procurement business category, which was 11.19 percent, and only one of these categories grew above ten percent. Furthermore, there are eight categories of business fields whose growth is between five and ten percent, namely the Real Estate business category of 9.94 percent, the sort of Water Supply, Waste Management, Waste and Recycling of 9.79 percent, the Corporate Services category of 8.53 percent, the Mining and Quarrying category at 8.44 percent, the Health Services and Social activities class at 7.47 percent, the Information and Communications category at 7.27 percent, the Financial and Insurance Services category at 6.49 percent, and the construction category at 6.45 percent. Based on these data, it has not been seen that the base/leading sector has the potential and high added value for economic growth in Ciamis Regency.

Efforts to encourage economic growth through economic transformation carried out by the Ciamis Regency Government continue to be pursued by encouraging domestic industries to increase industrial value added downstream of natural resource products. Downstream efforts not only support the strengthening of the economic structure but also support inter-sectoral and inter-regional integration and realize the development of an independent, sovereign, advanced, just, and inclusive industrial sector. This is by the Ciamis Regency Long-Term Regional Development Plan (RPJMD) for the 2019-2025 strategy is directed at achieving prosperity through the creation of a solid social and economic structure of society based on independence and competitive advantage supported by competitive human resources, infrastructure. Good governance and efficient and effective governance.

This research is directed to look at various potential natural resources and other potentials that exist in Ciamis Regency that can be developed and have high added value by determining the primary economic sector and leading sector through the Location Quotient Method to increase regional competitiveness to achieve economic growth and level of economic growth. High and sustainable welfare. The Location Quotient method is an analytical tool that can be used easily, quickly, and precisely to determine the base (leading) economic sector with high competitiveness. The research questions posed are:

1. What are the economic potentials that include leading sectors and sub-sectors in Ciamis Regency,
2. To what extent are the leading sectors able to increase industrial competitiveness in Ciamis Regency.

## II. LITERATURE REVIEW

### A. *The Economic Base Sector*

The theory of Regional Economic Development, known as Economic Base Theory, is based on the view that a region's economic growth rate is determined by the magnitude of the increase in exports from that region. In regional economic theory, economic activities are grouped into primary and non-basic activities. Basic activities export goods and services outside the economic boundaries of the community concerned. Meanwhile, non-basic activities are activities that only provide goods and services needed by people who live within the edges of the community's economy. These activities do not export, so they have a broad product scope, and the market area is only local. The weakness of this theory is that the economy is based on external demand, which can lead to a very high dependence on market forces nationally and globally (Ananda, 2018).

The basic premise of the economic base theory is that the primary sector produces goods and services for regional markets. Outside the region concerned, sales outside the area will generate income for the part, increasing demand for goods and services in it, and increase the demand for goods and services. The volume of non-basic activities. The flow of income from outside the region causes an increase in consumption and investment, which will increase revenue and create new job opportunities. (Ridwan, 2016)

The basic (leading) sector is an economic activity that serves the domestic market and markets outside the region. The primary sector can produce products and services that will later bring profits. This means that the area can export goods and services produced by the sector to other regions. (Posner, 2020).

The primary sector is a sector that has great potential in determining the overall development in the region, while the non-base industry supports the overall result. Finally, the primary sector is a sector or economic activity that serves both the market in the area and outside the region. Indirectly, the region can export goods and services produced by the industry to other places. (Shmygol et al., 2020).

The method used to determine the basis and non-base sectors is the location quotient (LQ) method. Meanwhile, shift-share analysis is used to determine the forward or backward industry. The sectors analyzed in the base sector, and the non-base sector is commodities. Commodities in each region have differences that can later become the region's characteristics. (Prats, 2018).

### B. *Location Quotient*

Location Quotient (LQ) is an indirect method of the basic economy that compares the share of employment or added value of specific sectors in the desired area with the percentage of jobs or added value of the same industry nationally. (Wati et al., 2019). The Location Quotient technique is widely used to analyze economic conditions by identifying the specialization of economic activity and measuring the relative concentration of economic activity to get an overview of the determination of the leading sector as the top sector in economic activity. The LQ technique is one of the approaches commonly used in the primary economic model as a first step to understanding the industry of action that triggers growth. (Jumiyanti, 2018). This technique has advantages and limitations in its use. The LQ technique is relatively straightforward to use. However, the burden of this technique is that it requires high data accuracy because good data collection is complicated to do in the field, making it challenging to collect data. In addition, the LQ technique has not been able to provide conclusions from the sectors identified as strategic sectors. However, for the first stage, it is sufficient to give an overview of the capabilities of a region in the specified industry. (Mo, et.al, 2020; Hidayah & Tallo, 2020).

LQ analysis provides a relative comparison between sectors through a specific area with the comparison area. By comparing closely, a reliable base sector will be found in economic growth and optimizing the economic development of a region. ((Fracasso et al., 2018; Firmansyah, 2021) The formula used to determine the value of LQ by using the Value Added/Income Approach (GDP) is as follows: Haryanto, 2021)

$$LQ = \left[ \frac{X_{ir}/X_r}{X_{in}/X_n} \right]$$

Where:  $X_{ir}$  = sector  $I$  in area

$X_r$  = number of all sectors in the area

$X_{in}$  = industry  $I$  on the broader area

$X_n$  = the number of all sectors in the wider area

One aspect of LQ analysis is as an indicator for determining the leading sector, where the LQ coefficient value  $> 1$  means that the sub-sector is leading and very prospective if developed to improve the regional economy.  $LQ = 1$ . The commodity is classified as non-basic and does not have a comparative advantage. Its production is only sufficient to meet the region's needs and cannot be exported.  $LQ < 1$  this commodity is also classified as non-basic, meaning that the production of commodities in a region cannot meet their own needs, so they need to be supplied or imported from abroad (Basuki & Muji Raharjo, 2017).

### C. Gross Regional Domestic Product (GRDP)

GRDP, or in other terms *Gross Regional Domestic Product*, is the amount of added value for goods and services produced by various production units in the territory of a country within a certain period (usually one year). (Karim et al., 2017). Gross Regional Domestic Product is the amount of gross added value arising from all economic sectors in the area. In other words, GRDP is the total value of final goods and services produced by all production units within a region or region in a certain period without taking into account ownership. (Son et al., 2018). Gross Regional Domestic Product (GRDP) at the regional (district) level describes the ability of a region to create an output (added value) at a particular time. (Jaya & Kholilah, 2020).

One of the benefits of GRDP is to determine the level of net product or added value generated by all industrial factors, the rate of economic growth, and the pattern of economic structure in a certain period in a country which is usually one year. Calculating GRDP is to help make regional policies or plans, evaluate development results and provide information describing regional economic performance. (Karim, 2017).

To formulate GRDP, two approaches are used, namely production and use. Both of them present the composition of value-added data broken down according to the source of economic activity (business field) and the components of its use. Gross Regional Domestic Product and its derivative aggregates are presented in 2 (two) valuation versions, namely based on "current prices" and based on "constant prices." Referred to as current prices because all aggregates are valued using prices in the current year, while constant prices are based on costs for a specific base year. (Septiana & Thai, 2021). The function of GRDP according to current prices is used to determine the ability of economic resources, shifts, and the economic structure of a region. Meanwhile, constant GRDP is used to determine real economic growth from year to year or economic growth that is not influenced by price factors. (Susanto & Zairin, 2020)

In general, the approaches used for calculating GRDP are the production approach, income approach, and expenditure approach, with the formula for each system as follows: (Ektiarnanti & Fauziah, 2021).

- a. The production approach is a calculation method that takes into account the amount of production from various sectors, with the following formula:

$$Y = NTB1 + NTB2 + \dots \dots \dots \text{etc}$$

Where: Y: Income

NTB: Value added from each economic sector

- b. Approach income is a method for calculating GRDP by adding up all factors of production receipts in the form of rent, wages, investment, and profit. The formula for calculating GRDP is:

$$Y = r + w + i + p$$

Where: r : Rent

i : Investment

p: Profit w: Wages

- c. An expenditure approach is an approach to calculating GRDP by loading various kinds of expenditures made by economic actors, with the formula as follows:

$$Y = C + G + I (XM)$$

Where : Y: National income

G = Government expenditure

C: Household consumption

X = Exports

I: Investment

M = Imports

### D. Industrial Competitiveness

Industrial competitiveness is defined as the ability of an industry to show excellence in certain respects by offering the most favorable situations and conditions and better work results compared to other sectors. In other words, industrial competitiveness is the ability of a company or industry to face the challenges of

competition from its foreign competitors. (Hendrawan, A. 2020). In addition, to the Center for Urban and Regional Studies (CURDS), regional competitiveness is defined as the ability of the company sector in an area to generate income more evenly for the community. The dimensions of a company's competitiveness consist of cost, quality, delivery time, and flexibility (Almira, 2020).

As Michael Porter proposed, Industry Competitiveness Analysis explains that measuring an industry's productivity competitiveness becomes essential in producing goods and services. Productivity can increase per capita income, followed by the economic growth of a country. According to Porter, competitiveness for an industry can increase financial capacity that can boost economic growth in the long term, which can be used as a stimulator to increase productivity and the ability of independent businesses. There is a belief that market mechanisms can lead to efficiency. (Arifin, 2021)

The Competitiveness Diamond model proposed by Porter says that the industry in a region excels not from its suitability but the group's success with the linkages between companies and supporting institutions. In the industrial cluster, the companies involved are not only large and medium-sized but also small. (Tirtayasa, (2021). There are four critical elements in Porter Diamond's concept of competitiveness. These elements include factor conditions, demand conditions, related supporting industries, strategy, structure, and competition. In addition, the idea of competitiveness is indirectly influenced by the role of the government and the opportunities. (Marwa & Yulianita, 2021).

Porter introduced the theory of a country's competitive ability, which is depicted in the diamond model as shown in the following figure:

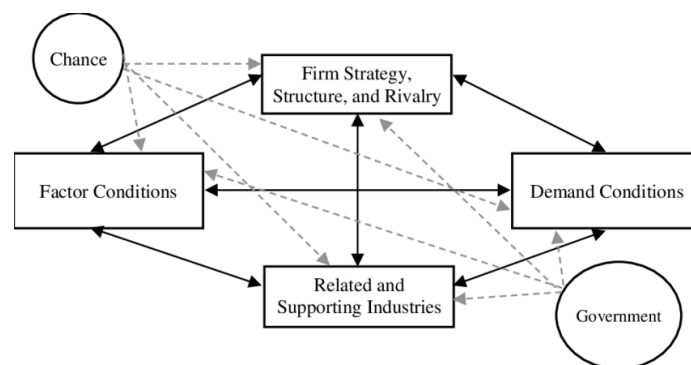

Fig 1. Porter's Diamond Competitive Advantage Model

According to Porter, the importance of competitiveness for three things, namely increasing productivity and self-reliance, can increase economic capacity, both in terms of regional economic conditions and economic actor entities, so that economic growth increases; the last is the belief that market mechanisms create more efficiency. (Princess, 2022). In the theory of competitiveness, the theory of comparative advantage and competitive advantage is known, which is used to measure the level of competitiveness. Four factors determine competitiveness in competitive advantage: factor conditions, demand conditions, supporting and related industries, strategic conditions, company structure, and competition. In these four factors, two factors influence the interaction: the role of government and the role of opportunity. (Kharub & Sharma, 2017).

### III. RESEARCH METHODOLOGY

This study uses a descriptive analysis method with a qualitative approach, namely how to solve problems or answer problems that are being faced by collecting, classifying, and analyzing data to make an objective picture of a situation. (Winarno Surakhmad in Herdayati, & Syahril, 2019). Data collection was carried out using a survey based on secondary data. Secondary data collection is sourced from documents owned by the Central Bureau of Statistics of Ciamis Regency and BPS of West Java Province related to GRDP (Gross Regional Domestic Product) data based on Constant Prices based on Business Fields in 2017 - 2021. In this study, the primary research variable is the Potential Base sector economy and increasing industrial competitiveness with an intermediate variable, namely the Location Quotient Method. The analytical technique used to identify the economic potential of the leading sector and sub-sector is by using the Location Quotient Method with the help of Data processing conducted within a spreadsheet from Excel.

## IV. RESULT / FINDING

In this section, the research results on Location Quotient are explained to determine the essential (leading) and non-basic economic sectors in Ciamis Regency based on GRDP data based on constant prices according to business fields in Ciamis Regency and West Java Province in 2017-2021. First Phase What is done is to compare the GRDP of Ciamis Regency (as presented in table 1) and the GRDP of West Java Province as follows:

Table 2. West Java Province Gross Regional Domestic Product Growth Rate Based on Constant Prices by Business Fields 2017-2021

Fields 2017-2021 Business Fields	2017	2018	2019	2020	2021
1. A. Agriculture, Forestry, and Fisheries	1.60	2.09	2.80	2.30	1,31
2. B. Mining and Quarrying	-2.02	-4.13	-2.75	-4.11	0.82

In stages Next, based on the data of Gross Regional Domestic Product in Ciamis Regency and West Java Province in 2017-2021, data processing is carried out with the help of Microsoft Excel to determine the Location Quotient Value with the following results:

Table 3. Location Quotient Analysis of Economic Sector

Business Field	Location Quotient						Ket.
	2017	2018	2019	2020	2021	Average	
1. Agriculture, Forestry, and Fisheries	1.41	0.82	1.05	0.65	2.98	1.38	Base Sector
2. Mining and Quarrying	-	-0.74	0.87	-	10.53	2.09	Base Sector
3. Manufacturing Industry	1.00	1.12	1.20	0.38	1.05	0.95	Non-Basic Sector
4. Electricity and Gas Procurement	-	448,60	-	-	0.98	89.09	Base Sector
5. Water Supply, Waste Treatment, Waste and Recycling	1.02	2.04	2.92	0.92	1.04	1.59	Base Sector
6. Construction	1.02	1.27	0.95	1.27	1.02	1.11	Base Sector
7. Wholesale and Retail Trade, Car and Motorcycle Repair	1.13	1.26	0.73	0.70	0.98	0.96	Non-Basic Sector
8. Transportation and Warehousing	1.11	1.14	1.23	0.10	-2.59	0.20	Non-Basic Sector
9. Provision of Accommodation and Food and Drink	0.85	0.87	1.16	1,44	2.85	1.43	Base
10. Information and Communication	1.02	1.06	0.92	0.98	1.02	1.00	Non-Base Sector
11. Financial Services and Insurance	0.85	0.95	0, 32	4.86	1.17	1.63	Base Sector
12. Real Estate	1.02	1.07	0.93	4.39	0.87	1.65	Base Sector
13. Plus Services Performance	1.02	1.11	0.93	0.73	1.02	0.96	Non-Base Sectors
14. Government Administration, Defense, and Social Security	0.21	0.07	0.22	0.15	0.76	0.28	Non-Base Sector

17. Other Services	1.01	1.07	0.93	0.87	1.01	0.98	Non-Based Sector

Source: Data Processing Results, 2022

From the results of the analysis of the economic sector potential of GRDP based on constant prices on a field basis Business In 2017-2021, it can be seen that business or industrial fields that have contributed to the regional economy in Ciamis Regency based on the Location Quotient Method Analysis are:

- a. There are 9 (nine) sectors with an LQ value  $> 1$ , so the financial industry is included in the Base Sector category. Or superior, namely the agriculture, forestry, and fishery sectors; Mining and excavation; Electricity and gas procurement; Water Supply, Waste Treatment, Waste and Recycling; construction; transportation and warehousing; provision of accommodation and food and drink; financial and insurance services; real estate; and Education Services;
- b. There is 1 (one) economic sector has an LQ value = 1, namely the information and communication industry. Where this sector is included in the category of Non-Based
- c. Sector. Wholesale and retail trade; repair of cars and motorcycles; transportation and warehousing; Company Services; Government Administration, Defense, and Social Security; Health services and Social Activities; and other services.

Meanwhile, to see the achievement of the value of each sector of the Business Field during the 2017-2021 period, it can be explained as follows:

- a. Agriculture, Forestry, and Fisheries Sectors; in the period 2017-2021 has an average value of LQ  $> 1$ , meaning that this sector as a whole becomes the base/leading sector in Ciamis Regency; it is also by the direction of Ciamis Regency's development potential in the field of Agriculture and Horticulture. Except in 2018 and 2020, the LQ value was  $< 1$ , so in those two years, this sector was not included in the base sector but did not affect the average value acquisition, so it was still included in the base sector.
- b. Mining and Quarrying Sector; In the Ciamis district, the Mining and Quarrying Sector is not a leading sector/base; it can be seen from the LQ value every year  $< 1$  even though economic growth tends to be negative because LQ pays attention to Economic Growth at the Provincial Level, it causes the average LQ value to reach value  $> 1$ , so it is included in the base sector.
- c. Processing Industry Sector: During the 2017-2021 period, the LQ value  $> one$  is included in the base sector except in 2020 LQ  $< 1$ , but overall the average LQ value is  $< 1$ , so in Ciamis Regency, the Manufacturing Industry is included in the non-basic economic sector.
- d. Electricity and gas Procurement Sector; In the last five years (2017-2021 period), this sector has had an LQ value of  $< 1$ , except in 2018, it has an LQ value of  $> 1$ , which is quite large so that it dramatically affects the calculation of the overall LQ average value which results in a value  $> one$  so that it is included in the primary economic sector.
- e. Water Supply, Waste Treatment, Waste, and Recycling Sector: In the Ciamis district, this sector has always been the primary economic sector because, in the 2017-2021 period, the LQ value is  $> 1$  except in 2020 along with the Covid 19 pandemic, this sector is no longer a sector basis sector, but in the next period this sector is again included in the category of the
- f. construction sector base sector: based on the calculation results, the LQ value of the Construction sector gets an average value of  $> 1$  so that this sector is included in the primary economic sector, although, in 2019, the LQ value is  $< 1$ ; however, this does not affect the overall average value of the construction sector which still gets an LQ  $> one$  including the base sector (Leading)
- g. The wholesale and retail trade, car and motorcycle repair sector; The LQ value of the Trade and Retail sector based on the results of the assessment obtained an average value of LQ  $< 1$  so that this sector is included in the non-base sector (not superior) even though in 2017 and 2018 this sector had become the base sector (leading) because the value was  $> 1$ .
- h. The transportation and warehousing sector; In the 2017-2021 period, the transportation and warehousing sector is included in the non-base (not superior) sector, although in 2017 and 2018, this sector received an LQ value  $> 1$  in the following years, the LQ value obtained  $< 1$  even there was an LQ value. quite a significant negative, namely in 2021
- i. the sector of providing accommodation and food and drink; The results of the calculation of the LQ value in the 2017-2021 period obtained an average value of  $> 1$  so that this sector is included in the base sector (leading), although in the 2017-2018 period the LQ value was  $< 1$ , it did not affect the overall average value.
- j. Information and Communication Sector: Based on the calculation results of the information and communication sector, it gets a value of LQ = 1, where based on the provisions, if LQ = 1, then it is

- included in the category of the non-basic sector (not superior) because it is only able to meet the needs in the Ciamis Regency area itself and cannot be exported.
- k. Services and Insurance Sector; This sector, based on the calculation results, get an LQ value  $> 1$ , so it is included in the base sector (Featured), although if you look at the LQ from 2017 to 2019, the LQ value  $< 1$  means that it is included in the non-base sector, but in 2020 and 2021 the LQ value is substantial, so that affects the overall average value where  $LQ > 1$ .
  - l. Real Estate Sector: Calculation results for 2017-2021 obtained an average value of  $LQ > 1$  so that the real estate sector is included in the base sector (leading)
  - m. The Company's service sector; because the results of the LQ calculation during the 2017-2021 period get a value of  $< 1$ , this sector is included in the non-base (not superior)
  - n. The sector of the Government Administration, Defense, and Social Security Sector; based on the results of calculations during the period 2017-2021, this sector gets an LQ value  $< 1$ , so it is not included in the leading sector (non-base sector)
  - o. Education Sector: This sector in the last five years (201-2021) got an average LQ value  $> one$ , which means that the Education sector is included in the primary (leading) economy.
  - p. Sector, the Health Services and Social Activities Sector; The average LQ value for this sector is  $< 1$ , meaning that it does not include the base sector (not superior), although the annual LQ value gets a deal  $> one$  but with a relatively small value so that it affects the overall average value.
  - q. Other Service sectors: in Kabupaten Ciamis, other service sectors get a value from the calculation of  $LQ < 1$ , which shows that this sector is not included in the leading sector (non-base sector). Although the annual LQ value has an LQ value  $> 1$ , it does not affect the calculation of the average value because the value is small.

#### V. DISCUSSION

Based on the results of research from 17 economic sectors based on business fields in Ciamis Regency for the 2017-2021 period, as many as 9 (nine) sectors, including the Basic Economic Sector category, where the economic sector/business sector is the basis or a source of growth. The results of this study are in line with several previous studies, which revealed that the primary economic sector is a leading sector that can encourage growth or development for other sectors, both sectors that supply inputs and industries that use outputs as inputs in the production process. In addition, this business field has a comparative advantage, meaning that the results from this field can not only meet the needs of the region concerned but can also be exported outside the region. In addition, from this study's results, 8 (eight) sectors are included in the non-basic economic sector category with a value of  $LQ = 1$  and  $LQ < 1$ . For the value of  $LQ = 1$ , it is classified in the non-basic sector because it does not have a comparative advantage. In contrast, production in the Business is only enough to meet the region's needs and cannot be exported. Another study also revealed that  $LQ = 1$ , indicating that there is balanced productivity, which means this sector is still unsuitable for export (the sector's role is the same in the region and nationally). While the value of  $LQ < 1$  is included in the non-base sector because production in the business field in an area cannot meet its own needs, so it needs supplies or imports from outside. (Prats, 2018). Several previous studies have shown that business fields, commodities, and raw materials included in the primary economic sector are designated as leading sectors that are the mainstay of economic growth and can support industrial competitiveness. (Fracasso & Vitucci, 2018; Panagiotopoulos & Kaliampakos, 2021).

By looking at the various research results and discussions that have been carried out, this research supports the theory revealed by previous research. However, the coverage of the base and non-base sectors produced has differences from the previous study both in terms of the business sector and the distribution of the value of the Location Quotient. This happened because the scope of the discussion and the content and data of the GRDP used were also different. Even so, the advantages of this study can explain the sectors identified as strategic sectors and industrial competitiveness by paying attention to the availability of raw materials both in terms of land and productivity, as well as the condition of existing industries made from strategic sector commodities that have not previously been carried out by other studies.

#### VI. CONCLUSION AND RECOMMENDATION

From the results of research and discussion conducted using the Location Quotient Method, which aims to analyze economic conditions to determine the base sector in an area with data sources from Gross Regional Domestic Product (GRDP) GRDP based on Constant Prices based on Business Fields in 2017 - 2021 and referring to the research, the question shows that the primary and non-basic economic sectors in Ciamis Regency consist of 9 (nine) primary sectors and 8 (eight) non-base sectors. This means that most of

these business sectors can be a source of growth, has a comparative advantage, and the results can not only meet the needs of the Regency itself but can also be exported outside the economic area, which can generate added economic value. (Mo & Park, 2020). Even so, from the analysis results, there are also business fields that are included in the non-base sector category, meaning that the sector is only able to meet the needs of its region, cannot export to other areas, or has not even met the requirements of its place, so it needs to be imported from the different sizes so that these sectors need to be imported from other regions. The industry does not yet have competitiveness and has not been able to become a source of economic growth. (Panagiotopoulos & Kaliampakos, 2021). For this reason, based on the research results and conclusions, the following can be recommended:

- a. The Ciamis district government must continue to seek synergy with provincial and central government policies so that essential sectors will continue to be a source of growth and non-basic sectors. Can be transformed into a primary sector,
- b. The Ciamis Regency Government continues to strive to improve the quality of policies and focus on non-basic sectors so that these sectors are increasingly competitive and able to become sources of economic growth.
- c. The author realizes that in this study, there are still shortcomings where the sample data used is still limited and less representative, as well as less objective measurements. For this reason, other researchers are expected to be able to improve these deficiencies as material for further improvements.

#### ACKNOWLEDGMENT

On this occasion, the author would like to express his infinite gratitude to all parties, especially the committee of the Conference on Sustainable Collaboration in Business, Information, and Innovation, which has allowed the author to join and participate in this activity. I also express my gratitude to all leaders of Galuh University, especially the Faculty of Economics, who have encouraged and facilitated the author in this conference activity. And to all parties I cannot mention one by one, thank you for all the help and motivation. Hopefully, what has been given becomes a good deed that gets a reward from Allah SWT.

## Analysis of Factors Affecting Human Growth Index in North Maluku

Aprilia Dwi Prastika, Dr. Didit Purnomo, S.E., M.Si<sup>1</sup>

<sup>1</sup>Muhammadiyah Surakarta University ; Economic Development, Faculty of Economics and Business  
Muhammadiyah Surakarta, Sukoharjo, Central Java, Indonesia.

### Abstract

*The Human Development Index is a comparative measurement of life expectancy, literacy, education and standard of living (Handalani, 2018; Nafi'ah, 2021). This study aims to animate and determine the pattern of HDI in North Maluku Province in 2011-2021. Panel data analysis was performed using the e-Views 10 program using multiple linear regression methods. Model determination was carried out using chow test and hausman test, and the selected model was Fixed Effect Model (FEM). The results of the analysis show that the HDI pattern in the region studied shows that economic growth, poverty, minimum wage and open unemployment have a positive and significant effect on the Human Development Index (HDI) partially.*

*Keywords— Economic Growth; Poverty; Minimum Wage; Open Unemployment; Human Development Index; and Literacy*

---

### I. INTRODUCTION

In a country, development is carried out to make a country a more developed country. Development in a country is also carried out to alleviate poverty that exists in the country. This is the case in various developing countries that are carrying out development. Development in a country also shows the initiative of the country to meet the needs of its people in everyday life. Development is also carried out to increase foreign exchange from a country because a country's profits will increase if a development is carried out (Fortuna et al., 2021). In other words, the development carried out in a country can alleviate the poverty that exists in the country so that it can develop into a more developed country.

So far, developed, developing, or undeveloped countries have only been measured through per capita income, therefore HDI applies aspects of human quality development with a more comprehensive measure. In a country, broadly and various measures of human quality are studied by researchers using HDI as one of the study materials or discussion topics. Human development intended in HDI is not the same as human resource development that is usually intended in economic theory. As a workforce whose productivity must be increased is a designated thing from human resources to humans as one of the factors of production. In this case to achieve the goal of increasing the output of human goods and services only as a tool (input) (Suciati et al., 2015).

The problem of poverty is currently a problem that must be overcome in developing countries. This is due to the large population in most developing countries in the world. Population growth in developing countries is not balanced with economic growth, resulting in low welfare of the population in developing countries. Poverty in developing countries is a multidimensional problem, covering various dimensions such as social, economic, cultural, political, and legal. Poverty in developing countries also occurs due to the unmet needs and rights of the people of developing countries. In addition, poverty also limits people's ability to develop skills, resulting in hampering the development process (Nurlana et al., 2020).

HDI can also access development outcomes, namely poverty, economic growth and open unemployment. The existence of economic growth can help increase the human development index, reduce the number of unemployed and poverty, in addition to seeking the expansion of human resources in all fields for choice to the population who are superior in their skills, prioritizing the improvement of basic human abilities in order to fully participate in all fields of development to reduce unemployment and poverty. (Izzah, 2015).

According to Faelassuffa & Yuliani, (2022), the Human Development Index is also influenced by other factors, such as the availability of job opportunities which are further determined by many factors, especially economic growth, infrastructure and government policies. Infrastructure is built by the state through capital expenditure. In the Regulation of the Ministry of Finance Number 101 / PMK.02 / 2011 capital expenditures can

be in the form of: land, equipment and machinery and buildings, roads, irrigation and other capital shopping networks, and capital expenditures of the General Service Agency (BLU).

In addition, to improve the quality of human resources, the government as the implementing agent of national development certainly needs capital as the basis of development. The government makes investments or investments aimed at human development. Government spending is a reflection of the policies taken by the government. In this case, the government expenditure is used to finance the public sector which is more important and becomes a priority in improving the quality of human resources which is reflected in the Human Development Index (HDI) (Rangkuti, 2019). Based on the background presentation above, the purpose of this study is to find out and also analyze whether Poverty, Open Unemployment Rate, Provincial Minimum Wage and Economic Growth, and Government Spending have an influence on

## II. LITERATURE REVIEW

### A. Poverty

Chamber in Sajogyo, (2017) poverty is a condition in which a person experiences a shortage of money and goods to ensure survival. In a broad sense, poverty is an integrated concept that has five dimensions, namely: 1) Poverty, 2) helplessness 3) the problem of facing an emergency situation, 4) dependence, and 5) alienation both geographically and sociologically. Furthermore, Niswati (2014), revealed that there is an absolute core of poverty. The famine that plagues them becomes a perspective from poverty, as well as the inability to social disgrace and the inability to educate children (education) and care for children's health. The absolute poverty line is very important for assessing the effects of anti-poverty policies between times, or estimating the impact of a project on poverty (for example, the provision of small-scale credit). The poverty rate will be compared between one country and another only if the same absolute poverty line is used in both countries. The World Bank needs absolute poverty lines in order to compare poverty rates between countries. This is useful in determining where to channel existing financial resources (funds), as well as in analyzing progress in the fight against poverty. In general, there are two measures used by the World Bank in measuring poverty, namely: a.) US\$1 per capita per day where it is estimated that there are about 1.2 billion people in the world living below that size; b) US\$2 per capita per day of which more than 2 billion people live less than that limit. The US dollar used is US\$ PPP (Purchasing Power Parity), not the official exchange rate (exchange rate). These two boundaries are absolute poverty lines (BPS, North Maluku Regency, 2022).

### B. Open Unemployment

Unemployment is a macroeconomic problem that affects human beings directly and is the most severe. For most people, losing a job means a decrease in living standards and psychological stress (Mankiw, 2017). According to Sukirno in Ardian et al., (2021) unemployment is someone who is already classified as a labor force, who is actively looking for a job at a certain level of wage, but has not yet obtained the job he wants. In addition, Pradipta & Dewi, (2020) also classifies unemployment by its characteristics, which are divided into: 1) open unemployment, 2) incurable unemployment, 3) underemployment, and 4) seasonless unemployment. More specifically, in this study, the type of unemployment that will be used in this study is open unemployment. Open unemployment can mean a labor force that is not yet employed and is actively looking for work (Adam et al., 2020). The open unemployment rate can be calculated as follows:

$$TPT = \frac{\text{Jumlah Pengangguran}}{\text{Jumlah Angkatan Kerja}} \times 100\%$$

### C. Provincial Minimum Wage

Upah merupakan faktor yang sangat berpengaruh dalam masalah ke tenagakerjaan. Hal this karena keinginan orang bekera adalah to menda patkan upah yang layak guna memenuhi kebutuhan hidup (Sari, 2021). Bila tingkat upah yang ditawarkan by pengusaha dinilai t idak mencukupi by pekerja, maka pekerja tersebut tidak akan men erima pekerjaan yang ditawarkan (Garnella et al., 2020).

The provincial minimum wage is the smallest amount of wage that employers give to their workers. The minimum wage consists of (Helvira & Rizki, 2020):

- a. Minimum wage based on provincial or district/city area
- b. Minimum wage by sector in the province or regency/city area

#### D. Economic Growth

According to Hidayat & Woyanti, (2021) and Nugraeni & Aji, (2021) economic growth is a process of continuous increase in capita output in the long term and is one of the indicators of development results, the higher the economic growth, usually the higher the welfare of the community. (Ardian et al., 2021) said that there are three factors or components, especially in the economic growth of each country. The three factors are:

- a. Capital accumulation, which includes all forms or new types of investments invested in land, physical equipment, and capital or human resources.
- b. Population growth, which will eventually increase the number of the labor force.
- c. Technological advances, in the form of new ways or improving old ways of dealing with jobs.
- d. The economic growth formula is as follows:
- e.

$$\text{Growth} = \frac{PDRB_t - PDRB_{t-1}}{PDRB_{t-1}}$$

#### E. Human Development Index

HDI is used to measure the extent of the success of the quality of human life and) serves to measure the achievement of human development based on a number of basic components of quality of life. As a measure of quality of life, HDI is built through a basic three-dimensional proximity. i.e. longevity and healthy living, knowledge, and standard of living. Each dimension is represented by indicators. The dimensions of longevity and healthy living are represented by life expectancy indicators at birth. Meanwhile, the average length of schooling and the expectation of length of school are indicators that represent the dimension of knowledge. Finally, the dimensions of Indonesia's decent standard of living are represented by an adjusted indicator of per capita expenditure. (BPS, North Maluku Regency, 2022).

The formula used in calculating the Human Development Index is as follows:

$$\text{HDI} = \frac{1}{3} (\text{Index X1} + \text{Index X2} + \text{Index X3})$$

Where:

X1 : length of life

X2 : level of education

X3 : decent standard of living that uses the indicator of purchasing power ability.

There are 3 groups of human development status based on HDI values, namely: (1) HDI < 50 is said to be low, (2) 50 ≤ HDI < 80 is said to be medium/ medium, and (3) HDI ≥ 80 is said to be high.

#### F. Relevant Research

Some of the previous studies that are in line with this research between laian were conducted by Subayil & Lalu, (2020) who examined the relationship and influence of poverty, economic growth, and capital expenditure on the Human Development Index (HDI). This research was processed using a regression of panel data where the results of this study revealed that poverty has a negative effect, economic growth and capital expenditure have a positive effect. The second study was conducted by Seran, (2017) which examined the relationship and influence of economic, educational and technological growth on the human development index using panel data. The results of the research obtained show that economic growth and education have a significant effect on HDI. Further research was written by Sania et al., (2021) who examined the relationship and influence of GRDP, Poverty Rate, economic growth, local indigenous income, and capital expenditure on the Human Development Index (HDI). The results of this study show that GRDP has a positive and significant influence on HDI in D.I.Yogyakarta and the poverty rate has a negative and significant influence on HDI in D.I.Yogyakarta. While other variables have no effect on HDI. The last research was conducted by (Faellassuffa & Yuliani, 2022; Hidayat & Woyanti, 2021) who examined the relationship and influence of opinion distribution, unemployment rate, and government spending on HDI. Using panel data, the results of this study the distribution of government income and expenditure had an insignificant positive effect on HDI. Meanwhile, the unemployment rate negatively affects the HDI.

### III. RESEARCH METHODOLOGY

This research is a quantitative study by taking time series data, while the data used is time series data from 2011-2021 North Maluku Province.

This study used time series data analysis as a data processing tool. Gujarati, (2018) states that to describe time series data

The regression model is as follows:

$$IPMit = \beta_0 + \beta_1 TMis + \beta_2 TAng + \beta_3 UM + \beta_4 EG + \epsilon_t$$

Where:

HDI= Human Development Index

TMis= Poverty Rate

TAng = Open Unemployment Rate

UM = Minimum Wage

EG=Economic Growth

$\beta_0$  = Intercept

$\beta_1, 2, 3, 4$  = Independent variable regression coefficient

$\epsilon_t$  = Error component

#### IV. RESULT/FINDING

Hypothesis testing is carried out in order to correctly interpret the regression results. Hypothesis testing is carried out simultaneously using simultaneous tests (*F Statistical test*), as well as partially using t-tests. The results of the F test, t test and determination coefficient test are shown in Tabel 1.

Table 1. Fixed Effect Model Estimation

HDI = 1.211 + (-0.011)TMis + (-0.027)TAng + 0.005UM + 0.017EG				
	(0.078)**	(0,069)**	(0.000)**	(0.075)**
R <sup>2</sup> =0.878	Adj R <sup>2</sup> =0.889	F Stat=17.827	Prop Fstat=0.000	

Description: \*\*Significant on  $\alpha = 0.0510$ .  
The number in parentheses is the t-statistical probability value.  
Source: Secondary Data Processed, 2022

##### a. Simultaneous Test (Statistical F Test)

The F test is a significance test used to test the simultaneous influence of all independent variables on dependent variables. The hypotheses in this study are:

$H_0 : \beta_1 = \beta_2 = \beta_3 = 0$ , meaning that simultaneously independent variables have an insignificant effect on dependent variables.

$H_a : \beta_1 \neq \beta_2 \neq \beta_3 \neq 0$ , meaning that simultaneously independent variables have a significant effect on dependent variables.

The decision-making criteria are if the significance of the  $< 0.05$ , then  $H_0$  is rejected and if the significance of the  $> 0.05$  then  $H_0$  is accepted. From Table 1 it can be seen that the probability level (*F-statistic*) of 0.000 which is smaller than  $\alpha$  (0.05), so  $H_0$  is rejected and  $H_a$  is accepted. It can be concluded that the variables of poverty rate, open unemployment rate, provincial minimum wage and economic growth simultaneously had a significant effect on the HDI in 2014-2018.

##### b. Partial Test (T test)

The t test is used to partially test the influence of independent variables on dependent variables. The hypotheses of this study are:

- a. Testing of Poverty Rate Variables  
 $H_{01}: \beta_1 = 0$ , meaning that partially the poverty rate has no effect on the HDI.  
 $H_{a1}: \beta_1 \neq 0$ , meaning that partially the poverty rate has an influence on the HDI.
- b. Testing of Variables of The Rate of Leverage  
 $H_{01}: \beta_2 = 0$ , meaning that partially the open unemployment rate has no effect on the HDI.  
 $H_{a1}: \beta_2 \neq 0$ , meaning that partially the open unemployment rate has an influence on the HDI.
- c. Provincial Minimum Wage Variable Testing  
 $H_{01}: \beta_3 = 0$ , meaning that partially the provincial minimum wage has no effect on the HDI.  
 $H_{a1}: \beta_3 \neq 0$ , meaning that partially the provincial minimum wage has an influence on the HDI.
- d. Testing of Economic Growth Variables  
 $H_{01}: \beta_3 = 0$ , meaning that partially economic growth has no effect on HDI.  
 $H_{a1}: \beta_3 \neq 0$ , it means that partially economic growth has an influence on HDI.

The criteria for acceptance and rejection of  $H_0$  and  $H_a$  are carried out by looking at the degree of significance or calculated value of t. If the significance of  $< 0.05$ , then  $H_0$  is rejected and  $H_a$  is accepted, then  $H_0$  is rejected and  $H_a$  is accepted or partially the independent variable has a significant effect on the dependent variable. Conversely, if the significance of the  $> 0.05$ , then  $H_0$  is accepted and  $H_a$  is rejected or partially the independent variable has an insignificant effect on the dependent variable.

Based on Tabel 1, the test of the hypothesis of the influence of each independent variable on the dependent variable can be explained as follows:

- a. The Poverty Rate variable with a coefficient value of -0.011 and its significance value (Prob.) is 0.078, so the first hypothesis ( $H_0$  is accepted). The conclusion that can be processed is that the Poverty Rate has a negative and significant influence on HDI.
- b. The Open Unemployment Rate variable with a coefficient value of -0.027 and its significance value is 0.069 so the second hypothesis ( $H_0$  is accepted). The conclusion that can be cultivated is that the open unemployment rate has a negative and significant effect on HDI.
- c. The Minimum Wage variable with a coefficient value of 0.005 and its significance value is 0.000 so the third hypothesis ( $H_0$  is accepted). The conclusion that can be cultivated is that the provincial minimum wage has a positive and significant influence on hdi.
- d. The Economic Growth Variable with a coefficient value of 0.017 and its significance value is 0.075 so the fourth hypothesis ( $H_0$  is accepted). The conclusion that can be processed is that economic growth has a positive and significant influence on HDI.

### c. Coefficient of Determination Test ( $R^2$ )

The coefficient of determination ( $R^2$ ) essentially measures how far the model's ability to explain the variations of independent variables is. The greater the coefficient of determination, the greater the variation of its independent variable affects the dependent variable.

Based on Tabel 1 obtained the value of the coefficient of determination ( $R^2$ ) of 0.878. The figure shows that the HDI variable in North Maluku Province in 2011-2021 can be explained by the variables of poverty rate, open unemployment rate, provincial minimum wage and economic growth, of 87.80%, while the remaining 12.20% is explained by other variables that are not included in this study.

## V. DISCUSSION

### A. Effect of Poverty Rate on Human Development Index

The results showed that the poverty rate had a significant effect on HDI, this was in line with previous theories and research in this study. According to Widayanti et al., (2022) stated that there is a very close influence between the high level of poverty and HDI. "For most people, those who do not have permanent jobs or are only part-time are always among the very poor groups of people". People who work for a fixed fee in the government and private sectors are usually among the upper middle class.

It is also explained more explained (Yuniarti & Imaningsih, 2022), the adverse effect of the high poverty rate is the ability of people's purchasing power which ultimately reduces HDI. The decrease in people's welfare due to

the high poverty rate will have an impact on lower HDI. If the poverty rate in a country is very bad, political and social chaos always prevails and has a bad effect on people's welfare and the prospects for economic development in the long term.

This result is also supported by research conducted by Yuniarti & Imaningsih, (2022) with his research entitled Inflation, unemployment and poverty, which concluded that an increase in the poverty rate resulted in a decrease in HDI. This research was also supported by research (Setyawan, 2001) which resulted in a strong influence between the poverty rate and various macroeconomic variables such as the unemployment rate.

#### *B. Effect of Open Unemployment Rate on Human Development Index*

The results showed that the unemployment rate had a significant effect on HDI, this was in line with previous theories and research that became the theoretical basis in this study. According to Lincolind Arsyad (in Subayil & Lalu, 2020) states that there is a very close influence between the high unemployment rate and the HDI. "For most people, those who do not have permanent jobs or are only part-time are always among the very poor groups of people". People who work for a fixed fee in the government and private sectors are usually among the upper middle class.

Also explained more broadly by Sukirno, (2017), the adverse effect of unemployment is to reduce people's income which ultimately reduces the level of prosperity that a person has achieved. The decline in people's welfare due to unemployment will certainly increase their chances of being trapped in poverty because they have no income. If unemployment in a country is very bad, political and social turmoil always prevails and has a bad effect on people's welfare and the prospects for economic development in the long term.

This result is also supported by research conducted by Seran, (2017) with his research entitled Inflation, unemployment and poverty, which concluded that an increase in the unemployment rate results in an increase in the poverty rate and vice versa with a coefficient of 0.183. Seran's research, (2017) is also supported by research by Pradipta & Dewi, (2020) which resulted in findings of a strong influence between HDI and various macroeconomic variables such as the unemployment rate.

#### *C. The Effect of the Minimum Wage On The Human Development Index.*

The minimum wage has a positive effect on the human development index. In general, the development of the population in developing countries is very high and large in number. The problem of population growth is not just a matter of numbers, the problem of population also concerns the interests of development and the welfare of mankind as a whole. In the context of development, the view of the population is divided into two, namely some consider it as an obstacle to development and some consider it as a spur of development. One of the factors affecting the human development index is the wages received by workers. On the other hand, the minimum wage is related to the standard living needs of a province. In North Maluku Province, the minimum wages received are above the standard of living needs, so that with the purchasing power of the people who are above the standard of living needs, the human development index will also be better.

According to Todaro (2017) which is also proven in research conducted by Fitria Andriani & Westi Riani, (2022), Nurlana et al., (2020), and Soekapdjo & Oktavia, (2021), penduduk as a driver of development because a larger population is actually a potential market that is a source of demand for various kinds of goods and services which will then drive various kinds of economic activities so that it can create a scale an economy in production that will benefit all parties, lower the cost of production and create a source of supply or supply of cheap labor in sufficient quantities so that it will be able to stimulate improving the welfare of society which means that poverty will decrease (Sania et al., 2021).

#### *D. The Effect of Economic Growth on the Human Development Index*

Economic growth has a positive effect on the human development index (Hidayat & Woyanti, (2021), and Nurlana et al., (2020)). Income level and HDI have a broad correlation. But revenue growth does not automatically increase HDI. Similarly, the improvement of health and education that led to an increase in HDI did not necessarily

lead to an increase in income. This is because the resources generated by economic growth cannot be used to promote the improvement of other indicators. In addition, the structures and processes occurring in society cannot provide benefits to the poor. For example, various increases in yields benefit only landowners and not labor. However, conditions may change. The poor can benefit dually from income growth as well as increased HDI if the government is willing to use the benefits of growth to finance health services and access to education for the poor. In addition, the existing structures and processes in the community are appropriate, so that the benefits of economic growth are also enjoyed by the poor. According to the World Development Report, progress on both areas reinforces each other and one without the other is not enough (Nurlana et al., 2020). The direction of the relationship between economic growth and human development indexes found in this study is positive which means that if the economic growth of North Maluku Province is getting better / higher, the human development index will also be better.

This is in line with the research conducted by (Ardian et al., 2021; Nugraeni & Aji, 2021) as well as research conducted by (Hanifa, 2019) where in the three studies it is explained that economic growth is a factor that influences the human development index. The three studies explained that the higher the economic growth in an area will be positively correlated with the human development index.

## V. CONCLUSION

From the results of the analysis and discussion that has been carried out in the previous chapter, it can be concluded that:

- a. From the regression results it is known that the coefficient of the poverty rate is -0.011 with a probability of 0.078. This shows that there is a positive and significant influence of the variable level of diversity on the human development index in North Maluku. This means that every 1% growth in economic growth, the human development index will decrease by 0.011 index figures.
- b. From the results of the regression it is known that the coefficient of the open unemployment rate is -0.027 with a probability of 0.069. This shows that there is a positive and significant influence of the open unemployment rate variable on the human development index in North Maluku. This means that every 1% growth in the minimum wage open unemployment rate, the human development index will be reduced by 0.027 index figures.
- c. From the results of regression it is known that the minimum wage coefficient is 0.005 with a probability of 0.000. This shows that there is a positive and significant influence of the provincial minimum wage variable on the human development index in North Maluku. This means that every 1% growth in the minimum wage, the human development index will increase by 0.005 index figures.
- d. From the results of regression it is known that the coefficient of economic growth is 0.017 with a probability of 0.075. This shows that there is a positive and significant influence of economic growth variables on the human development index in North Maluku. This means that every 1% growth in economic growth, the human development index will increase by 0.017 index figures.
- e. The results of the regression analysis showed that the F test value was 17.827 with a probability of 0.000, this shows that the variables of poverty rate, open unemployment rate, provincial minimum wage and economic growth simultaneously have a significant effect on the HDI of North Maluku Province in 2011-2021.
- f. The results of the regression analysis showed the value of the coefficient of determination ( $R^2$ ) of 0.878. The figure shows that the HDI variable in North Maluku in 2011-2021 can be explained by the variables of poverty rate, open unemployment rate, provincial minimum wage and economic growth, of 87.80%, while the remaining 12.20% is explained by other variables that are not included in the study.

### *Suggestion*

- a. The human development index (HDI) is currently represented by the poverty rate, open unemployment rate, provincial minimum wage and economic growth, it is advisable to add the GRDP variable which in the previous study was one of the variables that had a considerable influence on the HDI
- b. For further research, it is recommended to add variables that are expected to affect the human development index, or extend the research period so that it can provide a more objective picture of the results.

In the previous study, the open unemployment rate had a positive and significant influence on HDI, in this study the open unemployment rate had a negative and significant influence on HDI. Cultural culture, kinship values and mutual aid culture that still bind strongly to most people in North Maluku are the differences that the unemployment rate is not in line with HDI. (Please provide one statement that shows how this study differs from previous studies)

## **Influence Analysis of Human Resource Development On Economic Growth in East Java Province in 2017-2021**

Triastuti Putri Sholeha<sup>1</sup>, Dr. Didit Purnomo, S.E., M.Si. <sup>2</sup>

<sup>1,2</sup>Muhammadiyah Surakarta University ; Economic Development, Faculty of Economics and Business Muhammadiyah Surakarta, Sukoharjo, Central Java, Indonesia.

### **Abstract**

*Economic growth is an increase in the ability of an economy to produce goods and services. In other words, economic growth refers more to changes that are quantitative in nature and are usually measured using data on gross domestic product or per capita output income. This study aimed to analyze the influence of life expectancy, average length of schooling and per capita expenditure on economic growth in East Java in 2017-2021 Data analysis method used multiple linear regression. The data used was time series data. Model determination was carried out using chow test and hausman test, and the selected model was Fixed Effect Model (FEM). The results of the analysis showed that the influence of life expectancy, average length of schooling and per capita expenditure had a positive and significant influence on economic growth in partial terms as evidenced by the results of the t-test. The results of the influence test together, showed significant values and had a positive effect. The results of the determinant test (R2) also showed that the free variable contributes to the dependent variable.*

*Keywords—Average Length of Schooling; Economic Growth; Life Expectancy; Per capita Expenditure.*

---

### **I. INTRODUCTION**

In simple terms, development can be interpreted as an effort or process to make changes for the better. In its implementation, development has a wide complexity of problems. The development process occurs in all aspects of people's lives, both economic, political, social, and cultural aspects (Amalia, 2017). Human beings as subjects and at the same time objects of development must be able to improve their quality of life, for this reason, the role of government and society is needed. Man is the real wealth of the nation.

The development of human resources physically and mentally contains meaning as an improvement in the basic abilities of the population. The basic capabilities of such a population are necessary to increase the opportunity to participate in the development process. The improvement of basic abilities can also be done through improving the health degree, knowledge and skills of the population. This is important because it can be reflected in productive economic, socio-cultural, and political activities (Arsyad, 2018). The purpose of development is to realize an Indonesian society that is just, competitive, developed, and prosperous in the container of the Unitary State of the Republic of Indonesia.

Development should be directed in such a way that each stage is getting closer to the goal. Decent living is a universally recognized human right. The Indonesian Constitution,'45, explicitly recognizes this by mandating that the main task of the government of the Republic of Indonesia is to "promote the general welfare, educate the life of the nation and realize a social justice for all Indonesians". That means, living free from poverty or enjoying a decent life is the human right of every citizen it is the duty of the government to ensure the realization of it. National development is basically to improve the general welfare that is fair and equitable for all Indonesians (Asmawani & Pangidoan, 2021; Nugraeni & Aji, 2021; Suryana, 2015).

The human development paradigm developed by the United Nations Development Programme (UNDP) as a process of expanding options for the population. Thus the population is the ultimate goal and development as a means to achieve the goal. To achieve the goal of human development, there are four main things that must be considered, namely productivity, equity, sustainability, and empowerment. However, the development paradigm has drawn a lot of criticism because the results of development have also created inequality and inequality, ecological damage, and shackled human freedom (Rafiqi, 2020). This materialistic development paradigm measures the achievement of development results only from the physical aspects quantified in mathematical calculations and statistical figures, so it tends to ignore the human dimension as the main subject of development and ignore the dignity of humanity.

According to the United Nations Development Programme (UNDP), in Economic Growth (Economic Growth) there are three composite indicators used to measure a country's average achievement in human development, namely: length of life, which is measured by life expectancy at birth; education measured based on the average length of schooling and the literacy rate of the population aged 15 years and over; a standard of living measured by per capita expenditure which has been adjusted to purchasing power parity. In the Indonesian Human Development Report, it is explained that the development of human development so far has been very dependent on economic growth from the early 1970s to the late 1990s.

Such growth allows humans to allocate expenditures for health and education. Meanwhile, government spending on health services and education is relatively small (Nuryan, 2016). As well as the need to increase the allocation of government spending for the social sector, it became increasingly felt when Indonesia experienced an economic crisis. The crisis led to a decline in human development achievements (Muda et al., 2019; Pradipta & Dewi, 2020). The existence of the GNP/GDP economic growth rating that emerged in the 60s, colored our thinking in measuring the success of development. GDP/GNP, indeed, is a macroeconomic measure that is still used by many countries, although the measure does not yet describe the truth, especially the picture of human quality.

Expenditure per capita provides an overview of the level of purchasing power of PPP (Purchasing Power Parity) of the community, and as one of the components used in looking at the status of human development in an area. The amount of income received by households can describe the welfare of a society (Ningrum et al., 2020). However, accurate income data is difficult to obtain, so in Susenas activities this data is approached through household expenditure data. Household expenditures consisting of food and non-food expenditures can illustrate how the population allocates its household needs. Although prices between regions are different, the value of household expenditures can still show differences in the level of welfare of the population between provinces, especially in terms of the economy (Wasista, 2020).

Economic growth factors are influenced by many things, both from the internal environment and the external environment. In this study, the economic growth factors to be studied only consist of life expectancy, average length of schooling and per capita expenditure. This limitation is made so that the research carried out is more focused and the discussion does not become biased.

## II. LITERATURE REVIEW

### A. *Life Expectancy*

Life Expectancy (AHH), is used as an indicator in measuring the health of an individual in an area. Life Expectancy (AHH) is the average estimate of the number of years a person can travel during life. Life Expectancy (AHH) is defined as the age that a person born in a given year may reach (Amanah, 2016). Life expectancy is calculated using an indirect estimation approach. There are two types of data used in calculating life expectancy (AHH), namely Children Born Alive (ALH) and Children Still Alive (AMH). Meanwhile, to calculate the life expectancy index, the maximum value of life expectancy is used according to UNDP standards, where the highest number as the upper limit for calculating the index is used 85 years and the lowest is 25 years (UNDP standard). Life expectancy can be long if the health status, nutrition, and environment are good (Adzni, 2015; Asmawani & Pangidoan, 2021; BPS, 2019) .

### B. *Average Length of School*

According to Todaro, (2017), states that education is a fundamental development goal. Where education plays a key role in establish a country's ability to absorb modern technology and to develop capacity to create sustainable growth and development. The average length of schooling indicates the higher formal education achieved by the people of a region. The higher the average length of schooling means the higher the level of education undergone. The average length of schooling is the average number of years spent by the population aged 25 years and over at all levels of formal education followed in the thesis (Widiatma, 2016). The average length of schooling can be formulated:

$$IRLS = \frac{RLS}{total\ people}$$

According to Todaro, (2017), this level of income is greatly influenced by the length of time a person obtains an education. The average length of schooling is an indicator of the level of education in an area (Mahya, 2021; Manurung & Hutabarat, 2021; Pradipta & Dewi, 2020). Education is a form of human capital that shows the quality of Human Resources (HR). To be able to maximize the difference between the expected profit and the estimated costs, the optimal strategy for a person is to try to complete the highest possible education. Investment in human capital will look higher in benefits if we compare the total cost of education incurred during education to the income that will later be obtained when they are ready to work. Highly educated people will start their full-time work at an older age, however, their income will quickly rise compared to people who work early (Todaro, 2017).

#### C. *Expenditure Per capita*

The expenditure per capita indicator is used to measure the standard of human living. This indicator is also influenced by existing knowledge and opportunities to realize knowledge in various productive activities so as to produce output in the form of goods and services as income (Putrakunto, 2017). Then the existing income creates expenses or consumption. Expenditure per capita provides an overview of the level of community PPP (Purchasing Power Parity), and as one of the components used in looking at the status of human development in an area (Sukirno, 2018).

#### D. *Economic Growth*

According to Hidayat & Woyanti, (2021) and Nugraeni & Aji, (2021) economic growth is a process of continuous increase in per capita output in the long term and is one of the indicators of development success, the higher the economic growth, the higher the welfare of the community. Ardian et al., (2021) said that there are three factors or components, especially in the economic growth of each country. The three factors are a capital calculation, which includes all forms or new types of investment invested in land, physical equipment, and capital or human resources (Hidayat & Woyanti, 2021; Nurlana et al., 2020), population growth, which will eventually increase the number of the labor force (Asmawani & Pangidoan, 2021; Yuniarti & Imaningsih, 2022), and the last one is the advancement of technology, in the form of new ways or improving old ways of handling jobs (Asmawani & Pangidoan, 2021; Hepi & Zakiah, 2018).

The economic growth formula is as follows:

$$\text{Growth} = \frac{PDRB_t - PDRB_{t-1}}{PDRB_{t-1}}$$

#### E. *Hypothesis*

Life expectancy is the approximate average number of years a person can live during a lifetime. Amanah (2016) suggests that life expectancy can be measured from the health status of a community. The degree of health is in line with a person's condition, the better one's economic condition, the longer the life expectancy, and can be used as a benchmark for better economic growth. Until the first hypothesis in this study is that life expectancy has a positive effect on economic growth.

According to Todaro, (2017), the average length of schooling indicates the higher level of formal education achieved by the people of an area. In a study on the level of community welfare by Widiatma (2016) that the perceived length of schooling the higher the level of education taken indicates that the economic growth of an area is getting better. Based on this, the second hypothesis of this study is that the average length of school has a positive effect on economic growth.

#### F. *Relevant Research*

Studies regarding economic growth, human development, and the factors affecting it have been widely carried out by many researchers. At the beginning of economic development of a country, generally economic development planning is oriented towards growth problems (growth). This is understandable considering that the main barrier to the development of developing countries is the occurrence of capital shortages.

Research by Hepi & Zakiah, (2018) "Determinants of Regional Economic Growth: An Inter-Provincial Study in Indonesia". This study aimed to determine the effect of educational attainment, life expectancy, inflation rate, fertility rate, mortality rate, infants, regional dummy (indicators of human capital: educational attainment & life expectancy), on regional economic growth in 26 provinces in Indonesia (excluding Timtim) in 1975-1995. This

study used the OLS analysis tool. The results of his research were variabel that have a positive effect on economic growth are education, life expectancy, and infant mortality rates. Meanwhile, the fertility rate and inflation rate have a negative effect on economic growth. Provinces that have high human capital will grow faster against their respective steady state positions. Increasing educational attainment by one unit will increase GRDP growth by 1.5% to 2.6%.

Rafiqi, (2020), Economic Growth and Human Development. In this study, the bound variable was Economic Growth (GDP) per capita in 76 developing countries in Latin America for the period 2000-2020. Meanwhile, the free variables included life expectancy, adult literacy, women's education level, public expenditure for the social sector, domestic investment level, and income distribution. This study used a simultaneous equation model. The result of his research was that the initial level of human development has a significant positive effect. Adult literacy and life expectancy have a significant positive effect. Public investment and spending on the social sector has a significant positive effect. A better distribution of income corresponds to a high rate of economic growth. Based on the results of the study, it was suggested that human development should precede or accompany economic growth in order to produce virtuous development patterns/cycles.

Research Muda et al., (2019) presented the results of his study on the economic growth of 87 countries for 2005-220 and 97 countries for 1975-1985. They found a positive correlation between GDP growth rates and the following variables; income per capita, education level, life expectancy, government spending, exchange rate, inflation rate and the index of the rule of law and democracy have a real effect on economic growth. Based on the Barro model above, it showed that human development which is reflected by people's purchasing power (income per capita), education level and life expectancy (health) have a very important role in encouraging economic growth.

Wasista's research, (2020) on Investment Analysis in Human Capital and the accumulation of physical capital against the increase in Gross Domestic Product. The results showed that Human Capital has a positive effect on economic growth. The accumulation of Physical Capital and investment also have a positive effect on economic growth.

Research (Arofah & Rohimah, (2019) "Analysis of the Relationship between Economic Growth and Human Development in West Java period 2003-2013. This study aimed to determine (a) the influence of domestic investment, labor, human development, and economic crisis on economic growth, (b) the influence of economic growth, government spending on social fields, income distribution, enrollment rate of elementary schools of the female population, regional openness and economic crisis on human development, (c) the simultaneous relationship between economic growth and human development in West Java. The results of his research were economic growth, government spending on sausages, income distribution, the level of elementary school enrollment of the female population, regional openness and economic crises have a positive and significant influence on human development, there is a two-way causality relationship between economic growth and human development in West Java.

### III. RESEARCH METHODOLOGY

This research was a quantitative study. While the data used was time series data from 2017-2021 East Java Province.

This study used time series data analysis as a data processing tool. Gujarati, (2018) states that to describe time series data

The regression model is as follows:

$$EG = \beta_0 + \beta_1HHid + \beta_2RLSek + \beta_3PP + \epsilon_t$$

Where:

EG = Economic Growth

HHid = Life Expectancy

RLSek = Average Length of Schooling

PP = Per capita Expenditure

$\beta_0$  = Intercept

$\beta_{1,2,3}$  = Independent variable regression coefficient

$\epsilon_t$  = Error component

The estimation stages of the econometric model above will include: estimation of model parameters using the Pooled Least Square (CEM) approach, Common Effect Model (CEM), or Fixed Effect Model (FEM); selection of the best estimated model with the Chow test and Hausman test; test the goodness of the model on the selected model, and test the validity of the influence of the independent variable on the selected model (Ghozali, and Ratmono, 2019).

#### IV. RESULT/FINDING

Hypothesis testing was carried out in order to correctly interpret the regression results. Hypothesis testing was carried out simultaneously using simultaneous tests (F *Statistical* test), as well as partially using t-tests. The results of the F test, t test and determination coefficient test were shown in Tabel 1.

Table 1. Fixed Effect Model Estimation

EG = 0.987 + 0.047HHid + 0.039RLSek + 0.019PP			
		(0.069)**	(0.069)**
R <sup>2</sup> =0.796	Adj R <sup>2</sup> =0.789	F Stat=21.297	Prop Fstat=0.027
Description: **Significant on $\alpha = 0.05$ 10. The number in parentheses is the t-statistical probability value. Source: Secondary Data Processed, 2022			

##### A. Simultaneous Test (Statistical F Test)

The hypotheses in this study were:

H<sub>0</sub>:  $\beta_1 = \beta_2 = \beta_3 = 0$ , meaning that simultaneously independent variables have an insignificant effect on dependent variables.

H<sub>a</sub>:  $\beta_1 \neq \beta_2 \neq \beta_3 \neq 0$ , meaning that simultaneously independent variables have a significant effect on dependent variables.

The decision-making criteria are if the significance of the  $< 0.05$ , then H<sub>0</sub> is rejected and if the significance of the  $> 0.05$  then H<sub>0</sub> is accepted. From Table 1 it can be seen that the probability level (F-statistic) of 0.017 which is smaller than the  $\alpha$  (0.05), so H<sub>0</sub> is rejected and H<sub>a</sub> is accepted. It can be concluded that the variables of Life Expectancy, Average Length of Schooling, Provincial Per capita Expenditure and economic growth simultaneously had a significant effect on Economic Growth in 2017-2021.

##### B. Partial Test (T test)

The hypotheses of this study were:

###### a. Life Expectancy Variable Testing

H<sub>01</sub>:  $\beta_1 = 0$ , meaning that life expectancy has no effect on economic growth.

H<sub>a1</sub>:  $\beta_1 \neq 0$ , meaning that life expectancy partially has an influence on Economic Growth.

###### b. School Length Average Variable Testing

H<sub>01</sub>:  $\beta_2 = 0$ , meaning that partially the Average Length of Schooling has no effect on Economic Growth.

H<sub>a1</sub>:  $\beta_2 \neq 0$ , meaning that partially the Average Length of Schooling has an influence on Economic Growth.

###### c. Testing of Per capita Expenditure Variables

H<sub>01</sub>:  $\beta_3 = 0$ , meaning that part of the province's Per capita Expenditure has no effect on Economic Growth.

H<sub>a1</sub>:  $\beta_3 \neq 0$ , it means that part of the province's Per capita Expenditure has an influence on Economic Growth.

The criteria for acceptance and rejection of H<sub>0</sub> and H<sub>a</sub> are carried out by looking at the degree of significance or calculated value of t. If the significance of  $< 0.05$ , then H<sub>0</sub> is rejected and H<sub>a</sub> is accepted, then H<sub>0</sub> is rejected and H<sub>a</sub> is accepted or partially the independent variable has a significant effect on the dependent variable. Conversely, if the significance of the  $> 0.05$ , then H<sub>0</sub> is accepted and H<sub>a</sub> is rejected or partially the independent variable has an insignificant effect on the dependent variable.

Based on Tabel 1, the test of the hypothesis of the influence of each independent variable on the dependent variable can be explained as follows:

- a. The Life Expectancy variable with a coefficient value of 0.047 and its significance value (Prob.) is 0.069, so the first hypothesis ( $H_0$  is accepted). The conclusion is that Life Expectancy has a positive and significant influence on Economic Growth.
- b. Variable Average Length of School with a coefficient value of 0.039 and its significance value is 0.069 so the second hypothesis ( $H_0$  is accepted). The conclusion is that the Average Length of School has a positive and significant effect on Economic Growth.
- c. The Variable Per capita Expenditure with a coefficient value of 0.019 and its significance value is 0.017 so the third hypothesis ( $H_0$  is accepted). The conclusion is that provincial Expenditures Per capita have a positive and significant influence on Economic Growth.

C. *Coefficient of Determination Test ( $R^2$ )*

Based on Tabel 1 obtained the value of the coefficient of determination ( $R^2$ ) of 0.796. The figure showed that the variables of Economic Growth in East Java Province in 2017-2021 can be explained by the variables of Life Expectancy, Average Length of School, Provincial Expenditure Per capita and economic growth, of 79.6 0%, remained 20.4 0% is explained by other variables not included in the study.

## V. DISCUSSION

### A. *The Effect of Life Expectancy on Economic Growth*

Life Expectancy (AHH) is a tool to evaluate the government's performance in improving the welfare of the population in general, and improving the degree of health in particular. In comparing the level of welfare between community groups, it is very important to look at life expectancy (Asmawani & Pangidoan, 2021; Endang & Hermawati, 2018; Reliableani, 2018). In countries where the health level is better, each individual has an average longer life, thus economically having a higher chance of earning an income. A high life expectancy and a larger elderly population will also demand wisdoms that are compatible and appropriate to these changes. It is also a challenge to be able to take advantage of the elderly population who are still potential so that they can be utilized according to their knowledge and experience (Adzni, 2015; Asmawani & Pangidoan, 2021). Health is a fundamental need for every human being, without public health it cannot produce a productivity for the country.

The economic activities of a country will run if there is a health guarantee for each of its inhabitants. Related to the theory of human capital that human capital plays a significant role, even more important than technological factors in spurring economic growth. The health of the population largely determines the ability to absorb and manage sources of economic growth both in relation to technology to institutions that are important for economic growth (Asmawani & Pangidoan, 2021; Manurung & Hutabarat, 2021).

The increase in life expectancy illustrates the improvement in nutrition and public awareness of health and the environment so that it will affect the improvement of population productivity which will have a positive impact on the pace of economic growth. The higher a person's life expectancy, which means that the longer the life span will increase community productivity (Arofah & Rohimah, 2019; Wasista, 2020). Increased productivity will automatically trigger economic growth in South Sulawesi. This condition is as with the results of research by Ranis & Stewart (2001) Economic Growth and Human Development (Amanah, 2016; Hepi & Zakiah, 2018).

### B. *The Effect of Average Length of School On Economic Growth*

Education (formal and non-formal) can play an important role in reducing poverty in the long term, either indirectly through improving productivity and efficiency in general, or directly through training the poor with the skills needed to increase their productivity and in turn will increase their income (Endang & Hermawati, 2018; Pradipta & Dewi, 2020).

The higher a person's level of education and the longer a person goes to school, the knowledge and expertise will also increase so that it will encourage an increase in one's productivity. The company will

get more results by hiring workers with higher productivity, so that the company will be willing to provide higher wages/salaries to the person concerned (Adzni, 2015; Asmawani & Pangidoan, 2021; Mahya, 2021). In the end a person who has high productivity will get better well-being, which can be shown through an increase in his income and consumption.

Such an average condition of length of school has no effect on the level of labor productivity. On the other hand, it can be seen that there is a discrepancy between the qualifications of human resources and the economic structure. However, when viewed from the level of labor productivity that is more dominant towards agricultural sektor is the population who only take education until elementary school and even those who drop out of school. Most of the population who graduated from elementary school and dropped out of school, especially in rural areas, prefer to go directly to the rice fields than agricultural scholars whose average length of schooling is longer but productivity in the agricultural sector is very low even the bachelor's degree in agriculture is not applied, in fact most agricultural scholars choose to work in the service and banking sectors so that the phenomenon that occurs is an educational mismatch (Rafiqi, 2020; Wasista, 2020).

The results of this study were supported by statistical data that try to link the influence of average school length on labor productivity, and the results obtained are insignificant between the average length of schooling and labor productivity (Amanah, 2016; Rafiqi, 2020).

### *C. The Effect of Expenditure Per capita on Economic Growth*

In a broader scope the standard of living deserves to describe the level of welfare enjoyed by the population as a result of the improvement of the economy. The ability of people's purchasing power to a number of basic needs which is seen from the average amount of per capita consumption as an income approach that represents the achievement of development for a decent life (Adzni, 2015; Arofah & Rohimah, 2019; Asmawani & Pangidoan, 2021). The level of welfare is said to increase in the event of an increase in real consumption per capita, that is, the nominal increase in household expenditure is higher than the inflation rate in the same period. Household expenditures consisting of food and non-food expenditures can illustrate how the population allocates its household needs (Muda et al., 2019; Rafiqi, 2020).

To measure the purchasing power of the population between regions, BPS uses data on the average consumption of selected commodities from the National Socioeconomic Survey (SUSENAS) which is considered the most dominant consumed by the Indonesian people and this has been standardized so that it can be compared between regions and between times adjusted to the PPP (Purchasing Power Parity) index. Many reasons cause macroeconomic analysis to need to pay attention to household consumption in depth. The first reason is that household consumption provides income to the national income. In most countries, consumption expenditure is about 60-75 percent of national income. The second reason is that household consumption has an impact in determining fluctuations in economic activity from one time to another (Muda et al., 2019).

A person's consumption is directly proportional to his income. (Asmawani & Pangidoan, 2021). Household decisions affect the overall behavior of the economy both in the long and short term. Consumption decisions are essential for long-term analysis because of their role in economic growth. Fluctuations in consumption are an important element of the boom and recession of the economy, in this case suggesting that changes in consumer spending plans could be a source of shock to the economy.

Per capita consumption has a positive impact on increasing economic growth if there is an increase in real consumption per capita, that is, the nominal increase in household expenditure is higher than the inflation rate in the same period. Where if per capita consumption increases, it means that demand will also increase so that production will also increase. In line with this increase, it will trigger an increase in economic growth in East Java. In accordance with Keynes' opinion that the tendency to consume marginal (marginal propensity to consume) is crucial for policy recommendations to reduce widespread unemployment (Adzni, 2015). Many reasons cause macroeconomic analysis to need to pay attention to household consumption in depth. The first reason is that household consumption provides income to the

national income. In most countries, consumption expenditure is about 60-75 percent of national income. The second reason is that household consumption has an impact in determining fluctuations in economic activity from one time to another. A person's consumption is directly proportional to his income. (Arofah & Rohimah, 2019).

In addition, in line with Harrod Domar's theory, it is argued that even though the capacity to produce increases, national income will only increase and economic growth will be created if people's expenditure increases compared to the past (Wasista, 2020).

## V. CONCLUSION

From the results of the analysis and discussion that has been carried out in the previous chapter, it can be concluded that the life expectancy variable as one of the research variables, most of the previous research conducted on economic growth very rarely used the life expectancy variable as an indicator. The longer life expectancy is usually one of the factors inhibiting economic growth due to the unproductive age which is an obstacle to economic growth. In this study, it was proven that life expectancy has a positive and significant influence on economic growth.

For further research, it is recommended to add variables that are expected to affect economic growth, or extend the research period so that it can provide a more objective picture of the results.

## Proposed Product Costing With ABC Method For E-Commerce of Organic Products

A. Trias Rachmatika<sup>1</sup>, B. Timotius<sup>2</sup>

<sup>1,2</sup>Faculty of Economics and Business, University of Indonesia, UI, Jakarta, Indonesia

### Abstract

*This study is to propose a product costing using the Activity-Based Costing (ABC) method. The object of the case study is PT X, an e-commerce company that sells local organic products. The decline in the profitability of PT X is presumed to be due to inaccurate product costs, leading to inappropriate decision-making regarding the selling price. Inaccuracy indicates that currently available product cost information only comes from net purchases. In contrast, overhead costs have not been allocated to products. Therefore, overhead costs must be accurately traced to products to avoid distortion of cost information. Previous studies on the ABC method mainly focused on manufacturing companies. This study traces overhead costs to products using EAD and APD matrices in a case study on e-commerce that has not been widely discussed. This research uses a case study strategy and a qualitative approach. Data collection was done through interviews with eight respondents, plus document analysis. The study found a significant difference between product costs using the ABC method and the costs of products currently available at PT X. The most significant difference of 139% is in the refill product. PT X to adopt the ABC method in product costing because it can accurately trace overhead costs consumed by each product. The implication is that PT X needs to re-price its products based on product costs using the ABC method.*

*Keywords—Activity-based costing; EAD and APD matrices; e-commerce; product cost*

### I. INTRODUCTION

The worldwide organic food market continues to grow. Global retail sales for organic food and beverages reached more than US\$112 billion in 2019, growing by 55% since 2013 and will continue to increase in the years to come (Sahota, 2021). The assumption that organic food is healthier and environmentally friendly is one of the determining factors why consumers prefer organic over non-organic food (Hansmann et al., 2020). In addition, the high number of non-communicable diseases increases knowledge and health awareness and influences consumers to buy organic food (Pacho, 2020). Thus, awareness of health, food safety, and environmental concerns are important reasons why consumers prefer to consume organic food.

The Indonesian interest in consuming organic food increased during the Covid-19 pandemic, rising by 17.4% compared to the pre-pandemic (Wachyuni & Wiweka, 2020). Some organic food providers experienced a marketing growth of 100-300% at the beginning of the pandemic. However, some providers experienced little change, or even a decrease in demand (Organic Institute, et al., 2020). The high price is one of the barriers to customers buying organic food (Hansmann et al., 2020). In Indonesia, price is an important consideration and condition for consumers of organic products in making purchase decisions (Najib et al., 2020). Opportunities, as well as challenges to meet the essential requirements of organic food consumers, are continuously pursued by PT X, an e-commerce company that sells local organic products. PT X strives to provide healthier and environmentally friendly products with reliable availability and competitive prices. The mission of PT X is to make organic vegetables like "regular vegetables" in terms of price to attract consumers. PT X claims that the price of its products is lower than their competitors.

Since price is essential for Indonesian consumers, this must be determined very carefully. However, the price should be in the sweet spot between the desire to attract consumers, the requirement to cover costs, and expected profits (Länsiluoto et al., 2007). PT X experienced a decline in profitability throughout 2021 that was presumed to be driven by inaccurate product costing. Current product costs at PT X come from net purchases and do not allocate other direct costs and overhead costs attributable to their products. When accurate product cost is not available, decision-making errors can occur. Deciding on the best and most profitable strategy is not possible if information about product costs is distorted (Cooper & Kaplan, 1988). It means that product costs that only come from net purchases are no longer relevant to be used as a basis for pricing in PT X; prices can be set too high and are therefore unattractive to consumers, or too low to cover costs. Avoiding errors in analysis and making reliable decisions about prices are critical reasons for PT X to have accurate product cost information.

Activity-Based Costing (ABC) is designed to provide more accurate information about production, activity, and product costs so that companies can focus on products and processes that maximize profits (Cooper & Kaplan, 1990). In brief, ABC is assignment cost based on activities. PT X has three distinct product groups, namely harvest, stock, and refill, each of which require a unique set of product handling activities; by using the ABC

method, it can be seen that each product absorbs different activities and costs. Product costs obtained from ABC are utilized to determine the right price and as the basis for other strategic decisions.

## II. LITERATURE REVIEW

Decades ago, distorted cost information was due to choosing an inappropriate costing system; this led Cooper and Kaplan to propose an alternative method called Activity-Based Costing. The theory proposed that almost all company activities support creating a product or service, from production to delivery, excluding research and development and idle capacity costs (Cooper & Kaplan, 1990). Product costs are those costs related to the production of goods or the provision of services, while non-production costs are related to research and development, selling, and administration costs (Hansen et al., 2009). Thus, only costs related to activities to produce goods and services, such as the cost of raw materials, direct labour, and overhead costs, can be assigned to products or other cost objects. In merchandising companies, the cost of purchasing and product transportation is part of the overall product cost (Blocher et al., 2019).

Tracing costs to cost objects is divided into direct and overhead costs. As seen in Figure 1, direct costs are traced straight to cost objects, while overheads go through two stages (Blocher et al., 2019). The two steps in the first stage are i) identifying the activities and cost resources and then ii) assigning the costs of these resources to activities. In the first stage, it is necessary to determine the resources consumed by the activity because it may only consume a small amount of the resources in the cost account on the company's financial statements (Blocher et al., 2019). The second stage is assigning activity costs to cost objects, where an activity is taken to mean the action performed by people or equipment in the organization (Hansen et al., 2009). The overhead cost tracing process uses cost drivers, defined as factors that change or generate activity costs (Cooper & Kaplan, 1990). Tracing overhead costs in stages, as shown in Figure 1, demonstrates that ABC focuses on how to correctly assign overhead costs to products.

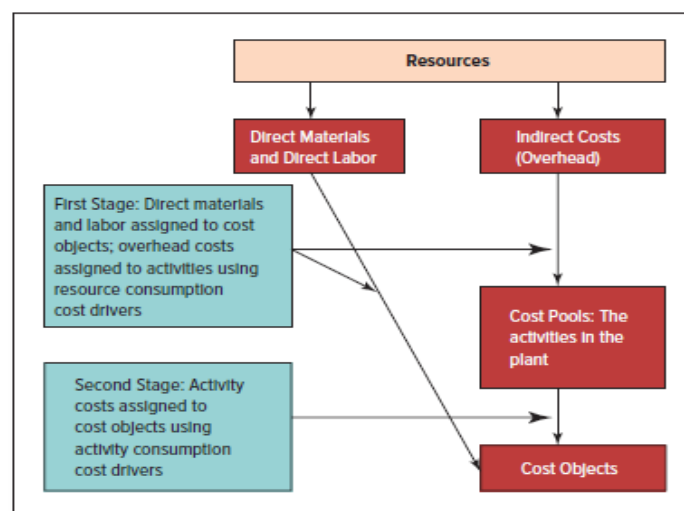

Fig.1. The Activity-Based-Two-Stage Procedure (Blocher et al., 2019)

Some studies state that the application of ABC in organizations has both advantages and disadvantages. The primary obstacle to implementing ABC is that it tends to be a complex and high-cost exercise (Pietrzak et al., 2020). However, the advantage of ABC is as a long-term investment that supports companies focusing on marketing products to profitable customers in order to gain financial benefits through growth and profitability (Jänkälä & Silvola, 2012). ABC is not designed to deliver automated decisions, but rather to allocate costs accurately, and even though only 5% or 10% of costs can be traced to products, it is still more valuable than allocating all costs without any basis (Cooper & Kaplan, 1990).

The conceptual framework in Figure 2 is designed to lay out the logical flow underpinning this research. Tracing overhead costs uses the Expense-Activity-Dependence (EAD) Matrix to link costs to activities, while the

Activity-Product-Dependence (APD) Matrix is used to link activities to products (Roztocki et al., 2004). Tracing direct and overhead costs results in more accurate product costs.

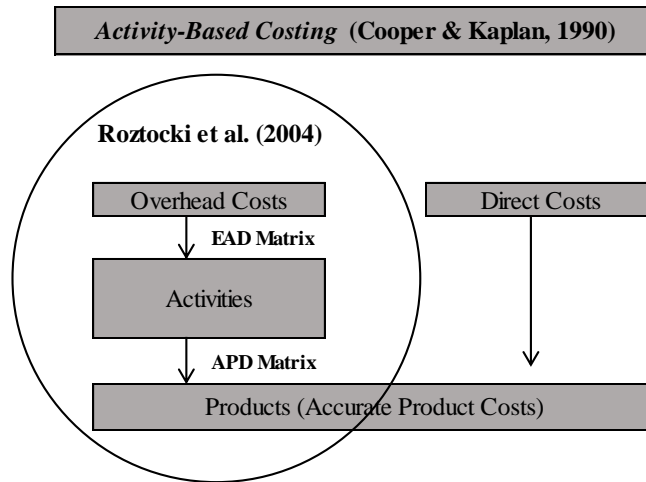

Fig. 2. The Conceptual Framework

Previous studies regarding product costing using the ABC method mainly use manufacturing companies as the object of study. Two studies have been found that utilize the EAD and APD matrices as tools to trace costs; one traces the overhead costs for postal operators' services (Blagojevi & Markovi, 2010), and the other seeks to determine route costs for Italy's national and international transport service companies (Raucci & Lepore, 2020). Both studies found that implementing ABC had a beneficial impact, especially for small and medium-sized companies that still use the traditional cost system. The difference between this study and previous research is in the object of study. This research is based on a case study of ABC implementation utilizing EAD and APD matrices in an e-commerce company to determine its product pricing. Accurate cost assignment using the ABC method provides an opportunity to improve cost allocation, operational performance and business strategy decision making.

### III. RESEARCH METHODOLOGY

This research uses a case study strategy and a qualitative research approach. Data collection instruments include interviews and document analysis. Several documents are analyzed in this study, namely the financial statements of PT X for the period January-December 2021, data on product purchases and sales, pick-up and delivery data, and a list of products offered on the PT X web store. Interviews were conducted with eight selected respondents, specifically the director of PT X, the financial manager, and six members of staff. The respondents were selected by PT X to match the criteria the company was given, namely staff who are experienced and have the deepest understanding of the activities in their respective divisions. These criteria are the most standard approach to collecting the information needed to create a list of activities for the ABC method (Hansen et al., 2009). This study divides the implementation of the ABC method into five stages. There follows the details of each stage, in the form of steps taken, designed to understand the causal relationship between activities, costs, and products.

**Stage 1.** Identify activities and activity drivers. The first step is to understand the company's business processes and then identify and classify each one as either primary or secondary. Based on the definition and details of the activities at PT X, only four are directly related to, and consumed by, the final cost objects which, in this case, are products. These four activities are; (1) purchasing, (2) picking up products, (3) sorting, packaging, and storing, and (4) delivering products to customers.

The next step is to define the activity driver. Understanding the activities at PT X is also intended to assist in determining the activity drivers that are associated with the activity-level classification or cost hierarchy. Purchasing, picking up products, sorting, packaging, storing, and delivering products are batch-level activities that are unaffected by the number of units. However, the number of purchase orders drives purchases; picking up products is driven by the number pick-ups; and the number of invoices drives product deliveries. Furthermore,

the intensity of these activities drives the sorting, packaging, and storing of products. The list of primary activities and activity drivers is shown in Table 1.

Table 1. Primary activities and activity drivers

Primary Activity	Activity Drivers	Activity-Level
Purchasing products	Number of purchase orders	<i>Batch-Level Activity</i>
Picking up products	Number of times products are picked-up	<i>Batch-Level Activity</i>
Sorting, packaging, and storing products	Intensity of activities	<i>Batch-Level Activity</i>
Delivering products	Number of invoices	<i>Batch-Level Activity</i>

Source: Respondents MK and S1 (2022)

**Stage 2.** Identify costs and cost drivers. The first step in this stage is to understand the costs incurred by PT X, and this understanding is derived from examining the financial statements. Then, costs are classified according to their relationship to the product. Costs that can be assigned directly to products are included in direct costs, whereas those that cannot be directly assigned but are consumed by primary activities are classified as overhead costs and are assigned to products on an activity basis. Meanwhile, costs that are neither consumed directly nor indirectly in the purchasing process until the delivery of the product are classified into period costs and are not assigned to any product. The next step is to define the overhead cost driver. Table 2 shows costs and cost drivers.

Table 2. Costs and cost drivers (000's)

Expenses	Amount	Direct costs	Assigned to products based on activities		Period costs
			Overhead costs	Cost drivers	
Net Purchase of harvest products	1.515.768	1.515.768			
Net Purchase of stock products	673.656	673.656			
Net Purchase of refill products	143.826	143.826			
Packaging	37.071	37.071			
Direct labour	19.920	19.920			
Courier	238.804		238.804	Number of drop-off points	
Agent transit	101.012		101.012	Number of agents	
Transportation	285.509		285.509	Distance	
Payment gateway fees	69.372		-		69.372
Advertising and promotion	54.354		-		54.354
Salaries and allowances	1.603.520		519.019	% of working hours	1.084.501
Repair and maintenance	25.213		22.691	Number of assets repaired	2.521
Dues and subscriptions	161.359		-		161.359
Electricity	61.192		42.681	Space size	18.510
Securities and cleaning	66.537		55.775	Space size	10.761
Vehicle rental	29.250		29.250	Number of vehicles	-
Office expenses	70.869		-		70.869
Miscellaneous	36.216		-		36.216
Total	5.193.446	2.390.241	1.294.741		1.508.464

Source: PT X Financial Statement (2021)

**Stage 3.** Tracing overhead costs to activities. The first step here is to create an EAD matrix using an Excel worksheet. The matrix consists of columns containing a list of activities and rows containing a list of costs. The checkmarks on the matrix, as illustrated in Table 3, shows that the costs incurred can come from several activities or only from specific activities. Marking the matrix looks simple, but it can guide companies in understanding the relationship between costs, activities, and products at the beginning of the ABC implementation (Roztock et al., 2004).

Table 3. EAD matrix-relationship between cost and activities

Overhead costs	Purchasing products	Picking up products	Sorting, packaging, and storing products	Delivering products
Couriers				√
Agent transit				√
Transportation		√		√
Salaries and allowances	√	√	√	√
Repair and maintenance		√		√
Electricity			√	√
Securities and cleaning			√	√
Vehicle rental				√

Source: Respondent S1 (2022)

The second step is determining the proportion of activity contributions to costs, as shown in Table 4. The proportion was determined in two ways: the educated guess technique and the actual data (Roztocki et al., 2004). The actual data was acquired from accounting staff. For example, delivering products consumes 100% of the courier, agent transit, and vehicle rental costs. Actual mileage data, as the cost driver of transportation, shows that picking up products consumes 19.32% and product delivery 80.68% of the total transportation cost. Thus, this proportion is assigned to activities in the EAD matrix.

An educated guess is used to determine the estimated number of working hours, due to the unavailability of actual data. Each employee has been interviewed about their duties and asked to estimate their working hours. Then, the duties are classified into primary or secondary activities. The percentage of working hours for primary activities is then calculated from the total working hours of each employee.

Then, the checkmarks are replaced with predetermined proportions derived from actual data and the educated guess technique. A 1 in the 'Total' column indicates that the costs identified in that row are assigned 100% to one or more activities.

Table 4. EAD matrix-proportion of activity to costs

Overhead costs	Purchasing products	Picking up products	Sorting, packaging, and storing products	Delivering products	Total
Couriers	0	0	0	1,0	1
Agent transit	0	0	0	1,0	1
Transportation	0	0,1932	0	0,8068	1
Salaries and allowances	0,0553	0,1588	0,4036	0,3823	1
Repair and maintenance	0	0,5000	0	0,5000	1
Electricity	0	0	0,9341	0,0659	1
Securities and cleaning	0	0	0,9341	0,0659	1
Vehicle rental	0	0	0	1,0	1

Source: Respondents S1 &amp; S6 (2022)

The final step in this stage is to calculate the cost consumed, in rupiah, by each activity. The proportions shown in Table 4 are multiplied by overhead cost in Table 5 to obtain the total rupiah. Then each row is summed to get the total activity cost. The amount in the total activity cost row must be equal to the amount in the total cost column of Rp1.294.741 meaning that all costs have been charged to the activity. Table 5 shows the result of activity costs.

Table 5. EAD matrix-activity costs (000's)

Overhead costs	Purchasing products	Picking up products	Sorting, packaging, and storing products	Delivering products	Total overhead costs
Couriers	-	-	-	238.804	238.804
Agent transit	-	-	-	101.012	101.012
Transportation	-	55.162	-	230.346	285.509
Salaries and allowances	28.700	82.397	209.498	198.424	519.019
Repair and maintenance	-	11.346	-	11.346	22.691
Electricity	-	-	39.869	2.812	42.681

Securities and cleaning	-	-	52.101	3.675	55.775
Vehicle rental	-	-	-	29.250	29.250
Total activity costs	28.700	148.905	301.468	815.668	1.294.741

Source: Respondents S1 &amp; S6 (2022)

**Stage 4.** Tracing activities to products. The steps here are the same as tracing cost to activities on the EAD matrix. The first step is to create an APD matrix using an Excel worksheet. The second step is to determine the relationship between activity costs and product by ticking the checkmark on the matrix. An activity may have no relationship with a specific product, or may even have a relationship with all products, as seen in Table 6.

Table 6. APD matrix-relationship between activities and products

Activities	Harvest	Stock	Refill
Purchasing products	√	√	√
Picking up products	√	√	-
Sorting, packaging, and storing products	√	√	√
Delivering products	√	√	√

Source: Respondents S1 &amp; S6 (2022)

The third step is to obtain the proportion of activity contributions to products from actual data and from educated guesses. For example, the number of purchase orders throughout 2021 is known to be 3.490, consisting of 2.757 (79%) for harvest products, 497 (14,24%) for stock products, and 236 (6,76%) for refill products. The educated guess technique is used to estimate the intensity of the sorting, packaging, and storing activity because each product is handled differently. The proportion of activities to product is then entered into the EAD matrix, as per Table 7.

Table 7. APD matrix-proportion of activity to products

Activities	Harvest	Stock	Refill	Total
Purchasing products	0,7900	0,1424	0,0676	1
Picking up products	0,9349	0,0651	-	1
Sorting, packaging, and storing products	0,3333	0,3133	0,3533	1
Delivering products	0,6022	0,3007	0,0971	1

Source: Respondents S1 &amp; S6 (2022)

The last step is to calculate the activity costs, in rupiah, consumed by each product. The proportions shown in Table 7 are multiplied by each activity cost shown in Table 5. Then, each column is summed up to obtain the total cost of the product. The total in the product cost column must be the same as the total in the activity cost row. After all the stages and steps to this point are carried out, tracing the overhead costs to products, with the help of the EAD and APD matrices, is complete. Table 8 summarizes the results of calculating all activity costs assigned to products.

Table 8. APD matrix-product costs (000's)

Activities	Harvest	Stock	Refill	Total
Purchasing products	22.672	4.087	1.941	28.700
Picking up products	139.205	9.700	-	148.905
Sorting, packaging, and storing products	100.489	94.460	106.519	301.468
Delivering products	491.182	245.274	79.213	815.668
Total overhead costs	753.548	353.521	187.672	1.294.741

Source: Respondents S1 &amp; S6 (2022)

**Stage 5.** Tracing direct costs to products. Direct costs consist of product purchases, packaging, and direct labour costs. These costs are assigned to products based on actual data absorbed by each product, as shown in Table 9.

Table 9. Assign direct costs to products (000's)

Costs	Harvest	Stock	Refill	Total
Net purchase	1.515.768	673.656	143.826	2.333.250
Packaging	-	25.062	12.009	37.071
Direct labour	19.920	-	-	19.920
Total direct costs	1.535.688	698.718	155.835	2.390.241

Source: Respondents S1 &amp; S6 (2022)

## IV. RESULT / FINDING

The product costs resulting from the ABC method are compared to the costs used by PT X to determine the price. Table 10 shows a significant difference of more than 50%, between existing product costs (Row D) and product costs with the ABC method (Row C). The most significant difference, 139%, is in refill products. The difference shows that direct and overhead costs amounting to Rp1.351.732 should be allocated to these products.

Then, the percentage difference between the two product costs is compared with the margin percentage determined when setting prices for each product. Row G shows that the margin percentage set for stock and refill products is smaller than the percentage difference in product costs (Row F). It shows that PT X set a lower price than the cost of the product. Stock and refill products are at a loss. The current margin cannot cover direct costs and overheads, including expected profits.

Table 10. The product costs comparison (000's)

Descriptions	Harvest	Stock	Refill	Total Costs
A. Direct costs	1.535.688	698.718	155.835	2.390.241
B. Overhead costs	753.548	353.521	187.672	1.294.741
C. Product costs (ABC)	2.289.236	1.052.239	343.508	3.684.983
D. Product costs (Existing)	1.515.768	673.656	143.826	2.333.250
E. Difference (Rp)	773.468	378.583	199.681	1.351.732
F. Difference (%)	51%	56%	139%	
G. % of current margin	67%	44%	35%	

Source: PT X Financial Statement (2021)

## V. DISCUSSION

The results and findings presented in Table 10 indicate that PT X set prices that are lower than the product cost. The current margin cannot cover the direct and overhead costs, let alone the expected profit. The research findings confirm that the existing product costs are inaccurate. Product costs that only come from net purchases and neglect significant overhead costs cannot be relied upon as a basis for price determination. There are two indications to justify adopting the ABC method as a product cost approach at PT X, namely the existence of a significant cost difference (Hansen et al., 2009) and the tendency towards high overhead costs, which allows for distortion of cost information (Roztocki et al., 2004).

The research findings imply that PT X needs to consider increasing their prices, especially for stock and refill products. The percentage of the appropriate margin requires further study because other influencing factors and confounders must be identified, such as sales of the product itself, competitor sales, and other strategic considerations (Shapiro & Sawyer, 2003). Any price increase may impact consumers' purchase decisions, given that consumers of organic products are price sensitive. For this reason, PT X needs to review their activity costs. For example, in the APD matrix shown in Table 9, there is a high costs for delivery activities, and these need to be analysed to determine whether some of these activities are actually inessential and do not add value. The same applies to sorting, packaging, and sorting activities. Analysis and elimination of non-value-added and non-essential activities will certainly improve cost efficiency.

## VI. CONCLUSION AND RECOMMENDATION

Based on the analysis and discussion, the following conclusions and recommendations are hereby offered. Using the ABC method provides more accurate cost information than is currently the case. The actual costs of each product can be used as the basis for pricing at PT X. The ABC method helps management avoid setting prices lower than product costs. It also provides improvement opportunities for the activities that absorb more costs. PT X can then ascertain which products are profitable and which are not. In order to bring these advantages to fruition, acceptance and support from management and employees is vital to change from the current costing system to the ABC method.

This study recommends applying the ABC method at PT X for several reasons.

- a. A significant difference arises from the comparison between ABC product costs and traditional product costs, proving that existing costs are irrelevant as the basis of pricing.
- b. This is a small company, with fewer than 100 employees, so the data collection process does not require a significant time investment.

- c. Using the EAD and APD matrices does not require investment in high-cost specialized software or applications. The matrices are run on Microsoft Excel, a program commonly used by the finance staff that is easy to operate, and allows for error-free calculations.

There are two limitations to this study. First, actual data on employees working hours are not known. If the actual data is owned, the allocation of salary and allowance costs will be more accurate. The second limitation is that this research was conducted during the Covid-19 pandemic, so the direct observations required to collect data for the ABC method (Hansen et al., 2009) could not be made. Observing activities directly, especially the sorting, packaging, and storing, may lead to more accurately determining activity drivers and proportions.

Further research on implementing ABC could use the Analytical Hierarchical Process (AHP) to determine the proportion for which actual data cannot be obtained; this delivers a higher level of accuracy than the educated guess technique. In addition, different matrices, such as the lattice matrix, could be utilized to trace overhead costs. Future research is expected to improve the reliability of cost information at PT X and other e-commerce companies.

## Performance Improvement Of Outsourced Government Employees Through Organizational Commitment And Organizational Citizenship Behavior (Ocb)

### Abstract

*This article addresses the low performance of outsourced employees at the Department of Population Control, Family Planning, Women's Empowerment and Child Protection (PPKBP3A) in Ciamis Regency because the targets set in the government's performance have not been achieved. The employee is allegedly due to the absence of organizational commitment and Organizational Citizenship Behavior (OCB) of employees in meeting work targets and objectives. The aim is to understand and analyze the relationship between organizational commitment and OCB on the performance of outsourced employees at the PPKBP3A Office, Ciamis Regency. The method used is descriptive, where the analysis uses path analysis by lisrel including coefficient of determination, and correlation. The result is that there is a positive and significant relationship between OCB and OC variables on employee performance. where the results of path analysis lisrel structure equation is performance = 0.454 OC + 0.506 OCB + 0.292 e, where R2 is equal to 0.708. Outsourced employees need government treatment in an effort to increase organizational commitment and OCB so that their performance increases. Thus, it is necessary to take a series of simultaneous actions in educating outsourced employees starting from before being accepted as an employee, after being accepted and evaluating performance. This article aims to broaden the point of view of the research object that differs between permanent and outsourced employees in the field study of human resource management—another contribution for the government in implementing employee outsourcing.*

*Keywords—Organizational commitment; organizational citizenship behaviors; employee performance; outsourcing employees; non-government employees*

### I. INTRODUCTION

The success of an organization is strongly influenced by the performance of individual employees individually and collectively, which impacts its society. Therefore, every organization always tries to improve employee performance to achieve its goals through continuous improvement efforts (Luu, 2019; Nahrisah & Imelda, 2019; Pio & Tampi, 2018). However, this process does not just stop there; the classic thing in organizations is that performance targets that are not following the organization's wishes are still a problem always faced in an organization. In particular, the organization must know the factors that influence employee performance to meet the elements of causality by deduction and induction (Graham, 1991; Hanh Tran & Choi, 2019; Vipraprastha et al., 2018; Yohana, 2017). In addition, of course, in the perspective of innovative work behavior, it can be a decision for managers in terms of employee suitability, motivation, and innovative work behavior, especially in autonomous motivation (Saether, 2019).

Several researchers have found that factors affect employee performance in carrying out their duties (Pio & Tampi, 2018; Ribeiro et al., 2018); it can be sourced from individual and organizational environmental factors (Griep & Vantilborgh, 2018). Organizations can improve and maximize employee performance when employees have an exemplary organizational commitment and Organizational Citizenship Behavior (OCB) in carrying out their work (Khan et al., 2020). The development of an attitude of commitment and OCB is undoubtedly essential to encourage the company's growth. On the other hand, high performance comes from organizational commitment and OCB, which provides a strong bond between employees and the organization to carry out their obligations properly according to their roles and positions. This bond is in the form of social citizenship, which is formed due to social transactions and interactions between the company and its employees (Lin et al., 2010; Vipraprastha et al., 2018).

Employees as human resources in an organization are not only required to be able to carry out their duties properly. When an employee joins an organization, it is expected that the employee will have loyalty and concern for the organization's future and is always ready to support the organization in achieving its goals (Luu, 2019). One of the efforts to achieve organizational goals is to have employees committed to the organization. Organizational commitment is needed as an indicator of employee performance in an organization in building loyalty (Podsakoff et al., 2009). Organizational commitment has the meaning of loyalty and involves a dynamic relationship and the desire of employees to make a meaningful contribution to the organization (Pristiwati, 2018). We can conclude that the higher the commitment, the higher a person's tendency to be directed to actions following

employee performance. The existence of a burden will make employees actively support all organizational activities. Therefore organizations need to pay more attention to the presence of their employees so that organizational commitment to the organization is also high. (Hutagalung et al., 2020).

Organizational commitment and OCB within employees are two aspects that organizations highly expect to improve organizational performance. Companies that can encourage their employees always to be obedient to the values and rules in the workplace, helpful behavior, and maintain good relations with coworkers. Companies will be able to provide more significant opportunities to improve the competence of their employees, which will have an impact on work results. And the achievement of organizational goals (Jufrizen et al., 2020; Mahayasa, 2018). However, not all research focuses on outsourcing to district governments, especially those that specifically address reproductive health and control of prosperous and underprivileged families. Non-civil servant officers at the Office of Population Control, Family Planning, Women's Empowerment, and Child Protection (PPKBP3A) in Ciamis Regency are interesting to study because they have no organizational commitment, OCB. They are not permanent employees who have a long future and career path to work in a company organization, but the company also has an assessment of the performance and achievements of these employees. Outsourcing performance assessment at the PPKBP3A Office in Ciamis Regency is based on the Regulation of the Head of the National Population and Family Planning Agency Number: 87/Per/G3/2014, namely: [1] the achievement of the estimated demand for new Family Planning participants; [2] increased prevalence of contraception rate; [3] fostering active family planning participants; [4] increasing family resilience and empowerment programs through group development activities for under-five families, youth family development, elderly family development, and efforts to increase prosperous families.

Achievements of New Active Family Planning (contraception) Participants January-December 2020

a.

Achievements of New Active Family Planning (contraception) Participants January-December 2020

b.

Fig 1. The performance achievements of the PPKBP3A office from January to December 2020 can be seen from: a. achievement of new family planning participants; b. achievement of active family planning participants; c. KB dropout rate percentage (Source : Dinas KB Kabupaten Ciamis, 2021)

The performance of outsourcing employees at the PPKBP3A Office in Ciamis Regency has not been optimal. Namely: the agency's performance target has not been achieved. The achievement of family planning participants and active family planning participants must be above 100%, and the use of contraception that has dropped out (mean termination) is less than 10%. Figure 1 shows that half of the sub-districts in the Ciamis Regency have not yet reached the target set. In addition, many of the achievements achieved by outsourcing employees in sub-districts are below 100.62% of the district average. Some of these districts are:

Sukadana was 98.77%, Banjarsari 98.47%, Cikoneng 97.41%, Pamarican 97.43%, Sadananya 90.98%, Cijeunjing 95.26%, Rajadesa 93.67%, Cimaragas 92.93%, Tambaksari 89.27%, Cidolog 83.46%, Banjaranyar 79.54%, and Panjalu 78.70%. In achieving new family planning participants, outsourcing performance is still, on average, 80.22%, and almost half of the sub-districts handled by outsourcing employees are still below 80%. In addition, the dropout rate for family planning participants is still high from the target of less than 10%. Still, the average Ciamis District is 13.46%, and almost all sub-districts handled by outsourcing do not reach less than 10%. The low achievement caused disappointment for the government agency because its outsourcing performance affected the government's performance.

The situation shows that the development of active family planning participants is still not optimal. This non-optimality causes a gap. Namely, outsourcing employees are considered temporary employees. Still, they have better abilities and motivation to get good performance to extend employee tenure to benefit the organization. On the other hand, the performance target set by the PPKBP3A Office in Ciamis Regency cannot be achieved, while there are fewer government employees to be able to work in the field in each sub-district. In this case, there are still no disciplined employees; there are not present without prior notification to supervisors. The employees often never helped other employees with tasks other than their respective main tasks. Employees at work are still waiting for orders from superiors, which are less than optimal. Employees' contribution in anticipating problems that occur in the organization and the lack of employee initiative in carrying out their duties.

This study aimed to improve the performance of outsourced employees at the PKBBP3A Ciamis Regency through organizational commitment and OCB. Therefore, the analysis was carried out using the stages of the influence between employee performance and organizational commitment, the impact between employee performance and OCB, and the impact between employee performance and organizational commitment and OCB.

Several researchers have found that there is a positive influence between performance on organizational commitment (Darmawan, 2021; Giyanti, 2020; Nurul Indika, 2020; Saputri et al., 2021), the effect of performance with OCB (Basalamah & Saleh, 2020; Kholifah, 2014; Pratama, 2020; Sompie et al., 2022; Sukandar, 2019), and the effect of performance on organizational commitment and OCB (Farid et al., 2019; Motowidlo, 2000; Nahrisah & Imelda, 2019; Purwantoro, 2019). However, all research by scholars has been carried out on the object of companies, institutions, or organizations where the focus is on permanent employees; this research focuses on outsourcing employees who have duties as field officers who guide the community in implementing Family Planning achievement indicators at the district level. This research is significant for contributing to the field study of organizational management and human resources on the side of outsourcing workers or non-employees of the district government. Furthermore, this research also contributes to managing human resources at the outsourcing of the Family Planning Office in districts/cities in Indonesia, which also faces the same problem as part of problem solving and human resource management policies.

## II. LITERATURE REVIEW

Organizational commitment can be interpreted as shown by employees to fulfill organizational goals and objectives by implementing the organization's values with a high sense of belonging and wanting to continue to serve. Organizational commitment can be affiliated with the organization individually and collectively (Luu, 2019; Nahrisah & Imelda, 2019; Pio & Tampi, 2018). That is not transactional work in terms of wages and employment but reflects building social relationships that continue to psychological comfort (Darmawan, 2021; Nurul Indika, 2020; Saputri et al., 2021). Organizational commitment can be considered the level of employee dedication to the organization where he works, the willingness to work on behalf of the organization's interests, and the possibility of maintaining its membership (Helastika & Izzati, 2019; Qurbani & Solihin, 2021). Commitment is considered a person's power over actions related to one or more goals. In another opinion, commitment is the power to bind an individual to a movement relevant to one or more purposes (Gombe & Danladi, 2019; Wei & Tai, 2010). Finally, engagement is an attitude that reflects employee loyalty to the organization and is an ongoing process in which the participants in the organization express their concerns about the organization, its success, and well-being (Luthans, 2011). There are four general behavioral indicators of organizational commitment (Kaswan, 2011), namely: [1] willingness to help colleagues complete administrative tasks; [2] unifying the activities and priorities that are owned to achieve the goals of the larger organization; [3] understand the organization's need to achieve larger organizational goals.

The performance of employees mainly determines the success of various agency activities. The better the performance of the agency's employees, the better the performance of the company/institution. The term performance comes from the term job performance or actual performance. The quality and quantity of work employees perform when they perform their duties following their assigned responsibilities. In other words, performance is prime what employees do or don't do in carrying out their work (Priansa, 2018). The coefficient of psychological ability consists of IQ (intelligence quotient) and potential abilities called actual abilities (knowledge + ability). In addition, motivational factors are formed by employee attitudes in dealing with work situations. The mental attitude itself is a state of mind that encourages employees to do their best at work. Therefore, the mental attitude of employees needs to be prepared mentally (mentally, physically, intentional, and situationally ready). In short, employees must be mentally and physically prepared, understand the main goals and work objectives, and take advantage of the work context (Podsakoff et al., 2009; Purwantoro, 2019; Ribeiro et al., 2018).

OCB is an individual contribution that goes beyond the requirements of a role in the workplace. This OCB contains various actions that help others voluntarily assign additional responsibilities and comply with workplace rules and procedures. This behavior shows the added value of employees, which is a form of prosocial behavior. In short, it encourages positive, constructive, and meaningful social conduct (Titisari, 2014). Another opinion is As an additional role behavior of employees, the most fundamental difference is in compensation. This behavior is usually not rewarded. Individual behavior is not summed up in rewards. There is no additional incentive for employees acting in particular roles (Kurniawan & Alimudin, 2015). Based on the above definition, it can be concluded that OCB is organizational behavior for employees who work beyond the demands of the role (extra-role) outside the job description, which is voluntary and is a personal choice, has a concern for helping colleagues, obeys administrative regulations, tolerates situations that less than ideal, avoid conflicts with coworkers, and play an active role in contributing to the interests of the organization.

OCB has dimensions: [1] altruism, namely the behavior of employees helping coworkers who are having difficulties in the situation at hand regarding tasks in the organization and other people's problems. This dimension refers to giving help which is not an obligation he bears; [2] conscientiousness, showing behavior led by trying to exceed what the company expects. Voluntary behavior that is not an employee's obligation or duty. This dimension reaches far beyond the call of duty; [3] sportsmanship, namely conduct that tolerates less than ideal conditions without raising objections. Someone who has a high level of sportsmanship will increase a positive climate among employees; employees will be more polite and cooperate with others to create a more pleasant work environment; [4] Courtesy, maintain good relations with coworkers to avoid interpersonal problems. A person who has this dimension is a person who values and cares for others; and [5] civic virtue, showing behavior that indicates responsibility in organizational life (following changes in the organization, taking the initiative to recommend how can improve operations or managerial procedures and protecting corporate resources). This dimension refers to the responsibility that the organization gives to a person to improve the quality of the field of work occupied.

The cause of the non-optimal performance of outsourcing employees is the low organizational commitment due to the quiet sense of fairness and employee job satisfaction due to the high workload and inappropriate benefits. In addition, work security is not guaranteed because outsourcing employees can be laid off. Furthermore, some employees do not understand the Family Development and Family Planning program due to a lack of training (Herlina, 2014), lack of employee involvement (Mardiyanti et al., 2019; Yanti et al., 2018), and a crisis of trust within the organization. In addition to organizational commitment, the low level of OCB owned by outsourcing employees is also the cause of the non-optimal performance of the PPKBP3A Office in Ciamis Regency. In this case, there are still employees who are not disciplined, and there are employees who are not present without prior notification to superiors, there are employees who have never helped other employees with tasks other than their respective main tasks, employees at work are still waiting for orders from superiors, less than optimal. Employees' contribution in anticipating problems that occur in the organization and the lack of employee initiative in carrying out their duties.

Another critical factor that can increase productivity and affect performance in a company is behavior that leads to positive things or known as OCB (Mahayasa, 2018; Vipraprastha et al., 2018). Organizations generally believe that to achieve excellence, they must strive for the highest individual performance because, basically, individual performance affects the performance of a team or workgroup and ultimately affects the performance of the organization as a whole (Asih & Dewi, 2017). Therefore, the behavior that is demanded by organizations today is not only in-role behavior but also extra-role behavior. Extra-role behavior is critical because it provides better benefits to support its sustainability. Extra-role behavior is behavior at work that is not contained in the employee's formal job description but is highly appreciated if displayed by the employee because it increases the effectiveness and viability of the organization (Farida, 2021; Hidayati, 2019). This extra-role behavior is also known as Organizational Citizenship Behavior (OCB). OCB is a term used to identify employee behavior. OCB is a form of behavior that is an individual choice and initiative, not related to the organization's formal reward system but, in aggregate, increases organizational effectiveness. This means that this behavior is not included in the employee's job requirements or job description, so it will not be punished if it is not displayed (Srimulyani et al., 2016).

OCB is related to the manifestation of an employee as a social being (Webb, 2018). Of course, he must have good social capital in an environment. The most important is trust (Syarifudin & Ishak, 2020). OCB is a form of voluntary activity from organizational members that support managerial functions. The OCB will be low because of the accumulation of several employees who incite other employees with attitudes usually expressed in actions that show selflessness and concern for others. Employees who have OCB will control their behavior to choose the best behavior for the organization's benefit (Husniati & Pangestuti, 2018; Podsakoff et al., 2009). Successful organizations need workers who are willing to do work beyond what the organization expects. Therefore, OCB behavior in employees deserves special attention and appreciation so that employees are encouraged to do OCB. These behaviors include helping coworkers, obeying workplace rules and procedures, and volunteering for extra tasks (Pristiwati, 2018; Saputri et al., 2021). Thus the variables we chose are depicted in Figure 2.

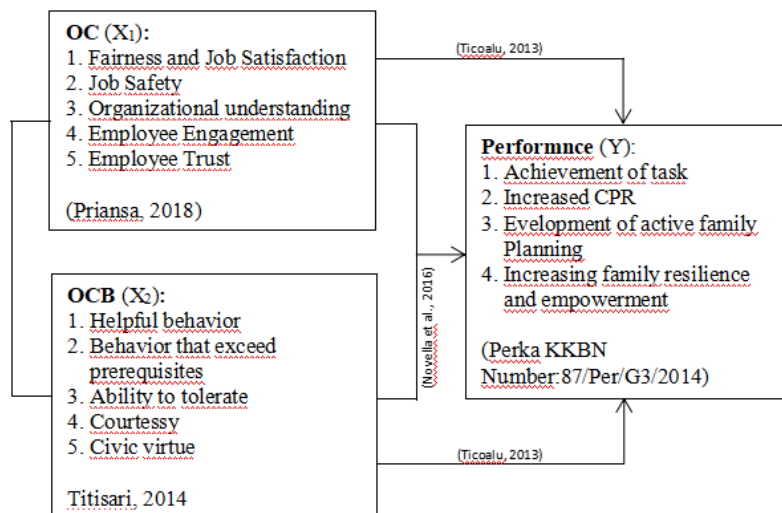

Fig 2. Research Framework

Based on the framework, the research hypotheses that we suggest are:

- H1 : OC is suspected of partially correlation employee performance.
- H2 : OCB is suspected of having a partial correlation on employee performance.
- H3 : OCB and OC are suspected to correlation employee performance simultaneously.

### III. RESEARCH METHODOLOGY

The research location is the Office of Population Control, Family Planning, Women's Empowerment and Child Protection, Ciamis Regency, located at Jalan Jendral Ahmad Yani, No. 38 Ciamis District. The research schedule that the author uses is for eight months, starting from November 2020 to August 2021. The total population in this study is all outsourced employees in the PPKBP3A Office of Ciamis Regency, with as many as 116 employees. This study simplifies the population, namely the number of outsourced 116 employees, by calculating the sample size using the Slovin technique. The number of sampling are 54 people from all the total outsourcing employees. This study uses a quantitative descriptive approach according to the research problem has two qualitative and quantitative points of view.

Data collection is a systematic and standard procedure to obtain the required data, and data collection can be carried out in various natural settings (Arifin, 2020; Sugiyono, 2017). The data collection activities used in this study are: [1] Literature research is carried out by searching scientific journals, books, data collection, government documents, and reports which will then compile as supporting data; [2] Field search, which was carried out utilizing observation and obtaining perception data using the instrument on the questionnaire. The questionnaire results will be in the form of numbers, statistical analysis tables, and research descriptions and conclusions. This questionnaire contains statements that contain the variables X and Y. The assessment of the questionnaire uses a numerical rating from a weighted value of one to five. Where do not agree (1); disagree (2); hesitant (3); consent (4); strongly agree (5). [3] interviews were conducted by collecting data by asking for an explanation directly from the parties concerned. Collecting data using a questionnaire, namely by asking or making a list of questions addressed to respondents that logically relate to the research problem. Data analysis uses path analysis from Lisrel 8.70 software to facilitate the analysis process. We chose the path analysis to answer the hypothesis and explained its causality through correlation and regression testing through the direct path. The model used is path analysis-multiple regression. We decided this because the sampling was less than 100, in addition to knowing the correlation between two exogenous variables, X<sub>1</sub>, X<sub>2</sub>, and one endogenous variable, Y, without intervening variables. The variables in this study include OC (X<sub>1</sub>) yaitu fairness and job satisfaction, job safety, organizational understanding, employee engagement, employee trust (Priansa, 2018). Untuk OCB (X<sub>2</sub>) variabel yang digunakan meliputi helpful behavior, behavior that exceed prerequisites, ability to tolerate, courtessy, and civic virtue (Titisari, 2014). Variabel Performance (Y) adalah schievement of task, increased CPR, evelopment of active

family Planning, and increasing family resilience and empowerment (Perka KKBN Number:87/Per/G3/2014). Adapun rumus yang digunakan untuk path analysis model regresi berganda adalah :

$$Y = \rho_{yx_1} + \rho_{yx_2} + \varepsilon \quad (1)$$

Dimana :

$\rho$  = regression coefficient

Y = performance

X1 = OC

X2 = OCB

$\varepsilon$  = standard error

The direct effect of  $X_1$  on Y was;  $H_0: X_1Y = 0$  (There is no significant effect of OC on performance);  $H_a: X_1Y \neq 0$  (There is a significant effect of OC on performance). Criteria: a)  $H_0$  is rejected, or  $H_a$  is accepted if the significance is  $< 0.05$ ;  $H_0$  is received, or  $H_a$  is rejected if the significance is  $> 0.05$ . The direct effect of  $X_2$  on Y was;  $H_0: X_2Y = 0$  (There is no significant effect of OCB on performance);  $H_a: X_2Y \neq 0$  (There is a significant effect of OCB on performance). Criteria: a)  $H_0$  is rejected, or  $H_a$  is accepted if the significance is  $< 0.05$ ;  $H_0$  is received, or  $H_a$  is rejected if the significance is  $> 0.05$ .

Secara simultan causalitasnya adalah The direct effect of  $X_1, X_2$  on Y was;  $H_0: X_1X_2Y = 0$  (There is no significant effect of OC and OCB on performance);  $H_a: X_1X_2Y \neq 0$  (There is a significant effect of OC and OCB on performance). Criteria: a)  $H_0$  is rejected, or  $H_a$  is accepted if the significance is  $< 0.05$ ;  $H_0$  is received, or  $H_a$  is rejected if the significance is  $> 0.05$ .

#### IV. RESULT / FINDING

##### A. *The effect of organizational commitment on performance*

This analysis is used to predict changes in the weight of certain variables when other variables change (see Appendix 1). The findings in the correlation coefficient test of organizational commitment ( $X_1$ ) on employee performance (Y) found that the correlation coefficient test above can be seen that the correlation coefficient between organizational commitment variables and the implementation of outsourced employees at the PKBP3A Office in Ciamis Regency is 0.454. the number meaning a positive correlation between the variables of organizational commitment and employee performance with the correlation coefficient in the interval 0.400 – 0.599. The correlation coefficient means between commitment and employee performance has a middle internship. The result (r) is also positive. The correlation value obtained from Performance on OC is positive, it means that the higher the Performance, the stronger the influence on OC. From the correlation results obtained a number of 0.454 with a probability value (sig) = 0.000 (0.000 < 0.05). Because sig < 0.05 then  $H_0$  is rejected and  $H_a$  is accepted. This means that there is a positive and significant relationship between the Performance variable and OC. Showing the relationship between organizational commitment and employee performance has a positive relationship, where the novelty is that if organizational commitment increases, employee performance also increases.

##### C. *Effect of OCB on employee performance*

Conducted this analysis to see the effect of OCB on the performance of outsourced employees at the PPKBP3A Office in Ciamis Regency (see Figure 2). In the calculation of the correlation coefficient test above, it can be seen that the correlation coefficient between the variable commitment to OCB and the performance of outsourcing employees at the PPKBP3A District Office. Ciamis is 0.506, which means a positive correlation between organizational commitment variables and employee performance with the correlation coefficient in the interval 0.800 – 1,000, so the correlation coefficient between OCB and employee performance has a middle relationship.

From the analysis results above, the value of r is also positive, meaning that the relationship between OCB and employee performance has a positive relationship. The correlation value obtained from Performance on OCB is positive, it means that the higher the Performance, the stronger the influence on OCB. From the correlation results obtained a number of 0.506 with a probability value (sig) = 0.000 (0.000 < 0.05). Because sig < 0.05 then

Ho is rejected and Ha is accepted. This means that there is a positive and significant relationship between the Performance variable and OCB.

C. The effect of organizational commitment and OCB on employee performance

Simultaneously analysis was used to determine the relationship between organizational commitment variables (X<sub>1</sub>) and Organizational Citizenship Behavior (X<sub>2</sub>) together on employee performance (Y) on outsourcing employees at the PKBBP3A Office, Ciamis Regency, through the data generated in Appendix 3. Furthermore, in regression analysis, multiple variables are used to predict the value of the dependent variable (Y) if the independent variables are at least two or more. A multiple linear regression test was used to causalities determine the degree or strength of the relationship between variables X<sub>1</sub> and X<sub>2</sub> with Y. Based on path analysis Lisrel results, it can see that the equation is Performance = 0.454 OC + 0.506 OCB + 0,292 e. The equation means that if OC increases by 1, the value of performance will increase by 0.454, and if an increase in OCB increases by (1), the value of Y will increase by 0.506. If OC and OCB = 0 or do not change then the value of Y = 0.292.

Fig 3. Path Analysis Results

Tabel 1. Covarian Results of OC, PCB to Performance

	Performance	OC	OCB
Performance	1.000		
OC	0.725	1.000	
OCB	0.749	0.536	1.000

Tabel 2. Correlation Matrix of Independent Variables

	OC	OCB
OC	1.000 (0.198) 5.050	
OCB	0.536 (0.159) 3.375	1.000 (0.198) 5.050

The correlation value obtained from the performance of OCB and OC is positive, it means that the stronger the performance, the higher the effect on OCB and OC. From the correlation results obtained numbers of 0.454 and 0.506 with a probability value (sig) = 0.000 (0.000 < 0.05). Because sig < 0.05 then Ho is rejected and Ha is accepted. This means that there is a positive and significant relationship between OCB and OC variables on employee performance. From the results above, the value of r is also positive 0,708, which means that the relationship between organizational commitment and OCB on employee performance has a positive relationship. This means that if organizational commitment and OCB increase, employee performance will also increase.

## V. DISCUSSION

### 6. *Organizational commitment affects employee performance.*

The organizational commitment to outsourcing employees at the P2KBP3A Office in Ciamis Regency is in positif results. The correlation test results show that organizational commitment has a relationship with employee performance of 0.454. That means a positive correlation between organizational commitment variables and employee performance variables with a correlation coefficient between the interval 0.400-0.599. Therefore, it can be seen that the correlation coefficient between organizational commitment variables and employee performance has a moderate relationship.

Correlation illustrates that if organizational commitment is appropriately implemented, the performance of outsourcing employees at the P2KBP3A Office in Ciamis Regency will increase. The results of this study are in line with Priansa's (2016) opinion that organizational commitment is essential because employees who have a solid obligation to the organization will display their best performance and are productive in carrying out their work. Therefore, a strong organizational commitment to employees will affect the performance exhibited by employees.

As an outsourced employee of the Ciamis Regency P2KBP3A Office, the Field Extension Officer can be said to have moderate organizational commitment. Based on the research results on respondents, we can see that this is because there are indicators of organizational commitment that are still low, namely indicators of job security and justice and job satisfaction. However, other indicators include having a good understanding of the organization, high employee involvement, and high trust in the organization. Thus, if the organizational commitment is exemplary, it will support employee performance.

Based on this, can conclude that the results of this study support the hypothesis that there is an influence between organizational commitment on employee performance. In theory, the relationship between the two variables, namely organizational commitment to employee performance, is acceptable. Association means that the higher the managerial responsibility of the employee, the employee's performance will increase. In other words, there is evidence that organizational commitment is one of the factors that affect employee performance.

### 7. *OCB affects employee performance*

OCB affects the results. The findings show that the OCB of outsourced employees at the P2KBP3A Office of Ciamis Regency is included in the high category. The correlation test results show that OCB has a relationship with employee performance of 0.506, the number means a positive correlation between the OCB variable and the employee performance variable with the correlation coefficient between the interval 0.800-1,000, so the number means that the correlation coefficient between the OCB variable and employee performance has a strong relationship. Therefore, based on the results of the hypothesis test, the variable that the hypothesis is accepted. Thus, OCB has a positive effect on employee performance. Furthermore, we can illustrate that if OCB is adequately implemented, the outsourcing of the P2KBP3A Office in the Ciamis Regency will increase.

The results of this study are in line with the opinion that the facts show that organizations with employees who have good OCB will have better performance than other organizations (Basalamah & Saleh, 2020; Giyanti, 2020; Nurul Indika, 2020). OCB is a unique aspect of individual activity in performance. Organizations will succeed if employees are not only doing their main tasks (Farid et al., 2019; Pio & Tampi, 2018; Ribeiro et al., 2018) but are also willing to do extra tasks, such as being willing to cooperate, help, give advice, actively participate, provide additional services to service users, and are eager to use their working time effectively (Hanh Tran & Choi, 2019; Yohana, 2017). Prosocial behavior or extra actions beyond the defined role description in the organization or company are referred to as OCB. Successful organizations need employees who will do more than just their formal duties and are willing to deliver performance that exceeds expectations. Organizations want employees to be ready to perform tasks that are not listed in their job descriptions (Kholifah, 2014; Sukandar, 2019).

Based on the explanation above, we can conclude that the results of this study support the hypothesis that there is an influence between OCB on employee performance. In theory, the relationship between the two variables, namely OCB on employee performance, is acceptable. Therefore, we can mean that the higher the OCB owned by the employee, the employee's performance will increase. In other words, there is evidence that OCB is one of the factors that affect employee performance.

#### 8. *Organizational commitment and OCB affect an employee.*

Based on the analysis findings, organizational commitment and OCB of outsourcing employees at the P2KBP3A Office of Ciamis Regency are included in the high category. Furthermore, the results of the calculation of multiple correlation analysis show that the relationship between organizational commitment and OCB has a connection with employee performance structured  $\text{Performance} = 0.454 \text{ OC} + 0.506 \text{ OCB} + 0,292 \text{ e}$ . The number means a positive correlation between the OCB variable and the employee performance variable, with a correlation coefficient between 0.800-1,000 intervals. Therefore, We can see that the correlation coefficient between organizational commitment variables and OCB with employee performance has a good relationship.

Therefore, based on the results of the hypothesis test, we can conclude can see that the hypothesis is accepted. Thus, organizational commitment and OCB have a positive and significant effect on employee performance. The result illustrates that if organizational commitment and OCB are appropriately implemented, the performance of employees on outsourcing employees at the P2KBP3A Office in Ciamis Regency will increase. The positive value result is in line with the opinion of Kashmir (2016), which states that the factors that influence the achievement of performance are ability, expertise, knowledge, work design, personality, work motivation, leadership, leadership style, organizational culture, job satisfaction, work environment, loyalty and commitment (Kasmir, 2016).

The results of the research that the author did complement and strengthen the results of research conducted by researchers Novelia et al. (2013), which tested the effect of commitment and OCB on performance (Study on Nursing Personnel at the Regional General Hospital dr. Soegiri Lamongan) with research results showing that simultaneously organizational commitment and OCB have a positive and significant effect on employee performance (Novelia et al., 2016). Based on the discussion above, we can conclude that the results of this study support the hypothesis that there is an influence between organizational commitment and OCB on employee performance. In theory, the relationship between the three variables, namely organizational commitment and OCB on employee performance, is accepted. The better the organizational commitment and OCB, the employee's performance will increase. In other words, there is also evidence that organizational commitment and OCB are factors that affect employee performance.

## VI. CONCLUSION AND RECOMMENDATION

Based on the findings and results, can understand that performance on OC is positive and significant, it means that the higher the Performance, the stronger the influence on OC. The correlation test results show that organizational commitment and employee performance have a moderate level of relationship, and the results of the coefficient of determination have a positive influence as well. Based on the results of hypothesis testing, it is known that the hypothesis is accepted.

OCB on outsourced employees of the Ciamis Regency P2KBP3A Service is included in the Very High category. Based on the results of the analysis, it can be concluded that there is a positive and significant relationship between the Performance variable and OCB, it is known that the hypothesis is accepted. Thus, OCB has a positive and significant effect on employee performance, meaning that if OCB is high, employee performance will increase.

The performance of outsourced employees at the P2KBP3A Office in Ciamis Regency is included in the high category. Based on the results of the path analysis, it can be concluded that there is a positive and significant relationship between OCB and OC variables on employee performance. Likewise, based on the hypothesis test results, it is known that the hypothesis is accepted. Thus, organizational commitment and OCB have a positive and significant effect on employee performance. The result means that employee performance will increase if organizational commitment and OCB are high.

Based on the conclusions and results of research regarding the effect of organizational commitment and OCB on outsourcing employees at the P2KBP3A Office of Ciamis Regency, suggestions for the same corporate management policy as managing to outsource in government are based on respondents' responses to organizational commitment. Can See that the job security indicator has the highest score. Low. Organizations should pay more attention to employees, especially on work security, so that employees feel safe and comfortable being part of the organization to increase work productivity. In addition, the organization must also try to maintain and improve the abilities and skills of employees so that they can complete tasks well, and employees who excel need to be appreciated.

Based on the respondent's response to OCB, that is an indicator of sportsmanship, namely behavior that tolerates less than ideal conditions in the organization without raising objections. The test means that the organization must pay more attention to the situation and requirements in the field. Because this dimension of sportsmanship goes well, employees will perform various tasks that far exceed the organization's expectations and can face all conditions and challenges in the field to improve performance achievements. Based on respondents' responses regarding employee performance, it is known that the initiative indicator gets the lowest score. It is hoped that the organization will always provide guidance, routine training, and evaluation aimed at creating employees who have creative and innovative ideas to improve the achievement of the Family Development and Family Planning program following the expected targets.

#### ACKNOWLEDGMENT

This research was funded by the Faculty of Economics for the Fiscal Year 2020/2021 collaborative research involving students. Thanks to the Dean of the Faculty of Economics for research of the financing and publications and the Management Study Program, who has provided support and assistance so that this research is better and can be published.

### Abstract

*This paper investigates the effect of relationship between firm age and performance. This study using data from annual report especially annual report for Islamic bank. The data collected by purposive sampling and we have 11 islamic banks on Indonesia during the period from 2014 to 2018. This study was conducted using panel data and regression analysis. We find that firm age has a negative effect to performance. The result is consistent with Ali (2020) has negative relationship between age and performance. These result indicate that firm age in Islamic bank of Indonesia is not a benchmark for their companies.*

*Keywords—age; ROE; islamic bank*

---

### I. INTRODUCTION

The financial institution is a convenience that provide various services and facilities such as saving and financing business activities. financial institutions are very important in stabilizing the country's economy. Specifically, in terms of Islamic banking institutions. Islamic banking in Indonesia still has many challenges, one of the first challenges is the level of Islamic banking literacy which is still low in the community, which is 8.93 percent. This literacy is far behind from national financial literacy of 38.03 percent. Meanwhile, the Islamic financial inclusion index is also still behind at 9.1 percent compared to the national financial inclusion of 76.19 percent. However, the growth of the Islamic banking business continues to move in a positive direction.

This can be seen from the increase in assets in 2014, the total assets of Sharia banking, both Sharia commercial banks and Sharia business units, reached Rp. 260.36 T. This figure is only 4.78% of the total assets of conventional banking, which is Rp. 5,445.65 T and continued to increase in December 2015 by Rp.296.26 trillion or an increase of 20.33% to Rp. 356.50 T at the end of December 2016. Then it increased in 2017 to 435 T, and in 2018 it was 489 T. Market Sharia bank share in 2014 was 4.56%, 2015 was 4.87%, 2016 was 5.3%, 2017 was 5.78%, 2018 was 5.96%. Based on this information, the performance of the banking sector is good, marked by the total assets that continue to increase from year to year.

Indonesia has sharia banks namely Muamalat, BNI syariah, BRI syariah, BCA syariah, BSM, and others. Sharia banking in Indonesia are still inferior to conventional bank. when talking about the age of conventional bank that existed earlier than Islamic banks. First islamic bank in indonesia is muamalat. One bank that has a good performance and has the most loyal and engaged bank customers in the Islamic banking industry based on an MRI (Market Research Indonesia) study in the “5th Infobank Satisfaction, Loyalty & Engagement (SLE) Award 2022” event. The first Islamic bank in Indonesia won first place in three categories from the four main categories assessed, namely Loyalty Index, Engagement Index, and Marketing Engagement. The first two categories have been competed from the previous year. While the latter is a new category that measures how emotionally attached customers are in marketing and influencing people they know to become customers of Bank Muamalat. This award is a collaboration between Infobank Magazine and Marketing Research Indonesia (MRI).

Through sustainable services and various financial solutions, these banks are considered capable of maintaining customer trust in the midst of the current pandemic and technological disruption. Bank Muamalat also won the first position in customer satisfaction (customer satisfaction index) for the category of Customer Service, Branch Offices, and ATMs (Auto Teller Machines). Bank muamalat which can still maintain its existence, with the age of the bank being said to be quite long because it is the first Islamic bank in Indonesia and is a senior bank compared to other banks, this shows the company's good performance and is able to survive the competition. When viewed from the age of the banking system, a long age should be able to increase the company's performance.

According to research by Agyei and Marfo-Yiadom (2011), it is stated that companies that have a long age have an effect on performance. Lestari and Juliarto (2017) found a significant positive effect between age and

performance. Rose et al (2010), it is explained that as the age of the company increases, the experience of the company also increases, which is better than the previous year. On the other hand, research conducted by Ali et.al (2020) states that age has a negative effect on performance, this also shows that as Pakistani Islamic banks age, their profitability decreases. In line with Loderer and Waelchli (2009), due to the old age of the company, outdated processes and structures, it may not be able to maintain its competitive advantage.

Business experiences for banks will affect the existence of banks in dealing with financial problems competition. The age of the company is able to show the information that can be obtained by the candidate investors. Newly established banks must take actions that build trust for their stakeholders. From previous research, it was found that company age is one of the most important factors that determine the growth of the company, the diversity of the company's growth and the possibility of company is dissolved. Company age is one of the important attributes of the company. But, many Islamic banks in Indonesia are new and their age is still short. Can it compete with banks that have a longer life than other Islamic banks that existed first? Based on previous research, researchers want to know, does the banking age affects to performance, especially Indonesian Islamic banking.

## II. LITERATURE REVIEW

Previous research on the relationship between company age and financial performance. Majumdar (1997) conducted research on the Asian market, the results of the study revealed that companies with an older age were less productive but more profitable than large companies that were productive but less profitable. The company's performance improves as the company ages. Long term business can increase productivity, profitability, and equity ratio but can decrease debt ratio. Coad et.al (2013) stated that older companies are able to generate better sales so that it affects profitability.

Research on age and performance conducted by Ali et.al (2020), found that age has a negative effect on performance, which means that a long age gives low performance. This also happens (Mwangi & Murigu, 2015; Kaya, 2015; Liargovas & Scandalis, 2014; Murigu, 2015) suggesting that long life can make companies less flexible, monotonous, and unwilling to develop by creating changes, which causes growth to decline. Aburim (2014) states that if a new bank is established, it cannot be immediately profitable because it must first break even. As stated by Agyei and Marfo-Yiadom (2011), although bank age can improve its performance, after a certain limit, this relationship can reverse.

Lestari and Juliarto (2017) found a significant positive effect between age and performance. Rose et al (2010), it is explained that as the age of the company increases, the experience of the company also increases, which is better than the previous year. Therefore, along with increasing age, the ability to process management more effectively and efficiently can increase the level of capital increase, thereby realizing higher company performance.

And based on one of the Islamic banks, namely Muamalat bank which is the first bank and has a longer life than other Islamic banks, and is still able to maintain its existence and performance. Based on this explanation, the hypothesis is

H1: Long age has a positive effect on performance

Company size is one of the variables that describe the company and its market power (Almajali, Alamro & Al-Soub, 2012). Murea (2015), a bank with a large size provides a positive performance, because the bank is able to access a wider market and provide a competitive advantage. Saona (2016) argues that banks can maximize their profitability only up to the optimal size. Companies with large sizes are able to achieve economies of scale (Mwangi & Murigu, 2015; Liargovas & Scandalis, 2014). As a result, larger firms can be more efficient in their operations compared to smaller firms (Almajali et al. 2012). Previous research (Al-Qudah & Jaradat, 2013; Masood & Ashraf, 2012) also shows that firm size is positively related to Islamic bank operations. So this research shows the size has a positive effect on performance.

Muturi (2013) argue that high debt in the company's capital structure makes leverage risky and the company goes bankrupt (Matemilola et.al, 2017) if the company is unable to pay its debts (Mazviona, Dube & Sakahuhwa, 2017). Therefore, a significant negative relation is expected between Islamic banks' leverage and performance.

### III. RESEARCH METHODOLOGY

These study using panel data from Indonesia Islamic bank during 2014 to 2018 and analysis using regression. The data collected from annual report. namely Muamalat, BNI Syariah, BCA Syariah, BRI Syariah, BSM, Maybank Syariah, Mega Syariah, Panin Dubai Syariah, Bukopin Syariah, BJB Syariah, Victoria. Following Khan (2020), we employ profitability as measurement of financial performance. We set ROE as a proxy for profitability. For control variable, we use size, leverage. Murerwa (2015), bank size is a significant contributor towards its positive performance. Omondi and Muturi (2013) argue that an increase in debt in the capital structure of a firm makes leverage riskier.

We test our hypothesis by using the following model:

$$ROE = \alpha + \beta_1 Age_{it} + \beta_2 SIZE_{it} + \beta_3 Leverage_{it} + \epsilon_{it}.$$

### IV. RESULT / FINDING

Table 1. Descriptive Statistics.

Variable	Obs	Mean	Std. Dev	Min	Max
<b>ROE</b>	55	-0,0034218	0,1106704	-0,3204	0,1197
<b>AGE</b>	55	9,181818	6,098242	4	27
<b>LEV</b>	55	0,224383	0,2200564	0,057381	0,9024065
<b>SIZE</b>	55	29,92535	1,301265	27,2184	32,21946

Table 1 illustrates that the average ROE variable is -0,0034218. AGE variable is 9,181818. And table 1 shows control variables, namely SIZE, and leverage.

Table 2. Hypthesis Testing.

Variable	Coef	P>z
<b>AGE</b>	-0,0032264	0,0195
<b>SIZE</b>	0,0590086	0,0000
<b>LEVERAGE</b>	0,0229626	0,3455
<b>_cons</b>	-1,719954	0,3857716

### V. DISCUSSION

Base on table 2. It can be seen that age has a negative effect on Roe. These result different with hypothesis, which states that long age has a positive effect to roe. The hypothesis argument with negative effect is that age, are unable to take advantage of their learning experiences as they age. The old companies has a negative effect because of their outdated processes and structures, may not be able to maintain their competitive advantage.

### VI. CONCLUSION AND RECOMMENDATION

This study investigates the effect of relationship between firm age and performance islamic banks on Indonesia during the period from 2014 to 2018. We find that firm age has a negative effect to performance, it is mean that a long life can make companies less flexible, monotonous, and unwilling to develop by creating changes. These result indicate that firm age in Islamic bank of Indonesia is not a benchmark for their companies.

## **Analysis of the Effect of Inflation, Exchange Rates, Gross Domestic Product and Net Exports on Indonesia's Balance of Payments in 1995-2020**

A. Titania Agustin<sup>1</sup> and B. Eni Setyowati<sup>2</sup>

<sup>1,2</sup>Economic Development, Muhammadiyah Surakarta University, Surakarta, Indonesia

### **Abstract**

*The balance of payments has an important role as a fundamental indicator of a country's economy. This is because the balance of payments relates to a country's ability to absorb foreign exchange and foreign payments. This study aims to determine the effect of Inflation, Exchange Rate, Gross Domestic Product (GDP) and Net Exports on Indonesia's Balance of Payments. The data used is secondary data in the form of a time series from 1995 to 2020 obtained from the Central Statistics Agency, Bank Indonesia and World Bank. The data analysis method used in this research is multiple linear regression analysis with the Ordinary Least Square (OLS) method approach. The results of this study indicate that the variables of Gross Domestic Product (GDP) and Net Exports have a positive and significant effect on Indonesia's Balance of Payments. While the variables of Inflation and Exchange Rate, have no effect on Indonesia's Balance of Payments. The results of the F test indicate that the estimated model used in this study exists, with a coefficient of determination of 0,4152 meaning that 41,52% of the variation in Indonesia's Balance of Payments variable can be explained by the variables of Inflation, Exchange Rate, Gross Domestic Product (GDP) and Net Exports. The remaining 58,48% is influenced by other variables or factors that are not included in the estimated model.*

*Keywords— Indonesia's Balance of Payments; inflation; Exchange Rates; Gross Domestic Product (GDP); Net Exports*

### **I. INTRODUCTION**

The current development and economic stability of each country cannot be separated from global economic conditions. The global economy can be created through international trade relations between countries. Indonesia is a developing country that adheres to an open economic system that requires international trade to boost the country's economy. Without international trade, capital will not flow from developed countries to developing countries, because international trade is needed to meet unproductive domestic needs and increase economic growth. This situation makes competitiveness a determining factor in competition between countries to benefit from an increasingly open world economy and this can be seen through the condition of a country's balance of payments (Astuti et al., 2015).

The balance of payments is a periodic report that summarizes the flow of economic transactions with foreigners. The nature of the balance of payments is balanced and to compensate, it can be covered by foreign loans or by selling state assets which can increase foreign exchange reserves. Transactions included in the balance of payments are current transactions as well as capital and financial transactions (Nwanosike et al., 2017).

Three factors can determine the balance of payments namely, the value of net capital flows, exports and imports. A country's economy will experience problems if its balance of payments is always in deficit. The balance of payments is said to be in deficit when the total payments to foreign countries exceed the total receipts from abroad. A deficit in the balance of payments will cause various kinds of adverse impacts on activities and the balance of the economy in a country. One of the causes of the emergence of a balance of payments deficit is the current account deficit. However, imports that exceed exports are also a very important factor in creating a balance of payments deficit. Meanwhile, The balance of payments is said to be in surplus when the total receipts from abroad exceed the total payments to foreign countries. Therefore, it is very important that the balance of payments and its components are always in a surplus, because it reflects the performance of a country and its people in dealing with international trade and if there is a balance of payments deficit, the country must issue its foreign exchange reserves to cover the deficit (Kahar et al., 2017).

A continuing balance of payments deficit will cause foreign exchange reserves to dwindle, where foreign exchange reserves should be used to import goods and services and to pay debts and interest. Meanwhile, an unstable balance of payments surplus will have a negative impact in the long term because it shows signs of

foreign exchange accumulation which means that the use of foreign exchange is inefficient, thus affecting people's welfare (Jeremy & Hayati, 2019).

Every country will continue to strive to maintain a stable and balanced balance of payments. Therefore, if a country fails to achieve a balance of payments surplus, then at least its balance of payments must be in balance and avoid the deficit as much as possible (Romadhoni & Cahyono, 2016). The balance of payments is said to be balanced when the outflow of money originating from imports of goods and services as well as the outflow of capital equals the inflow of money originating from the export of goods and services as well as the inflow of capital (Sukirno, 2007).

Fig 1. Development of Indonesia's Balance of Payments in 1995-2020 (Source: Bank Indonesia, 2022)

In Fig 1, it can be seen that the development of Indonesia's balance of payments in 1995-2020 showed a fluctuating trend (surplus and deficit). The highest surplus in Indonesia's balance of payments for the last 26 years occurred in 2010 amounting to US\$ 30.343 million. The surplus was influenced by the trade balance, which recorded an increase in surplus due to a significant increase in exports of non-oil and gas commodities, especially commodities based on natural resources due to strong global demand and high prices in international markets. In addition, direct investment inflows also increased significantly in line with the improving investment climate and stable macroeconomic situation. Meanwhile, the highest deficit in Indonesia's balance of payments for the last 26 years occurred in 2013 which was US\$ 7.325 million. The deficit was influenced by the slowdown in global economic growth and the decline in world commodity prices, which resulted in a decline in Indonesia's exports, which were mostly based on natural resources. On the other hand, the balance of payments deficit was also caused by an increase in the current account deficit and a decrease in the capital and financial account surplus.

From the development of Indonesia's balance of payments, it is important to note that Indonesia's balance of payments continues to fluctuate from year to year. This phenomenon shows that Indonesia is one of the countries that follow international relations to contribute to the Indonesian economy. Indonesia's balance of payments has a very important role in macroeconomic management in Indonesia. Where the balance of payments can be used as a benchmark in measuring the ability of an economy, especially those related to debt payment obligations and export-import transactions. In addition, the balance of payments is also one of the indicators that influence the actions of market participants and the quantities in them, which have an important role in the formation of a country's income. Therefore, the balance of payments is a sector that plays an important role in promoting economic improvement in the country. Indonesia's balance of payments is something interesting to look at further because there are many factors that can affect Indonesia's balance of payments, such as inflation, exchange rates, Gross Domestic Product (GDP) and net exports. When viewed from the aspect of previous research, empirical

studies related to the analysis of a country's balance of payments have been carried out and have shown mixed results.

Afrizal (2020), in his research states that in the long term, inflation has a positive and insignificant effect on Indonesia's balance of payments, the rupiah exchange rate has a negative and insignificant effect on Indonesia's balance of payments, while GDP has a positive and significant effect on Indonesia's balance of payments. In the short term, inflation has a positive and significant effect on Indonesia's balance of payments, while the rupiah exchange rate and GDP have a negative and significant effect on Indonesia's balance of payments.

Aidi et al. (2018), in his research states that the exchange rate and inflation have a statistically significant negative impact on the balance of payments in Nigeria. Meanwhile, real GDP has a statistically significant positive effect on the balance of payments in Nigeria.

Anisa (2017), in her research states that foreign exchange rates have a negative and significant effect on Indonesia's balance of payments. Meanwhile, GDP and net exports have a positive and significant impact on Indonesia's balance of payments.

Astuti et al. (2015), in his research states that the analysis of the international balance of payments using the duasa model showed the results of the study that the exchange rate had a positive and significant effect on Indonesia's balance of payments. Inflation has a negative and insignificant effect on Indonesia's balance of payments. Meanwhile, real GDP has a positive and significant impact on Indonesia's balance of payments.

David & Elijah (2020), in their research state that in the short term, the exchange rate has a positive and significant effect on the balance of payments in Nigeria, while inflation has a negative and significant effect on the balance of payments in Nigeria. In the long run, the exchange rate and inflation have a positive and significant effect on the balance of payments in Nigeria.

Effendy (2014), in his research states that in the long term, the exchange rate has a positive and significant effect on the balance of payments. The same is true in short-term relationships. In the long term, GDP has a positive and significant effect on the balance of payments. However, in the short term, GDP still has a positive but not significant effect. Meanwhile, inflation has a different effect. In the short term and long term inflation has a positive and not significant effect on the balance of payments.

Kahar et al. (2017), in his research states that GDP and net exports have a positive and significant effect on Indonesia's balance of payments, while the exchange rate has a negative and insignificant effect on Indonesia's balance of payments.

Niermasasi et al. (2016), in his research states that in the short term and long term the exchange rate has a positive and significant effect on the balance of payments. Inflation in the short and long term has a negative and insignificant effect on the balance of payments. GDP in the long term has a positive and significant effect on the balance of payments, while in the short term it has a positive and insignificant effect on the balance of payments.

Rangkuty et al. (2020), in his research states that net exports positively and significantly affect the movement of balance of payments developments in Indonesia, South Korea, India, Brazil and Mexico. Inflation positively but not significantly affect the development of the balance of payments in Indonesia, South Korea, India, Brazil and Mexico. Meanwhile, the exchange rate has a negative and significant effect on the balance of payments in Indonesia, South Korea, India, Brazil and Mexico.

Sujianto (2020), in his research states that in the short term, inflation and GDP have a positive and insignificant effect on Indonesia's balance of payments, while the exchange rate has a negative and insignificant effect on Indonesia's balance of payments. In the long term, GDP has a positive and significant impact on Indonesia's balance of payments. Meanwhile, inflation and exchange rates have a negative and significant impact on Indonesia's balance of payments.

Nwanosike et al. (2017), in his research states that the exchange rate has a negative and significant effect on the balance of payments in Nigeria. Meanwhile, Osisanwo et al. (2019), in his research states that in the long term, the trade balance has a positive and significant effect on the balance of payments in Nigeria, meanwhile the exchange rate, inflation rate and GDP have a negative and significant effect on the balance of payments in Nigeria. In the short term, the trade balance and GDP have a positive and significant impact on the balance of payments in Nigeria. Meanwhile, the exchange rate and inflation rate have a negative and significant effect on the balance of payments in Nigeria.

Based on the description above, this study aims to examine and analyze the effect of inflation, exchange rates, Gross Domestic Product (GDP) and net exports on Indonesia's balance of payments from 1995 to 2020.

## II. LITERATURE REVIEW

### *K. Balance of Payments*

The balance of payments is a systematic record of all economic transactions, including trade in goods or services, financial and monetary transfers between residents of a country and residents of foreign countries for a specified period of time, usually one year. The balance of payments is generally divided into the current account which includes the goods balance, the services balance and the unitary transfer balance. Capital transactions which include income and financing of a country, as well as financial transactions which include direct investments, portfolio investments, and other investments. The balance of payments can be affected by the balance of goods transactions through exports and imports as well as the capital account through the inflows and outflows of capital which in turn can lead to dynamics in the balance of payments. This dynamic can be observed in situations where the balance of payments at one time can show a deficit or surplus and at other times it can show a balance (Hady, 2009). The balance of payments shows the value and development of imports and exports, as well as the amount of funds flowing between one country and another, so that it can be known whether the country is an exporter of goods and capital, or vice versa as an importer of goods and capital (Apandi et al., 2016).

### *L. International Balance of Payments Equation*

The International Balance of Payments (BOP) equation is the sum of the Current Account (CA) surplus and the Capital and Financial Accounts (CFA) surplus. The balance of payments equation written using a mathematical substitution process is as follows (Astuti et al., 2015):

$$\text{BOP} = \text{CA} + \text{CFA} \quad (1)$$

The current account balance can be influenced by domestic and foreign income, where growth in national income can disrupt the current account balance. Meanwhile, the capital and financial account balances may be affected by real interest rates. Increase in interest rates above the world level can attract external capital so as to increase the balance of capital and financial transactions.

### *M. Balance of Payment Approach*

Three approaches used to study the balance of payments namely, the elasticity approach, the absorption approach and the monetary approach. The elasticity and absorption approach is often referred to as the Keynesian approach. The elasticity approach focuses on changes in exchange rates as a means of change to correct balance of payments imbalances. The absorption approach is a combination of changes in income, expenditure and exchange rates to improve the balance of payments (Jamli, 2001). While the monetary approach is an approach that believes that the balance of payments is a monetary phenomenon related to the money supply and the balance of payments of a country (Jeremy & Hayati, 2019).

### *N. Relationship of Inflation with Balance of Payments*

Inflation is the tendency of general prices to increase continuously or it can also be said to be a symptom of the continuous increase in the prices of goods and various general factors of production, continuously within a certain period (Soebagyo, 2016). Inflation is one of the monetary economic variables that can affect the stability of the balance of payments. High inflation has a negative impact on the economy of a country because it can reduce people's purchasing power and reduce overall national production which in turn can lead to a drastic decline in export activities and affect the performance of the balance of payments (Aidi et al., 2018).

High inflation causes prices of domestic goods and services to increase, causing a decrease in demand for export goods and a tendency to increase demand for imported goods, which in turn can cause a balance of payments deficit (Rangkuty et al., 2020). While according to Sujianto (2020), one of the triggers for inflation is the amount of money circulating in the community is greater than what is needed. If the money supply increases, it will again cause people to spend excess money, for example by importing or buying valuable foreign documents so that capital outflows will occur, which in turn can lead to a balance of payments deficit. In theory, it is stated that if inflation increases, it will reduce the balance of payments. The relationship between inflation and the balance of payments is supported by research from Sujianto (2020), David & Elijah (2020), Aidi et al. (2018) and Osisanwo et al. (2019), which states that inflation has a negative effect on the balance of payments. However, contrary to research conducted by Rangkuty et al. (2020), Effendy (2014) and Afrizal (2020), which state that inflation has a positive effect on the balance of payments.

*O. Relationship of Exchange Rate with Balance of Payments*

Exchange rate can be defined as the number of units of currency needed to be exchanged for per unit of another currency, or in other words, the price of one currency against another currency. The exchange rate or exchange rate shows how much rupiah is needed to get foreign money. Exchange rate movements serve as a balancing wheel to get rid of imbalances in the balance of payments (Samuelson & Nordhaus, 2004). According to Keynesian theory (elasticity approach), an increase in the exchange rate or depreciation will be able to improve the balance of payments. If the balance of payments can be improved by depreciation, then this is what is called the Marshall-Lerner condition, where depreciation will be able to improve the balance of payments if the combined elasticity of demand for domestic and foreign imports is more than one. However, the opposite will happen (the balance of payments worsens) if the combined elasticity of demand for domestic and foreign imports is less than one (Jamli, 2001). This means that, exports and imports are price elastic, so that every time there is a price change due to depreciation, where the price of goods abroad increases while the price of goods at home decreases, the demand for exports will increase and imports will decrease. Increased exports will increase foreign exchange reserves so as to improve the balance of payments (Astuti et al., 2015).

Meanwhile, according to the theory of the monetarist approach, if a domestic currency depreciates or a foreign currency appreciates, it will cause domestic prices to increase. This depreciation can improve balance of payments performance by increasing capital inflows from investors as a result of rising interest rates in response to rising domestic prices and increasing demand for domestic money (Sujianto, 2020). In theory, it is stated that if the exchange rate increases, it will increase the balance of payments. The relationship between the exchange rate and the balance of payments is supported by research from Effendy (2014), Astuti et al. (2015), David & Elijah (2020) and Niermasasi et al. (2016), which states that the exchange rate has a positive effect on the balance of payments. However, contrary to research conducted by Aidi et al. (2018), Nwanosike et al. (2017), Osisanwo et al. (2019) and Rangkuty et al. (2020), which states that the exchange rate has a negative effect on the balance of payments.

*P. Relationship of Gross Domestic Product (GDP) with Balance of Payments*

Gross Domestic Product (GDP) is one measure of a country's ability to be able to produce goods and services in one year, manifested by domestic factors, both owned by its own citizens and foreign nationals (Mankiw, 2006). An increase in GDP is able to improve the balance of payments through exports of production and imports of capital which can increase foreign exchange reserves. According to the absorption approach theory, a balance of payments deficit occurs when the absorption (consumption) value is greater than the production level, which can be corrected by increasing income and reducing absorption. One way that can be done to improve the balance of payments is to increase national income, where an increase in national income in the form of an increase in national production will encourage increased exports of production. This will then increase the country's foreign exchange, so that it will improve the balance of payments (Jamli, 2001).

Meanwhile, according to the theory of the monetarist approach, an increase in national income will stimulate an increase in the demand for money. If the demand for money in the short term can still be met by the amount of money in the country, then this will not affect the balance of payments. However, if the demand for money occurs in the long term, it will lead to a lack of money supply which can encourage capital imports to Indonesia. The import of capital will increase the total foreign exchange reserve balance, which means it can increase the balance of payments (Sujianto, 2020). In theory, it is stated that if GDP increases, it will increase the balance of payments. The relationship between GDP and the balance of payments is supported by research from Anisa (2017), Kahar et al. (2017), Astuti et al. (2015), Aidi et al. (2018) and Sujianto (2020), which state that GDP has a positive effect on the balance of payments. However, contrary to research conducted by Afrizal (2020), Romadhoni & Cahyono (2016) and Osisanwo et al. (2019), which states that GDP has a negative effect on the balance of payments.

*Q. Relationship of Net Exports with Balance of Payments*

Net exports are the value of goods and services exported to other countries minus the value of goods and services imported from other countries. Net exports are positive when the value of exports is greater than the value of imports and negative when the value of imports is greater than the value of exports. Another name for net exports is the trade balance, because it shows how trade in goods and services deviates from the benchmark for equality of exports and imports (Mankiw, 2006).

One component of the balance of payments is the balance of trade. The trade balance plays a larger role than the capital and financial accounts in contributing to the balance of payments surplus. However, a capital and financial account surplus can also support a country's external resilience. The capital and financial account surplus is expected to cover the current account deficit so that the performance of a country's balance of payments is maintained. Export and import activities are the main activities of the trade balance that can affect the balance of

payments. This is because an increase in export and import activities can encourage a balance of payments surplus, where a higher export value compared to the value of imports can cause a trade balance surplus and have an impact on increasing the balance of payments surplus (Salamah & Wahyuni, 2021). In theory, it is stated that if net exports increase, it will increase the balance of payments. The relationship between net exports and the balance of payments is supported by research from Anisa (2017), Kahar et al. (2017), Rangkuty et al. (2020), Salamah & Wahyuni (2021) and Osisanwo et al. (2019), which states that net exports have a positive effect on the balance of payments.

#### *R. Research Hypothesis*

Based on the discussion of various theories and previous research, in this study the following hypothesis is formulated, it is suspected that inflation has a negative effect on Indonesia's balance of payments. Meanwhile, the exchange rate, Gross Domestic Product (GDP) and net exports have a positive effect on Indonesia's balance of payments.

### III. RESEARCH METHODOLOGY

In this study, the scope of research is the effect of inflation, exchange rates, Gross Domestic Product (GDP) and net exports on Indonesia's balance of payments. The place of research is in Indonesia. This type of research is descriptive quantitative research namely, research on data collected and expressed in the form of numbers. The data used is secondary data in the form of time series from 1995 to 2020. Secondary data is data that has been collected or processed through research or surveys conducted by certain agencies, agencies or institutions. The data used in this study include data on the dependent variable namely, Indonesia's balance of payments, as well as data on the independent variables, namely inflation, exchange rates, Gross Domestic Product (GDP) and net exports. The data sources are obtained from the Central Statistics Agency, Bank Indonesia and the World Bank.

#### *S. Operational Definition of Research Variables*

This study uses one dependent variable namely, the balance of payments Indonesia as well as four independent variables namely, inflation, exchange rates, Gross Domestic Product (GDP) and net exports.

##### a. Indonesia's Balance of Payments

Balance of payments is a systematic record of all economic transactions, including trade in goods or services, financial and monetary transfers between residents of a country and residents of foreign countries for a specified period of time, usually one year. In this study, Indonesia's balance of payments data obtained from Bank Indonesia was used. The unit used is Million US\$.

##### b. Inflation

Inflation is the tendency of general prices to rise continuously in a certain period. In this study using inflation data obtained from the Central Statistics Agency. The unit used is percent (%).

##### c. Exchange rate

The exchange rate is the price of one currency against another. The exchange rate used in this study is the exchange rate of the rupiah against the United States dollar. In this study using exchange rate data obtained from the World Bank. The unit used is IDR/US\$.

##### d. Gross domestic product

Gross Domestic Product (GDP) is the total value of final goods and services produced by various production units in the territory of a country within one year. In this study using GDP data obtained from the World Bank. The unit used is Million US\$.

##### e. Export Net

Net exports are the value of exports minus the value of imports. In this study using net export data obtained from the Central Statistics Agency. The unit used is Million US\$.

#### *T. Analysis Techniques*

This study analyzed the data by statistically testing the variables used. The results of the analysis are expected to be used to determine the relationship and the magnitude of the influence of several independent variables on the dependent variable. This research will observe the effect of inflation, exchange rate, Gross Domestic Product (GDP) and net exports on Indonesia's balance of payments in 1995-2020. The analytical tool used in this research is multiple linear regression analysis with the Ordinary Least Squares (OLS) method approach which is processed using statistical data processing applications Microsoft Excel 2010 and Eviews 2009, with the following econometric model formulation (Gujarati & Porter, 2009):

$$BOP_t = \beta_0 + \beta_1 INF_t + \beta_2 ER_t + \beta_3 GDP_t + \beta_4 NE_t + \varepsilon_t \quad (2)$$

Description :

<i>BOP</i>	= Indonesia's Balance of Payments (Million US\$)
<i>INF</i>	= Inflation (%)
<i>ER</i>	= Exchange Rate (IDR/US\$)
<i>GDP</i>	= Gross Domestic Product (Million US\$)
<i>NE</i>	= Net Export (Million US\$)
$\varepsilon$	= Error term
$\beta_0$	= Constant
$\beta_1 \dots \beta_4$	= Regression coefficient of independent variable
<i>t</i>	= Year to <i>t</i>

The estimation stages of the econometric model above include estimator model parameter estimation, classical assumption test consisting of multicollinearity test, residual normality test, autocorrelation test, heteroscedasticity test, and specification test or model linearity. Then the results of the regression were tested for the goodness of the model which consisted of a simultaneous significance test or model existence test (*F* test) and the interpretation of the coefficient of determination (*R*<sup>2</sup>) and then carried out a partial significance test or effect validity test (*t* test).

#### IV. RESULT / FINDING

This study observes the effect of inflation, exchange rates, Gross Domestic Product (GDP), and net exports on Indonesia's balance of payments in 1995-2020, using multiple linear regression analysis using the Ordinary Least Squares (OLS) method. The results of the OLS estimation test and all the complementary tests are summarized in Table 1.

Table 1. OLS Estimation Test Results

Ordinary Least Squares (OLS)				
Variable	Coefficient	t-Statistic	Prob.	Multicollinearity (VIF)
Constant	-3986,3610	-0,7671	0,4515	NA
INF	-9,7856	-0,0864	0,9320	1,3665
ER	-1,1408	-1,6833	0,1071	2,5899
GDP	0,0217	2,7081	0,0132**	4,3000
NE	0,4906	3,5294	0,0020*	1,8117
Diagnostic Test				
R-Squared	0,4152	Residual Normality (Jarque Bera)		0,0601
Adjusted R-Squared	0,3038	Autocorrelation (Breusch Godfrey)		0,1289
F-Statistic	3,7271	Heteroscedasticity (White)		0,3496
Prob. F-Statistic	0,0192	Model Specification (Ramsey Reset)		0,4873
Durbin-Watson Stat.	2,2747			

Source: secondary data (Eviews 9). Description: \*significant at  $\alpha = 0,01$ ; \*\* significant at  $\alpha = 0,05$ ; \*\*\* significant at  $\alpha = 0,1$ .

Based on Table 1, multiple linear regression equations were obtained using the Ordinary Least Squares (OLS) method as follows:

$$\widehat{BOP}_t = -3986,3610 - 9,7856INF_t - 1,1408ER_t + 0,0217GDP_t + 0,4906NE_t \quad (3)$$

In Table 1, the diagnostic test shows that the estimated model has passed the five classical assumption tests, which include the multicollinearity test, residual normality test, autocorrelation test, heteroscedasticity test, and model specification test. The statistical empirical probability values from the residual normality test, autocorrelation test, heteroscedasticity test, and model specification test, each have a value of 0,0601 ( $> 0,05$ ),

0,1289 ( $> 0,10$ ), 0,3496 ( $> 0,10$ ) and 0,4873 ( $> 0,10$ ), thus indicating that the estimated model has a normal residual distribution, free from autocorrelation and heteroscedasticity problems, with exact model specifications (linear). All independent variables are inflation, exchange rate, Gross Domestic Product (GDP) and net exports has a VIF value  $< 10$ , which means that all these variables do not cause multicollinearity problems in the estimated model.

Based on the model existence test ( $F$  test) shows that the estimated model exists, it can be seen from the statistical empirical probability value  $F$  of 0,0192 ( $\leq 0,05$ ), with a coefficient of determination ( $R^2$ ) or moderate predictive power, which is 0,4152, which means 41,52% of the variation in Indonesia's balance of payments variable can be explained by the variables of inflation, exchange rate, Gross Domestic Product (GDP) and net exports. The remaining 58,48% is influenced by other variables or factors that are not included in the estimated model.

Separately, based on the validity of the effect ( $t$  test) shows that the variables that significantly affect Indonesia's balance of payments are Gross Domestic Product (GDP) and net exports with a statistical empirical probability  $t$  of 0,0132 ( $\leq 0,05$ ) and 0,0020 ( $\leq 0,01$ ). Meanwhile, inflation and exchange rate variables have no effect on Indonesia's balance of payments with statistical empirical probabilities  $t$  of 0,9320 ( $> 0,10$ ) and 0,1071 ( $> 0,10$ ).

## V. DISCUSSION

Based on the results of this study, it can be seen that Indonesia's balance of payments during 1995-2020, was only influenced by Gross Domestic Product (GDP) and net exports. Meanwhile, inflation and the exchange rate have no effect on Indonesia's balance of payments.

### A. *Effect of Inflation on Indonesia's Balance of Payments*

The results of this study indicate that the inflation variable has a regression coefficient of  $-9,7856$  with a statistical empirical probability value  $t$  of 0,9320 ( $> 0,10$ ), meaning that inflation has no effect on Indonesia's balance of payments. So how big a change occurs in inflation, it will not cause a significant change in Indonesia's balance of payments. These results are not in accordance with the hypothesis of this study which states that inflation has a negative effect on the balance of payments. In theory, it is stated that if inflation increases it will decrease the balance of payments.

The results of this study are in line with research conducted by Wulandari (2015), Niermasasi et al. (2016) and Astuti et al. (2015), which states that inflation has no effect on the balance of payments. Inflation is not a factor that has a strong influence on the stability of Indonesia's balance of payments. This may be due to low inflation that does not significantly affect changes in investment so that the balance of payments figures can not capture these shocks. In addition, it could also happen that the implementation of fiscal and monetary policies in dealing with inflation is not able to reduce foreign investment conditions to become conducive again so that foreign investors interest becomes low or it can also occur where the political situation caused by inflation has not been able to convince foreign investors to invest by investing their capital into the country, so that the balance of payments for capital flows is not affected by inflation.

### B. *Effect of Exchange Rate on Indonesia's Balance of Payments*

The results of this study indicate that the exchange rate variable has a regression coefficient of  $-1,1408$  with a statistical empirical probability value  $t$  of 0,1071 ( $> 0,10$ ), meaning that the exchange rate has no effect on Indonesia's balance of payments. So how much change occurs in the exchange rate, it will not cause a significant change in Indonesia's balance of payments. These results are not in accordance with the hypothesis of this study which states that the exchange rate has a positive effect on the balance of payments. In theory, it is stated that if the exchange rate increases (devalues/depreciates against foreign currencies) it will increase the balance of payments.

The results of this study are in line with research conducted by Afrizal (2020), Kahar et al. (2017) and Sujianto (2020), which state that the exchange rate has no effect on the balance of payments. The exchange rate is not a factor that has a strong influence on the stability of Indonesia's balance of payments. This is probably due to the current unfavorable exchange rate policy for expansion of productivity and increased exports. Exchange rate depreciation can not be used to support current transactions and this phenomenon can be attributed to the less sensitive nature of exports to changes in exchange rates. In addition, it could also happen that changes in exchange

rates, both depreciation and appreciation, do not significantly affect the prices of goods and services, so that the volume of exports and imports does not change much and is affected. Demand for exports and imports is mainly due to production and consumption needs which are bound by contracts with the company so that the volume must be fulfilled. If the volume of exports and imports does not change, the balance of payments will also not change.

#### C. *Effect of Gross Domestic Product (GDP) on Indonesia's Balance of Payments*

The results of this study indicate that the Gross Domestic Product (GDP) variable has a regression coefficient of 0,0217 with a statistical empirical probability value  $t$  of 0,0132 ( $\leq 0,05$ ), meaning that the Gross Domestic Product (GDP) has a positive and significant effect on Indonesia's balance of payments. Pattern of relationship between Gross Domestic Product (GDP) and Indonesia's balance of payments is linear-linear. So if the Gross Domestic Product (GDP) increases by US\$ 1 million, then Indonesia's balance of payments will increase by US\$ 0,0217 million. On the other hand, if the Gross Domestic Product (GDP) falls by US\$ 1 million, Indonesia's balance of payments will decrease by US\$ 0,0217 million. These results are in accordance with the hypothesis of this study which states that GDP has a positive effect on the balance of payments. In theory, it is stated that if GDP increases it will increase the balance of payments.

The results of this study are in line with the research conducted by Anisa (2017), Kahar et al. (2017), Astuti et al. (2015), Aidi et al. (2018) and Sujianto (2020), which states that GDP has a positive and significant effect on the balance of payments. An increase in GDP means an increase in income received by the general public. Increasing people's income can improve current account performance by increasing exports. The existence of government policies related to exports can also increase the value of exports. In addition, the increase in people's income will also increase the demand for public money which is assumed to be countermeasures against domestic credit expansion. The government does this by raising the interest rate which in turn is able to attract foreign investors to invest in the country so that capital inflows occur which will later cause a surplus in the balance of payments.

#### D. *Effect of Net Exports on Indonesia's Balance of Payments*

The results of this study indicate that the net export variable has a regression coefficient of 0,4906 with a statistical empirical probability value  $t$  of 0,0020 ( $\leq 0,01$ ), meaning that net exports have a positive and significant effect on Indonesia's balance of payments. Pattern of relationship between export net with Indonesia's balance of payments is linear-linear. So if net exports increase by US\$ 1 million, then Indonesia's balance of payments will increase by US\$ 0,4906 million. On the other hand, if net exports fall by US\$ 1 million, Indonesia's balance of payments will decrease by US\$ 0,4906 million. These results are in accordance with the hypothesis of this study which states that net exports have a positive effect on the balance of payments. In theory, it is stated that if net exports increase, it will increase the balance of payments.

The results of this study are in line with the research conducted by Anisa (2017), Kahar et al. (2017), Rangkyut et al. (2020), Salamah & Wahyuni (2021) and Osisanwo et al. (2019), which states that net exports have a positive and significant effect on the balance of payments. Export activities of a country will get the value of a certain amount of money in foreign currency which is a source of state income. So if net exports increase, the source of state income will also increase because the increased net exports are indicated by higher exports than imports. This increase in net exports will accumulate later in the increase in the position of foreign exchange reserves because exports are income for the country and imports are expenses for a country. Therefore, an increase in net exports will increase a country's income so that it will increase foreign exchange reserves which means it will improve the balance of payments.

## VI. CONCLUSION AND RECOMMENDATION

This study was conducted with the aim of knowing the effect of inflation, exchange rates, Gross Domestic Product (GDP) and net exports on Indonesia's balance of payments in 1995-2020, using multiple linear regression analysis using the Ordinary Least Squares (OLS) method. The results of this study indicate that the variables of Gross Domestic Product (GDP) and net exports have a positive and significant effect on Indonesia's balance of payments. Meanwhile, inflation and exchange rate variables have no effect on Indonesia's balance of payments. The results of the  $F$  test indicate that the estimated model used in this study exists, with a coefficient of determination of 0,4152 meaning that 41,52% of the variation in Indonesia's balance of payments variables can be explained by the variables of inflation, exchange rates, Gross Domestic Product (GDP) and net exports. The remaining 58,48% is influenced by other variables or factors that are not included in the estimated model.

Based on the research results and the conclusions that have been described, the suggestions that can be given for this research are specifically for the monetary authority, namely Bank Indonesia to take appropriate policies to stabilize the exchange rate and inflation so that the financial sector in Indonesia is maintained and stable so that exchange rate and inflation no longer have a negative effect on Indonesia's balance of payments position. In addition, the Government also needs to encourage increased export activities and improvement of quality standards of goods to be exported to other countries so that foreign exchange reserves in Indonesia continue to increase so that Indonesia's balance of payments remains stable. Meanwhile, it is hoped that future researchers can dig deeper into the performance of Indonesia's balance of payments and produce more complex research results by adding other independent variables in addition to the independent variables that already exist in this study and can use different methods with a longer time horizon. So as to be able to obtain more accurate, complete and clear information related to the right policy to overcome Indonesia's balance of payments deficit.

#### ACKNOWLEDGMENT

The author realizes that this research would not have been completed without the support and assistance of various parties. Therefore, on this occasion, with all humility, the author would like to express many thanks to Mrs. Ir. Maulidyah Indira Hasmarini, MP as Secretary of the Development Studies Program and Prof. Dr. Anton Agus Setyawan, SE, M.Sc. as Dean of the Faculty of Economics and Business, University of Muhammadiyah Surakarta. In addition, the author also would like to thank parents, family and friends who have helped and supported the author in completing this research, and thanked Telkom University for providing the opportunity for the author to take part in the international conference on Sustainable Collaboration in Business, Information and Innovation (SCBTII) 13<sup>th</sup> 2022 at Telkom University.

## Examining Perceived Benefit of Online Behavioral Advertising on Behavioral Intention

Elgina FM Manalu<sup>1</sup> and Daniel Tumpal Aruan<sup>2</sup>

<sup>1,2</sup> Faculty of Economic and Business: dept. of Management, University of Indonesia, Depok, Indonesia

### Abstract

*Marketers are taking advantage of the global surge in digital advertising spending, which has been driven by the quick acceleration of consumers to online media, by displaying Online Behavioral Advertising (OBA). OBA is considered as one of keyway to connect with the audience as it can deliver more relevant ads to users (personalization). However, the collection and use of information is frequently hidden away, leading to a situation for which customers perceive the collection and use of personal data as intrusive, resulting in negative perceptions. The purpose of this study is to see how perceived benefit (relevance, credibility, and perceived usefulness) affects OBA acceptability, click intention, and customer behavioral intent. Using an experimental design research through data coming from online questionnaire, analysis of variance was conducted to test 2 (relevance: high DCP vs low DCP) x 2 (credibility: overt vs covert) x 2 (perceived usefulness: more trusted vs less trusted using a between-subject experimental design (n=198). Of the 8 stimuli studied, the results showed that stimuli 8 with high relevance, high credibility and high perceived usefulness resulted in a highest mean value for OBA acceptance. The research also showed that higher degree of benefit on OBA influence higher ads acceptance. OBA acceptance then has a positive effect on click intention and behavioral intention. This study provides academic contributions and managerial implications regarding in form of marketing strategies through the display of an effective OBA to encourage consumer purchase intentions.*

*Keywords— Display Ads; Online Behaviour Advertising; Perceived Benefit*

---

### I. INTRODUCTION

The widespread acceptance of technology and the internet in society is in line with the increase in online shopping activities. According to data from NielsenIQ, the number of online shopping consumers in Indonesia who use e-commerce reach 32 million in 2021. This number has increased by 88% compared to 2020 (CNN INDONESIA, 2021). This ultimately encourages companies to compete with each other to increase online marketing activities by displaying online ads.

According to eMarketer in 2021, digital advertising spending globally increased by 20.4% compared to 2020 to reach US\$ 455.30 (eMarketer, 2021). Data from Nielsen shows that digital advertising spending in Indonesia has also increased by 67% compared to 2020. Total digital advertising spending reached 15.9% of total advertising spending with a value equivalent to IDR 41.18 trillion (Kompas, 2021.)

Recent development in online monitoring and profiling technologies have transformed the way individuals, particularly consumers, are communicated with, allowing real-time targeting and personalization while user accesses the internet (Moore et al., 2015). Firms can target consumers based on their general interests using analysis of technology of the editorial content of the web page on which the ads would be displayed (Goldfarb et al., 2018). The technique of showing digital ads to consumers based on their online behavior is referred as Online Behavioral Advertising (OBA) (Aiolfi et al., 2021). It tracks and compiles data on user's online behavior such as visited websites, duration, and activities on those websites (Lee et al., 2016).

OBA's mechanism started with a simple cookie which placed on the user computer that helps identify recently visited pages to infer the needs of the user; on the other times, the ads to be displayed are determined dynamically by the use of analytical profiling techniques based on data collected from a big data that combines the click history stream of each user and complex algorithms that allow real time bidding for an ads space (Försch & de Haan, 2018; Qin et al., 2017; Sinclair, 2016). These ads can appear on various websites and social media.

Aguirre et al., (2015) claims that OBA practices are becoming increasingly common as industry claims that they increase advertising effectiveness and enable experimentation for marketers at relatively lower costs (Alreck & Settle, 2007). OBA provides benefits for companies to predict the specific interests and preferences of consumers in a timely manner and result selectively expose consumers to specially tailored advertisements (Ham, 2017). From the standpoint of the consumer, OBA has the advantage of higher relevance and fit, in that it provides

the right product or service at the right time and streamlines the information search process by removing the need for customers to further search.

On the one hand, personalization should render a banner more relevant and thus increase its effectiveness (Anand & Shachar, 2009; Ansari & Mela, 2005), on the other hand the use of more personal information may induce feelings of intrusiveness that interfere with the consumer's cognitive processing and interrupt goal pursuit (Li et al., 2002) such that it prevents the consumer from taking notice of the ads contents. Intrusive ads also may be perceived as annoying and result in reactance, such that consumers behave in the opposite way to the one intended by the advertiser (Clee & Wicklund, 1980; Ying et al., 2009).

Several previous studies have focused on the effect of OBA and how to measure acceptance and resistance to OBA (Boerman et al., 2017; Ur et al., 2012). The theoretical background of OBA research tends to be fragmented and perceptions of OBA appear to be differed (Varnali, 2021). When it comes to risk, consumers perceive the collection and use of personal data as an invasive tactic that leads to negative perceptions of loss of privacy (Moore et al., 2015; Phelan et al., 2016; Smit et al., 2014; Summers et al., 2016; Ur et al., 2012; Varnali, 2021). On the other hand, when it comes to benefits, OBA makes advertising more relevant to consumers with personalized advertising (Aiolfi et al., 2021; Ur et al., 2012).

Aiolfi et al., (2021) found that acceptance of the OBA is positively related to relevance, perceived usefulness, and credibility of the personalized advertisements, while the intention to avoid personalized ads is strictly related to the privacy concerns. Consequently, OBA acceptance and avoidance affected the click intention on the ad and the behavioral intention that are decisive for the success of data-driven digital advertising. However, in previous studies investigating the acceptance and avoidance of OBA was limited to one intensity of advertising personalization. Prior research in OBA, the survey-based methodology has not been able to describe the actual situation since participants are limited in their ability to remember what has been experienced before. That is, experimental research design is the most appropriate research to determine the causal relationship between variables (Kotler and Keller, 2009), the experimental research design is considered the most valid and widely used research in marketing (Malhotra, 2007). Also, consumer's reaction to a personalized message depends on both the degree of customization and the potential benefits of the offer (van Doorn & Hoekstra, 2013a). Thus, this study will be conducted with an experimental approach to determine the effect of the perceived benefits of OBA on OBA acceptance by using different factor intensities. Therefore, a research that can discuss how the perception of benefits in online behavioral advertising (OBA) on OBA acceptance with the use of different factor intensities is needed.

Prior research also showed that the effects of OBA on purchase intentions and identified click intention as predictor of the behavior of consumer's purchasing process. If the level of click intention increases, the likelihood of purchasing a product will increase (Urban et al., 2014). Finally, this study will examine how perceived benefits of OBA at different levels of distinctiveness affect OBA acceptance and click intention and ultimately behavioral intention in Indonesian consumers.

## II. LITERATURE REVIEW

Display ads are the placement of paid ads using graphic or multimedia ads units on website pages to achieve the goal of providing brand awareness, familiarity, favorability, and purchase intention. Most display ads that available today are programmatic, based on real-time auctions, so ads can be targeted at the individuals who are fit the campaign objectives. Since new technologies allow companies to identify their target audience, monitor and collect data about the individuals behavior, the new advertisements are more customizable and engaging as well as better equipped to understand consumers' behaviors and intention (Van Doorn & Hoekstra, 2013).

OBA allows advertisers to target ads at visitors as they move across the website or visit other sites in the ads (Chaffey & Chadwick 2018), OBA is the process of tracking people activities on internet and then showing them individually targeted advertising based on that data (Boerman et al., 2017). There are numerous definitions of OBA in the literature, but they all have two things in common: monitoring and tracking of consumer online behavior and the use of data acquired through targeted advertising.

The theoretical background of OBA research is highly fragmented, and many of the OBA studies use a variety of theories from different disciplines, such as social and cognitive psychology, communication, and marketing to better understand and explain this type of practice. Several studies focus on the effects of the OBA and how to

measures acceptance and resistance to the OBA (Boerman et al., 2017; McDonald & Cranor, 2010; Smit et al., 2014; Ur et al., 2012). However, the perceptions about the OBA seem to be divergent. Specifically, previous studies state that the OBA is characterized by a continuous contrast between benefits and risks.

Research that conducted by Aiolfi et al., (2021) confirmed the direct and positive effect of relevance and credibility of OBA-promoted content on personalized ads acceptance, which results in higher levels of click intention and consequent positive behavioral intentions in terms of actual buying behavior. This study also explains how privacy concerns about data-driven advertising positively affect the intention to avoid implementing OBA which results in lower click intention ratios.

In terms of OBA relevance, experimental study that was conducted by Bleier & Eisenbeiss (2015a) confirmed that banners with a high degree of content personalization (DCP) are most effective when a consumer has just visited the advertiser's online store, but quickly lose effectiveness as time passes since that last visit. Personalization increases click-through irrespective of whether banners appear on motive congruent or incongruent display websites and also in terms of view-through, personalization increases the ad effectiveness only on motive congruent websites, but decreases it on incongruent websites.

Another experimental study was conducted by Aguirre et al., (2015) that revealed that when firms practice overt information collection strategies, personalization leads to greater click-through intentions. This study claims covert strategies do not change click-through intentions because participants unaware of the information collection felt more vulnerable in the face of a highly personalized advertisement. This means that advertisers may increase the credibility of their ads and the likelihood that users would view and click on personalized ads by giving customers more control over their personal information (Tucker, 2014).

Aiolfi et al., (2021) found that perceived usefulness is not significantly impact the acceptance of OBA. A system with a high perceived usefulness is one for which the user believes there is a favorable use-performance relationship (Davis, 2011). Study conducted by Bleier & Eisenbeiss (2015b) conducted to investigate on how trust moderates in influence the ad personalization on consumers' internal and external responses in the lab more trusted retailers can increase the perceived usefulness of their ads through a combination of high depth and narrow breadth of personalization without eliciting increased reactance or privacy concerns. Otherwise, less trusted retailers, banners with higher depth are not perceived more useful, but instead trigger increased reactance and privacy concerns, regardless of their personalization breadth. The suggestion for the future research, researcher suggest to conduct these studies with experimental approach.

### III. RESEARCH METHODOLOGY

Advertisers are increasingly recognizing the OBA as one of the most effective ways to reach their target demographic. Furthermore, the OBA is designed to deliver more relevant advertising to users on a theoretical basis. However, because customers ignore of the procedures underpinning the OBA, the gathering of information and its usage is frequently veiled, resulting in ethical issues (Boerman et al., 2017). Although numerous theories have been utilized to further our understanding of the OBA's antecedents, it is critical to comprehend how and in what measure consumers value the OBA's benefits (e.g. relevance, credibility, perceived usefulness) in order to embrace the OBA.

The study aims to identify the potential contents able to provide value for individuals in terms of OBA, and therefore capable of influencing them in degree of customization. Thus, it may result in a behavioral intention to purchase the products promoted by the OBA. Specifically, the conceptual framework is based on the following hypotheses.

#### *Relevance – OBA Acceptance*

Several prior studies have shed light on how advertisement content influences consumer responses to OBA. Many studies agree that ad relevance is one of the primary reasons why OBA outperforms non-personalized advertising in terms of performance. The attention and visibility of an advertisement are affected by changes in its relevance (Bellman et al., 2013). The Elaboration Likelihood Model states that the more personal and relevant a message is, the more likely it is to be recognized, and hence more effective (Petty et al., 1983). It is possible to learn the general interests and demands of the audience through monitoring and profiling, allowing for the presentation of targeted adverts at the proper time, resulting in more relevant exposure. When a person is engaged,

he or she is more likely to commit cognitive effort to evaluating the value of a product; conversely, when engagement is low, a person is less likely to dedicate cognitive effort to analyzing the value of a product (Petty et al., 1983). Thus, based on these things, the following hypotheses can be drawn:

- H1 : The higher the level of relevance of OBA, the higher the level of acceptance of OBA.  
The level of relevance (relevance) of OBA has a positive influence on OBA acceptance

#### *Credibility – OBA Acceptance*

According to the literature, OBA is more effective than non-targeted commercials, however the result is dependent on audience and advertiser conditions. This refers to the data that is utilized to adjust advertising and transparency, also known as advertising credibility (Aiolfi et al., 2021; Boerman et al., 2017). By providing consumers more control over their personal information, advertisers may boost the credibility of their ads and enhance the likelihood that users will see and click on tailored ads (Tucker, 2014). Furthermore, advertisers should be more honest in their data acquisition and use in order to customize ads, taking advantage of open communication. In particular, Jai et al., (2013) state that Consumers' negative reactions to the use of cookies can be mitigated by providing accurate information. As a result, more trustworthy advertising should not just focus on alerting users about this technique, but also on attempting to alleviate their anxieties, particularly among the elderly and the less educated (Smit et al., 2014). As suggested by Aguirre et al., (2015), Higher OBA acceptance rates can be achieved by gathering information openly. In reaction to tailored advertising, there has been an increase in click intention. Based on these things, the following hypotheses can be drawn:

- H2 : The higher the level of credibility of the OBA, the higher the level of acceptance of the OBA. The level of credibility of OBA has a positive influence on OBA acceptance

#### *Perceived Usefulness – OBA Acceptance*

The effectiveness of OBA depends on factors controlled by advertisers such as information used to personalize advertisements and advertiser transparency and consumer-related factors (Aiolfi et al., 2021; Boerman et al., 2017). Consumer factors influencing OBA acceptance include the perceived usefulness of advertising, which is influenced by designing commercials that thoroughly represent interests (Bleier & Eisenbeiss, 2015b). Perceived usefulness is the degree to which a person believes that using a particular system will improve his or her job performance (Davis, 2011). From the OBA perspective, data-based advertising obtains high usability benefits, which in turn are believed by users to have a positive acceptance-performance relationship (Aiolfi et al., 2021). Thus, OBA acceptance is positively related to the benefits of advertising, so the hypothesis is drawn:

- H3 : The higher the level of perceived usefulness of OBA, the higher the level of acceptance of OBA. The level of perceived usefulness of OBA has a positive influence on OBA acceptance.

#### *OBA Acceptance – Click Intention*

The process of monitoring people online activity, i.e., click-intention responses to ads, is one of the primary pillars of OBA (Boerman et al., 2017; Zuiderveen Borgesius, 2015). According to recent research on OBA, click intention is one of the key consequences of ad acceptance or avoidance among OBA outcomes. OBA acceptability appears to positively increase click intention rates due to perceived levels of personalisation, relevance, and usefulness (Aguirre et al., 2015; Aiolfi et al., 2021; Bleier & Eisenbeiss, 2015a; Boerman et al., 2017; Tucker, 2014). When transparency and consumer understanding of OBA have a beneficial impact on OBA adoption, it changes customer responses to on behavioral advertising, resulting in increased levels of click intention (Aguirre et al., 2015). Thus, click intention is positively related to OBA acceptance, so the hypothesis is drawn:

- H4 : The higher the OBA acceptance rate, the higher the click intention level on the OBA.  
 Acceptance of OBA (Acceptance) has a positive influence on Click Intention

*Click Intention – Behavior Intention*

The effect of OBA acceptance or avoidance on click intention (Bleier & Eisenbeiss, 2015a; Boerman et al., 2017) is in line with a stimuli-organism-response model in which stimuli influences an individual's cognitive and affective responses, which are then translated into specific behaviors (Aiolfi et al., 2021; Bleier & Eisenbeiss, 2015a; Boerman et al., 2017; Jai et al., 2013). The first consumer response is click intention, which is followed by behavioral intention, which is operationalized as the user's intention to buy or not buy: the consumer first clicks on the ad, and then decides whether or not to buy a product or service (Aiolfi et al., 2021). Thus, click intention is said to be a predictor of consumer buying process behavior (Urban et al., 2014) Click intention can enable consumers browse websites for more information and conduct detailed searches on consumer website pages by allowing them to seek more details or information about a product or service (Urban et al., 2014). According to the theory of planned behavior (Ajzen, Icek, 1985), behavioral intention refers to the intention to perform a behavior that is a proximate cause of the behavior. In specifically, intentions represent the motivational component of a behavior, i.e., how much conscious effort a person will put forth to do a behavior (Ajzen, Icek, 1985). As far as OBA is concerned, behavioral intention refers to the likelihood that a user will click on an ad and make a product purchase. The literature has examined the effects of OBA on purchase intention and actual purchase, identifying them as a measure of OBA effectiveness. In particular, intention to click is an excellent predictor of behavior in this stage of the consumer buying process (Urban et al., 2014). If the click intention rate increases, the likelihood of buying the product increases. In addition, the relationship between click intention and behavioral intention is more effective, resulting in a higher likelihood of purchase, when advertisements match consumer needs (Van Doorn & Hoekstra, 2013) and even more so when consumer preferences are defined more carefully and they are more focused. on specific and detailed information (Lambrecht et al., 2013). This finding is in line with the stimuli-organism-response model, in which the intention on to use an ad in the future to make a purchase is positively influenced by the intention to click on the ad in relation to consumer awareness. OBA benefits due to the relevance, usefulness, and credibility of personalized messages (i.e. stimuli) (Aiolfi et al., 2021; Bleier & Eisenbeiss, 2015c; Boerman et al., 2017; Jai et al., 2013).

- H5 : The higher the level of click intention on the OBA, the higher the level of behavioral intention to purchase the product offerings promoted by the OBA. Click Intention has a positive influence on behavioral intention

*Research model*

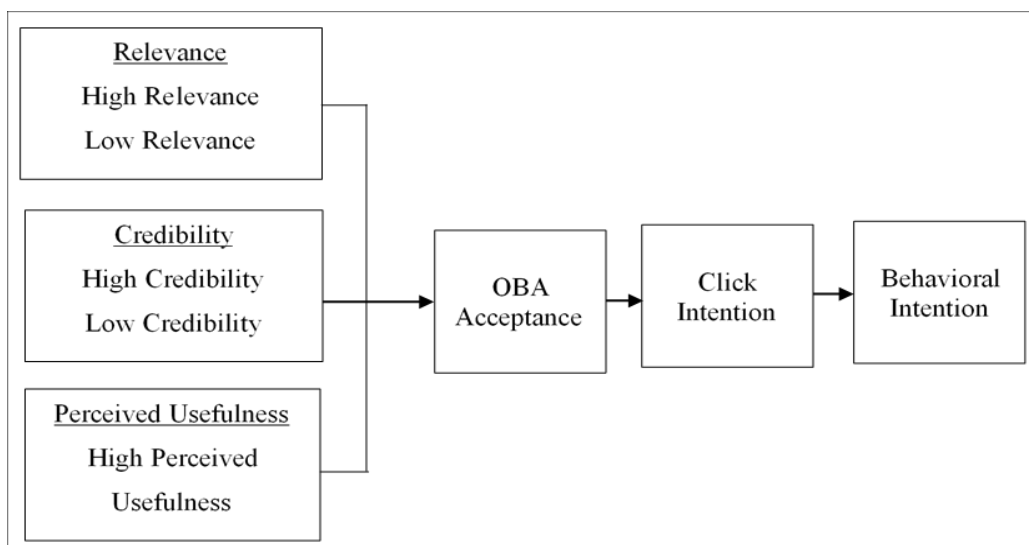

Fig.1. Research Framework

#### IV. RESEARCH METHODOLOGY

The appropriate method to be used in this research is experiment. The experimental design was used in this study with the aim of controlling the factors or variables that influence the causal relationship between the manipulated variable and other dependent variables. In this study, the manipulated variables were; relevance at the high DCP and low DCP levels, credibility at the overt (high credibility) and covert (low credibility) levels and perceived usefulness at the more trusted (high perceived usefulness) and less trusted (low perceived usefulness) levels. While the dependent variables to be measured are OBA acceptance, click intention and behavioral intention. This study uses an experimental method to control for other factors that can affect the causality relationship that has been built. The object of this research is the display of OBA which is processed by the researcher with reference to the manipulation of the stimuli. To build a research stimuli, the researcher will edit the advertisement image by displaying the manipulation of relevance, credibility and usefulness in verbal and non-verbal forms.

The design of this research is 2x2x2 which consists of three manipulated independent variables, namely OBA relevance, OBA credibility and OBA perceived usefulness. Thus, by referring to the characteristics of the experimental research design above, the researchers built eight stimuli sets based on a combination of three manipulated independent variables. Research participants will be presented with eight types of stimuli that have been created by researchers which will then be tested for their effects on OBA acceptance, click intention and behavioral intention. In accordance with the type of experimental design, in exposing the stimuli to each research participant, the researcher will conduct a randomization process. The randomization process was carried out to maintain objectivity in the research process. In the procedure, the researcher will give a random Stimuli to the research participants by using a randomizer tool that will constantly randomize the questionnaires that will be obtained by the participant. There are eight types of stimuli that have been described previously, where the participant will receive one stimuli at random.

##### *Pilot test*

The pilot test aims to determine the product category, product type, brand, e-commerce or e-marketplace that will be used in the research. In this pilot test, researchers collected several general products, brand names and prices to be used as product objects in the OBA stimuli.

To find the components that make up the stimuli, a pilot test will be carried out with the following steps:

- Pilot test 1: The researcher collects product categories that are commonly used as objects in the OBA stimuli by giving several participants the opportunity to choose the product category that is most frequently searched or purchased online.
- Pilot test 2: The researcher gives the participant the opportunity to choose three types of products from the product category obtained from the results of the pilot test 1. Then the participant is asked to choose one of several fictitious brand names given by the researcher.
- Pilot test 3: Researchers collect online information on e-commerce or marketplaces that are most often used in online purchases by giving participants the opportunity to choose one of 8 options.

The findings from this pilot test will be continued to the stimuli development stage by referring to the structure and manipulation text that will be used in the study.

##### *Manipulation Check*

We use ANOVA to check the stimuli that be used in the research is in the form of advertising images containing product images, brand names, prices, and manipulated text. The OBA relevance manipulation used in this research stimuli was adapted from Bleier & Eisenbeiss, (2015a). The OBA credibility variable will be manipulated by text adapting the research Aguirre et al., (2015) and the perceived usefulness variable was manipulated with text and visuals referring to the research of Bleier & Eisenbeiss, (2015c) The manipulation check stage was carried out to test the effectiveness of independent variable manipulation in experimental research.

##### *Data*

The primary data was obtained by researchers through a survey by distributing questionnaires to be filled out by participants online. The online questionnaire will be made in Google Forms format which will be distributed through several social media. 184 online questionnaires were given with 3 scenarios (relevance—ads are displayed

according to the last product and brand viewed, advertisements display different products with the same brand) ×2 (credibility—text regarding data collection for marketing purposes, without text) ×2 (perceived usefulness) – advertising with trusted sellers, less trusted sellers). On average, 23 participants answered each of the eight scenarios, by random assignment. Participants begin by reading the text containing the scenario and instructions.

### *Procedure*

First, the researcher subjected each participant to a text briefly the mechanism of the emergence of OBA. Second, the researcher participants are given text in the form of scenarios for participants to imagine the flow of the advertisements that are displayed. Scenario video is also presented visual Stimuli representing an example of online behavioral advertising associated with the decision-making process of searching for a product on a company's website. The researcher then gave a screening statement about the product used in the advertisement to ensure that the participants really remembered the scenario of the OBA advertisement. After the Stimuli, participants answered manipulation check questions and continue to answer questions regarding their attitude toward the online behavioral advertising such as relevance, perceived usefulness, and credibility of this type of advertising. Furthermore, participants were asked to fill in the level of agreement on the twelve statements given. The statements given are all indicators of the variables studied. The fourth stage is divided into 8 parts. In the last stage, participants were asked to fill out a participant's profile including gender, age, last education, occupation, online shopping spending per month, and frequency of online shopping in the last month.

### *Measures*

All the considered variables measured with multiple-item scales with Likert measurement scale from 1 (disagree) to 7 (agree). Data on sex and marital status using a nominal scale. Meanwhile, data on age, latest education, monthly expenditure, monthly online shopping expenditure, frequency of accessing e-marketplace sites in the last month using an ordinal scale. Specifically, all the scales used in the online survey come from previous research adapted from Aiolfi et al., (2021). Specifically, click intention three items adapted from Gironda and Korgaonkar, 2018; Aguirre, et al., 2015.

## V. RESULT / FINDING

### *Pilot Test*

Total 30 participants consisting of 15 men and 15 women participated on every pilot test. The participants profile on the pilot test are expected to represent participants in the main test. Through a survey using Google Forms, participants were asked to choose what product categories might be purchased or searched online. Result from Pilot Test show that the clothing/apparel category is the most chosen category with 12 answers (40%). 22 answers from pilot test 2 choose T-Shirt product type 43,3% participants choose “Weargenics” as fictitious brand. Furthermore, Tokopedia is used as e-marketplace as 62.1% participant's selection.

### *Manipulation Check*

The first manipulation check was carried out on 48 participants consisting of 22 males and 26 females. Manipulation check was carried out using a short questionnaire through the google form media, where each participant received one image of a stimuli advertisement at random. Based on the results obtained, it can be concluded that the manipulation of high relevance, high credibility and high perceived usefulness can be accepted by participants. On the other hand, manipulation of low relevance, low credibility and low perceived usefulness credibility has not been accepted by the participants.

The second manipulation check was carried out on 24 participants who filled out a short online questionnaire. This second manipulation check aims to determine the success rate of the revised manipulation stimuli. At this stage, manipulation of low relevance, low credibility and low perceived usefulness is observed again by displaying a stimuli. They identified the OBA with high relevance as significantly has higher mean than low relevance OBA ( $M_{low\ relevance} = 6.13$ ,  $M_{high\ relevance} = 13.54$ ;  $p = .0000$ ). Participants in the overt condition also agreed that their OBA is credible ( $M_{overt} = 6.96$ ,  $M_{covert} = 11.67$ ;  $p = .0000$ ). Participants also identified the OBA with high perceived usefulness as significantly has higher mean than low perceived usefulness ( $M_{high\ perceived\ usefulness} = 4.71$ ,  $M_{low\ perceived\ usefulness} = 18.25$ ;  $p = .0000$ ). Based on the results of the manipulation check 2, the researchers got results where the majority of participants gave a change in their assessment of low relevance, low credibility and low perceived usefulness and the result show that the stimuli already accepted.

### Pretest

Pretest is conducted to measure the validity and reliability of each indicator on each variable used as an experimental instrument. Validity and reliability of the variable indicators were tested using SPSS. Validity test of the indicators was carried out using data collected from a total of 35 participants using a 7-point likert scale. It showed that all KMO values of each variable are  $> 0.500$  and the significance value of each variable obtained is  $< 0.001$ . The KMO value and significance value describe the correlation between variables so that it is feasible for factor analysis to be carried out. In addition, the results of validity test of each indicator on each variable value shows a value above 0.500. This shows that the indicators used in this study passed the test of statement indicators for each variable measured in this study. Reliability test showed that all Cronbach's alpha values in each variable are  $> 0.600$ . The Cronbach's alpha value shows the consistency between each variable indicator. Cronbach's alpha also shows that the indicators used in this study passed the reliability test and were declared reliable for use in the main test.

### Hypothesis Testing

We used three-way ANOVA to analyze hypothesis 1, 2 and 3 and regression analysis to analyze hypothesis 4 and 5. The results of hypothesis testing are shown in Figure 2. Results allow us to support all hypothesis. Specifically, the final analysis allow us to confirm the evidence of a positive and direct effect of the relevance (p-value  $< 0.000$ ) and the credibility (p-value  $< 0.004$ ) of the contents promoted by the OBA on the acceptance of the personalized advertising. This results in a more click intention rate (H4:  $\beta = 0.455$ , p-value  $< 0.000$ ) and consequently in a positive behavioral intention in terms of actual purchase behavior (H5:  $\beta = 0,741$ , p-value  $< 0.000$ ).

Table. 23 Hypothesis Testing

Hypothesis	Indicator	Degree (Level)	EMM	Coefficient	P-Value	Remarks
H1	REL -> OA	High	33.863			
		Low	27.612		0.000	Significant

Source: Author (2022)

We also compare mean value from each stimuli condition Fig.2 to find out which stimuli that has the highest mean value, resulted on most influence OBA acceptance. The result show us that stimuli-1 (high relevance, high credibility and high perceived usefulness) give the strongest influence to OBA acceptance among all stimuli condition while stimuli 8 has the lowest mean value.

Finally, by using Three Way ANOVA, all stimuli will be compared to see the difference in the OBA acceptance value through the Pos Hoc Dunnet test Table 2.

Stimuli 8 (low relevance, low credibility, and low perceived usefulness) is used as a reference condition that will compare it's results with other stimuli by giving different treatments. It is obtained that the largest comparison is between stimuli 8 vs stimuli 1 with a mean difference of 17,089 with a negative value. This value shows that mean value of OBA acceptance on Stimuli 1 is higher 17,089 compared to stimuli 8. We also see closer the difference between stimuli 8 and other stimuli by comparing the difference in every treatment (high level) on every stimulu. Compared to stimuli 4 (high relevance, low credibility, low perceived usefulness) it is showed that mean difference is 15,367. On this condition, credibility and perceived usefulness are in the low category and relevance is only in the high category. It can be said that relevance in the high level gives a big and dominant influence. Compared to stimuli 6 (low relevance, high credibility, low perceived usefulness) it showed that given a different treatment, by increasing credibility to high, the mean difference of OBA acceptance is 11,847. This shows that there is a difference between the two stimuli conditions. Last, compared to stimuli 7 (low relevance, low credibility, high perceived usefulness) given a different treatment, by increasing perceived usefulness to high, mean difference to OBA is 9,281. As a conclusion with these three results, it can be said that giving relevance, credibility and perceived usefulness at a high level can increase OBA acceptance with high relevance giving the biggest impact among other independent variable.

Table. 24 Stimuli Comparison

<i>OBA Acceptance</i>	<b>Dunnett T3</b>	<b>Mean Difference (I-J)</b>	<b>Sig.</b>
Stimuli 8 (LR, LC, LPU)	Stimuli 4 <b>HR, LC, LPU</b>	-15.36715*	0.000
	Stimuli 6 LR, <b>HC, LPU</b>	-11.84722*	0.000

## VI.CONCLUSION AND IMPLICATION

Our research contributes to advance the state of knowledge about the importance of perceived benefit on OBA to influence actual behavior of online shoppers and its application in online retail environment such as e-marketplace. Prior research came up SEM approach to seek both the benefits (relevance, credibility, and perceived usefulness of personalized online behavioral advertising) and the risks (privacy and ethical concerns) of the OBA. While in practice, companies use a large number of algorithms to be able to personalize their advertisements in different conditions among each consumer (Bleier & Eisenbeiss, 2015a). Filling the gap in the existing literature, the research, through experimental design, seeks to see how benefits (relevance, credibility, and perceived usefulness) in OBA influence OBA acceptance with the use of different factor intensities is needed.

On the theoretical perspective, the results showed that the relevance at the higher-level treatment give significant effect on OBA acceptance compared to OBA with low relevance treatment. This finding confirms the Elaboration Likelihood Model theory which states that the more personal and relevant a message is, the more likely it is that the message will be noticed, thus making it more effective (Petty et al., 1983). The results also showed that in the overt condition (high credibility treatment) it would have a significant effect on OBA acceptance. This is related to if advertisers give users more control over their personal information, it can increase the credibility of advertisements and increase the likelihood of users to receive and click on the OBA (Tucker, 2014). OBA acceptance affected positively the intention on click intention and the behavioral intention confirming a significant effect of click intention on behavioral intention. Our results are consistent with literature that examined the effects of OBA on purchase intentions and identified click intention as predictor of the behavior of consumer's purchasing process. If the level of click intention increases, the likelihood of purchasing a product will increase (Urban et al., 2014).

On the managerial perspective, the research suggests marketers to focus attention on intensify the benefit (relevance, credibility, and perceived usefulness) on OBA to optimize the acceptance of OBA.

The results show that the combination of high relevance, high credibility and high perceived usefulness has a higher effect on ad acceptance. The findings of this study support marketing managers to display ad combinations that are more acceptable to users. OBA relevance at high level is the factor that gives the highest OBA acceptance effect. These findings can be used by advertisers as a reference in displaying OBA by making efforts to tailor ads to user interests.

High credibility on OBA acceptance suggests marketeers to pay attention to display the information sources and intermediaries, especially nowadays when the consumer is more concern about data privacy. The research also showed that high perceived usefulness with display of more trusted seller will affect OBA acceptance compared to less trusted seller. Less trusted seller still able to promote their content through OBA if combine with high relevance ads to expect for more acceptance. Once the benefit optimized, it will affect click intention and actual purchase intention of online customer.

## VII. LIMITATION AND FUTURE RESEARCH

Some limitations are associated with the experimental design. This research study uses a fictitious brand in the displayed OBA but the e-marketplace used is the result of the majority of participants' answers to the pilot test (Tokopedia) and not a fictitious brand. Further research can examine OBA originating from e-marketplaces or fictitious websites to avoid the influence of brand familiarity between participants and advertisers.

In addition, the manipulation of variables in the research is limited to high and low levels, while the relevance of advertising has a wider dimension of personalization. Future research can conduct variable manipulation at several levels, such as the relevance of advertisements using the participant's name or information about participants that is explicitly displayed in the OBA. On our experiment, the types of ads displayed in OBA are static while in practice OBA has displayed dynamic ads with different sizes. We also suggest further research examine OBA by using dynamic advertising displays or comparing ad receipts based on the appearance and location of advertisements on the website.

Finally, we invite all the researchers who want to investigate this topic to see the effect of OBA on purchase intentions such as multiple touchpoints, attribution, social media, and influencer marketing. Further research also can add a control group to confirm that the research results are caused by the manipulation of the independent variables and there is no influence from external variables that are not included in the study.

## Factors Affecting Income Inequality In The Province Of South Kalimantan 2017-2020

A.Yuniar Puspita Dewi<sup>1</sup> and B. Eni Setyowati<sup>2</sup>

<sup>1,2</sup>Economic development, Muhammadiyah Surakarta University, Surakarta, Indonesia

### Abstract

*Income inequality is a major problem that is often faced in developing countries. High income inequality results in delays in development, economic resources and increasingly high inequality between rich and poor groups of people. This study aims to analyze the factors that influence income inequality in the province of South Kalimantan in 2017-2020 using three independent variables, namely Human Development Index, open unemployment rate and population. The analytical method used is the panel data regression method. The results obtained from the panel data regression analysis, namely the Fixed Effect Model (FEM) that the right approach to explain the effect of the dependent variable with the independent variable in this study. Based on the validity test, the Human Development Index variable has a significant effect, while the open unemployment rate and population have no significant effect on income inequality.*

*Keywords— Income Inequality; Human Development Index; Total Population; Panel Data.*

### I. INTRODUCTION

In the economic development of a developing country, it is not far from the problems that must be faced, because economic development is a benchmark to see the development of a region or region. The purpose of doing economic development is to create economic growth, unemployment, reduce poverty and income inequality [1].

One of the problems that are often faced in economic development is income inequality. In addition, income inequality is a reality that exists in the midst of the world community, both in developed and developing countries is also an important issue for review [2].

Economic development is not always evenly distributed, income inequality between regions is a serious problem. There are some areas that experience fast economic growth, but also areas that experience slow economic growth. The area did not experience the same development and progress due to development and progress, this was due to the lack of resources [3].

The Gini index is a measure that describes the level of income inequality in the province, the Gini index has a number level from 0 to 1, which means that if inequality is above one, it means that the inequality is very high. The following can be seen in table 1 data on the Gini index in the province of South Kalimantan:

Fig 1. Comparison of the Gini Ratio in South Kalimantan Province (Source: BPS South Kalimantan Province)

Based on the data in Figure 1 above, it can be concluded that each region in South Kalimantan has various Gini ratio levels, which means that the level of income in various regions of South Kalimantan cannot be said to

be evenly distributed. In 2020, the City of Banjar Baru has a Gini ratio index value higher than other regions, which is 0.381, while Tanah Laut Regency has the lowest Gini ratio index value with a value of 0.250.

Inequality in South Kalimantan Province is that most regions or regions are still relatively underdeveloped, with a total of 13 regencies/cities. Based on the problems described above, the purpose of this study is to determine the factors that influence income inequality in the province of South Kalimantan in 2017-2020.

## II. LITERATURE REVIEW

### A. Income inequality

Income inequality is the difference between the rich and the poor, which results in differences in prosperity due to income inequality (Baldwin, 1986).

Inequality occurs in each region due to differences in the resources owned by each region where inequality occurs. As a result, the income earned by the residents of each region experiences differences in resources that create inequality. In addition, differences in resources can also distinguish the development process in an area. This difference in the development process causes differences between regions that are considered advanced and those that are backward (Sjafrizal, 2012).

To measure income inequality, there are measuring tools to measure income inequality, namely the Williamson index and the Gini index. In this study, the authors chose to use the Gini index measuring instrument in measuring income inequality in South Kalimantan Province.

### B. Gini Index

Gini index is a calculation tool to measure income inequality. The Gini index has an average number in the range from 0 to 1. At this level, it can measure the inequality of income obtained by the community. Based on the Gini index class, it is divided into several classes, as follows:

Table 1. Income inequality

Score	Description
< 0.4	Low Inequality Rate
0.4 – 0.5	Moderate Inequality
>0.5	High Inequality

In its own calculation, the Gini index has the following formula:

$$GR = 1 - \sum f_i [Y_i + Y_{i-1}]$$

Information:

GR : Gini coefficient

$F_i$  : Number of people who receive income class-i

$Y_i$  : Cumulative amount of income of class-i

$Y_{i-1}$  : Cumulative amount of total expenditure of class-i

### C. Lorenz Curve

The Lorenz curve is a curve that describes the cumulative income description function. This curve is located in a square where the tense side represents the cumulative percentage of national income, while the bottom side represents the cumulative percentage of the population. The Lorenz curve which is closer to the diagonal (straighter) implies a more even distribution of national income. On the other hand, if the Lorenz curve is further away from the diagonal (more curved), then it reflects a worsening situation, the distribution of national income is increasingly unequal or uneven. The further the Lorenz curve is from the diagonal line (perfect equality), the higher the inequality shown. The most dangerous situation from perfect inequality, for example a situation where all income is only received by one person, will be indicated by the overlap of the Lorenz curve with the bottom horizontal axis and the right vertical axis (todaro, 2003).

### D. Kuznet theory

Kuznet presented a hypothesis regarding the relationship between a country's economic growth and the inequality of income distribution among the population in the inverted U-shaped form. This indicates that at the beginning of growth, the income distribution gap was even higher (Djojohadikusumo, 1994). However, at a certain stage the income distribution gap will decrease (Todaro, 2003). As in the following image:

Fig 2. Kuznet Hypothesis (Source: Todaro, 2003)

#### *E. Relationship between Human Development Index and Income Inequality*

That the human development index has a positive and significant influence on income inequality in the province of East Java. The level of life expectancy that is quite high can form and create a productive workforce and in the end it will increase the income per capita of the community, it is clustered in areas that are central to economic activity, especially in industrial centers or areas with high incomes, causing rapid growth. Uneven and triggers economic inequality [4].

#### *F. The Relationship of the Open Unemployment Rate to Income Inequality*

Unemployed people cannot produce economic products. This situation is clarified that urbanization towards areas that are more economically developed has led to the emergence of open unemployment so that many big cities are burdened by an increasing labor force but limited employment opportunities and creates greater inequality [5].

#### *G. Relationship between Population and Income Inequality*

In ancient literature and Maltus theory, population is generally seen as an obstacle to development. Its existence in large numbers and high growth is considered to only add to the burden of development. That is, a large population reduces per capita income and creates employment problems, while in modern literature, the population is actually seen as a trigger for development. The continuity of production activities is because there are people who buy and consume the goods produced. An increase in aggregate consumption allows productive enterprises to develop, as well as the economy as a whole (Dumairy, 1996).

### III. RESEARCH METHODOLOGY

This study discusses the factors that influence income inequality in South Kalimantan Province in 2017-2020. The data used in this study is panel data where this data uses time series data for 4 years and a cross section of 13 districts/cities.

#### *A. Research Variable*

Income inequality (Y) is the difference in an area with other areas that are in a certain area. The Human Development Index (X1) is a composite index used to measure the average achievement of a country in three basic aspects of human development including the life expectancy index, education index and income index. The Open Unemployment Rate (X2) is the percentage of the number of unemployed to the total workforce in each year.

Total Population (X3) is a group of individuals who live in a certain area.

#### *B. Data Collection Technique*

The data taken in this study used secondary data. Data on independent and dependent variables were obtained from the Central Statistics Agency of South Kalimantan Province.

### C. Data Analysis Technique

The regression model estimation method using panel data is carried out with three approaches, including the Common Effect Model (CEM), Fixed Effect Model (FEM) and Random Effect Model (REM). The basic model equations used in this research are as follows.

$$GI_{it} = \beta_0 + \beta_1HDI_{it} + \beta_2OUR_{it} + \beta_3TP_{it} + \varepsilon_{it}$$

Description:

GI	: Gini Indeks
HDI	: Human Development Index
OUR	: Open Unemployment Rate
TP	: Total population
$\beta_0$	: Constant
$\beta_1\beta_2\beta_3$	: Regression Coefficient
i	: District/City
t	: Year
$\varepsilon$	: Error term

### D. Common Effect Model

The Common Effect Model is an approach the simplest panel data model because it only combines time data series and cross sections. By simply combining the data without looking at differences between time and individuals, the OLS method is used to estimating the panel data model (Widarjono, 2018). The Common Effects model can be written as following:

$$Y_{it} = \beta_0 + \beta_1X_{1it} + \beta_2X_{2it} + \beta_3X_{3it} + e_{it}$$

Description:

Y	: dependent variable
X	: independent variable
i	: cross section
t	: time series

### E. Fixed Effect Model

Fixed Effect Model is a panel data estimation technique that using a dummy variable to capture the difference in the intercept. This estimation model is often called the Least Squares Dummy Variables (LSDV) (Widarjono, 2018)

### F. Fixed Effect Model

In the Fixed Effect model, the use of dummy variables aims to represents ignorance of the actual model. However, this too lead to a reduction in the degree of freedom which ultimately reduce the efficiency of the parameters. The problem can be solved by using the error terms known as random effects method. In this method, the disturbance variables may be mutually relates between time and between individuals (Widarjono, 2018).

## IV. RESULT/FINDING

Based on the estimation results selected in this study is the Fixed Effect Model (FEM). The results of the estimation in this study indicate that the human development index has a significant effect on income inequality in the province of South Kalimantan, the open unemployment rate and population have no effect on income inequality in the province of South Kalimantan. The following are the results of the T test in this study, namely:

Table 1. T Test Result

Variable	Coefficient	Std. Error	t-Statistic	prob.
C	1.950754	0.616297	3.165283	0.0031
HDI	-0.027881	0.012101	-2.304021	0.0271
OUR	-0.013782	0.010673	-1.291270	0.2048

TP	1.14E-06	1.02E-06	1.122604	0.2690
----	----------	----------	----------	--------

Source: Data processed

The F test is also used as a tool to see the effect simultaneously. The following are the results of the F test in this study:

Table 2. F Test Result

F-statistic	4.566580
Prob (F-statistic)	0.000093

Source: Data processed

Based on table 2 shows that the probability value of F statistic is  $0.000093 < 5\%$  (0.05) meaning that (Ho) is rejected and (Ha) is accepted. The results of the F test explain that the human development index, the open unemployment rate and the number of residents simultaneously have a significant simultaneous effect on income inequality which is expressed by the Gini ratio.

In addition, the coefficient of determination test ( $R^2$ ) is carried out in order to measure how much the independent variable affects the dependent variable. The following are the results of the Coefficient of Determination ( $R^2$ ) test in this study, namely:

Table 3. Coefficient of Determination Test Results ( $R^2$ )

Adjusted R-squared	0.511956
--------------------	----------

Source: Data processed

Based on table 3 above, it shows that the value of the result of the Coefficient of Determination ( $R^2$ ) test is 0.511956. This explains that the effect of the independent variable on the dependent is 51% and the remaining 49% is influenced by other variables.

The regression analysis that has been carried out aims to determine the factors that influence income inequality in the province of South Kalimantan for the period 2017-2020. The influencing factors include the human development index, the open unemployment rate, and the population. The following is a summarized table regarding the relationship between the independent variable and the dependent variable, as follows:

Table 4. Panel Data Regression Results

Variable	Coefficient	Probabilitas	Description
C	1.950754	0.0031	significan
HDI	-0.027881	0.0271	significan
OUR	1.14E-06	0.2690	not signifikan
TP	-0.013782	0.2048	not signifikan
Adjusted R-squared			0.511956
F-statistic			5.417298
Prob (F-statistic)			0.002095

Source: Data processed

Based on table 4, it shows that the output of the data processing uses the panel data regression method, namely the value of the constant coefficient of 1.950754. Means that the value of the Gini index is 1.950754.

## V. DISCUSSION

### A. *Effect of Human Development Index on Income Inequality*

The results of hypothesis testing in this study indicate that the HDI variable is significant to income inequality in South Kalimantan Province in 2017-2020. This is evidenced by a significant value  $< 5\%$  (0.05) with a probability value of 0.0271 and a coefficient value of -0.027881, meaning that if every person's HDI increases by 1 person, it will reduce income inequality by -0.027881 percent.

These results mean that every increase in HDI will be followed by one of the factors that can further widen inequality in the province of South Kalimantan. The test results in the human development index research have a significant effect on income inequality. These results support the research of Widyastuti and Lucia (2021) in their research that the Human Development Index has a positive effect on income inequality in West Java Province [6].

In addition, where large increases in income can play a relatively small role in human development. Inequality that occurs in an area can affect the level of community welfare in an area. The inequality of the human development index causes some areas to be more developed because of human quality and areas that are not developed because of low human quality[1].

#### *B. Effect of Open Unemployment Rate on Income Inequality*

Based on the results of the analysis of the Open Unemployment Rate variable, it has no significant effect on income inequality. The variable coefficient of the open unemployment rate is 1.14E-06 with a probability of 0.2690, which means that a 1% increase in the open unemployment rate has no effect on an increase in inequality of 0.2690 percent. These results support Hariani's research (2019) where the unemployment rate has an insignificant relationship to income inequality in 38 districts/cities of East Java in 2012-2015[7].

#### *C. The Effect of Population on Income Inequality*

Based on the results of the analysis of the population variable has no significant effect on income inequality. The coefficient of the population variable is -0.013782 and the probability value is 0.2048, which means that if the population increases by 1%, it has no effect on income inequality in South Kalimantan Province in 2017-2020. These results support Hartandi's research (2018) where population has no influence on income inequality in Central Java.

## VI. CONCLUSION AND RECOMMENDATION

### *A. Conclusion*

Based on the results of the analysis of the factors that influence income inequality in South Kalimantan Province in 2017-2020, it shows that the human development index has a significant effect on income inequality in South Kalimantan province in 2017-2020. Meanwhile, the open unemployment rate and population have no significant effect on income inequality in South Kalimantan Province in 2017-2020. Which means that if the unemployment rate is open and the population increases it will not affect income inequality in South Kalimantan Province.

### *B. Recommendation*

Based on the conclusions obtained, it can provide some suggestions for the South Kalimantan Provincial government that it must continue to improve the human development index such as education, per capita income, and health in order to realize a quality human development index so that it can reduce income inequality and can affect people's welfare. The government also needs to create extensive job opportunities to improve the quality of the workforce in alleviating the unemployment rate in South Kalimantan Province. For the next writer, in the selection of variables, it is better to involve better variables.

## ACKNOWLEDGMENT

We would like to thank Sustainable Collaboration in Business of Telkom University in Indonesia, who give me the opportunity to attend this international conference.

## The Effect Of The Number Of Unemployment, The Number Of Population And The Literature Rate On Poverty Rate In Indonesia 2016-2020

A. Yasmine Rahma Sheva Surya Safira<sup>1</sup> and B. Eni Setyowati<sup>2</sup>

<sup>1,2</sup>Economic Development, Universtas Muhammadiyah Surakarta, Surakarta, Indonesia

### Abstract

*Poverty is a problem related to the inability to access economic, socio-cultural, political and participation in society. This study aims to determine the effect of the influence, population, and literacy rate on poverty in Indonesia in 2016-2020. In this study reveals how the influence of poverty affects the factors studied. In this study the data used were secondary data in the form of time series (2016-2020) and cross sections (34 provinces in Indonesia). The selection of the best method in this study using the Fixed Effect Model (FEM). By using panel data analysis tool using eviews 9. The results of this study indicate that the population and literacy rate have a significant effect on poverty in Indonesia. Meanwhile, the movement has proven to have no effect on poverty in Indonesia. This study shows that the estimated model, namely the Fixed Effect Model (FEM) is 0.642049. This means that 64.20 percent of the variation in poverty changes in Indonesia is explained by variations in composition, population, and literacy rates. While the remaining 35.8 percent is explained by variations of other variables not included in the model. The conclusion shows that poverty has a positive effect on the total population, population, and literacy rate in Indonesia.*

*Keywords— poverty rate; unemployment rate; population; literacy rate*

---

### I. INTRODUCTION

Poverty is a multi-faceted phenomenon of food insecurity, lack of basic necessities, and physical handicap. Poverty basically contains three broad approaches: basic need, income approaches, and capability approaches (Setyowati & Rahayu, 2020). Poverty is a worldwide problem where poverty is also difficult to overcome because there are many factors that influence it, therefore in every country there is a poverty problem. Poverty can also affect several factors, namely, the number of unemployed, the population and literacy rates. Of these factors can affect poverty in Indonesia.

Basically Unemployment refers to the socio-economic situation in which individuals are willing to work but cannot get a job (Ghoto, 2021). Therefore, development in the economy is the main goal for developing countries, including Indonesia. Development is not related to growth but also to improving welfare, security, justice and the quality of resources, including human resources (SDA) and natural resources (SDA). Poverty is one of the basic problems that affect the economic development of a country. Due to the multidimensional nature of poverty, which means that the primary is in the form of poor assets and the secondary aspect is poor in social networks, financial resources, and information and others (Arif Novriansyah, 2018). In the case of poverty, the population factor also has an effect, more and more population without being balanced with jobs can cause unemployment which will result in increasing poverty.

There are several factors that affect poverty. First, there is absolute poverty which means that a person does not cover the minimum needs of life, including the needs for food, clothing, health, housing and education needed to live and work. Second, cultural poverty refers to the attitude of a person or society that does not want to try to improve the level of life despite efforts from outsiders to help it. Third, relative poverty is closely related to structural development problems. Namely, development policies that have not been balanced cause income inequality (Tazkiya, 2015).

Other factors that influence poverty include unemployment. Unemployment there are several factors, namely unemployment can be seen from the slow development of a country caused by a high increase in unemployment and not balanced with employment (Arif Novriansyah, 2018).

The main area of concern in today's world is education. The socio-financial progress of any country depends on education and literacy. A country with high human resource development is considered to have a high level of proficiency, which in turn helps to increase production and high productivity. It also encourages socio-financial aspects that are developing throughout the country (Nadeem et al., 2021). Poverty can also affect the literacy rate because it can be an indicator of the education development of the population. The higher the literacy rate, the

higher the quality and quality of human resources. Lack of education costs can cause economic problems that can trigger poverty.

This study aims to determine the factors that can affect poverty such as population, unemployment and literacy rates in Indonesia in 2016-2020.

## II. LITERATURE REVIEW

In general, it is one of the fundamental problems that is the center of attention of the government in the country. In general, poverty is a condition in which a person or group is unable to fulfill basic rights to maintain and develop a dignified life. It can be said that the poor people spend on average per capita per month below the Poverty Line (GR). Poverty is grouped into two categories, namely poverty which means that poor people have income levels below the poverty line caused by poverty that occurs due to the influence of development policies that have not reached the whole community.

There is also unemployment which can affect poverty. Unemployment can occur as a result of the high rate of change in the workforce that is not matched by the existence of a fairly wide job field and the absorption of labor which tends to be small in percentage. This is due to the low growth rate of job creation to accommodate workers who are ready to work (Arif Novriansyah, 2018).

First, there is the meaning of the dependent variable. The dependent variable is what is measured in the experiment. This is a change due to a change in the independent variable. The dependent variable is called the output variable, criterion, or consequential. That is the result of the influence caused by the independent variable. In this study the dependent variables used are:

### A. *Poverty*

Poverty in this study is measured by the number of poor people according to the criteria of the Central Statistics Agency in each province of Indonesia in 2016-2020. From BPS data, the number of poor people is the total population with per capita spending below a certain threshold which is expressed as the poverty line. According to the Central Bureau of Statistics, the poverty line is a representation of the minimum amount of rupiah needed to meet the minimum basic needs for food which is equivalent to 2100 kilocalories per capita per day and basic needs for food. between the independent and dependent variables are related which:

### B. *Unemployment*

When the unemployment rate increases, the poverty rate also increases and when unemployment decreases, the poverty rate also decreases. So poverty can be a determinant and dominant factor that affects humanitarian problems such as backwardness, ignorance, neglect, crime, violence, human trafficking, illiteracy, school dropouts, street children, child labor. Thus poverty cannot only be viewed from one side of low income but must be viewed from many interrelated aspects (Yacoub, 2012).

### C. *Population*

The relationship between population and poverty is that the number of people is related to poverty, this means that the more the population increases, the more the number of poor people if the number of jobs is not balanced with the increase in population, it can result in an increase in the poverty rate. This is because many people have no income so they are unable to meet their daily needs which has resulted in an increase in the number of poverty.

### D. *Literacy Rate*

Poverty sometimes also means the absence of access to education and jobs that are able to overcome the problem of poverty and gain proper respect as citizens. Basically the literacy rate has a negative and significant impact on poverty because the literacy rate can also be an indicator of the education development of the population. The higher the literacy rate or literacy rate, the higher the quality and quality of human resources. related to the equation above, there are previous studies that support this research. the following are previous studies:

(Batul et al., 2019) In this research, it is related to Education plays an important role to pave way towards economic growth. Investment in education enhances the living standards and it is necessary for economic growth and social well-being of a society. This study forecasted the education status and its impact on economic growth by taking data from 1971 to 2016 in Pakistan. Secondary data were taken from International Finance Statistics and World Bank Development Indicators. The variables included in the research were poverty, Education status, and Economic growth. Time series analysis was carried out on the data. The empirical methodology adopted for this purpose includes the use of Augmented Dickey Fuller test, WALD test, Johanson cointegration test, and

VECM test. The study found long-run relationship between economic growth and the education status when poverty serves as dependent variable measuring economic growth in case of Pakistan. This showed that education does affect economic growth in the long run but not in short run. The interdependency between the variables suggested that policies should be formulated that would have a long lasting positive impact on the education status of the population and the continuity of the policies to achieve its objectives is more essential.

(Nolen, 2013) In this study with regard to poverty there are several explanations for poverty. Employment measures have been criticized for being potentially inadequate when looking at changes in poverty or literacy over time or in determining the success of certain public policies. Use the size of the number of unemployed can be misleading as well. I used a similar externality argument with those used in literacy debates and provide a measure class that captures externalities profession.

(Setyowati & Rahayu, 2020) This study explains about Poverty is a multi-faceted phenomenon of food insecurity, lack of basic needs, and physical disabilities. Poverty basically contains three broad approaches: basic needs, income approach, and capabilities approach. Islamic microfinance is convergence of Islamic finance and microfinance. It has great potential to combine Islamic principles focusing on the poor and disadvantaged with a mission microfinance to reach the poor and give them access to finance. This study intends to know the factors that influence poverty and to see how Islamic Microfinance (IMF) as an alternative solution for empowering the poor. This research takes the case Study of KSPPS or BMT KUBE Colomadu Sejahtera in Karanganyar Regency, Surakarta. The method used is the Logit model. Variables that affect and significant effect on poverty is income, number of dependents, and training been followed

(Tamrin et al., 2022) In this study the local government has tried to increase economic growth and poverty alleviation, but this problem has not achieved the desired result. This study aims to determine direct and indirect effects of private investment, labor, infrastructure spending, human resources development index on economic growth and poverty levels in East Kutai Regency. To analyze the data used path analysis. The data used is secondary data in the form of time 2007-2021 data series. The results of this study indicate that the direct effect of Private Investment, Labor, Human Development Index on growth has a positive direction but not significant. On the other hand, infrastructure spending for economic growth has positive approach. Then the direct effect of private investment, human development poverty index, is positive and not significant if it has a direction. Immediate effect of Labor Force, Infrastructure Expenditure on Poverty Level is negative and important. The poverty rate through economic growth has a positive and significant impact direction. Indirect Effect of Labor Force on Poverty Levels Through the Economy growth has a negative direction and is not significant. Indirect effects of infrastructure spending on poverty levels through economic growth has a negative and significant effect direction.

In addition, the number of residents in the economic development of an area is a fundamental problem, because uncontrolled population growth can result in not achieving economic development goals, namely community welfare and reducing poverty. (Terhadap et al., 2016). A high population but unable to balance employment will lead to a high poverty rate or it can also increase the number of poverty.

Many poor people experience ignorance even systematically. Therefore, it becomes important for us to understand that poverty can lead to chaos, and ignorance is clearly synonymous with poverty. Literacy is one indicator of education. The welfare of the community will be directly proportional to the community's need for quality education so that the literacy rate will increase. On the other hand, countries with high levels of poverty will be in line with human resources with low levels of education.

The higher a person's education, the more the person's productivity will increase so that it will increase both individual and national income.

In this study, there are some data in the form of tables to show the number in each region in Indonesia and there are several related data regarding the number of variables in this study.

No.	Province	2017	2018	2019	Average
1.	Jawa Tengah	4,15	4,19	4,19	4,17

## Sustainable Collaboration in Business, Information and Innovation 13<sup>th</sup> 2022

2.	Jawa Timur	4,10	3,77	3,77	3,88
3.	Jawa Barat	8,49	8,22	7,78	8,16
4.	Aceh	7,39	6,54	5,48	6,47
5.	DKI Jakarta	5,36	5,73	5,50	5,53

*Source : Central Java Provincial Statistics Agency*

In the end, the level of unemployment and poverty in a region will affect the economic growth of a country or region, this is clear considering that economic growth is one of the most important indicators.

The population in economic development is a fundamental problem. According to Malthus' theory, population growth is the result of the development process. However, population growth cannot occur without a proportional increase in welfare. If the rate of capital accumulation increases, the demand for labor also increases. Such conditions encourage population growth. However, an increasing number of people can reduce per capita income and can cause employment problems.

The more the population grows, it can affect poverty, because humans are much faster than the production of agricultural products which will cause the population to find it difficult to meet the needs of life so that it will have an impact on increasing poverty.

Table 2 . Total Population in Indonesia in 2016-2020

No.	Year	Amount
1.	2016	258496.5
2.	2017	261355.5
3.	2018	264161.6
4.	2019	266911.9
5.	2020	269603.4

*Source : Indonesia in Figures 2016*

While there is a process of increasing yield which is lower than the production factor which is fixed in number, namely land, the food supply will only increase according to an arithmetical sequence. Since food growth cannot keep up with the speed of population growth, per capita income tends to continue to decline to such a low level that the population must maintain conditions slightly above the subsistence level.

The level of education in Indonesia also continues to improve and increase. One indicator that can be used as a benchmark for equitable social welfare is by looking at the high and low percentage of the population who are literate. The level of literacy can be used as a measure of the progress of a nation. Literacy Rate (AMH) is a comparison between the number of people over fifteen years old who can read and write with the number of people aged fifteen years and over who cannot read and write. The highest literacy rate limit is 100, while the minimum limit of zero is the UNDP standard. This condition describes 100% or the entire community is able to read and write, and vice versa, a value of zero describes the condition that is unable to read and write.

Therefore, the literacy rate can also be an indicator of the education development of the population. The higher the literacy rate or literacy rate, the higher the quality and quality of human resources. People who can read and write are assumed to have the ability and skills because they can absorb information both verbally and in writing.

In Indonesia, there are still many people, especially children and the elderly generation who are illiterate. Factors that cause the growth of illiteracy in the next generation who are not familiar with technology, for example digital books. In fact, the use of digital books is an alternative to reduce illiteracy rates.

Table 3. Literacy rate in 5 provinces in Indonesia year 2017-2019

No.	Provinsi	2017	2018	2019
	Jawa Tengah	99.87	99.88	99.92
	Jawa Timur	99.82	99.88	99.91
	Jawa Barat	99.96	99.99	99.98
	Aceh	99.96	99.92	99.98
	DKI Jakarta	99.96	99.97	99.96

Source: Central Bureau of Statistics of Central Java Province

As we know from table 1.3 the Literacy Rate of Central Java Province has increased and almost all Provinces have almost the same difference, but Central Java Province every year has an increase in Literacy Rate.

Based on the above background, this researcher intends to find out the factors that influence poverty such as population, unemployment, and literacy rates on poverty in Indonesia.

### III. RESEARCH METHODOLOGY

The analytical method used in this research is descriptive and quantitative analysis. To analyze the effect of the number of unemployed, population, and literacy rates on the poverty rate in Indonesia in 2016-2020, this study uses panel data analysis.

To analyze the effect of unemployment, population, and literacy rate on the poverty rate in Indonesia, this study contains several models or many objects and several types of data (Anggadini, 2015).

The panel data regression model has several formulas that can be used and are formulated as follows (Srihardianti & Prahutama, 2016) :

$$PL_{it} = \alpha + \beta_0 + \beta_1 UNP_{it} + \beta_2 TP_{it} + \beta_3 LR_{it} + \mu_{it} \quad (1)$$

Where :

- PL : Poverty Levels for the i-th region and t time
- UNP : Unemployment for region i and time t
- TP : Total Population for the i-th region and t-time
- LR : Literacy Rate for the i-th region and i-time
- i* : show province
- t* : show time series
- a* : constant
- $\beta_{0,1,2,3}$  : intercept coefficient and slope
- $\mu$  : nuisance or unobservable factors

From the econometric model above, there is a residue that has three possibilities in the model specifications. So there are three approaches in using this panel data, namely Pooled Least Square (PLS), Fixed Effect Model (FEM), and Random Effect Models (REM); In determining the best estimation model, the Chow test and the Hausman test were used.

### IV. RESULT/FINDING

The results of the panel data regression estimation on the econometric model using the Pooled Least Squares (PLS), Fixed Effect Model (FEM), and Random Effect Model (REM) approaches are shown in Table:

Table 4.

Variabel	Koefisien Regresi		
	PLS	FEM	REM
<i>C</i>	702,4156	-7002,234	396,9855
<i>UNP</i>	-0,722880	1,911115	-0,467566
<i>TP</i>	-2,57E-05	0,091323	-3,92E-05
<i>LR</i>	-6,445376	63,62134	-3,398762
<i>R</i> <sup>2</sup>	0,073732	0,642049	0,009656
<i>Adjusted R</i> <sup>2</sup>	0,056992	0,545159	-0,008242
F-Stat	4,404573	6,626634	0,539501
Prob.F Stat	0,005205	0,000000	0,655881

Some econometric models have residues that have three possibilities in the model specification. So there are three approaches in using this panel data, namely Pooled Least Square (PLS), Fixed Effect Model (FEM), and Random Effect Models (REM). In determining the best estimation model, the Chow test and Hausman test are used. In this method can use Pooled Least Square (PLS) or Common Effect Model (CEM). The panel data model only combines time series and cross section data using the OLS method with common effect estimation. ) (Syukron & Fahri, 2019).

#### A. Chow Test

Tables 5. Chow Test Estimation Results

Effect Test	Statistic	d.f.	Prob.
Cross-section F	6,398884	(33,133)	0,0000

In selecting the right test in panel data between the Common Effect Model (CEM) and Fixed Effect Model (FEM) and Random Effect Models (REM), the Chow test can be used to determine whether the common effects model is better to use than the fixed effect method.

#### B. Husman Test

Table 6. Husman Test Estimation Results

Test Summary	Chi-sq.Statistic	Chi-sq.d.f.	Prob.
Cross-section random	116,044351	3	0,0000

The Husman test is used to determine the Husman statistical value is greater than the critical value, the more appropriate model is the Fixed Effect model, whereas if the Husman statistical value is less than the critical value, the correct model is the Random Effect (Suliswanto, 2012).

Because  $p$ -value for F (0,0000)  $\leq \alpha$  (0,05), so  $H_0$  rejectd. So the best model to use is the Fixed Effect Model (FEM).

Table 7. Fixed Effect Model (FEM) Estimation Results

$\widehat{PL}_{it} = -7.002,234 + 1,911115 UNP_{it} + 0,005739TP_{it} + 63,62134LR_{it}$
(0,5020) (0,0000)*** (0,000)***
R2 = 0,642049; DW = 0,865474 ; F-statistic = 6,626634; Prob. F = 0,000000

---

Keterangan:

\* Significant to  $\alpha = 0,01$

\*\* Significant to  $\alpha = 0,05$

\*\*\* Significant to  $\alpha = 0,10$

The number in brackets is the t-statistical probability value

---

Based on the results of the partial significance test on the econometric model that can be seen above, it is proven that the population and literacy rate have a significant effect on poverty in Indonesia. Meanwhile, unemployment has proven to have no effect on poverty in Indonesia.

The number of unemployed has a regression coefficient of 1,911, where the pattern of the relationship between the number of unemployed and poverty is linear, so that if the number of unemployed increases by 1 person, then Poverty will increase by 1 person, as well as if the number of unemployed people decreases by 1 person.

The population has a regression coefficient of 0.0057 with a pattern of relationship between population and linear-linear poverty, so that if the Population increases by 1 person, Poverty will increase by 1 person, so if the Population decreases by 1 person then Poverty will decrease by 1 person.

The literacy rate has a regression coefficient of 63.621 with the pattern of the relationship between the literacy rate and poverty is linear-linear, so that if the literacy rate increases by 1 index number, Poverty will decrease by 1 person, while if the literacy rate decreases by 1 index number, Poverty will increase by 1 person.

## V. DISCUSSION

### A. Effect of Independent Variables

Table 8. Partial Significance Test Results (t test)

Variable	Probability t-statistik	Criteria	Conclusion
UNP	0,5020	>0,10	Not significant
TAPI	0,0000	$\leq 0,01$	Significant to $\alpha = 0,01$
LR	0,0000	$\leq 0,01$	Significant to $\alpha = 0,01$

Based on the results of the partial significance test on the econometric model in the table above, it is proven that TP and LR have a significant effect on PL (Poverty) in Indonesia. Meanwhile, UNP (Unemployment) has proven to have no effect on PL (Poverty) in Indonesia.

UNP has a regression coefficient of 1.911, where the pattern of the relationship between UNP and PL is linear, so that if UNP (the number of unemployed) increases by 1 person then Poverty will increase by 1 person, as well as if UNP decreases by 1 person then PL (poverty) will decrease by 1 person.

TP has a regression coefficient of 0.0057 with a linear-linear relationship between TP and PL, so that if the Population (TP) increases by 1 person then Poverty (PL) will increase by 1 person, it is better if the Population (TP) decreases by 1 soul then Poverty (PL) will decrease by 1 soul.

LR has a regression coefficient of 63.621 with the pattern of the relationship between LR and PL is linear, so that if LR increases by 1 index number, Poverty will decrease by 1 person, while if PL decreases by 1 index number, Poverty will increase by 1 person.

### *Economic Interpretation*

Effect of UNP= unemployment on PL

The results of the effect validity test (t test) on the econometric model show that UNP has a positive effect on poverty in Indonesia. This proves that the results of this study are in accordance with the initial hypothesis, because unemployment has a positive effect on poverty in Indonesia. This is in accordance with

research conducted by Diratama and Umaruddin Usman in 2018, with a study entitled The Effect of Population, Unemployment and Economic Growth on Poverty in the Riau Islands, where Unemployment has no effect on Poverty that occurs in Kelupauan Riau. The Effect of Foreign investment on Gross Regional Domestic Product.

The results of the effect validity test show that TP has a positive effect on PL in Indonesia. This proves that the results of this study are in accordance with the hypothesis that population has an effect on the level of poverty in Indonesia.

*The Effect of Literacy Rate on Poverty*

The results of the effect validity test show that the Literacy Rate has a positive influence on poverty, this is in accordance with the hypothesis on Poverty in Indonesia. This proves that the results of this study are in accordance with previous research.

Province	Effect	Costant
ACEH	218,2001	-6.786,03
SUMATERA UTARA	-645,7297	-7.647,7297
SUMATERA BARAT	165,9716	-6.836,2624

SULAWESI SELATAN	-102,5084	-7.104,7424
SULAWESI TENGGARA	462,6329	-6.539,6011
GORONTALO	617,7093	-6.384,5247
SULAWESI BARAT	601,0457	-6.401,1883
MALUKU	559,1244	-6.443,1096
MALUKU UTARA	551,7553	-6.450,4787
PAPUA BARAT	681,6651	-6.320,5689
PAPUA	1169,759	-5.832,759

Based on the results of the constants above, it is known that those with low constants are in the province of West Java with a constant value of -10,778,521, which means that West Java has the lowest poverty rate compared to other provinces in Indonesia. Meanwhile, the highest constant is in Papua Province with a constant value of -5,832,759 which means Papua has the highest poverty rate compared to other provinces in Indonesia.

## VI. CONCLUSION AND RECOMMENDATION

In this study, after conducting analysis tests and panel data with the number of unemployment, population, and literacy rates on the poverty rate in Indonesia in 2016-2020 it can be concluded that:

- In the t-test the population and literacy rates have an effect on poverty. Meanwhile, the population has no effect on poverty. Thus the population and literacy rate have a positive effect, while poverty and unemployment have a negative effect on poverty.
- The number of unemployed has a positive effect on poverty in Indonesia in 2016-2020
- The results of the effect validation test show that the number of unemployment on poverty in Indonesia. This proves that the population has an effect on the poverty level in Indonesia in 2016-2020
- Literacy Rate has a positive influence on poverty in Indonesia in 2016-2020.

Suggestions that can be used for further researchers to be better in the future are as follows:

- In this research problem, poverty can use improving the quality of human resources and will be able to have a major influence on reducing poverty **rates** that occur in Indonesia.
- There must be something that guarantees the fulfillment of basic needs and encourages them to fulfill their secondary and tertiary needs, in order to achieve this is by creating a fair economic distribution in the midst of society.
- To reduce poverty, the government should increase economic growth. Economic growth is one of the keys to reducing poverty, because growth increases the need for labor, which means opening up job opportunities.
- The government needs to improve so that the education quality of the population continues to increase. This will support production activities so that the income obtained is maximized and poverty will be reduced.

## **Analysis Of The Influence Of Gross Regional Domestic Product (GDP), Unemployment, And Education On Poverty In Central Java 2016 – 2020**

A.Ibnu Ahmad Firmansyah<sup>1</sup>, B.Eni Setyowati<sup>2</sup>

<sup>1,2</sup>Economic Development, Muhammadiyah Surakarta University, Surakarta, Indonesia

### **Abstract**

*Poverty is one of the Central Java Provincial government programs, due to the large number of poor people in Central Java Province in 2021 amounting to 3.934 million people and occupying the serial number of the two provinces with the highest number of poor people in Indonesia. Reducing the number of poor people is one of the priority programs of the Central Java provincial government, with a target of reducing the poverty rate below 10 percent. This study intends to determine the factors that influence poverty so that later it is expected to be used as a basis for determining policies in overcoming the problem of poverty in Central Java. The data used in this study is secondary data obtained from the Central Statistics Agency (BPS) as well as several other references as support. While the analytical method used in this research is the panel data linear regression analysis method with the REM (Random Effect Model) method with the help of Eviews 7.0 software. The results of this study indicate that the unemployment variable has a positive and significant effect on the poverty level in Central Java Province.*

*Keywords— Poverty; Education; Unemployment; Panel Data.*

### **I. INTRODUCTION**

Poverty is a global problem, where countries around the world always face and pay attention to these problems (Todaro and Smith; 2006). According to Arsyad (2010) poverty can be broadly classified into two aspects, namely primary aspects and secondary aspects. The primary aspect is the aspect in the form of poor assets (wealth), socio-political organization, knowledge, and skills. Meanwhile, the secondary aspect is the poor aspect of social networks, financial resources and information. Poverty can also be interpreted as an absolute or relative condition in an area where a person or group of people is unable to meet their basic needs according to the prevailing values or norms (Nugroho et al; 2012).

Based on data from the Central Statistics Agency (BPS), the projected population of Indonesia in 2021 is 272.25 million people and ranks as the fourth most populous country in the world. Of the 34 provinces in Indonesia, Central Java Province is a province with a population of 36.74 million people and occupies the serial number of the three most populous provinces in Indonesia (BPS, 2021). The large number of residents in Central Java Province will certainly cause problems in the social sector such as poverty. The number of poor people in Central Java Province in 2021 is 3.934 million people and occupies the serial number of the two provinces with the highest number of poor people in Indonesia after East Java Province. Reducing the number of poor people is one of the priority programs of the Central Java Provincial government, with a target to reduce the poverty rate in 2021 to below 10 percent (Central Java Province Regional Poverty Reduction Coordination Team, 2021). Therefore, research on poverty is very important to do with the aim of knowing what causes poverty in Central Java Province, with the aim that it can be sought how to reduce poverty in Central Java Province.

According to Sukirno (2006) the increase in job vacancies which is lower than the increase in labor will result in many workers not getting jobs. The Central Java Provincial Government has established various policies through various programs to reduce poverty levels but also has to look at it from a macro perspective, starting from gross regional domestic product (GRDP), education and unemployment

### **II. LITERATURE REVIEW**

Ni Made Myanti Astrini A. (2013) in a journal entitled "Analysis of the Influence of GRDP, Unemployment, and Education in Bali". In this research, the research method used is multiple linear regression analysis method using time series data. The results of this study indicate:

- a. The variable GRDP growth rate partially does not have a significant effect on the level of poverty in Bali Province due to the unequal income inequality of the community.

- b. The variable literacy rate partially has a negative and significant effect on poverty in the Province of Bali. The significance of the literacy rate in influencing poverty is because the higher the literacy rate, the lower the illiteracy rate.
- c. The partially open unemployment rate has a positive and significant effect on the poverty rate in Bali Province. The significance of the open unemployment rate in influencing the poverty level is because the lower the unemployment, the poverty will decrease.

Fitri Amalia (2012) in a journal entitled "The Influence of Education, Unemployment, and Inflation on Poverty Levels in Eastern Indonesia (KTI) for the period 2001-2010. The purpose of this paper is to determine the effect of education, unemployment, and inflation on poverty levels in eastern Indonesia. The method used in this research is panel data. The results of this study indicate that the unemployment variable does not affect the poverty level in Eastern Indonesia, while the other two variables, namely education and inflation, have a significant effect with a 95% confidence level of the poverty level. Based on the F statistical test, it shows that all independent variables (education, unemployment, and inflation) have a significant effect on the poverty rate in Eastern Indonesia at the 95% confidence level.

Himawan Yudistira Dama, Agnes L Ch Lopian, and Jacline I. Sumual (2016) in a study entitled "The Effect of Gross Regional Domestic Product (GDP) on Poverty Levels in Manado City (2005-2014) aims to examine the effect of GRDP on poverty levels in the city of Manado from 2005-2014. The analytical method used is simple regression analysis. The results showed that the Gross Regional Domestic Product (GRDP) had a negative and significant effect on the Poverty Level in Manado City. Gross Regional Domestic Product (GRDP) has the most important role for economic growth in Manado City, especially in efforts to reduce poverty levels in Manado City.

I Wayan Sudiana and I Ketut Sudiana (2015) with the title "The Influence of GDP, Education and Manpower Structure on Poverty in Bali Province". The purpose of this paper is to examine the effect of GRDP, education, and labor structure on poverty in Bali Province from 1995-2013. The results showed:

- a. The GRDP variable has a negative and significant effect on the poverty level in Bali Province, 1995 – 2013. This means that if real per capita income increases, the percentage of poor people decreases.
- b. The education level variable, in this case the average length of schooling, has a negative but significant effect on the poverty level in Bali Province, 1995 – 2013. This means that if public education increases, the percentage of poor people will decrease.
- c. The variable of labor structure in the agricultural sector has a positive effect on the poverty rate in Bali Province, 1995 – 2013, but it is not significant. This positive effect can be interpreted that if the percentage of the population working in the agricultural sector increases, it causes the percentage of the poor to increase. On the other hand, if the percentage of the population working in the agricultural sector decreases, the percentage of the poor will decrease.

Yarlina Yacoub (2012) in a study entitled "The Influence of the Unemployment Rate on the Poverty Level of Regency/City in West Kalimantan Province" aims to examine the effect of the unemployment rate and poverty rate in West Kalimantan Province from 2005-2010. The results of the data used are panel data (pooled data). The results showed that the unemployment rate had a significant effect on the poverty level of districts/cities in West Kalimantan Province. Empirical data shows that the pattern of the relationship is not always unidirectional between the unemployment rate and the poverty rate. This study, which was conducted in districts/cities in West Kalimantan Province, contradicts the theory. Theoretically, the poverty rate will move with the unemployment rate. In this case, when the unemployment rate increases, the poverty rate will automatically increase.

Anggit Yoga Permana and Fitrie Arianti (2012) with the title "The Influence of GDP, Unemployment, Education, and Health on Poverty in Central Java in 2004-2009". The purpose of this paper is to examine the effect of GRDP, unemployment, education, and health on poverty in Central Java Province from 2004-2009. The results of the study show

- a. The GRDP growth rate variable has a negative and significant effect ( $\alpha = 5$  percent) on poverty, meaning that an increase in the GRDP growth rate will reduce poverty
- b. The unemployment rate variable has a positive and significant effect ( $\alpha = 5$  percent) on poverty, meaning that an increase in the unemployment rate will have an effect on increasing the poverty rate.
- c. The education variable has a negative and significant effect ( $\alpha = 5$  percent) on poverty, meaning that the higher the level of education, the less poverty.
- d. The health variable has a negative and significant effect ( $\alpha = 5$  percent) on poverty, meaning that the higher the level of health, the lower the poverty rate.

Daryono Soebagyo (2018) in a study entitled *The Effect of Economic Growth, Inflation and Investment on Unemployment Rates in Indonesia*. This study aims to determine whether there is an effect of economic growth, inflation, and investment on the unemployment rate in Indonesia. The independent variables used in this study are economic growth, inflation and investment obtained from BPS and the World Bank in 1987-2017. The dependent variable used is the unemployment rate obtained from the BPS in 1987-2016. The type of data used is annual time series secondary data. This study uses the OLS (Ordinary Least Square) method, estimated by the E-Views program. The results of this study indicate that the variables of economic growth, inflation and investment have a negative and significant effect on the unemployment rate in Indonesia.

Muhammad Arif (2019) in a study entitled *Analysis of the Poverty Level in Central Java Province 2016-2018*. The Gross Regional Domestic Product has a negative and significant effect on the Poverty Level in Central Java Province. The results of this study are in line with previous research conducted by Wahyu Febri Dwiatmojo (2017), with the title "Analysis of the Poverty Level in Central Java Province in 2011-2015. Which explains the negative relationship between GRDP and the Poverty Level will trigger the Government to increase GRDP so that economic growth increases. The increasing economic growth in Central Java Province indicates that the government is able to improve the welfare of its people, thereby reducing poverty levels.

Maulidyah Indira Hasmarini (2017) *The Effect of Inflation, Investment, Minimum Wage and Economic Growth on Unemployment in Ex-Karisidenan Surakarta for the 2010-2014 period*. This study aims to determine whether there is an effect of inflation, investment, and economic growth on unemployment in Surakarta. The results showed:

- a. Relationship between Economic Growth and Unemployment Rate Based on the regression results, it shows that economic growth as measured by nominal GDP has a significant positive effect on unemployment in Karisidenan Surakarta in 2010-2014. That is, the increase in the unemployment rate is caused by increasing economic growth.
- b. Investment Relationship and Open Unemployment Rate
- c. Based on the regression results, it shows that investment does not have a significant effect on unemployment in the Surakarta Residency in 2010-2014.
- d. Relationship between Inflsi and Unemployment Rate
- e. Based on the regression results, it shows that inflation does not have a significant effect on unemployment in the Surakarta Residency in 2010-2014.
- f. Relationship of Minimum Wage and Open Unemployment Rate
- g. Based on the regression results, it shows that the Minimum Wage has a significant negative effect on unemployment in the Surakarta Residency in 2010-2014. That is, an increase in the unemployment rate is caused by a decrease in the Minimum Wage.

Eni Setyowati (2020) in a study entitled *The Role of Islamic Microfinance Institutions in Reducing Poverty*. This study aims to determine the factors that influence poverty and see how Islamic Micro Finance (IMF) is an alternative solution for empowering the poor. This research takes a case study of KSPPS or BMT KUBE Colomadu Sejahtera in Karanganyar Regency, Surakarta. The method used is the Logit model. The variable that affects and has a significant effect on poverty is income. This study concludes that microfinance institutions play a role in alleviating poverty in the Colomadu area, Karanganyar Regency. Financing by BMT for customers has a significant role in improving business skills, so it can also increase income and reduce poverty.

### III. RESEARCH METHODOLOGY

In this study, to analyze the effect of GRDP, Education, Unemployment on Poverty, a panel data regression analysis tool was used with the following econometric model:

$$POV_{it} = \beta_0 + \beta_1 PDRB_{it} + \beta_2 PEND_{it} + \beta_3 UNEMP_{it} + \epsilon_{it}$$

Where:

- POV : Poverty Rate (thousand)  
 PDRB : GRDP Growth Rate (%)  
 PEND : Education (%)  
 UNEMP: Open Unemployment Rate (%)  
 $\beta_0$  : Intersep  
 $\beta_1, 2, 3$  : Independent variable regression coefficient  
 $\epsilon$  : Component error  
 i : 29 districts 6 cities in Central Java

t : year t

The data that will be used in this research is secondary data in the form of panel data, which is a combination of time series and cross section data. Time series data covers the period 2016 to 2020, cross section data covers 29 regencies and 6 cities in Central Java. The data used are Poverty, GRDP, Education, Unemployment. Data will be obtained from the Central Statistics Agency (BPS).

According to Juanda and Junaidi (2012) there are three approaches in calculating the panel data regression model, namely:

- a. Pooled Ordinary Least Square (PLS)  
This PLS approach uses the usual OLS method. This method is the simplest method. In the estimation, it is assumed that each individual unit has the same intercept and slope (there is no difference in the time slice dimension). In other words, the resulting panel data regression will apply to each individual.
- b. Fixed Effect Model (FEM)  
In the FEM method, the intercept in the regression can be distinguished between individuals because each individual is considered to have its own characteristics. In differentiating the intercept, a dummy modifier can be used, so this method is also known as the Least Square Dummy Variable (LSDV) method.
- c. Random Effects Model (REM)  
Random Effects Model is used to overcome the weakness of Fixed Effect method. The Random Effects method does not use dummy variables but uses residual variables which are thought to have a relationship between time and between objects (Winarno, 2009).

According to Utomo (2013) the coefficient of determination ( $R^2$ ) aims to see the percentage of variation in the dependent variable that can be explained by the independent variables in the model. The value of the determinant coefficient is used to measure the contribution of the independent variables to the dependent variable. The value of the coefficient of determination ( $R^2$ ) ranges from zero to one. The closer it is to one, the better the model is because it shows the more suitable a regression line and the greater the variation of the independent variable can explain the dependent variable.

#### IV. RESULT/FINDING

The development of the poverty rate in Central Java Province in 2016 to 2020 experienced fluctuating developments. Where each district / city has a different increase or decrease each year. The highest poverty rate was in Sukoharjo Regency in 2016 which was 11.23% and decreased to 9.26% in 2020. The district/city with the lowest percentage of poor people was in Semarang City, which was 0.71% in 2015. 2016.

In the development of the growth rate of the Gross Regional Domestic Product (GRDP) of Central Java Province from 2016 to 2020, there was a significant increase. The largest Gross Regional Domestic Product (GRDP) is occupied by Magelang Regency, namely in 2016 of 6.68% and in 2020 occupied by Kebumen Regency of 6.28%. While the lowest order was occupied by Grobogan Regency in 2011 only at 3.19% and in 2016 it was occupied by Kudus Regency at 3.90%.

In the development of education in Central Java Province seen to experience very good development. In 2016, there were several regencies/cities with a high level of education, namely Pati Regency and Magelang City by 100% meaning that almost all residents understood the importance of education. Meanwhile, in 2016, Wonosobo Regency had the lowest position at 37.61% and in 2020 it increased by 48.97%.

Finally, the unemployment rate in Central Java Province from 2016 to 2020 experienced a significant increase. The largest open unemployment rate was occupied by Magelang City, which was 11.51% in 2016 and in 2015 it was occupied by Tegal Regency by 9.52%. While the lowest order was occupied by Temanggung Regency in 2016 at 3.54% and in 2020 at 1.50%.

### A. Regression Results

Table 1. The results of the estimation of the effect of GRDP, Education, and Unemployment on poverty in Central Java Province in 2016-2020

	Dependent variabel:		
	PLS	FEM	REM
Constanta	24.02033	16.97091	17.21448
PDRB (Coefficient)	-0.072690	0.021304	0.019181

## V. DISCUSSION

### A. Model Existence Test (F Test)

F test is used to test how far the influence of the independent variable on the dependent variable. The test criteria is if the prob F-statistic  $\leq 0.05$  then  $H_0$  is rejected, which means the model used exists. On the other hand, if the prob F statistic  $> 0.05$  then  $H_0$  is accepted, which means that the unused model exists.

### B. Intrepetasi Determinan (R2)

Based on Table 4.1 it is known that the interpretation of the determinant (from the Random Effect Model model is 0.430602 or 43%. That is, the Poverty variable can be explained by the independent variables (GDP, Education, and Unemployment) in the model, and the remaining 56.94% variation poverty is explained by other independent variables not included in the model. The following are mentioned in Table 4:

## VI. CONCLUSION AND RECOMMENDATION

Based on the results of the analysis of the research that has been discussed in the previous chapter, it can be concluded as follows:

- The education variable shows a negative and significant relationship to poverty. Which has a coefficient of -0.076 which means, if the number of school participation rates increases by 1 percent, it will reduce poverty by 0.076 percent.
- Unemployment variable has a negatif and significant influence on poverty. This is because the increase in unemployment that occurred in Central Java was not always followed by a decrease in poverty in Central Java, which can be seen from the Open Unemployment Rate data and Poverty data in Central Java Districts/Cities in 2016-2020.
- Testing the model using the Chow test which shows that the PLS model is more appropriate to use in this study than the FEM model. Testing the model using the Hausman test shows that the REM model is the most appropriate model to use compared to the FEM model. So, from the selection of the most appropriate model chosen in this study is REM.
- Based on the existence of the model (Test F) at a significance ( $\alpha$ ) of 0.05, the model shows that the model used exists, which means that the variables of gross regional domestic product (GRDP), education, and Unemployment contained in the regression equation jointly affects the poverty variable at = 5%.
- The results of the determinant coefficient test) show that the magnitude of the R-square value is 0.430602 or 43.06%. That is, the Poverty variable can be explained by the independent variables (Gross Regional Domestic Product (GRDP), Education, and Unemployment) in the model. While the remaining 56.94% is explained by variations in other factors that are not included in the model.

## ACKNOWLEDGMENT

We would like to thanks sustainable collaboration in business of Telkom University in Indonesia, who give me the opportunity to attend this international conference.

## The Dynamics Of The Bureaucracy System And Gender Equality In Government - Civil Servant Alternative Perspective Study

A. Kurniawati Santi Andriani<sup>1</sup> and B. Kanti Pertiwi<sup>2</sup>

<sup>1,2</sup>Faculty of Economic and Business, Universitas Indonesia, Depok, Indonesia

### Abstract

*Since 2010, Indonesia's government has showed its commitment to advancing gender equality through the Gender Mainstreaming Policy Strategy. All relevant government agencies are expected to execute a series of Gender Mainstreaming Policies as a result of this policy. The goal of this study is to determine whether bureaucratic work practices support or obstruct the Gender Equality Policy, as evidenced by the formulation of what elements can obstruct gender development in the agency and what the agency might be able to do from an employee's perspective. Despite the fact that the Gender Mainstreaming Policy is necessary for all agencies, it is centralized in practice to meet the needs of each agency. The goal of this study is to assess Indonesian government agencies' gender mainstreaming policy strategy.: There is still a limited of research and information on how the Gender Equality Policy is implemented in the public sector, as evidenced by the policy on gender equality implementation and the interactions that occur between these parts. Through thematic analysis based on exploratory surveys and interviews with related parties, interpretive methods are used to discover the meaning of gender equality and gender mainstreaming for employees and to reveal deeper reflections on these policies in the framing of the government bureaucratic system. The support of the bureaucratic system is inextricably linked to gender equality policy. However, the importance of technology, as well as the role of managers and management in assisting or inhibiting gender progress, cannot be overstated. So that the policies put in place may be supported by the current bureaucratic system. Despite the policy's great objectives, it's probable that it wasn't properly applied within the organization. In this regard, it is hoped that the government will reassess how management and manager view policies and improve the bureaucratic administration system to boost gender mainstreaming initiatives even more.*

---

### I. INTRODUCTION

Within the context of change and the use of the administrative system in its fullest sense, good governance has today become the operative word in the development of all government bureaucratic reform policy objectives. The government has received numerous criticisms from the public sector for failing to deliver the caliber of services that people require (Brinkerhoff & Brinkerhoff 2015; Singh 2020). Not just in Indonesia, but also in other nations throughout the world, governments have started reforms by applying management concepts like New Public Management (NPM), which are remarkably similar to private sector methods.

In the late 1970s, NPM was first made available to public sector organizations (Pollitt 1990; Cohen et al. 1999; Dent & Barry 2004; Adcroft & Willis 2005; Diefenbach 2009). This movement is classified as a revolutionary movement by Williamson et al. (2019), both in terms of scope and intensity, as shown by the following:

- a. NPM has been introduced to all public service sectors: governments and governmental organizations, regional and local governments, higher education institutions, health services, criminal justice systems, police, legal professions, and professional service organizations (Kirkpatrick et al., 2005)
- b. NPM is an increasingly global phenomenon (Kirkpatrick et al., 2005). It can be found in Western industrialized countries such as the UK and continental Europe, the United States and Canada, Australia and New Zealand (Torres 2004; Macaulay 2020);
- c. NPM can also be found in other industrialized and developing countries in Asia and Africa (Cohen 2016). And also found in developing countries such as Malaysia and Sri Lanka (Samaratunge et al., 2008; Waheduzzaman 2019);
- d. In Anglo-Saxon and European countries at least, it has been supported by all major political parties, for example, by Republicans and Democrats, and by Conservative and Labor governments (Hood 1991; Newman 1998; Protherough & Pick 2002);
- e. Moreover, the idea of NPM is still gaining traction in previously somewhat resistant countries, such as Japan (Yamamoto 2003) or India (Chakraverti, 2004), even if some NPM enthusiasts doubt its applicability there (Schick 1998).

Indonesia as a developing country also applies NPM in the public sector. NPM was tried to be implemented in 2004 by local governments, which is in line with the determination of regional autonomy in Indonesia. In the bureaucratic reform carried out by the government, in 2009, NPM was implemented in two major institutions, namely the Ministry of Finance which is now called the Ministry of Finance of the Republic of Indonesia (Kemenkeu RI), and the Supreme Audit Agency of the Republic of Indonesia (BPK RI) using the Balanced Score Card (BSC). as a concept and by establishing a strategy map and Key Performance Indicators (KPI) as a performance measurement tool.

Previous studies found that introducing NPM had a number of negative consequences. Bureaucratic reform in Australia, for example, has led in the marginalization of gender equality concerns in the public sector, particularly in the Australian Public Services - APS (Williamson et al., 2019). Meanwhile, in Indonesia, bureaucratic reform has been accompanied by the emergence of a Gender Mainstreaming Strategy promoted by the government with the existence of IMPRES No.9/2000 on Gender Mainstreaming, which was stipulated through Working Paper I on Gender Mainstreaming and the government's policy for the Acceleration of Gender Mainstreaming.

The quantity of empirical studies on NPM in the public sector is nearly limitless (Diefenbach, 2009). For example, Eederwijk and Davids (2013) investigated how institutions reflect gender mainstreaming policies in order to effect societal change in the workplace. Williamson et al., (2019) propose a relationship between gender equality policies and work system flexion as a means of achieving gender equality. Soeter (2016) demonstrates through his research that NPM can give an appealing strategy and offer options and systems that can be implemented without radical modifications and are easier to accept politically in settings of structural governance and centralized bureaucracy. Then comes a discussion of the NPM reform, which binds people to bureaucracy, affecting employee self-efficacy as well as the rewards and penalties issued. (Siltala, 2013).

However, there are some limitations of this research. First, the report provides a relatively brief description of NPM and its basic assumptions and core elements (Pollitt, 1990; Hood 1991; Pollitt 2000; Kirkpatrick 2005). Second, Williamson (2019) states that relatively little research has specifically examined the extent to which NPM is reflected in specific policies adopted to promote gender equality in the public sector and whether these policies can change gender structures and relations. This is important because NPM has guided how public sector resources, governance and operating systems are deployed. How to frame policies from the dominant ideology (NPM) is very important to determine the impact of implementation or possible outcomes (Burgess et al., 2009). Third, there is a need for research that looks at how gender equality policies have the potential to dismantle gender norms in organizations (Elly & Meyerson 2000). Third, further research is needed to examine how gender equality programs have the potential to undermine gender norms in companies (Elly & Meyerson 2000).

Because this study discusses the framework for forming elements of NPM in the Indonesian government bureaucratic system and the limitations that have previously been disclosed, it is interesting to examine how NPM is reflected in gender equality policies in institutions/agencies, both in institutions that have, in process, and those that do not. has mapped gender equality through the PUG Policy from the standpoint of policy implementers. The goal is to provide a systematic identification of which essential parts of NPM have a significant influence on gender equality policies, as well as to examine the primary implications and consequences of these policies. To circumvent these constraints, academics investigate how gender equality policies are interpreted by government employees in order to measure the amount to which the NPM principles are reflected in policies (Diefenbach, 2009).

This study examines the relationship between bureaucratic reform, which is significantly affected by the NPM concept, and the implementation of a gender equality policy, which is a reflection of the public sector's Gender Mainstreaming plan. NPM will be identified and studied in the discourse of management and organizational studies as a result of this research. The gender framework in the workplace (Rao et al. 2016) is then utilized to construct critical research on power dynamics ingrained in institutions and communities, particularly the workplace. Soetars, et al. (2021) identified four major factors that either hinder or encourage gender equality in the workplace in government organizations in this study. This research is the basis for researchers to investigate gender dynamics in the workplace that may arise from the perspective of employees in government.

## II. LITERATURE REVIEW

### A. *Gender Mainstreaming*

Gender Mainstreaming (PUG) is a strategy developed in response to Impres No. 9 of 2000 to integrate gender into the planning, preparation, implementation, monitoring, and evaluation of national development policies and

programs. Meanwhile, Santoso (2015) defines PUG as a mechanism for integrating gender into all activities carried out by public organizations/agencies. The purpose of implementing a gender mainstreaming strategy is to answer the existence of gender content in K/L and then produce gender equality and justice efforts. Gender and the environment are two subjects that share a common approach, namely the desire to incorporate them into activities and policies. This method is known as mainstreaming.

There is a gap between the policies that have been approved and their implementation. One of them is the under-representation of women in positions of power. The higher the position, the fewer women there are in positions of leadership. Furthermore, there are few human resources who understand gender issues and approaches (Santoso, 2015). Gender knowledge development is an inseparable part of gender mainstreaming activities, owing to the need for "gender literate" human resources. Aside from that, there is also resistance to gender, with the assumption that this is only dealing with women's issues. Gender primarily focuses on the issue of men and women, despite the fact that women's positions are not equal. This equality is a scenario in which women have access to and opportunities; but, this does not imply that their achievements must be equal to men's.

In addition to resistance, cultivating PUG and NPM collaboration within the organization poses its own set of challenges because the policies developed are more decentralized in nature, tailored to the relevant Ministries/Agencies, and there are also many gaps in the application of NPM, causing all elements of NPM to be inequitably effective throughout the government and across various sectors within government (Luke et al., 2008).

### *B. New Public Management*

NPM is a wide phrase used to replace the notion of Old Public Management, embracing several neoliberal changes implemented by governments across industrialized countries since the 1970s (Williamson & Carson, 2019). According to Hood (1991), NPM can be defined as the intersection of competitive private sector principles applied in the science of public administration, also known as the Post-Bureaucratic Paradigm (Berzeley, 1992) and Reinventing Government (Osborne and Gaebler, 1992), but more commonly known as NPM. Meanwhile, NPM, according to Diefenbach, is a set of assumptions and value statements about how the public sector should be designed, organized, and managed, as well as how they should function in a quasi-business manner. The primary idea of NPM is to encourage public sector companies and their employees to follow a "business-like" and "market-oriented" pattern, notably performance, cost, efficiency, and auditing (Deem & Brehony 2005).

At the macro level, NPM sees decentralization and the reorganization of monolithic bureaucracies into smaller corporate divisions as opportunities for better efficiency. NPM also emphasizes competitiveness and cost-cutting measures such as increased use of contractors (Williamson & Carson, 2020). At the micro level, NPM focuses on managers as administrators rather than policy experts (O'Donnell et al., 1999). Replicating the tasks that managers perform in private companies, public sector managers are given new and even increased responsibilities in the areas of employee recruitment, selection, and performance management with the goal of increasing accountability and even performance.

NPM is a broad term that encompasses a variety of meanings, including organizational design and management, the application of economic institutions to public management, and policy patterns. The following are the NPM principles: *Penekanan pada keahlian manajemen profesional dalam mengendalikan organisasi.*

- a. Firm and measurable organizational performance standards, including clarity of goals, targets, and success indicators;
- b. The conversion and utilization of control inputs into outputs in bureaucratic operations totally measured by quantitative performance indicators;
- c. The movement of public sector units from a centralized to a decentralized management framework;
- d. Increased post-competition introductions in the public sector, such as cost savings and high standards achieved through contracts and the like;
- e. Emphasis on private-sector management methods such as short employment contracts, business planning, and mission statements
- f. Emphasis on cost-cutting, efficiency, and accomplishing more with less resources.

Diefenbach's (2009) typology is highly effective for understanding gender equality in the public sector. This typology is divided into five aspects, each of which serves as a useful lens for analyzing the potential successes and failures of gender equality projects. (1) business environment and strategic objectives; (2) administrative

structures and processes; (3) management system and performance measurement; (4) management and managers; and (5) personnel and company culture.

#### C. *Gender at Work Analytical Framework*

The gender framework in the workplace (Rao et al. 2016) investigates the power dynamics that exist within institutions and society in order to effect positive gender equality change. It was created in 2002 as a result of an international collaboration of feminist experts in the field of gender. A gender framework in the workplace concept seeks to assist organizations in breaking through gender-biased institutions by recognizing that change must occur both within and outside the organization. This framework asserts that changing norms and structures underlying inequality must be analyzed and addressed across four domains simultaneously: individual and informal 'Awareness and Abilities'; individual and formal 'Resources'; Systemic and formal 'Rules and Policies'; and finally the systemic and informal 'Social Norms and Structures' (Rao et al. 2017; Rao et al. 2016)

#### D. *Budaya Patriaki dan Ibuism*

The Dutch colonized Indonesia for approximately 350 years. In his day, the Dutch not only colonized Indonesia in terms of resources, but also the people, especially women. The colonization of women is carried out by making women the object of oppression. Women work only around the house, children and the kitchen, only as concubines, objects to satisfy lust, even men are allowed to continue their education but not for women. This culture is rooted so that a patriarchal culture is formed, where the authority of men is above women. women are creatures who are at the lowest social level (Nashir, 2017). According to Bhasin (1996), the word patriarchal literally means the power of the father or "patriarch". Initially intended as household power by men as household leaders. However, over time patriarchy became a male power, the relationship of power with what men controlled women with a certain system that made women controlled in various ways. Meanwhile, Titus Febrianto Adi Nugroho (2011) defines patriarchy as a concept that is described from the domination of men over women that takes place in the fields of social, economic, political, and cultural life. Simplified that the family is a social system, economic system, political system and culture in small portions but carried out collectively.

The existence of a patriarchal culture that places women as subordinates in the family since the colonialism era made the concept of ibuism formed. "Motherism" implies cultural values. In Indonesia, this understanding is developing and is still relevant to use. In the colonial era, Ibuism which was formed in a bourgeois-priyayi context (Djajadiningrat, 1987) described the concepts of women's position based on social status, class and power, ultimately dealing with cultural values that shape social construction based on the historical-cultural history of women in Indonesia. . Then, in the New Order era, the government used state capitalism. "State motherism" is a gender ideology that creates rigid stereotypes and is very restrictive because it is made with the aim of controlling and creating a hierarchical order (Suryakusuma, 2021). The ideology of Ibuism in the New Order era was formed by the government with the aim of creating a single awareness in several community groups. In the understanding of 'ibuism', women must serve their husbands, children and families, society and the country. They must be willing to work without pay, or with very low pay. State motherism started from the establishment of women's domestication through the presence of the Ministry of Women's Roles. In line with that, the Dharma Wanita organization is also a forum for actualizing the ideology of state motherism (Maida, 2022). Through this understanding emerged Dharma Wanita and PKK. In the reform era, Indonesia was dominated by Islamic groups, but women were controlled in the same way (Suryakusuma, 2021) referred to as Islamic ibuism.

### III. RESEARCH METHODOLOGY

#### E. *Data collection*

An exploratory survey was used to collect data, which was then followed by in-depth interviews with 15 participants who answered questions based on their perspectives, experiences, views, and feelings (Moser & Korstjens, 2018). Participants included ANS officials from Echelon III, IV, and IV, as well as functional authorities and personnel from K/central L's and regional governments. To avoid direct contact and the spread of the virus during the Covid-19 pandemic, an exploratory survey was conducted using social media, and all interviews were conducted online using Google Meet and Zoom. The gathering of exploratory surveys began in early February 2022 and was followed by interviews in April 2022. The collection of exploratory surveys was carried out in early February 2022 and continued with interviews conducted in April 2022. In table 1 the following is a description of the demographic data of survey and interview participants.

Table 1. Demographic data of exploratory survey and interview participants

#### F. Analysis Method

This is a qualitative study that investigates the richness, depth, and complexity of a phenomenon utilizing the interpretivism research paradigm. According to Shea and Yanov (2015), the goal of interpretive research is to study how humans comprehend their lives in the context of a specific time and place. According to Heryanto (2019), the analysis is carried out utilizing a thematic method, which is appropriate and powerful for understanding the collection of experiences, thoughts, or behaviors across the data set. It is the process of detecting patterns or themes in acquired data (Braun and Clarke, 2006). The thematic analysis method, according to Heryanto (2019), is separated into three phases: interpreting data, recognizing and assembling codes, searching for themes, includes determining themes, naming, and preparing reports. The codes that have these commonalities are classified based on the findings of the observations and the patterns of meaning contained within them. In the process of searching for themes, all themes, sub-themes, and supporting data are read back.

#### IV.RESULT / FINDING

The findings of the data analysis were divided into three significant themes: 'Gender mainstreaming campaigns are still underappreciated,' 'NPM intensifies organizational male culture,' and 'NPM impairs gender equality efforts.' The gender mainstreaming campaign is still underappreciated and is broken into three sub-themes, namely the idea of gender mainstreaming is still unfamiliar, the perception of the participants is different, and the view of offering different treatment is different. The second finding is that NPM emphasizes the organization's masculine culture by explaining masculinity in the workplace, gender productivity stereotyping, partiality of male executives, and favoritism of male personnel. Meanwhile, NPM's third finding, which includes the sub-themes of views and treatment of women, gender barrier policies, and career development barriers, weakens gender equality efforts.

#### G. Gender mainstreaming campaign is underestimated

From the description above, it can be concluded that the limited understanding of participants regarding PUG indicates that there is still a lack of socialization and information regarding the understanding of PUG to employees so that employees are still guessing about the concepts and objectives of the policy.

Meanwhile, according to the participants' views, when it comes to the issue of gender equality, some agencies can be said to have reduced the gap by minimizing the proportion of comparisons between male and female employees including the proportion of echelon positions in the agency as described by participant 106. However, participant 22 emphasized that sometimes Gender equality is only assessed by increasing the number of female

officials, even though these officials are not necessarily capable, so there is an assumption that has been developing so far is that the comparison of the number of employees based on gender has represented gender equality in the work environment. However, in terms of quality still need to be questioned.

“When it comes to the issue of gender equality. In our institution, it can be said that there is no gap between men and women. Even for echelon 2 positions, more than 30% of them are occupied by female employees...” (Participant 106, Institutional, Functional)

“Gender equality is sometimes only assessed to increase the number of female officials, even though they are not necessarily capable. My understanding is that gender equality should be more about opening up opportunities for all. Not in the end.” (Participant 22, Ministry, Implementer)

Then, the partial nature that appears in the PUG policy from the perspective of participant 9 is the creation of "benefits" that only benefit a certain gender, participant 9 said as follows:

"When PUG has been implemented, all should be treated the same, not only for things that are beneficial, such as promotions or assessments, but for all things that apply in agencies such as transfers, division of work, and so on." (Participant 9, Ministry, Executor)

From some of the statements above, it is revealed that the meaning of gender equality and the implementation of gender mainstreaming policies have not touched the core of the policy, the leadership as a regulator with limited understanding makes regulations and programs that are not mature enough so that many employees are still skeptical of this policy. There needs to be socialization and inculcation of values as well as the objectives and benefits of implementing the PUG policy as a whole to minimize bias in the meaning of the policy.

Participant 27 also stated that the policies made were specifically for female employees and only thought about women. Among them are related to the provision of public facilities and gender responsive policies that are aimed at only one gender,

"Yes, if I have seen it as being devoted to women, some public facilities are specifically for women. If I think that gender equality is not only about women, but actually men have certain rights that have been neglected. Like leave we say. Maternity leave. It's not just women who have children. In fact, men also have children. So when there is a birth, why are men only given 3 days of leave, for example. That's usually when I'm at my place for more than 3 days, there's already a pay cut, for example, I said. But he is also while he is the father of the child. This means that men actually need the leave too. Why is it only given to women? There should be a thought there, not only women, the role of men should also be considered.” (Participant 27, Ministry, Implementer)

This is as stated by participant 107 that the condition of his family cannot be accommodated flexibly by the workplace.

“My wife has a mental illness, which can relapse at any time and requires assistance. Meanwhile, offices cannot be flexible.” (Participant 107)

Gender equality campaigns, both through PUG and non-PUG programs are still considered not urgent. This was expressed by participant 46 who stated that gender equality has not become an important issue due to the absence of needs and complaints from employees.

"Gender equality has not become an important issue because there have been no complaints or complaints due to the comfort zone felt by employees for too long". (participant 46)

Based on 143 participants, the HR bureau, which oversees employee development, is more concentrated on general operational activities, while the PUG strengthening mechanism is considered weak and minimal.

“The HR bureau has increased to the equivalent of Echelon 2 (currently managed with the General Bureau, 90% of its activities are directed towards general operations, while employee development, the mechanism for strengthening PUG policies, etc. are weak and minimal), ...”. (Participant 143)

Based on participant 12, gender equality compiled through the PUG program has not yet fully synergized with other policies, so it seems that it is merely determining policies without considering policy implications on other policies or copy-pasting policies.

"Yes, the 2024 budget has been discussed since now, right this year. So it should have been discussed. Ok, in 2024 we have a target because we want the same number of employees, ok, let's sort this out, what policies don't exist to regulate it. I saw that when they compiled a program of activities, it did not synergize with the others. It's just ok, it's not there yet (policy synergy)...” (Participant 12)

Apart from this, support from budgetary alignments is considered important. Unfortunately, based on the participants' explanations, the 15 budgets currently formulated are still not impartial, so it is still a challenge in achieving gender equality.

“Realizing gender equality is the spirit and duty of the agency. Hard work continues to be carried out but the lack of a pro-budgetary budget, ARGs in regional apparatus have not been evaluated optimally and it is found that current conditions are still not responsive to gender, understanding, culture, environment and the quality of human resources are challenges in achieving gender equality. Relevant cross-sectors need to work together to achieve all gender-equal gender equality preconditions for PUG or local policies”. (Participant 15)

In addition to the importance of budget alignment, the role of leadership is considered to be the key to the running of the PUG program, based on participant expressions 79 stated that their concern regarding PUG policies is that sometimes the activity programs that have been formulated are not carried out due to changes in leadership and the assumption that the old program is not an achievement of the new leadership. if continued.

"What is a concern is that sometimes there are program activities that do not run because there is a change in leadership so that they consider the previous activities not the product of new officials who are reluctant to follow-up." (Participant 79)

#### *H. Gender mainstreaming campaign is underestimated*

As an implication of the implementation of NPM, the workload of employees increases because NPM sets clear standards that are measured in performance measurement, also emphasizes control of results/outputs. This is done by increasing the intensification and extensification of work. For example, the increase in administrative burden and rigidity of work processes. The workload borne by employees also tends to increase because agencies do not pay much attention to employee planning and mapping and long-term strategies such as the use of appropriate technology. The absence of planning for employee mapping has made agencies in turn tend to be passive. The agency has not necessarily prepared the right successor when there is employee retirement, and also the transfer/mutation of employees in the work environment, giving rise to the concept of work as a contest of masculinity for both male and female employees. The following are statements of employees regarding this matter:

This happened with Participant 125 where employees who are considered competent in carrying out their duties will carry out many responsibilities, due to budget efficiency, given work that should be done by 2 or 3 people, plus there is a Team SK for various activities. In turn, these additional tasks take up a lot of employee time compared to the duties of the position carried out.

“I am still a civil servant, but because I graduated from engineering, I became a woman myself in the unit/division that I currently occupy from a total of 8 people, due to lack of human resources and budget efficiency, I have to handle tasks that should be done by 2/3 people. During the CPNS period and until now I have not been appointed, I have received various Team Decrees which I can't even refuse if I can't, so far these additional tasks take up more of my time than the main tasks of my position”. (Participant 125)

In addition to the workload in the form of various employee job duties, sometimes multiple positions are unavoidable. As stated by Participant 101.

"The absence of X makes me participate in doing the financial filing work while also doing substantial work". (Participant 101)

Then, duplication of work becomes a problem for employees. In essence, technology is applied to help employees provide information so as to facilitate the work of employees. However, the application of inappropriate and unintegrated technology actually adds to the workload, namely duplication of work, duplication of reporting and other things that increase the workload.

“Some of the applications that are required to be filled are mostly just duplicates. Mainly related to reporting. An integrated application system will make it easier for employees so that time efficiency can be achieved”. (participant 78)

Still related to technology, in addition to the above, inappropriate application of technology actually adds or extends the employee's work process where the final result of the work is still manual. Things like this eventually extend the working time of employees.

"The application that is owned actually adds to the existing work process which is still manual". (Participant 130)

In addition to this, the work that is a lot and knows no time with fast follow-up also makes employees work long. Also disclosed by Participant 107 and Participant 147

"Load work of a lot of work, do not know the working time, follow-up must be fast". (Participant 107)

"Strongly agree, our time is increasingly limited with work, even Saturdays and Sundays are still working". (Participant 147)

Excessive workload can cause work-family conflict. Historically, referring to work-family conflict theory, this view holds that work and family roles are incompatible, providing conflicting expectations for time, energy, and behavior (Greenhaus & Beutell, 1985) especially in female workers who have multiple roles. Some of the main impacts due to all the workloads described above include employees experiencing long working hours, so the tendency to work overtime and overtime even on weekends is also unavoidable. This work culture is a work culture that tends to be masculine because it treats employees as if they have no maintenance responsibilities (caring duties) like female employees. In addition, in the workplace context, male employees feel special pressure to prove themselves in accordance with agency expectations, namely "superior men" (Berdahl et. al., 2018)

Furthermore, the results of the analysis also show that gender performativity stereotyping is still high, namely the view that women are weak, emotional, and resilient creatures (Pamungkas, 2022). In the work environment, this view is reflected by the differences in the duties, responsibilities, positions and positions of employees given based on gender/in terms of gender so that gender-based job stereotypes are formed.

"The division of work is divided based on ability, men are considered suitable to do work that requires time and physical ability. Meanwhile, women are placed in jobs that require accuracy, speed, and order." (Participant 111)

In addition to this, some superiors also view that men are versatile and able to do many things, in contrast to women who may not be suitable in some jobs, as stated by participant 40, as follows:

"Some superiors view that there are some jobs that are not suitable if carried out by women, they also think that men are versatile, so that men are considered capable of doing more things". (Participant 40)

Rooted gender performativity stereotypes in turn can form Gender Clustering where there is a certain part of an organization that is not only dominated by one gender but it is even possible that there is only one gender in that section. as explained by Participant 78

"For gender equality, a balanced proportion must be made in each satker. No gender clustering. Example: job X is only suitable for men and job Y is for women. Give equal opportunities to both genders." (Participant 78)

Comparison of participants based on gender in the above statement, in relation to the implied stereotyping it is possible that career development through this informal/unwritten training is aimed at a specific gender. These factors indicate that realizing gender equality in agencies with such a view is indeed very difficult to do.

Gender inequality is built into organizations through how gender is shaped both at work and in everyday practices and interactions that occur in the workplace (Acker, 1992; Ely & Meyerson, 2010; Martin, 2004). The culture of "favoritism" is one of them. This culture is reflected in the tendency of superiors to choose subordinates, as well as the tendency of employees to choose their co-workers associated with gender. Favoritism of male leader occurs when the highest leader or leader with a higher position chooses the leader below him. The main consideration made refers to gender, gender is generally male with a plus character, as stated by Participant 31 that male leaders are considered more qualified because if they are led by women, they will prioritize feelings so that if they occupy certain positions, the decisions taken will be not objective

"Men are seen as more capable and capable. Women are seen as creatures who tend to prioritize feelings so that if they occupy certain positions, it is feared that they will not be able to make objective policies/decisions. The role of women as mothers and wives is also often seen as an obstacle in careers". (Participant 31)

From the above statement, it shows that not only female employees have caring duties, but male employees also have the same needs and responsibilities, although in general the dual responsibilities are clearer for female employees.

Then, according to role fit theory, not only do people often "think manager/leader, think men" (Schein, 1973), but women can be punished or disliked when they hold managerial roles, because these roles are not in accordance with the nature and characteristics of women. female stereotype. The quality of female employees is less desirable

than that of men, female leaders are often poorly evaluated and are less likely to receive social approval for the same leadership behavior (Eagly 2013; Heilman 2012). As expressed by participant 166

“My work unit does not discriminate between men and women for promotion, the majority of what is seen is, in some conversations between employees there is an assumption that female superiors tend to be more volatile and subjective in making decisions. (Participant 166)

Apart from this, the work system of female superiors is also in the spotlight, specifically stated by several participants below.

"The answer is like Ms. X. Male bosses are better, because "I don't care what you do but the most important the job is done", male bosses. If the female boss is detailed. This is how it should be. So if we deviate from him he's a bit baper huh. But if the boss is a male, the results and orientation, the result orientation is done. Already. Done. So". (Participant 49)

Female bosses are also considered:

“I work in a section where the majority is filled by women, with a female boss and female co-workers who think having a female boss is more complicated to understand than having a male boss. Ways of making decisions that are less convincing and easily influenced by other parties. This makes the perception of the level of uncertainty in a woman's leadership higher. ...” (Participant 91)

“Women leadership is seen as slow to make decisions in the office where I work.” (Participant 155)

The work system of female superiors that is too detailed, slow in making decisions, making decisions that are less convincing and easily influenced by other parties makes the uncertainty of women's leadership even higher.

In addition to the tendency of higher leaders to choose male leaders over women, the culture of favoritism can also be seen from the tendency of superiors to choose their staff. This favoritism culture is also reflected in how a superior delegates tasks to his subordinates with gender considerations. As expressed by Participant 40

"There is, Miss, so I'm in position X and closely related to the logistics sector, and if it's there, according to my personal observation, women are mostly behind the desk, only doing the administration. At that time I also asked, 'sir, this is actually my friend (female) who feels that sometimes she doesn't have anything to do but why am I always active here' and my boss's answer is quite simple, 'yes, it's because you're a man. ', it's like, hehe, it's just like that.. that's how it is, you're a man.” (Participant 40, Institution, Implementer)

Based on the narrative of participants 166, a hectic workload requires employees to work overtime from time to time and often female employees cannot do it due to safety reasons and the dual role of female workers as workers, wives and mothers.

“The business of my work unit requires working at any time beyond working hours, so female employees often cannot do it because they are prone to coming home late at night. Therefore, it is often the employee who understands the most dynamic work developments are men and have an impact on performance between the two. (Participant 166, Ministry, Implementer)

In addition, the narrative of participants 157 stated that in sections that have more female employees than male employees, they tend to burden male employees with complicated and urgent work.

“There is a slight difference in the division of performance, but for jobs with a certain level of difficulty, it is only for me, because in 1 section I am only a man. For example, for jobs that require immediate analysis and urgency, they are always dispositioned to me.” (Participant 157, Ministry, Implementer)

From the description above, it can be seen that many or at least female employees do not make a difference that female employees benefit less from superiors and co-workers' support (Geller & Hobfoll, 1994) so that access to resources is also more limited than female employees.

#### *I. Gender mainstreaming campaign is underestimated*

In participant expression 31 stated that placing male gender/performing gender clustering in organizational structures and systems is considered to be more performing than placing female employees due to the consideration of stereotyping that women are less able to make objective decisions and the dual role of female employees will actually hinder performance.

“The section that carries out special/certain examinations is usually filled by men because men are seen as more capable and capable. They are more performant when in fact there are also many men who work "without performing". Then women are seen as beings who tend to put their feelings forward so that if they

occupy certain positions it is feared that they will not be able to make objective policies/decisions, plus the role of women as mothers and wives. considered to hinder performance.” (Participant 31, Institutional, Functional)

Participant 144 stated that working 24 hours a day (employees must always be ready whenever needed) is one of the policies that undermines gender equality, where basically every individual has his own problems in his life. This 24-hour work culture is vulnerable to work-life conflicts for its employees. Work creates family conflicts, with this work system masculinity is more pronounced and opportunities for certain genders are not wide open compared to other genders because of dual roles or limitations with family needs.

"In my opinion, a work culture that has to be 24 hours is not a work life balance and is not effective and efficient". (Participant 144)

Based on the presentation of participants 122, it is very difficult to take leave which is the right of employees and also the agency does not have a means of channeling opinions/labor unions other than the corps to channel aspirations, ideas, ideas and criticisms.

"The disposition likes to come suddenly, it is difficult to take leave which is a right, the office is due to work, only oriented towards sanctions without any reward, there is no means of channeling opinions / unions other than the corps". (Participant 122, Ministry, Implementer)

A long work culture, stereotyping and the difficulty of asking for rights for employees because work becomes a separate barrier for employees, especially female employees. This can slow down the creation of gender equality in the agency where the policy is implemented.

Participant 64 stated that sometimes issues related to the nature of women (pregnancy, breastfeeding, sick due to menstruation) were ignored for the needs of the agency even though they worked in divisions where the majority of them were female employees.

“The majority of where I work, especially my division, are mostly women. Sometimes issues related to the nature of women are ignored for work needs (pregnancy, following, sick due to menstruation)”. (Participant 64, institution, Implementer)

From the statement above, it is emphasized by the expression of Participant 37 who stated that previously the lactation room was provided for employees, but over time the space was removed. Then at the agency where the 37 participants work, the maternity leave policy with the initial clause of the performance allowance being paid in full for three months, then changed through PerKa with clauses in the first month of the full allowance, not the second 75% and the third month 50% as described below:

“Well, in the past, gender-responsive facilities were like breastfeeding rooms, lactation rooms, right? It used to exist, now it doesn't seem to exist." .... "Well, in terms of policy, I also just found out yesterday, not long ago, yes, there was a case, the head regulation regarding the performance allowance was that maternity leave was cut off, that's really sad. So maternity leave is 3 months right? If I'm not mistaken, when I was on maternity leave, it was full, 2016 was still full, so it's only 2021 or 2022, that's how it is. There is a clause, so the second month only receives 75%, the third month only receives 50% if I'm not mistaken”. (Participant 37, Institution, Implementer)

From the presentation of 37 participants, it can be seen that the basic characteristic of NPM, namely efficiency, is reflected in the Perka made related to maternity leave policies. Comparison of the initial policy changes, namely maternity leave for female employees who are given full benefits for three months then changed to clauses in the first month of full benefits, the second month 75% and the third month 50%

Gender unresponsive policies also occur in institutions where 56 participants work, where 70% of the total number of employees are female employees, with a large proportion of young mothers. Unfortunately, this proportion does not affect the response of the management in providing policies such as lactation rooms, so that many female employees who need these rooms are looking for unused spaces that can be used, as in the following statement;

“..., Oh, the nursing room, right... actually, there is no special room at our place, just because first, the majority of mothers work here (70% women), the two offices are also really big, the rooms are also big... about 16 thousand meters of his office. So yes, you can tuck in anywhere for those who are pumping, but there is no special room for lactation.” (Participant 56)

Budget efficiency is one of the characteristics of NPM. All budgets issued, clearly evaluated inputs and outputs. In contrast to the gender mainstreaming policy, which in carrying out the program, it cannot calculate

efficiency implicitly with clear levels and standards. However, the PUG policy can be said to be successful if it can improve the performance of its employees. This may make policy makers really consider the realization of the PUG program. In participant statements 56 it is clear that although lactation facilities are a major need because 70% of young productive female employees are employees, the policy becomes unimportant when the only considerations are efficiency and effectiveness which are analyzed using numbers.

The policy of ignoring gender equality also occurs at the level of staff and superiors where there is verbal and physical violence against female employees as stated by participant 81 below:

"There are so many incidents where seniors are verbally abusive and there are several times where they physically abuse female workers at my place." (Participant 81)

As stated by Berdahl (2018) which states that gender inequality occurs because of superiority and how gender is formed both in work and in daily practice and interactions at work (Ely & Meyerson, 2010). Masculine pressure on men motivates them to engage in "bad but brave" behavior (Glick et al., 2004)—including sexual harassment (Berdahl, 2007), physical aggression (Bosson, et al., 2009). Masculine pressure occurs because of the masculine work system in the organization. This is what causes NPM to undermine gender equality through verbal and physical violence which is generally carried out by superiors or senior employees to subordinates who are generally women.

NPM in the agency's strategic objective element which states that there is an interest orientation in order to build a "business like" goal for the benefit of the institution. However, in making policies, sometimes decisions related to agencies are intervened by external parties which have a big influence on policy making, duties and responsibilities so that they are prone to conflicts of interest that are not in accordance with the agency's objectives, as described by participants 136 and participants 35 as follows:

"I once had contact with X (an external party) as partner Y, in the end he didn't want me to move up to echelon 3. So I am in the position now. Because I felt like I wanted to be proposed to my current supervisor position, which is now held by him and I as his sub-correspondent. However, because of my problem with X, my boss seems to have taken a more dispassionate attitude towards me and in the work of forming a "team within a team" maybe a shadow team, where I was not included, even though I was a sub-core in the team". (Participant 63, Institutional, Functional)

"Oh yeah, I just remembered for the promotion, the mutation is like that, one more factor, don't underestimate the power of Dharma Wanita". (participant 35)

Performance and performance evaluation is one of the elements of NPM because it is in running "business like" in government. System merit can be used as a way of evaluating performance. But unfortunately this system does not work ideally, as explained by participant 146 that the absence of a fair system and wide opportunities for careers is one of the career barriers and is possibly due to the dominance of the leader's subjectivity.

"The challenge in career preference is only the absence of a fair system and wide opportunities for a career, because it is still done manually and dominated by the subjectivity of the highest leadership. Have the ability but if you don't come from the same group, your career is still gray." (Participant 146)

Another challenge is as stated by participant 12 that the selection process for high positions for echelon 2 positions in this case there is a selection system that has been established and must be passed, but it seems as a formality. One of the characteristics of NPM is a measurable evaluation, here the selection stage is NPM's way of evaluating candidates, unfortunately the stages are seen as a formality because in the "behind the scenes" process there is already a candidate determination based on likes and dislikes from the leadership

"Yes, he has to get an echelon 2 position, the problem is that to reach an echelon 2 position, there is a JPT process for selecting high leadership positions. There is a selection for positions, there are written tests, interviews, psychology, medical tests. It's just that if it is a high leadership reference, he will definitely pass. Or at least there is already this name out. So that the existing process seems to be just a formality. That's what's still thick, I don't know what it's like in other places but in X it's very thick. I'm not saying it's not fair, it's just that the referral atmosphere is very strong in making decisions. So likes and dislikes are very strong..." (Participant 12, Ministry, Functional)

From the statement above, it is implied that the performance evaluation process and the promotion selection process that have been formulated properly in accordance with the needs of the agency if the implementation is not carried out correctly, then gender equality will not be achieved because there is still subjectivity in leadership policies.

## V. DISCUSSION

According to the findings of this study, the participants are still unfamiliar with the program. Do not comprehend the concept or the objectives of participating in this program. Understanding that PUG is still foreign, participants' attitudes of gender equality in policy, views on giving different treatment, and PUG programs (internal) are not urgent for agencies were the sub-themes raised. Then, there is a partial perception from agencies related to this policy, and there is a strong belief from the agency that the smaller the gap between male and female employees shows that gender equality has begun to be realized in agencies that implement the policy. Unfortunately, the government still views gender equality as exclusively quantitative, with a tiny percentage gap suggesting that gender equality has been reached, but does not employ quality components such as capability in determining whether or not gender equality has been achieved in agencies.

Furthermore, the impact of this partial view is the agency's lack of seriousness, including those responsible for employee development, which tend to only lead to general operations and have not been synergized with other policies, agencies also do not prioritize budgets related to gender equality in agencies, despite the fact that the central government, together with four Ministers, carried out the national strategy for accelerating GM through gender responsive planning and implementation in 2013. Another limiting notion is that organizations assume gender mainstreaming measures are only for women. Policies and programs are only concerned with the advancement of women. Essentially, the PUG strategy is geared toward providing opportunity for all genders (male and female) to grow. Men become the dominant gender in government institutions because of high masculinity and a strong patrilineal tradition.

Another limited perception is that agencies believe that gender mainstreaming policies are only about women. Policies and programs that are carried out are only related to the advancement of women. Basically the PUG policy is more towards opening up opportunities for all genders (male and female) to develop. It's just that in government agencies, with high masculinity and a strong patrilineal culture, men become the dominant gender.

## VI. CONCLUSION AND RECOMMENDATION

Because each employee has his or her own ideal of gender equality and model mainstreaming, the limited understanding they have generates a bias in meaning, how employees infer the mission and goals of the organization. This suggests that there is still a need for socialization and information pertaining to a better understanding of PUG regarding the concept, content, and objectives of the policy developed inside the agency. Until now, many PUG projects have been hampered by the lack of a broad vision for PUG, limited funding allocations, and policymakers' or specific groups' unwillingness to change. Aside from that, with limited perspectives, the willingness of individuals inside it to alter institutions for the better through gender mainstreaming initiatives has challenges, mainly that not everyone in the organization wants to change in a positive direction. If the program is carried out in accordance with existing policies, the leadership is egotistical. The leader believes that the policy is not his accomplishment, therefore the program's sustainability may be overlooked, or the unwillingness of specific people to accept change since they are comfortable in their comfort zone.

Until now, many PUG programs have been hit by the absence of a grand strategy for PUG and limited budget allocations and the reluctance of policy makers or certain groups to change. Apart from that, with a limited perception, the willingness of individuals in it to change institutions for the better through gender mainstreaming programs has obstacles, namely not everyone in the organization wants to change in a positive direction, There is egocentricity from the leadership in implementing the program if it is carried out from previous policies. The leader, feels that the policy is not his achievement, so that the sustainability of the program may be neglected or the reluctance of certain groups to face change, comfortable in their zone

Furthermore, the implementation of the PUG policy has not yet reached the core of the policy because institutions and individuals' comprehension of it is still on the surface. Skepticism, a desire to remain in their comfort zone, and a belief that the policies they are implementing do not benefit one gender make gender equality difficult to attain. Agencies must socialize more and give instillation of values, objectives, and benefits of PUG policies, particularly for leaders as policymakers, to ensure that policies implemented are effective.

The long history of colonialism, as well as the entrenched patriarchal culture, have an impact on the social relationships of employees in the workplace. The distinct treatment of genders, as well as a significant appraisal of stereotyping and employee preference based on gender, point to these consequences. This condition suggests that job prospects for women are still limited, and there are still visible barriers that limit female employees' career

progression. It is not impossible that achieving gender equality will be tough. Because there has been no coordination of policy, development, and implementation, gender equality has become limp due to a lack of support and awareness regarding PUG in agency units.

### Abstract

*During COVID-19, there was a significant increase in the use of E-money among the community. Using e-money as a transaction tool in everyday life requires a trust factor. If people already believe in the technology/system of e-money, they will easily use it in their daily transactions. So, this research aims to determine the effect of Customer Trust on the use of ShopeePay and its impact on Millennial User Satisfaction in the COVID-19 Era. The hypothesis is Customer Trust influences the Use of ShopeePay and its implications on Millennial User Satisfaction in the COVID-19 Era. This study uses a quantitative method using descriptive and verification research methods. The Respondents were 97 respondents selected using the Non Probability Sampling method with the Unknown Population Sampling calculation technique. The data analysis technique used in this study is Structural Equation Model (SEM) and hypothesis testing using SmartPLS software version 3. The results show that Customer Trust positively and significantly affects ShopeePay usage. Customer Trust has a positive and significant effect on Millennial User Satisfaction. Using ShopeePay has a positive and significant effect on Millennial User Satisfaction. This study also shows that ShopeePay is more competent with similar applications. ShopeePay is a reliable and trustworthy platform. ShopeePay is in line with the characteristics of the millennial generation. The millennial generation wants everything to be practical, fast, and efficient. ShopeePay balance replenishment is also easy, providing time efficiency because the process is fast.*

*Keywords—Customer Trust, Millennial User Satisfaction; ShopeePay;*

---

### I. INTRODUCTION

In 2022, internet penetration reached 62.5% of the world's total population, which is known to have increased to 4.95 billion people using the internet. These data indicate a growth of 192 million (+4.0%) over the past year, believed to be much higher than this number due to research and reporting restrictions caused by Covid-19 (Kemp, 2022). In Indonesia, internet users reached 202.6 million, or 73.7% of the total population of 274.9 million in January 2021. The number of internet users in Indonesia increased during the COVID-19 pandemic due to the implementation of online learning and work-from-home policies (Kemp, 2021).

Most internet users are millennials. The millennial generation, also known as Gen Y, is people who were born in 1980-2000 with an age range of 19 to 39 years. They were born in an era of advanced technology. In both the sharing economy and collaborative consumption, Millennials have been recognized as an outstanding consumer group (Činjarević, Kožo, & Berberović, 2019). The millennial generation has the characteristics of multitasking in the use of technology and often illustrated by the name *Internet generation* or *Connect 24/7* (Činjarević, Kožo, & Berberović, 2019). The development of information technology has changed people's lifestyles and made people increasingly rely on the existence of information technology.

These technological advances create new challenges, one of which is in the marketing industry. Now people are very comfortable enjoying technological advances that are rapidly growing. There is no need to shop or pay bills directly to the store. All of this can be done online using a smartphone. Advances in technological developments have made entrepreneurs compete to be at the forefront of marketing technology, trying to fulfill customer needs, keeping customers with attractive promotional offers, and providing quality services to customers. Satisfying customer needs well, maintaining good relationships with customers, and providing quality services can create customer satisfaction (Dienaeni, 2020).

The application of information technology has been widely used in people's daily activities. One of them is a non-cash payment media that is rapidly growing every day, accompanied by various innovations to make it more effective, safe, fast, and convenient. These technological advances have changed people's lifestyles and often make people tend to be more consumptive. The use of smartphones in Indonesian society is increasing, causing the trend of non-cash payments to grow. Moreover, this is used as a ground for financial service companies to

offer transactions that can be carried out by the public effectively and efficiently through e-wallet brands launched by various financial services companies. An E-wallet is a type of electronic money where the money is stored on a server, not on a chip card (Aji, Berakon, & Husin, 2020). In Indonesia, several server-based e-money (e-wallet) providers such as Go-Pay, OVO, Link Aja, and DANA exist. Users can save money for every online transaction, such as food payments, online shopping, and airline tickets. The digital wallet application can be downloaded for free through everyone's smartphone.

At the end of 2019, the COVID-19 virus encountered the world, including Indonesia. In Indonesia, the coronavirus spread in early 2020. Indonesia is currently facing a national disaster from the COVID-19 pandemic. The government has taken several steps to deal with the spread of the COVID-19 virus, including the gradual implementation of Pembatasan Sosial Berskala Besar (PSBB) in areas where the spread of the COVID-19 virus is elevated, one of which is in the West Java region. The World Health Organization (WHO) urges the public to implement contactless payments. The use of contactless payment is to reduce contact with cash payments using digital wallets or electronic transactions. So it is expected that it can reduce the risk of being infected with the coronavirus that sticks to money, credit cards, or the hands of people who give or receive the money. Many people end up using e-commerce to fulfill their daily needs. The use of e-commerce also implements government requests to limit the usage of cash or paper money. Currently, many supermarkets also provide digital services. Electronic wallets have made it easier for people to complete transactions, primarily by limiting the use of cash or paper (Fatoni, Susilawati, Yulianti, & Iskandar, 2019). Based on a survey conducted in DKI Jakarta from April 20 to May 5, 2020, a survey showed that most citizens tended to increase online shopping. This increase is illustrated by the intensity of spending, which was previously only 1 to 5 times a month, to 1 to 10 times during the implementation of Pembatasan Sosial Berskala Besar (PSBB) (Pusat Penelitian Oseanografi - LIPI, 2020).

December 2020, electronic money transactions' value reached Rp 22.13 trillion. Not only that, but this figure also rose 12.17% compared to November 2021, which reached Rp 31.29 trillion. In November 2021, the volume of e-money transactions in Indonesia reached 530.02 million transactions. Then one month later, in December 2021, that number increased 13.63% to 602.29 million times (Annur, 2022). This shows that most people are aware of the existence of electronic money, which has been widely used in their daily lives.

Mobile payment services or e-wallets are increasingly popular, along with the increasing use of smartphones by up to 70% in the last five years in Indonesia. Moreover, there are more choices of cardless e-wallet applications for transactions. During the COVID-19 pandemic, 44% of Indonesians used cashless payments more often (Nurchayadi, 2020). One of the official and widely used e-money products in Indonesia is ShopeePay. ShopeePay is an electronic money service feature that can be used as an online payment method on the Shopee platform, offline at ShopeePay merchants, and to accommodate refunds made by the company PT. Airpay International Indonesia. Market research company Ipsos in Indonesia surveyed 1000 respondents aged 18 years and over regarding the experience of making purchases using digital wallets. The survey revealed that ShopeePay managed to excel as the most frequently used digital wallet brand and became the digital wallet that recorded the largest market share of transaction value, namely 48% of the total digital wallet users in Indonesia, followed by OVO (46%), GoPay (35%), DANA 26%, and LinkAja 16% (Nurchayadi, 2020). This is also supported by the results of research conducted by the High Tech, Property & Consumer Goods Industry Mark plus survey on 502 respondents representing big cities with the highest smartphone usage penetration in Indonesia. It states that ShopeePay has an average transaction frequency of 7 monthly, which makes ShopeePay the most used e-wallet (Merdeka, 2020). High levels of digital wallet usage generally increase with increasing user trust.

Using e-money as a transaction tool in everyday life requires a trust factor from the public. If people already believe in the technology/system of e-money, they will easily use it in their daily transactions. Based on the results of pre-research related to customer trust that researchers gave to 20 respondents in Kabupaten Garut, respondents believe that ShopeePay is safe to use for transactions, and ShopeePay has a good image/reputation in the eyes of the society. The services provided by ShopeePay are excellent. Most respondents use ShopeePay because it is very easy to top up/top up ShopeePay balances. ShopeePay can also be used anywhere, and ShopeePay is very practical.

User trust in using E-Money on Satisfaction compares what the customer expects with what is received by the customer. If what is obtained by the respondents exceeds their expectations, the user can achieve satisfaction and will create a sense of trust in a product. Customer satisfaction is closely related to customer loyalty in a company. So that to be able to win the business competition, companies must be expected to increase customer satisfaction.

From the explanation above, it can be seen that during COVID-19, there was a significant increase in the use of E-money among the community, so the researchers wanted to find out whether Customer Trust had an effect on the use of ShopeePay E-Money and how it affected Millennial User Satisfaction during the COVID-19 pandemic.

## II. LITERATURE REVIEW

### A. *Customer Trust*

Trust refers to a situation where the buyer depends on the company and believes that the company will act as expected (Zhang & Li, 2019). Trustworthiness is classified into three types: ability, benevolence, and integrity (Zhang & Li, 2019). In other words, trust can be measured using the buyer's belief in the company's ability, integrity, and virtue. These three variables of customer trust have a definition (a) Ability, which refers to the competence and characteristics of the seller to ensure that consumers receive satisfaction and security guarantees from the seller when making transactions via internet technology. Ability indicators include competence and institutional approval, (b) Benevolence, the seller's willingness to provide mutually beneficial satisfaction between the two parties. Sellers are not only pursuing maximum profit but also have excellent attention to realizing customer satisfaction. Benevolence indicators include attention, empathy, and acceptance, (c) Integrity, relating to the behavior or habits of the seller in running his business. The information and product quality provided to consumers is correct under the facts or not (Setyoparwati, 2019).

### B. *E-Wallet*

An E-wallet is a type of electronic money where the money is stored on a server, not on a chip card (Aji, Berakon, & Husin, 2020). Several server-based e-money (e-wallet) providers in Indonesia exist, such as Shopeepay, Go-Pay, OVO, LinkAja, and DANA. Several funds or the value of money stored on platforms owned by consumers. Some of the benefits or advantages of using e-money compared to using cash or other non-cash payment instruments are as follows (Adiyanti & Pudjihardjo, 2015):

- a. Easier, faster, and more convenient than using cash. Users do not need to look for money and wait for the cashier to give them a chance. In addition, it reduces errors when calculating money because the calculation is done automatically.
- b. The time required is much quicker because users only need to do a scan compared to when using a debit or credit card
- c. Consumer convenience, with advanced facilities provided by e-money, consumers do not need to carry cash for small-value transactions
- d. Increase consumer confidence, using the code/pin to lock the system in e-money, so not just anyone can use the money except the user. The security and privacy of its users are maintained safely.

### C. *Customer Satisfaction*

Customer satisfaction is comparing customer expectations and feelings after the transaction. If customers' experience meets their expectations, they will experience greater satisfaction and a greater desire to repurchase (Huang & Yu, 2018). Consumers will feel satisfied when the product fulfills consumer expectations, and if the product is far from consumer expectations, consumers will not feel satisfied. There are five dimensions of customer satisfaction including (a) Expectations, (b) Performance, (c) Comparison, (d) Experience, (d) Confirmation/Disconfirmation (Priansa, 2017).

During the COVID-19 period, the government implemented Pembatasan Sosial Berskala Besar (PSBB) in stages in areas indicated accelerate the spread of the coronavirus. Community needs should be fulfilled during PSBB. Therefore, many people use e-commerce to buy for their various needs. The use of e-commerce also implements the government's recommendation to use e-money in every public transaction activity to limit the use of cash or paper because suspected that cash could be a factor in the transmission of COVID-19 (Fatoni, Susilawati, Yulianti, & Iskandar, 2019).

Three components that form a person's trust are ability, benevolence, and integrity (Setyoparwati, 2019). If company have gained consumer trust, the level of trust in e-money usage will also increase. Many companies also continue striving to develop and improve related systems and rules regarding electronic money transactions to increase the comfort of their users (Tazkiyyaturrohman, 2018). In addition, some of the advantages of using e-money are easier, shorter time, consumer convenience, and transaction security (Tazkiyyaturrohman, 2018).

Customer satisfaction is one of the most significant factors in doing business. Because when customer satisfaction has been fulfilled, they will be loyal to the products issued by the company. Consumer satisfaction is the best guarantee in maintaining business and facing competition. To win against the competition in the financial services industry, companies must provide services that meet their needs and expectations and get customer satisfaction (Huang & Yu, 2018). Customer satisfaction is a feeling of pleasure or disappointment that someone owns based on a comparison between reality and what is obtained with the expectations held by consumers.

Customer satisfaction has five dimensions: Expectations, Performance, Comparison, Experience, and Confirmation/Disconfirmation (Priansa, 2017). Consumer purchasing decisions online can be influenced by factors, namely convenience, trust, and perceived risk that will be accepted by consumers/buyers. The current phenomenon makes people prefer to make practical and economical purchases that do not take long.

Fig 1. Research Framework

Several studies examine the use of e-money, customer trust, and consumer satisfaction. Research on the case study of a modern and smart store states that regardless of the risk of buying online, everyone buying goods online will do it again and again (Munandar & Khoriyah, 2020). Technology advances have made it easier for consumers with limited time to fulfill their needs. Through online stores, they are not spending a lot of time and effort shopping. They only need to open the marketplace via their smartphone, select the desired item, and then pay for the selected item via transfer or their digital wallet. Many studies have examined how the use of e-wallets increases. Research on the analysis of non-cash payment transactions through e-wallets found that habits, perceptions of trust, performance expectations, facilitating conditions, price values, social influences, and hedonic motivation positively affect behavioral intentions to use e-wallets (Faridhal, 2019). Another research regarding the analysis of the influence of the Big Five Personality on the behavior of using e-wallet technology with initial moderation of trust. The result is that e-wallet technology needs to build trust up front, to convince users that this technology is easier and safe to use as a transaction so that the beginning of this belief can increase the role of personality in influencing the acceptance and use of technology (Kristianti & Pambudi, 2017).

Studies have also investigated the relationship between the three variables of trust, use, and satisfaction. Research (Dzulhaida & Giri, 2018) shows that trust positively and significantly affects an interest in using electronic money, Research conducted by (Guspul, 2015) shows that trust positively affects satisfaction, and research conducted by (Charisma & Suprapti., 2020) shows that the higher the maximization of the use of e-money (utilitarian value) will maximize happiness and have a positive and significant effect on perceived satisfaction

Based on the framework model, the hypotheses in this study include the following:

- Hypothesis I : Customer trust has a positive effect on the use of ShopeePay in the covid 19 era
- Hypothesis II : Customer trust has a positive effect on millennial user satisfaction in the covid 19 era
- Hypothesis III : The use of ShopeePay has a positive effect on millennial user satisfaction in the covid 19 era

### III. RESEARCH METHODOLOGY

This research uses quantitative research using descriptive and verification research methods. The population in this study is the Millennial Generation of ShopeePay Users. The data used in this study are primary data obtained directly from questionnaires distributed via Whatsapp and Instagram on a predetermined sample and secondary data sourced from books, articles, journals, and other information related to the writing by the researcher. Respondents from this study were 97 respondents who were selected using the Non Probability Sampling method using a purposive sampling approach. Respondents' criteria are (1) ShopeePay users who are Millennial Generation, (2) Have a Shopee application, and (3) Have used ShopeePay at least one time. The measuring instrument used in this research is a structured questionnaire made by the researcher. Questionnaires completed with units of measurement and scoring for each answer were scored in stages based on the Likert scale.

The data analysis technique used in this research is validity and reliability testing and hypothesis testing using SmartPLS version 3 software.

Table 1. Variable Operationalization

Variable	Dimension	Indicator	Item Code	
<b>Customers Trust (CT)</b> (Setyoparwati, 2019)	<i>Abilities</i>	Competence	CT1	
		institutional approval	CT2	
		Attention	CT3	
	<i>benevolence</i>	Empathy	CT4	
		Acceptance	CT5	
		<i>integrity</i>	<i>fulfillment</i>	CT6
			<i>honesty</i>	CT7
			<i>dependability</i>	CT8
			<i>reliability</i>	CT9
<b>ShopeePay Usage (PS)</b> (Adiyanti, 2015)		Convenience	Easy Top Up <i>e-money balance</i>	PS1
			Can be used at many <i>merchants</i>	PS2
		Efficiency	Saving time	PS3
	Use of Technology		PS4	
	accessible	Can be accessed anytime and anywhere	PS5	
		Easily accessible	PS6	
	Security	Don't worry about providing information	PS7	
		Trust that personal data is protected	PS8	
		Believe that the money in shopeepay is guaranteed	PS9	
<b>Satisfaction Millennial Users (KMU)</b> (Priansa, 2017)	Expectation	In accordance with reality	KMU1	
		Not disappointing	KMU2	
	Product Performance	Service Features	KMU3	
	Comparison With Other Apps Experience	Top-up fee	KMU4	
		Using the product based on experience	KMU5	
		Product recommendation	KMU6	
		Hope Confirmation	In line with expectations	KMU7

The reliability in this study was carried out by testing the model using several stages, including testing the outer model (Indicator Reliability/Loading Factor, Internal Consistency Reliability, Cronbach's Alpha, Convergent Validity/Average Variance Extracted (AVE), Discriminant Validity) and the inner model (R Square, Goodness). of Fit Models). based on the tests that have been carried out, it can be concluded that this model is fit and reliable.

## IV. RESULT / FINDING

The following is an overview of the average Customer Trust, ShopeePay Usage, and Millennial User Satisfaction during the COVID-19 period.

Table 2. Average Customer Trust, ShopeePay Usage, and Millennial User Satisfaction

Customer Trust			
Question Item Code	Statement	Score	Assessment criteria
CT1	I believe that ShopeePay is more competent than similar applications	426	Very good
CT2	ShopeePay is a reliable and trustworthy application	383	Good
CT3	Shopeepay applies free shipping extra for users	406	Good
CT4	Customers Care ShopeePay handles user complaints well	402	Good
CT5	I accept all the terms and conditions for using ShopeePay	410	Very good
CT6	ShopeePay can be trusted to meet the needs of its users	419	Very good
CT7	The information provided by ShopeePay is accurate	408	Very good
CT8	ShopeePay works well in meeting the needs of its users	409	Very good
CT9	ShopeePay is reliable because of its good performance	412	Very good
	Average	408	Very good
Shopee Usage			
PS1	Top up ShopeePay balance is easy to do	411	Very good
PS2	Customers can use ShopeePay at many merchants	406	Good
PS3	ShopeePay provides time efficiency due to the fast payment process	400	Good
PS4	With ShopeePay 's financial technology, the transaction process is easier and faster	413	Very good
PS5	Customers can use ShopeePay anywhere and anytime	387	Good
PS6	ShopeePay application can be accessed easily	416	Very good
PS7	When transacting, customers are not worried that the information provided will be manipulated by irresponsible parties	405	Good
PS8	ShopeePay can protect user's confidential data	383	Good
PS9	Money security in ShopeePay is guaranteed	413	Very good
	Average	404	Good
Millennial User satisfaction			
KMU1	The promotions offered by ShopeePay are matching with reality	381	Good
KMU2	I am not disappointed in using ShopeePay	396	Good
KMU3	There is a password feature to protect shopeepay accounts from irresponsible parties	398	Good
KMU4	There is a refund feature if the product received does not match the order	400	Good
KMU5	ShopeePay balance top-up fees are cheaper than other applications	410	Very good
KMU6	I am satisfied using ShopeePay because the experience provided is good	408	Very good
KMU7	I will recommend ShopeePay to family	410	Very good
KMU8	I will recommend ShopeePay to friends	398	Good
KMU9	ShopeePay's performance is in line with my expectations	399	Good
	Average	400	Good

Based on the research results in table 2 above, the results of respondents' responses regarding Customer Trust can be seen. The average score obtained is 408, with very good assessment criteria. The respondent's response with the highest score is regarding the indicator that the respondent believes ShopeePay is more competent than

similar applications with an assessment score of 426, and the assessment criteria are very good. ShopeePay is believed to be more competent than other similar applications because ShopeePay has a good image in the community, and ShopeePay is also believed to be able to fulfill its users' needs well because the performance shown by ShopeePay is reliable in every use.

The results of respondents' responses regarding the usage of ShopeePay show, The average score obtained is 404 with good assessment criteria. The respondent's response with the highest score is the indicator regarding the ShopeePay application that can be accessed easily with an assessment score of 416, and the assessment criteria are very good. ShopeePay can be accessed easily through its smartphone users, and the features of ShopeePay are also easy to understand. They can be easily applied for daily transactions such as making payments at various merchants who have collaborated with ShopeePay and can make payments for online shopping through the Shopee app. Meanwhile, the respondent's response with the lowest score is regarding the indicator that ShopeePay can protect its user's confidential data with an assessment score of 383 and the assessment criteria are good. The ShopeePay application has a pin and fingerprint features that can protect user data and the money in it. When using ShopeePay for transaction activities or to change the personal data contained in it, users are required to enter a pin and fingerprint to be able to change it. This illustrates that ShopeePay can protect confidential user data, even though the results on the ShopeePay Usage variable have the lowest assessment score but are still in good assessment criteria.

The results of respondents' responses regarding Millennial User Satisfaction show that the average score obtained is 400 with good assessment criteria. The respondent's response with the highest score is regarding the ShopeePay balance top-up fee indicator, which is cheaper than other applications. The user indicator will recommend ShopeePay to families with an assessment score of 410, and the assessment criteria are very good. ShopeePay Top Up and transfer fees are cheaper than other similar applications such as Ovo, GoPay, Dana, Jenius, and LinkAja. Furthermore, the performance provided by ShopeePay to its users is very satisfying and reliable. So many users recommend ShopeePay to their friends or family. Meanwhile, the respondent's response with the lowest score is regarding the promotion indicators offered by ShopeePay match the reality with an assessment score of 381 and good assessment criteria. ShopeePay offers a variety of attractive promotions for its users, such as the Xtra feature, Free Shipping, Minimum Shopping, 0 Rupiah, and hefty cashback for every transaction. This data illustrates that ShopeePay holds promotions and the results match the reality or expectations of its users, although the results on the Millennial User Satisfaction variable have the lowest assessment score but are still in good assessment criteria.

Fig 2. Output Bootstrapping

Hypothesis I (There is an Influence of Customer Trust on the Use of ShopeePay during the COVID-19 period)

Table 3. CT & PS

	<i>Original Sample</i>	T Statistics	T Tabel	P Values	Keterangan
CT -> PS	0,863	31,774	1,986	0,000	H <sub>0</sub> ditolak

Based on the results of the output Path coefficients, it explains that the T statistic (31.774) > t table (1.986) and the value of P Values < significant alpha (0.05). Thus it is concluded that H<sub>0</sub> is rejected and H<sub>1</sub> is accepted. That means Customer Trust has a positive and significant impact on the use of ShopeePay in the current COVID-19 period.

Hypothesis II (There is an Influence of Customer Trust on Millennial User Satisfaction during the COVID-19 period)

Table 4. CT &amp; KMU

	<i>Original Sample</i>	T Statistics	T Tabel	P Values	Keterangan
CT -> KMU	0,337	5,169	1,986	0,000	H <sub>0</sub> ditolak

The T statistic (5.169) > t table (1.986) and the P Values < significant alpha (0.05). Thus it is concluded that H<sub>0</sub> is rejected and H<sub>1</sub> is accepted. That means Customer Trust has a positive and significant impact on Millennial User Satisfaction in the current COVID-19 period.

Hypothesis III (There is an Effect of Using ShopeePay on Millennial User Satisfaction during the COVID-19 period)

Table 5. PS &amp; KMU

	Original Sample	T Statistics	T Tabel	P Values	Keterangan
PS -> KMU	0,683	10,776	1,986	0,000	H <sub>0</sub> ditolak

The T statistic (10.776) > t table (1.986) and the P Values < significant alpha (0.05). Thus it is concluded that H<sub>0</sub> is rejected and H<sub>1</sub> is accepted. That means the use of ShopeePay has a positive and significant impact on Millennial User Satisfaction in the current COVID-19 period.

## V. DISCUSSION

Based on the results of this research analysis, the research found that the customer trust variable had a significant positive effect on the use of ShopeePay during the Covid-19 period. This study's results align with other research regarding the online transaction system on the Shopee application, which shows users who believe in the application will use ShopeePay for every transaction activity (Dadang & Purnamasari, 2020). This positive influence is also in line with trust and uses in financial technology (Nangin, Barus, & Wahyoedi, 2020).

This study also reveals the average customer's trust in Shopee, which shows very good criteria. Customer Trust has a significant role in using ShopeePay in the current Covid-19 Era. Because trust is essential in using digital payments, if the user already believes in the system implemented by ShopeePay, the user will not feel worried when making transactions and will continue to use it in their daily lives.

The Covid-19 situation, which encourages users to make cashless transactions, makes this an opportunity for Shopee and similar companies. With increasing demand, the competition is more challenging. However, based on

indicators from customer trust, the highest score states that respondents believe ShopeePay is more competent than similar applications with very good assessment criteria. ShopeePay is believed to be more qualified than other similar applications. It is because ShopeePay has a good image in the community, and ShopeePay is also assumed to be able to fulfil the needs of its users well because the performance shown by ShopeePay is reliable in every use.

Meanwhile, respondents' response with the lowest score is regarding the indicator that ShopeePay is a reliable and trustworthy application with good assessment criteria. Respondents can trust this because ShopeePay has been registered and supervised by Bank Indonesia, even though the results of user statements on the Customer Trust variable have the lowest assessment score but are still in good assessment criteria.

Customer trust has a positive influence on the usage of ShopeePay. The average score for using ShopeePay is within the good rating criteria. The indicator with the highest scores is that respondents can easily access the ShopeePay Application. ShopeePay can be accessed easily through its smartphone users, and the features of ShopeePay are also easy to understand. They can be easily applied for daily transactions such as making payments at various merchants who have collaborated with ShopeePay and can make payments for online shopping through the Shopee app. ShopeePay is easy to use anywhere and anytime and provides time efficiency.

The ShopeePay application has a pin and fingerprint features that can protect user data and the money in it. When using ShopeePay for transaction activities or to change the personal data contained in it, users are required to enter a pin and fingerprint to be able to change it. Although based on the results of the research, the lowest score is regarding the ShopeePay indicator being able to protect confidential user data. However, this score is still within the good assessment criteria.

This study also reveals that customer trust positively affects Millennial User Satisfaction in the current COVID-19 Era. When consumers trust a product produced by the company, they will feel satisfied and rely on the company and have a commitment to maintaining their relationship with it. Customer trust in certain product brands will be seen in their attitudes or decisions to make purchases in the long term, which is an expression of satisfaction after consuming the product (Susilawati & Wufron, 2017). This finding matches research conducted by Kartika & Ganarsih (2019), which shows that trust significantly positive affects customer satisfaction. This finding means that the better consumer trust, the better consumer satisfaction (Kartika & Ganarsih, 2019). And in line with the research of Sarika & Vasantha (2018), which shows that trust has a positive and significant influence because trust is the main factor that directly affects user satisfaction and also has an impact on intentions to use digital wallets (Sarika & Vasantha, 2018).

The average score of Millennial User Satisfaction gets good assessment criteria. The respondent's response with the highest score regards the ShopeePay balance top-up fee indicator, which is cheaper than other applications and also the indicator that users will recommend ShopeePay to families. ShopeePay Top-Up and transfer fees are more affordable than other similar applications such as Ovo, Gopay, Dana, Jenius, and LinkAja. In addition, the performance provided by ShopeePay to its users is very satisfying and reliable, so many users recommend ShopeePay to their friends or family.

Meanwhile, the respondent's response with the lowest score is regarding the promotion indicators offered by ShopeePay matching reality with good assessment criteria. ShopeePay provides a variety of attractive promotions for its users, such as the Xtra feature, Free Shipping, Minimum Shopping, 0 Rupiah and hefty cashback for every transaction. This illustrates that ShopeePay holds promotions, and the results match the reality or expectations of its users. However, the effects on the Millennial User Satisfaction variable have the lowest assessment score but are still in good assessment criteria.

The use of ShopeePay also positively and significantly affects Millennial User Satisfaction in the current COVID-19 Era. This is explained in research conducted by Charisma & Suprapti (2020), showing that the higher the maximization of the use of e-money will maximize happiness and will have a positive and significant effect on perceived satisfaction (Charisma & Suprapti, 2020). User satisfaction is obtained from a sense of security over the risk of carrying cash and the ease of using e-money in every transaction activity.

During this COVID-19 pandemic, people decreased all forms of direct interaction to avoid the coronavirus by using the digital wallet. ShopeePay can be used for daily transactions such as fast food delivery and online shopping. This is very popular among Indonesian consumers, especially the millennial generation, known as the technology-savvy generation.

The millennial generation cannot be separated from the smartphones that they are used to using daily. One of the characteristics of the millennial generation is that they want things to be fast and efficient. About the ShopeePay Usage variable shows that ShopeePay makes the transaction process more accessible and provides

time efficiency because the payment process is quick, and ShopeePay can also be accessed quickly and used at many merchants.

## VI. CONCLUSION AND RECOMMENDATION

Based on the results of the research obtained from the discussion that the author described in the previous chapter regarding Customer Trust on the Use of ShopeePay and its Impact on Millennial User Satisfaction in the COVID-19 Era, the researchers can conclude the results of the research compiled as answers to several questions contained in the problem formulation. The conclusions obtained are as follows:

1. Based on the first research objective, namely to find out Customer Trust, ShopeePay Usage, and Millennial User Satisfaction in the COVID-19 Era obtained through respondents' responses, the results are described as follows:
  - a. The Customer Trust variable shows that Customer Trust (User Trust) towards ShopeePay is so good because Users believe that ShopeePay is more competent with similar applications and ShopeePay is a reliable and trustworthy platform.
  - b. The use of ShopeePay shows that Users use ShopeePay because ShopeePay can be useable at many merchants, ShopeePay balance replenishment is also easy to do, and the use of ShopeePay is so easy to do and provides time efficiency because the process is fast and ShopeePay is also able to protect user data well.
  - c. Millennial User Satisfaction Many users are satisfied because using ShopeePay is in line with the characteristics of the millennial generation. The millennial generation wants everything to be practical, fast, and efficient. There are ShopeePay users who are satisfied and will recommend using ShopeePay to their friends and family.
2. Based on the hypothesis test to determine the effect of Customer Trust on the Use of ShopeePay in the COVID-19 Era, the decision H<sub>0</sub> was rejected, meaning that Customer Trust had a positive influence on the Use of ShopeePay in the COVID-19 Era.
3. Based on the results of hypothesis testing to determine the effect of Customer Trust on Millennial User Satisfaction in the COVID-19 Era, the decision H<sub>0</sub> was rejected, meaning that Customer Trust positively influenced Millennial User Satisfaction in the COVID-19 Era.
4. Based on the results of hypothesis testing to determine the effect of ShopeePay use on Millennial User Satisfaction in the COVID-19 Era, H<sub>0</sub> was rejected, meaning that ShopeePay use has a positive influence on Millennial User Satisfaction in the COVID-19 Era

Based on the results, the authors propose some suggestions regarding Customer Trust and Millennial User Satisfaction. Based on the responses regarding the indicator, ShopeePay is a reliable and trustworthy application with the lowest score compared to other indicators. It means that the company must be able to prove that ShopeePay is indeed trusted and safe to use. In the daily transaction activities of its users, ShopeePay Customer Care must also be able to handle user complaints properly and respond quickly to each user's questions to create user trust in the ShopeePay application itself. In terms of the Millennial User Satisfaction variable in this study, the promotion indicators offered by ShopeePay correspond to the reality of getting the lowest score compared to other items. The company is expected to be able to provide promotions that match the reality of what users will get. Compared to excessive promotion in advertisements that do not match reality. compatibility between expectations and reality is expected not to disappoint users and cause users to switch to other applications.

## Factor that Drives Organic Food Purchase in Indonesia: SOBC Framework

Andi Rachman Putra<sup>1</sup> and Rifelly Dewi Astuti<sup>2</sup>

<sup>1,2</sup>Faculty of Economics and Business, Universitas Indonesia, Jakarta 10430, Indonesia

### Abstract

*This research attempts to analyze factors that may stimulate the purchase of organic food in Indonesia.: Previous research has shown that there is a gap between consumer intention and behavior in decision making regarding the purchase of organic food or what is known as the green gap. Stimulus–Organism–Behavior–Consequence (SOBC) framework was used in order to provide a different insight towards consumer organic food purchase. To the authors best knowledge, little research has utilized SOBC framework in the context of organic food purchase. Cross-sectional data of 327 organic food buyers were collected using online self-administered survey. Partial least squares – structural equation modeling (PLS-SEM) was used to test the proposed theoretical model. The findings suggest that within SOBC framework, health consciousness and environmental concern act as stimulus for individuals to purchase organic food. These individuals were represented by three internal factors of openness to change, self-identity, and ethical self-identity positively related to willingness to purchase, which ultimately become stated buying behavior of organic food as the consequence. These findings imply that the producers of organic foods should specifically emphasize the health and environmental value offered by their products. Other theoretical and managerial implications are discussed.*

*Keywords—Organic Food, SOBC; Stated Buying Behavior; Willingness to Purchase*

---

### I. INTRODUCTION

The term "organic" in food production systems became popular towards the end of the 20th century and eventually recognized by researchers in the food industry (Rana & Paul, 2020). There has been a worldwide increase in consumer interest for sustainably grown foods, such as organic foods (Talwar et al., 2021). This interest in organic food can be attributed to various reasons, such as the absence of chemicals or synthetic additives in its production, as well as the ecological and animal-friendly nature of its attributes (Dowd & Burke, 2013). It can also be attributed to the increasing level of concern for environmental well-being around the use of genetically engineered chemical and synthesis for conventional food production (Tandon et al., 2021; Willer et al., 2016). As a result, the organic food market has grown significantly with the emergence of specialty retail outlets that focus on natural or organic foods (Kim, 2019; Tandon et al., 2021). Organic food consumption trend hat is currently happening globally originates from North America and Europe, which then extends to developing countries such as India and China. Developing countries have experienced significant changes in food purchasing behavior and consumption patterns due to increased disposable income, greater global interactions and lifestyle changes (Ali et al., 2010). Although the largest consumers of organic food come from North America and Europe, the demand for organic food from developing countries continues to increase (Chakrabarti, 2010). Even the Asian organic food market is expected to grow at its highest rate over the next five years (Nafees et al., 2021).

Organic agriculture entered the Indonesian agricultural system sporadically and on a small scale, starting with "Go Organic 2010" back in 2001. Furthermore, the One Thousand Organic Agriculture Village Development Program will be developed gradually in 23 provinces until 2024 (Purwantini & Sunarsih, 2020). This program has succeeded in encouraging organic farming activities in Indonesia, as can be seen from the increase of organic certified agricultural land by 99.7% in the 2016 – 2018 period. This can also be seen in the increase of organic certified operators by 212.6% within the same period (Aliansi Organik Indonesia, 2019). In 2019 the total consumption of organic products in Indonesia reached 13.9 million USD or 0.02% of global demand. With the increasing number of consumers who are attracted to organic products and Indonesia's growing economic conditions, organic products have a positive potential in the long term with an estimated growth of 3.5% in the period of 2019 – 2024 (Organic Trade Association, 2020). This data shows that from both the supply and demand side, organic products in Indonesia continue to develop.

Nevertheless, the amount of consumption and market share growth of organic food is still relatively low compared to conventional food (Chekima et al., 2017). Previous research has shown that there is a gap between intention and consumer behavior in making decisions regarding the purchase of organic food or what is known as the green gap (Sultan et al., 2020; Tandon et al., 2020a, 2020b). Although an individual shows a positive attitude towards organic food, the reality does not always lead to the purchase of organic food (Chekima et al., 2017). Experts consider that this gap is a significant obstacle in explaining the decision-making process of organic food purchase (Sultan et al., 2020). Previous literature shows the use of various theoretical frameworks in the research

of buying behavior of organic food, namely theory of planned behavior (Fleşeriu et al., 2020; Khare & Pandey, 2017), theory of reasoned action (Birch et al., 2018; Koklic et al., 2019), stimulus-organism-response model (Lee & Yun, 2015; Sultan et al., 2021; Tandon et al., 2021), value-attitude system model (Pandey & Khare, 2015) and self-determination theory (Tandon et al., 2020b). But as previously stated, the most consistent finding from previous research is the inconsistency between consumer claims and their actual behavior (Chekima et al., 2017).

This research utilized the Stimulus–Organism–Behavior–Consequence (SOBC) framework to examine factors that may stimulate the purchase of organic food in Indonesia. SOBC was chosen because this framework can provide a different understanding of consumer behavior towards organic food purchase, where SOBC components cover a wide spectrum of manifestations from stimulus to consequence (Talwar et al., 2021). Health consciousness, food safety concern and environmental concern was chosen as the stimulus, where previous research has shown that these three factors may stimulate the purchase of organic food (Shamsudin et al., 2018; Talwar et al., 2021). Organism or the internal state of individual represented by openness to change, self-identity and ethical self-identity that receive this stimulus will develop a behavioral response in form of willingness to purchase, and become stated buying behavior as the consequence of this behavioral response. Buying frequency of organic food also proven to have a differentiating effect on behavior and intention to make a purchase (Talwar et al., 2021). Therefore, the objectives of this research are to analyze the effect of health consciousness, food safety concern and environmental concern as stimulus on organism represented by openness to change, self-identity and ethical self-identity, to analyze the effect of organism on their behavior (willingness to purchase), to analyze the effect of behavior on their consequence (stated buying behavior), and to analyze the moderating effect of buying frequency towards the relationship between organism, behavior and consequence, all in the context of organic good purchasing.

## II. LITERATURE REVIEW

Green purchase behavior refers to the purchase of environmentally friendly or sustainable products that can be recycled or beneficial to the environment, as well as the avoidance of products that can harm the environment or society (Chan, 2001; Mostafa, 2007). Consumer behavior for green purchasing is usually evaluated in the form of a consumer's intention or willingness to buy a green product, where this intention ultimately becomes a purchase decision in order to preserve the environment (Joshi & Rahman, 2015). This research bases its framework on the premise of the Stimulus-Organism-Behavior-Consequence (SOBC) to better understand this behavior. SOBC is a framework that considers the implications of environmental stimuli (S) from the internal state of an individual, which includes cognitive processes and psychological constructions such as emotions, personality and motives. The internal state of an individual or organism (O) will affect the behavioral response (B) and subsequently, covert, or overt consequences (C). This process will ultimately affect an individual's consideration of environmental stimuli and internal conditions (Talwar et al., 2021). SOBC was first developed as a more complex mechanism of human behavior (Davis & Luthans, 1980) based on the premise of social learning theory (Bandura & Walters, 1977) When compared with other cognitive and operant-based models such as SOR and ABC, the SOBC framework allows testing of cognitive-behavioral-environmental events (Dhir et al., 2021).

### A. *Stimulus*

Environmental stimuli in SOBC can take the form of covert or overt situations that can cause an individual's internal state to become an impetus for certain behaviors (Whelan et al., 2020). Previous research indicates that health consciousness, food safety concern and environmental concern can act as motivators (Birch et al., 2018; Hansen et al., 2018; Nguyen et al., 2019). In line with previous research, this research uses this motivator as a situational environmental stimulus in the context of organic food consumption. Health consciousness reflects individuals' thoughts on health issues and their readiness to take action to ensure their health (Chen, 2009). Chemically and synthetically produced food is a common practice in modern agriculture and is considered to have an adverse effect. This can raise concerns among individuals about the potential impact of these foods on their health (Qasim et al., 2019; Shamsi et al., 2020). An individual's health consciousness can lead to openness in changing consumption patterns and developing self-identities that can act as motivators in considering the consumption of organic food (Talwar et al., 2021). Previous research found that consumers who are self-aware and responsible for their health are more likely to be open to new experiences and changes from consuming organic food. Health consciousness will also stimulate individual psychological factors such as self-identity and ethical self-identity in consumers whose consumption is in line with their values. These consumers perceive themselves as ethical shoppers, which results in a certain behavior towards organic food consumption (Talwar et al., 2021). Therefore, the following hypotheses are proposed:

**H1.a** health consciousness positively and significantly affects individual openness to change

**H1.b** health consciousness positively and significantly affects individual openness to change

**H1.c** health consciousness positively and significantly affects individual openness to change

Food safety concerns can be interpreted as consumer concerns about genetic modification or the presence of artificial, chemical and synthetic additives, or other ingredients in food products (Lee & Hwang, 2016). Consumers with a high concern for food safety may consider organic food as safe food because of the absence of chemicals in the food production process (Pham et al., 2019). Previous research assumes that food safety concern can act as a motivation that drives the value of openness to change from consumers and the results show a positive correlation (Talwar et al., 2021). Furthermore, food safety concerns have the possibility of being associated with the identity of healthy food consumers to ensure their health and well-being (Michaelidou & Hassan, 2008). Consumers who see themselves as ethically driven, have a strong ethical self-identity drive and show concern for their lifestyle and food choices for the environment (Husic-Mehmedovic et al., 2017). Such individuals may purchase organic foods because of their environmental tendencies (Kareklas et al., 2014). In previous research, food safety concerns act as a stimulus for their internal factors which are represented by openness to change and ethical self-identity. In the same research, it was found that food safety concern is negatively correlated with self-identity. This may be related to the demographic characteristics and further research is needed in order to draw generalizations from these two variables (Talwar et al., 2021). Therefore, the following hypotheses are proposed:

**H2.a** food safety concern positively and significantly affects individual openness to change

**H2.b** food safety concern positively and significantly affects individual openness to change

**H2.c** food safety concern positively and significantly affects individual openness to change

Environmental concern shows a person's level of awareness of environmental problems that indicates a willingness to personally contribute with the available solutions (Dunlap & Jones, 2002). Consumers who have environmental consciousness are motivated by products that are considered environmentally friendly and not harmful to the environment (Michaelidou & Hassan, 2008). Environmental consciousness (Hansen et al., 2018) has been identified as one of the most important drivers of consumer organic food behavior (D'Amico et al., 2016) or which in this research represents ethical self-identity. The results of hypothesis testing in other studies show that environmental concern has a positive influence on personal norms (Koklic et al., 2019) or what is considered self-identity in this research. The relationship between environmental concern and openness to change has never been tested in previous research, but there are studies that show that a large environmental concern is related to the high level of personality of the Big Five, one of which is openness (Hirsh & Dolderman, 2007). Other research also shows that an increase in environmental concern is associated with an increase in personality traits in the form of openness to experience (Hopwood et al., 2021). Individuals with high openness to experience are broad-minded and have a desire to try new things (LePine, 2003). Therefore, the following hypotheses are proposed:

**H3.a** environmental concern positively and significantly affects individual openness to change

**H3.b** environmental concern positively and significantly affects individual openness to change

**H3.c** environmental concern positively and significantly affects individual openness to change

#### *B. Organism*

Values (Mainardes et al., 2017; Vieira et al., 2013) and identity (Hansen et al., 2018; Michaelidou & Hassan, 2008; Qasim et al., 2019) of an individual have the potential to influence food consumption behavior. Therefore, values in the form of openness to change, self-identity and ethical self-identity are part of an individual's internal state that can affect willingness to purchase (Talwar et al., 2021). Openness to change can direct consumers to organic food because its consumption allows the development of a positive self-image and identity (Vieira et al., 2013). Previous research found that openness to change has an indirect positive influence on the purchase intention of organic food through behavior (Mainardes et al., 2017). Other research has expanded previous knowledge about the effect of openness to change on consumers' willingness to purchase, where the results of hypothesis testing showed a positive association (Talwar et al., 2021). Therefore, the following hypotheses are proposed:

**H4** individual openness to change positively and significantly affects willingness to purchase

Self-identity is an individual's belief in their uniqueness (Hansen et al., 2018), which is considered to have an association with an individual's organic food buying behavior (Talwar et al., 2021). Self-identity is a factor that has not been explored in previous studies in organic food (Lee & Hwang, 2016; Pino et al., 2012). Previous research extends the knowledge about self-identity effect of consumers' willingness to purchase, where the results of hypothesis testing do not show a positive association. It is possible that this association is related to the

demographic factors of the research, so further exploration is considered necessary (Talwar et al., 2021). Therefore, the following hypotheses are proposed:

**H5** individual self-identity positively and significantly affects willingness to purchase

Ethical self-identity is a distinct characteristic that aligns individuals with issues related to the environment and animal welfare (Qasim et al., 2019) which are considered to have associations with an individual's organic food buying behavior (Talwar et al., 2021). There is a significant difference regarding the effect of ethical self-identity which has a direct association (Hansen et al., 2018; Lee & Hwang, 2016) and a significant association (Dowd & Burke, 2013) with purchase intention. Previous research has expanded the knowledge about ethical self-identity effect on consumers' willingness to purchase, where the results of hypothesis testing showed a positive association (Talwar et al., 2021). Therefore, the following hypotheses are proposed:

**H6** individual ethical self-identity positively and significantly affects willingness to purchase

### *C. Behavior and Consequence*

There are indications about a significant gap regarding consumers' willingness to buy or purchase intention and their actual buying behavior (Qasim et al., 2019; Singh & Verma, 2017). This is referred to as the green gap or green inconsistency which is the difference between consumer intentions, purchase and consumption of organic food is one of the largest knowledge gaps in this field of research. Previous studies stated that the internal conditions of individual consumers who are driven by values in the organism has an association with the formation of behavioral conditions of willingness to purchase for organic food, as well as a consequential association between stated buying behavior and individual willingness to purchase organic food. The results showed a positive association between willingness to purchase and stated buying behavior (Talwar et al., 2021). Therefore, the following hypotheses are proposed:

**H7** willingness to purchase positively and significantly affects stated buying behavior

### *D. The moderating effect of buying frequency*

Buying involvement or consumer buying involvement related to organic food can have a differentiating effect on behavior and intention to make a purchase (Eisinger-Watzl et al., 2015; Kushwah, Dhir, & Sagar, 2019b; Pino et al., 2012). There are significant individual differences in the value, intention and behavior of buyers with different frequency of buying organic food. Previous research suggests that buying frequency has a significant moderating effect on associations between the internal state of an individual or organism, willingness to purchase and stated buying behavior. The results only showed moderating effect on the association between self-identity with willingness to purchase and willingness to purchase with stated buying behavior. However, the absence of a moderating effect of buying frequency on the association between openness to change and ethical self-identity with willingness to purchase may be related to the market and sample in the reserach, so fu further exploration is considered necessary (Talwar et al., 2021). Therefore, the following hypotheses are proposed:

**H8.a** buying frequency will increase the positive effect between openness to change and willingness to purchase

**H8.b** buying frequency will increase the positive effect between self-identity and willingness to purchase

**H8.c** buying frequency will increase the positive effect between ethical self-identity and willingness to purchase

**H8.d** buying frequency will increase the positive effect between willingness to purchase and stated buying behavior

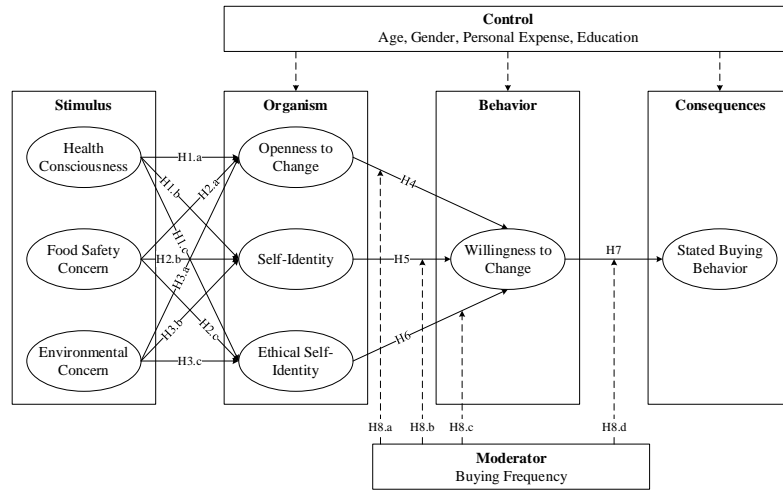

Fig. 1. Research Model Framework

III. RESEARCH METHODOLOGY

This research uses a quantitative research method to test the proposed hypotheses. The data was collected with an online cross-sectional survey using purposive sampling technique between April and May 2022. The respondent in this research is Indonesian who have purchased organic food within the last one month. The questionnaire comprised of eight constructs, each with measurement items adapted from previously validated scales. The items used a Likert scale to collect responses on a scale of one to five, with one indicating strong disagreement and five indicating strong agreement. Wording test were conducted and minor alteration were made to the questionnaire based on the feedback received. The questionnaire was then tested through a pilot survey with 32 respondents representing the target population. Feedback from the pilot survey was used to modify the questionnaire, which was utilized for final data collection. The questionnaire begins with asking participants about their familiarity with organic food products through a screening question that was made available to survey participants along with a short description of organic food. Next, the survey participants were asked about their organic buying behavior in the past month. As seen on Table 1, a total of 327 responses (41% male and 59% female) were used for further analysis with majority of them falls between 25-31 age group, post graduate education and monthly household expenses of 2 – 4 million IDR household expenses group.

Table 1. Respondent demographic profile.

No.	Characteristics	Category	Respondent (n = 327)	
1	Gender	Male	134	41,0%
		Female	193	59,0%
2	Age	<25	90	27,5%
		25-31	129	39,4%
		32-38	68	20,8%

Source: survey result

Partial Least Square based Structural Equation Model (PLS-SEM) was chosen to analyze the collected data using smartPLS 3 statistical software. PLS-SEM was chosen because this method is suitable for testing theoretical framework carried out from a predictive perspective (Hair et al., 2019). Model analysis using PLS-SEM comprised

of two step, measurement model assessment and structural model assessment. Measurement model assessment was conducted to determine the relationship between indicators and variables, including internal consistency reliability, convergent validity, indicator loadings, and discriminant validity. Structural model assessment was conducted to determine the model's capability in predicting one or more target variables, including collinearity assessment, coefficient of determination, predictive relevance and structural model relationship (Hair et al., 2017, 2019). Multi-group analysis was conducted to test the moderating effect of buying frequency. Finally, the proposed hypotheses were tested using path analysis.

Table 2. Research variable and measurement item.

Variable	Measurement items
<b>Health Consciousness (HC)</b> (Hansen et al., 2018)	HC1 I consider myself a health conscious consumer HC2 I choose food products that are good for my health HC3 I am aware of the changes in my health HC4 I am responsible for my health condition
<b>Food Safety Concern (FSC)</b> (Michaelidou & Hassan, 2008)	FSC1 I am very concerned about the amount of artificial additives in food FSC2 I am very concerned about the amount of preservatives in food FSC3 I am worried about the quality of the food at this time FSC4 I am concerned about food safety at this time
<b>Environmental Concern (EC)</b> (Suki & Suki, 2019)	EC1 The green environment is a major concern for me EC2 I am emotionally involved with environmental protection issues EC3 I am concerned about the deteriorating quality of the environment EC4 I think about how the quality of the environment can be improved
<b>Openness to Change (OTC)</b> (Claudy et al., 2015)	OTC1 I love finding new things to do OTC2 I like to find surprising things to do OTC3 I love looking for adventure OTC4 I like to take risks OTC5 I am open to new experiences
<b>Self-Identity (SI)</b> (Oh & Yoon, 2014)	SI1 My food consumption reflects my lifestyle SI2 My food consumption reflects my personal values SI3 My food consumption reflects my self-image SI4 My food consumption reflects my personal characteristics
<b>Ethical Self-Identity (ESI)</b> (Birch et al., 2018; Fatoki, 2020)	ESI1 Ethics is important to me when making purchasing decisions ESI2 I consider myself as someone who is interested in ethical consumption ESI3 I consider myself as an ethical consumer ESI4 I consider myself as someone who cares about ethical issues
<b>Willingness to purchase (WTP)</b> (Vassallo et al., 2009)	WTP1 I am willing to purchase organic food if it is available where I often buy food products WTP2 I intend to purchase organic food if it is available where I often buy food products WTP3 I plan to purchase organic food if it is available where I often buy food products WTP4 I will try to purchase organic food if it is available where I often buy food products
<b>Stated Buying Behavior (SBB)</b> (Singh & Verma, 2017)	SBB1 I purchase organic food products regularly SBB2 I still purchase organic food even though there are alternatives in form of conventional food SBB3 I don't mind paying premium prices for organic food

#### IV. RESULT/FINDING

##### A. Measurement model assessment

Four criteria of measurement model were assessed including internal consistency reliability, convergent validity, indicator loadings, and discriminant validity. Reliability values between 0.70 to 0.90 are considered "satisfactory to good" (Hair et al., 2019). However, a value higher than 0.95 is considered problematic, because it indicates that there is redundancy in the indicator so that it can reduce validity (Diamantopoulos et al., 2012; Drolet & Morrison, 2001). There are two internal consistency reliability criteria, namely Cronbach's alpha and composite reliability. Convergent validity shows the extent to which the variables converge to explain the variance of the indicators. The criteria used to evaluate convergent validity is average variance extracted (AVE), with a minimum acceptable value of 0.50. The recommended value for loadings is above 0.708 because this value indicates that the variable explains more than 50% of the indicator variance, thus providing acceptable reliability. Discriminant validity is the criterion used to evaluate discriminant validity, where the HTMT value that is too high more than 0.85 indicates a discriminant validity problem (Hair et al., 2019). As seen on Table 2, all criteria were found to lie between the recommended threshold value.

Table 3. Measurement model assessment result.

Variable	Indicator	Internal Consistency Reliability	Convergent Validity
----------	-----------	----------------------------------	---------------------

		Cronbach's Alpha	Composite Reliability	Loadings	AVE

### B. Structural model assessment

After the measurement model is confirmed to be reliable and valid, the next step in PLS-SEM is to evaluate the structural model. This is done to determine the model's capability in predicting one or more target variables. The criteria assessed in the structural model include collinearity assessment, coefficient of determination and predictive relevance (Hair et al., 2017). The criterion used to measure collinearity is the variance inflation factor (VIF), where a value below 3 is the ideal value and indicates that there is no collinearity problem between the predictor variables (Hair et al., 2019). Coefficient of determination or R<sup>2</sup> of the dependent variable measures the predictive power of the model that represents the combined effect of the independent variables on a dependent variable. R<sup>2</sup> is used to assess the power of the model to predict the data used in model estimation or in-sample predictive power (Sarstedt et al., 2014). R<sup>2</sup> has a value range from 0 to 1, where a value of 0.20 is considered high in the discipline of consumer behavior (Hair et al., 2017). Q<sup>2</sup> is an indicator of out-of-sample predictive power or predictive relevance. When a PLS model has predictive relevance, this model can accurately predict data that is not used in model estimation. Q<sup>2</sup> with values higher than 0, 0.25 and 0.5 shows small, medium and large predictive relevance of the model. The structural model has no collinearity issue as the VIF value lies between 1 – 2.232.

Table 3 shows that the structural model has a considerably high in-sample predictive power. For out-of-sample predictive power, the structural model has small power for variable openness to chance, self-identity, willingness to purchase, stated buying behavior and medium power for variable ethical self-identity.

Table 5. R<sup>2</sup> and Q<sup>2</sup> of structural model.

Dependent variable	R <sup>2</sup>	Q <sup>2</sup>
Openness to change	0.359	0.200
Self-identity	0.285	0.206
Ethical self-identity	0.394	0.259
Willingness to purchase	0.253	0.196
Stated buying behavior	0.266	0.197

Source: data processing result

### C. Moderating effect analysis

The moderating effect analysis of buying frequency was carried out using multi-group analysis. Respondents were divided into 2 groups, frequent buyers (more than 6 purchases in a month) and non-frequent buyers (1 – 5 purchases in a month). This division is done to ensure sufficient statistical power of each group, where the minimum recommended value is 160 (Cheah et al., 2020). With this division, the frequent buyer group has 167 data and the non-frequent buyer has 160 data. As seen on Table 4, frequent buyer has a higher path coefficient compared to non-frequent buyer on the relationship between openness to change with willingness to purchase, while frequent buyer has a lower path coefficient compared to non-frequent buyer on the relationship between ethical self-identity with willingness to purchase. There is no significant difference between the path coefficient of frequent buyer and non-frequent buyer on the relationship between ethical self-identity with willingness to purchase and willingness to purchase with stated buying behavior.

Table 6. Multi-group analysis result.

Relationship	Path Coefficients	
	Frequent buyer	Non-frequent buyer
OTC -> WTP	0,357	0,085
SI -> WTP	0,056	0,086
ESI -> WTP	0,034	0,317
WTP -> SBB	0,433	0,363

## V. DISCUSSION

The hypotheses testing was conducted using p values obtained from path analysis, which shows that the coefficient is statistically significant when the t value is greater than the critical value. This research uses one-tailed tests with a significance level of 5%, so that the critical value used is 1.65. The analysis results shows that health consciousness shared significant and positive correlation with openness to change (H1.a =  $p < 0.05$ ), self-identity (H1.b =  $p < 0.05$ ) and ethical self-identity (H1.c =  $p < 0.05$ ). Food safety concern on the other hand, does not shared significant correlation with openness to change (H2.a =  $p > 0.05$ ), self-identity (H2.b =  $p > 0.05$ ) and ethical self-identity (H2.c =  $p > 0.05$ ). Food safety concern even have a negative correlation with self-identity and ethical self-identity. Environmental concern shared significant and positive correlation with (H3.a =  $p < 0.05$ ), self-identity (H3.b =  $p < 0.05$ ) and ethical self-identity (H3.c =  $p < 0.05$ ). The willingness to purchase significantly and positively associated with openness to change (H4 =  $p < 0.05$ ), self-identity (H5 =  $p < 0.05$ ) and ethical self-identity (H6 =  $p < 0.05$ ). H7 was supported since stated buying behavior was also found to be significantly and positively correlated with willingness to purchase ( $p < 0.05$ ). Buying frequency only moderate the positive relationship between openness to change with willingness to purchase (H8.a =  $p < 0.05$ ). Buying frequency has a significant moderating effect on relationship between ethical self-identity with willingness to purchase, but the effect was negative. Therefore, not supporting the proposed hypotheses H8.b. It did not moderate the relationship between ethical self-identity with willingness to purchase (H8.c =  $p > 0.05$ ) and willingness to purchase with stated buying behavior (H8.d =  $p > 0.05$ ). This conclude that 11 out of 17 hypotheses were supported.

Table 7. Hypotheses testing result.

Source: data processing result

H1.a, H1.b and H1.c proposing health consciousness as a stimulus to individual psychological factors represented by openness to change, self-identity and ethical self-identity were supported in consonance with previous findings (Hansen et al., 2018; Kim, 2019; Qasim et al., 2019; Talwar et al., 2021). These results indicate that consumers who are aware of their health will be more open to new experiences from consuming organic food and the changes they get in their lives (Hansen et al., 2018; Mainardes et al., 2017). Consumers who are aware of their health will be interested in maintaining personal or family health (Kushwah, Dhir, Sagar, et al., 2019) through consumption of organic foods that are considered healthy (Dubé et al., 2014). They feel that they belong to a different social group with different values and beliefs compared to groups who are not organic food consumers (Kim, 2019). They are aware of the impact of their behavior and tend to purchase environmentally friendly products (Laroche et al., 2001), where organic food is one of the products marketed as environmentally friendly products (Magnusson et al., 2003). Health consciousness can stimulate consumer psychological factors represented by openness to change, self-identity and ethical self-identity to encourage the purchase of organic food. Health consciousness relates to the tendency of individual consumers to identify and actively take steps to protect their health, therefore motivate the purchase and consumption of organic food (Hansen et al., 2018; Michaelidou & Hassan, 2008; Shin & Mattila, 2019).

H2.a, H2.b and H2.c proposing food safety concern as a stimulus to individual psychological factors represented by openness to change, self-identity and ethical self-identity were not supported, which is not fully in line with previous research conducted by Talwar et al. (2021). Consumers with food safety concern assume that organic food is safe to consume because there are no chemicals in the production process (Pham et al., 2019). This can stimulate their internal factors to make them open to changes in their consumption patterns to organic food and stimulate the purchase of organic food through self-identity (Talwar et al., 2021). Conventional foods that are considered to have additional chemicals and preservatives can stimulate consumers to behave ethically in their consumption (Talwar et al., 2021), so that they have a tendency to buy organic food (Kareklas et al., 2014). On the other hand, several other research found no significant relationship between food safety concern with openness to change, self-identity and ethical self-identity (Nagaraj, 2021; Qasim et al., 2019; Talwar et al., 2021). This result might be attributed to the fact that food safety concern has no significant effect on regular consumer of organic food (Pino et al., 2012), which is the population on this research.

H3.a, H3.b and H3.c proposing environmental concern as a stimulus to individual psychological factors represented by openness to change, self-identity and ethical self-identity were supported in consonance with previous findings (D'Amico et al., 2016; Hopwood et al., 2021; Koklic et al., 2019). Environmental concern makes consumers more open in their consumption patterns to be more environmentally friendly, which in the context of this research is the consumption of organic food. They see themselves as part of a social group that cares about the environment, so they align their behavior in consumption patterns through the consumption of organic food. They also see themselves as someone who acts in an environmentally friendly way. They are more

likely to engage in a variety of environmentally supportive behaviors, such as the consumption of organic foods. Environmental concern can stimulate consumer psychological factors represented by openness to change, self-identity and ethical self-identity to encourage the purchase of organic food. Environmental concern which is how individuals evaluate the seriousness of environmental problems has been proven to motivate the purchase and consumption of organic food (Hughner et al., 2007; Koklic et al., 2019).

H4 proposing individual psychological factors represented by openness to change will cause a behavioral response in form of willingness to purchase organic food when receiving stimulus were supported in consonance with previous findings (Talwar et al., 2021). Consumers who are open to change are able to direct them to organic food (Vieira et al., 2013) and generate willingness to make a purchase (Mainardes et al., 2017). Consumers who are open to change are those who like to find new and surprising things to do, seek adventure, take risks and are open to new experiences. In accordance with this research, openness to change which represents internal factors causes behavioral responses in the form of willingness to purchase organic food.

H5 proposing individual psychological factors represented by openness to change, self-identity will cause a behavioral response in form of willingness to purchase organic food when receiving stimulus were supported, which is not in line with previous research conducted by Talwar et al. (2021). Self-identity is an under-explored factor in organic food research (Lee & Hwang, 2016; Pino et al., 2012). Talwar et al. (2021) argue that consumers do not consider the consumption of organic food in line with their self-image and lifestyle, and that there is an influence of demographic characteristics of the research conducted in Japan.

However, the results of this research are in line with other studies which show a positive and significant relationship between self-identity and willingness to purchase in organic food consumers (Dean et al., 2012; Saleki et al., 2019). They are consumers who believe that food consumption is a reflection of their lifestyle, personal values, self-image and characteristics. These findings support the argument made by Talwar et al. (2021) regarding the effect of demographic characteristics, which shows that there are differences in psychological factors of self-identity between organic food consumers in Japan and Indonesia.

H6 proposing individual psychological factors represented by ethical self-identity will cause a behavioral response in form of willingness to purchase organic food when receiving stimulus were supported in consonance with previous findings (Talwar et al., 2021). Consumers make consumption decisions based on ethical values because they feel they have a sense of responsibility for various environmental problems that occur. They reflect this value through purchasing products that are considered ethical, such as organic food (Kushwah, Dhir, & Sagar, 2019a). In accordance with this research, ethical self-identity which represents internal factors causes behavioral responses in the form of willingness to purchase organic food.

H7 proposing stated buying behavior as the consequence of behavioral response in form of willingness to purchase were supported in consonance with previous findings (Talwar et al., 2021). There are various studies that show that actual buying behavior is not always a consequence of willingness to purchase. Sometimes consumers have the desire to make a purchase but fail to do so (Gundala & Singh, 2021). This research confirms the findings of Talwar et al. (2021), that in the context of the SOBC framework stated buying behavior is a consequence of the behavioral response in form of willingness to purchase.

For the moderating effect of buying frequency, the results were not fully in line with previous research conducted by Talwar et al. (2021). Only H8.a were supported, where H8.b, H8.c and H8.d were all not supported. The effect of openness to change is stronger on frequent buyers compared to non-frequent buyers, indicating a moderating role of buying frequency. Meanwhile, the effect of ethical self-identity is weaker on frequent buyers when compared to non-frequent buyers. Even though the significant moderating role of buying frequency is present, the results are not as positive as the proposed hypothesis. Purchase frequency has a differentiating effect on intentions and buying behavior of organic food (Eisinger-Watzl et al., 2015; Kushwah, Dhir, & Sagar, 2019a; Pino et al., 2012). The results inconsistency found in this research with the previous research confirms argument made by Talwar et al. (2021) regarding the influence of demographics on the moderating role of buying frequency in organic food purchasing.

## VI. CONCLUSION AND RECOMMENDATION

Based on the results of hypothesis testing, several conclusions that can be drawn from this research. Within the SOBC framework, health consciousness and environmental concern can stimulate organisms represented by openness to change, self-identity and ethical self-identity to encourage the purchase of organic food. Meanwhile,

food safety concern is not proven to have a role as stimulus in organic food purchase. These consumers who receive stimulus will develop a behavioral response in form of willingness to purchase, and eventually become organic food actual buying behavior as the consequence of this behavioral response. Buying frequency is proven to have a moderating role on the relationship between openness to change and willingness to purchase.

This research offers several contributions to theoretical knowledge in this field of research. SOBC is a framework that is rarely used in research on organic food consumption. This research extends the framework established by Talwar et al. (2021) by adding the role of environmental concern as a stimulus in the context of organic food purchase. This research also provides insight for the green gap, where there is a gap between consumer intention and behavior in making decisions regarding the purchase of organic food which is often encountered in organic food research (Sultan et al., 2020; Tandon et al., 2020a, 2020b). The results show that the organic food actual buying behavior is a consequence of the consumer's behavioral response to internal psychological factors that receive a stimulus.

This research offers several contributions to managerial implication. Health consciousness has been proven to stimulate consumer behavioral responses, where most respondents stated that they felt responsible for their health. Organic food marketer can invite people to be more responsible for their health by consuming organic food. Comparative advertising can be used to show the advantages of organic food in terms of health benefits compared to conventional food. Environmental concern also proven to stimulate consumer behavioral responses, where most respondents stated that they were worried about the worsening environmental conditions. Organic food marketer can educate the public about the organic food production process that is more environmentally friendly compared to conventional food. Advertising can be done with messages that invite people to maintain environmental conditions by consuming organic food.

Organic food marketer can show how the consumption of organic food is able to align consumers with their internal factors. Ethical self-identity is the most relevant internal factor for organic food consumers, where on average the research respondents stated that they consider ethics when making purchasing decisions. Education about ethical consumption can be given which contains a message that buying organic food is ethical because the production is environmentally friendly. Government can also take part in public education about the benefits and advantages of organic food when compared to conventional food by utilizing existing organic programs such as Go Organic 2010 and Seribu Desa Organik. Government involvement can help create awareness and increase public understanding of organic food.

Limitations of this research is that SOBC framework based on social learning theory shows that the attitudes of Indonesian consumers are driven by social factors that lead to buying behavior for organic food as has been tested in several previous studies (Adhitiya & Astuti, 2019; Najib et al., 2021). This research does not use variables derived from social learning theory. Other limitation is that research on organic food has a dependence on the product category (Boobalan et al., 2022; Juhl et al., 2017), which in this research was not a considered factor.

Future researcher can overcome this limitation by expanding this research framework using variables based on social learning theory to broaden insight into the influence of social factors on organic food consumers in Indonesia. Multi-group analysis can also be conducted using this research framework by grouping respondents based on organic food products category to broaden the knowledge regarding consumers of organic food in Indonesia. Last, this research confirms the findings of Talwar et al. (2021) regarding the geographical influence on the relationship between food safety concerns and willingness to purchase, as well as the moderating role of buying frequency. Future research can conduct research in different geographic areas to test the generalizability of these findings.

## Analysis Talent Management Public Service Agency (Lembaga Manajemen Aset Negara)

Henny W Napitupulu, Mone Stepanus<sup>2</sup>

<sup>1,2</sup> Economics and Business Faculty: Universitas Indonesia, Jakarta, Indonesia

### Abstract

*In an organization the presence of Human Resource/Talent has a significant role which can help the organization to achieve its objectives, vision, mission and to maintain sustainability. Therefore, company need to implement a Talent Management that fit to the company's characteristic and needs. As a public service agency and non-echelon government organization, Lembaga Manajemen Aset Negara (LMAN) has a unique characteristic that reflects from its Hybrid employee (consist of 3 Category: Civil Servants, Non-Civil Servants/Professional, and Supporting Staff). By this condition, LMAN should conduct the implementation of Talent Management internally. This research is an empirical study with qualitative approach to 9 participants (from Division Head and Staff). The purpose of this study is to describe the existing conditions and to explore internal perceptions toward the implementation of Talent Management at LMAN and also to propose recommendations for continuous improvement in accordance with the characteristics/ needs of the organization. The research findings show that LMAN should improve several aspects from its Talent Management Model, there are: improvement in ABK formula, involving the Division Head in Employees placement, adding various employee development programs, implementing career management by considering employee aspirations, and improving the KPI (IKU) Formula. Furthermore, researcher also proposes a new Talent Management Model that consists of 8 steps, there are: business & income forecast, ABK Analysis (with new formula), job/current employee placement, recruitment, talent development, performance management, career management, retention and termination.*

*Keywords— Talent Management; Public Service Agency; Government Organization (Non-echelon); Hybrid Employee*

---

### I. INTRODUCTION

In an organization or company, the existence of Human Resources (HR) has an important and significant role, where superior and talented HR can make a positive contribution, especially in achieving the company's objectives, vision, mission, or targets, as well as helping to maintain the company's sustainability. In the scope of the organization, the term Human Resources (HR) is known as Talent. As a valuable asset for the company, company needs to develop a mechanism for managing human resources (talent) that is suitable for the characteristics and needs of the company. The management of this talent is known as Talent Management

Pella and Inayati (2011: 81) described Talent Management as a process to ensure a company has regeneration or future leaders who can support to achieve company's goals. Meanwhile Wahyuningtyas (2016) defines talent management as a series of activities that are integrated with each other in managing high-performing employees at various levels to achieve company goals, which activities can include; performance management, learning, talent review, employee retention, and succession. Based on the two descriptions of the definition, it can be seen that Talent Management consists of various integrated aspects.

Lembaga Manajemen Aset Negara (LMAN) is a Non-Echelon Public Service Agency (Badan Layanan Umum) at the Directorate General of State Assets (DJKN). LMAN has duties and functions to carry out management of governmental assets and provide public services in the field of government asset property management, from those activities LMAN is expected to contribute Non Tax Revenue (PNBP) to the Government. As an Public Service Agency (Badan Layanan Umum), LMAN has unique characteristics that are relatively different from other organizations. LMAN has a Hybrid (mixed) employee composition structure that consist of 3 (three) categories: Civil Servants employee, Non-PNS/Professionals, and Supporting Staff (Honorer). Therefore, LMAN requires Talent Management that is in accordance with the characteristics and needs of LMAN as an organization. LMAN has different Talent Management systems for the three categories of employees. On implementation Talent Management for civil servant (PNS) employees, the regulation/ the system refers to the Minister of Finance Regulation (PMK) Number 146/PMK.01/, while for the regulation to managed Talent of Non-PNS/ Professional Employees and Supporting Employees (Honorary), LMAN already stated the regulation

in Perdirut 5 Tahun 2020 and Perdirut 2 Tahun 2020. Moreover, to manage the *talent* LMAN also has Talent Management model that consist of 7 activities, there are: recruitment phase, talent pool, assessment, talent development, career management, performance management, and termination.

Fig. 1. LMAN Talent Management Model

Referring to the actual conditions and the Preliminary Interview, researcher found gaps or problems that need to be analysed further. One of the emerging gaps is shown from the LMAN's need for additional employees and the existing implementation recruitment at LMAN which cannot be done directly or relatively takes time with long procedure. On the other hand, the gap that arises is the misalignment between the application for additional HR and the needs of the organization, where the number of existing talent is still very low when compared to the work load and the needs of each Division which continues to grow in line with the LMAN's PNB target which increases every year. The existence of this gap becomes the basis for the author to conduct this research, where the author wants to examine further the implementation of each aspects of the current Talent Management Model and examines how the perceptions of the talents at LMAN towards the implementation of the existing Talent Management Model.

Furthermore, the purpose of this study is to describe the existing Talent Management and explore talent's perceptions to find things that can be improved as a form of continuous improvement so that the implementation of Talent Management can be more optimal and achieve LMAN objectives. This research is expected to be a reference or guidance for LMAN in designing Talent Management implementation strategy in the future. In addition, this research can also be a reference for organizations with similar characteristics in preparing the implementation of Talent Management.

## II. LITERATURE REVIEW

### A. Definition of Talent Management

Human resources is one of aspect that has a significant role in the success of the company/organization. In organizations/companies, Human resources is also known as talent. Pella and Inayati (2011:25), define talent as potential individuals or employees to become future leaders of the company. In line with this definition, Tansley (2011) also suggests describe talent as an individual who has superior performance, high ability in a field (expertise), has a leader character, is creative and optimistic.

Referring to the definition above, it can be seen that talent is a very valuable asset for the company, therefore an appropriate HR management mechanism is needed so that it can be aligned with the company's goals and vision. The mechanism for managing and developing talent is known as Talent Management. According to Armstrong (2008), talent management is a company activity to ensure their talent can help the company to achieve the company's objectives. Wahyuningtyas (2016) also defines Talent Management as a series of integrated activities in managing high-performing employees at all levels of the organization. Moreover, Berger and Berger (2018) describe in more detail the activities that are part of talent management. There are 8 (eight) talent lifecycle activities that are generally used in the implementation of talent management, these activities include: attracting talent, selecting or recruiting talent, acculturating or combining or adapting talents with the company, developing or developing talent, processes involving talent ( talent engagement), performance maximization, talent retention, and improving talent performance.

### B. LMAN's Profile and Business Process

LMAN is an organization under Indonesia Ministry of Finance which has duties and function to manage Government Property Assets. It has been mandated through Peraturan Presiden Number 27, 2014. Based on this regulation, LMAN acts as operator of Government Property (BMN) management and provides services to the public in the field of property asset management. In broader scope, the asset management activities include; services, asset utilization, property asset consultation, property appraisal, property construction, etc. The property

asset has 2 (two) classification, there are General Property Assets such as landed house, lands, office buildings, and other buildings. Other type is classified as Special Property Assets, for instance; LNG Plant located in Bontang and Lhokseumawe Arun. LMAN is also expected to contribute Non Tax Revenue (PNBP) to the Government.

In order to fulfil its duties, functions, vision and mission in government property asset optimization, LMAN has developed an asset management cycle which become the standard or guidance to manage the property assets. The asset management cycle consisted of 7 stages, there are: 1) requisition, 2) conceptualization, 3) pre-development, 4) development, 5) optimization, 6) monitoring, and 7) evaluation.

Stage 1, namely Requisition, is the initial stage of asset management, where at this stage asset requisition is carried out by paying an amount of money for assets redemption rights to the Indonesia Central Bank to change the confiscated assets from Central Bank into LMAN's assets. Property Asset that will manage by LMAN also comes from assets plotting by DJKN (Direktorat Jenderal Kekayaan Negara). Stage 2, is identified as Conceptualization phase. At this stage, LMAN will conduct a research or preliminary study towards property asset. The preliminary study includes several activities such as; asset assessment, potential business identification, risk profile mapping. The final output of this phase is a Business Case or Feasibility Study document that will be used as reference or guidance for asset management. Stage 3 is pre-development phase, where at this phase LMAN will secure the physical assets and documents legality, so that assets can be optimized with a valid and verified legality status. The output of this phase is the condition of assets that are free and clean from third party occupancy. Furthermore, the process continued to the 4<sup>th</sup> Stage of LMAN Asset Management Cycle, which called Development phase. In this phase, Asset will be developed with several options, for instance; rebuilding whole assets, major renovation, or minor renovation. The purpose of this phase is to make the idle asset have value added and become more commercial in market hence it can increase the value of asset. The asset upgrading process is carried out by adjusting market needs and business potential which can be identified from the Feasibility Study or Business Case that have been compiled in Stage 2.

After upgrading assets, the next step is Stage 5 namely Optimization. This stage can also be interpreted as the marketing stage where LMAN made negotiation with prospective partner/ tenant and discussing the rental rates. The completion of this process is marked by an asset utilization agreement/ rental agreement by both parties and financial closing or payment from tenant/partner. Stage 6 is known as Monitoring activity. At this stage, LMAN did maintenance and supervision to each asset that has been optimized to check the asset condition and proposed some upgrade or maintenance if needed. The result of these activities will be used as reference for evaluating the strategy for developing LMAN assets. The last stage is Stage 7 which called Evaluation Process. At this stage LMAN compiles a comprehensive report that showed the review of asset management activities that have been proceed by LMAN in a year (Portfolio and Review Report). The preparation of report includes financial performance, the benefits of asset management both socially and economically. The evaluation report then will be used as input for management in determining investment policies and other strategic plans. The output of this stage is recommendations for improvement of the asset development strategy and business strategy.

### *C. Organization Structure of LMAN*

As an Public Service Agency (Badan Layanan Umum), LMAN has unique characteristics that are relatively different from other organizations. LMAN has a Hybrid (mixed) employee composition structure that consist of 3 (three) categories: Civil Servants employee, Non-PNS/Professionals, and Supporting Staff (Honorar). The total number of employees in LMAN is 148 people. In the implementation of Talent Management in it, LMAN uses the Minister of Finance Regulation (PMK) No. 216/PMK.01/2018 as a reference for managing civil servants and non-civil servants, while for the Supporting Staff (Honorar), LMAN uses Perdirut No. 2/LMAN/2020. The two regulations were prepared independently by LMAN but still consider the regulations that apply within the Ministry of Finance.

Existing Talent Management for Civil Servants (PNS) employees are: 1) employee will get promoted in accordance with the provisions of regulation, 2) the mechanism for employee placement and ranks will be proceed based on employee placement regulation in Ministry of Finance, 3) The period work of PNS Employee at LMAN only for 3 years and can be extended maximum 2 years, 4) the employee can return back immediately to DJKN or Ministry of Finance if there is special assignment or request, 5) the grade of PNS Employee who work at LMAN will freeze during the working period at LMAN, therefore when the working period is off, the talent will go back to Ministry of Finance with same grade/ job position before joining LMAN. It is happened because working at LMAN will be consider as talent development not as career development activity.

Talent Management system for the professional category is clearly stated at Perdirut No.5/LMAN/2020. Based on this regulation, we can know the professional employee at LMAN firstly will be contract as PKWT with specific time, if the employee perform well, the contract will be extended and become permanent employee at LMAN. Meanwhile, for the supporting staff or known as Contract (Honorar), the regulations was stated on Perdirut No.2/LMAN/2020. According to one of passage at the regulation, we can know that all supporting staff only have 1 year working period, after 1 year the contract will be extended but not as a permanent employee.

#### *D. Existing Talent Management of LMAN*

After we identified from the regulation side, according to the current Talent Management Model we can also identified how LMAN managed their employees by analysing each aspect of the model. First, is from the Recruitment Designing and Planning aspect. Before the recruitment process is carried out, LMAN first identifies the number of new employee needs by conducting a workload analysis (ABK). Therefore the process to propose a recruitment activity usually consume long time and long procedure. Second aspect of the talent management model is employee placement. Employee placement at LMAN is proceed using 9 talent pool which classified from the employee assessment that held every 2 years. The third aspect is Assessment. LMAN make an assessment for employees every 2 years and using third parties such as consultant to execute the assessment. The purpose of the assessment is to determine the maturity level of employee from many aspects such as; skill level, knowledge, attitude, way of thinking and problem solving.

After the assessment phase and find the maturity level of each employee, LMAN will proceed it more by developing its talent. LMAN has some talent development program, such as; training, coaching and mentoring, special assignment to broaden exposure, etc. Not just internally, LMAN also courage and give opportunity to the employee to pursue higher education. Meanwhile, not just talent development, LMAN also manage the career of its employee by promoting its employee to higher position or make rotation to give the talent different exposure. After the career management, next phase of the talent management model is performance management. Talent performance at LMAN is determined from the IKU (Indikator Kinerja Utama) or KPI which has been set by the talent. Talent who perform well will show that all the target or KPI is 100% achieved, furthermore talent who can achieve KPI more than 120% will get extra bonus or incentive. The last aspect of existing Talent Management Model, is Termination phase. Talent termination can happen if there's specific condition such as; contract ended, pension, or downsizing.

### III. RESEARCH METHODOLOGY

This research is a qualitative-research that use empirical study. This research aims to examine a phenomenon or state of an object of research in detail by collecting facts that occur and developed by using existing concepts and/or literature (Amirudin and Asikin: 2004)

#### *A. Data Collection Method*

In addition, in this empirical study, the author focuses more on the results that Researcher has been gathered through interviews and direct observations of the research object. As described, the data collection methods that will be used in this study include:

##### *a. Interview*

Researcher will conduct an interview with the HR manager at LMAN, specifically in HR Division namely SMAKKI. The interview was conducted to explore some of the information needed by the researcher, such as: information related to the employee recruitment process, HR management Procedures that have been implemented, reward programs, as well as details regarding the HR management plan of the SMAKKI in the next one year. In addition to interviews with the SMAKKI, the author will also conduct interviews with several LMAN employees from each position level to find information, responses to the phenomena which related to business, staffing organizations, and talent management. Testimonials or the results of these interviews will become data for the researcher to compare with the existing theoretical basis and guidance. The comparison will then produce a gap that require improvement recommendations.

##### *b. Literature Study*

After conducting interviews, to obtain other supporting data, Researcher will also conduct a literature study to obtain more varied data and information in order to support the validity of the previously obtained data. The

literature study was also carried out by the researcher to find gaps between the results of interviews with the ideal conditions or HR management standards as regulated in the existing literature.

*c. Documentation*

Collecting data using three methods above also requires documentation so that every data collection process and data results are recorded systematically to facilitate checking the validity of the data.

*d. Type of Data*

After collecting data using the four methods above, Researcher will identify the type of data that will be used in this study. Meanwhile, based on the results of temporary interviews that have been carried out by the Researcher, there are 2 (two) types of data that will be used, primary and secondary data.

*Primary Data*

Primary Data. This data is obtained or collected directly either through individuals or groups using various data collection instruments. Primary data were also collected from the first source of the research object. In this study the primary data used include:

1. The results of the interviews with the Staff of HR Unit at LMAN (SMAKKI)
2. The results of the interviews with Division Head from each Directorate.
3. The results of interviews and observations with several employees from each employee category at LMAN.

*Secondary Data*

To strengthen the primary data, researcher also use secondary data in this research. Secondary data is data that can be obtained indirectly, in this case researcher does not need to collect directly from data sources but can be obtained from various available data sources such as books or literature, data or information from companies, etc. (Moehar, 2002). :13). The secondary data that will be used in this study are:

1. LMAN business model and strategy.
2. Regulation of Talent Management at LMAN (for each category of employee)
3. Employee talent pool
4. Data and information related to internal and external recruitment mechanisms within LMAN (which have been implemented)
5. Talent management standard data based on literature.
6. Talent Management Model (existing)

*e. Sample and Sampling Methods*

This research uses purposive sampling as a sampling technique. Sugiyono (2017:85) also describes Purposive Sampling as a method of determining the sample based on certain criteria. The determination of these criteria can be inclusion or exclusion, where the inclusion criteria are determined by referring to the research objectives while the exclusion criteria refers to specific/certain criteria. The criteria that is used in this study: a) Individuals who involved in the preparation and implementation of the Talent Management at LMAN, b) Individuals who run or are affected by any Talent Management activity at LMAN.

*f. Informan Profile*

Referring to the informant/respondent selection indicators above, it can be seen that this research considers aspects, namely employee categories, work units, position functions, and length of service. The list and information of participants / resource persons in this study, are:

Table 1. Informan Profile

	Jenis Kelamin	Kategori	Unit Kerja	Jabatan	Lama Bekerja	Media Wawancara	Durasi
1.	Laki-laki	PNS	Direktorat LF	Kepala Divisi	< 3 tahun	Zoom Meeting	53 menit
2.	Laki-laki	Non PNS	Direktorat OMR	Kepala Divisi	> 3 tahun	Zoom Meeting	58 menit
3.	Laki-laki	PNS	Direktorat KDO	Kepala Divisi	> 3 tahun	Zoom Meeting	1 jam 6 menit
4.	Perempuan	PNS	Direktorat PP	Kepala Divisi	> 3 tahun	Zoom Meeting	1 jam 12 menit
5.	Perempuan	Non PNS	Direktorat PP	Staf/ Pelaksana	> 3 tahun	Zoom Meeting	51 menit
6.	Laki-laki	PNS	Direktorat PP	Staf/ Pelaksana	> 3 tahun	Zoom Meeting	27 menit

7.	Laki-laki	Non PNS	Direktorat KDO	Staf/ Pelaksana	> 3 tahun	Zoom Meeting	25 menit
8.	Laki-laki	Non PNS	Direktorat OMR	Staf/ Pelaksana	> 3 tahun	Zoom Meeting	46 menit
9.	Perempuan	Non PNS	Direktorat LF	Staf/ Pelaksana	> 3 tahun	Zoom Meeting	30 menit

### B. Data Analysis

After obtaining the required data, researcher will analyze the data to identify gaps or problems and find recommendations for the most appropriate solution in solving the problem. Malhotra (2010) describes there are 3 (three) steps that can be taken by researchers in analyzing data.

#### a. Data Reduction

At this stage, researcher will select the data which most suitable for the needs and reducing the data that is considered not very significantly related to the research material.

#### b. Data Display

After data reduction, researcher will interpret the data either in the form of a narrative or description or in visual form such as diagrams, tables, or graphs to make the data easier to read.

#### c. Conclusion Drawing and Verification

At this stage, researcher draw conclusions and verify the results of the data obtained. The conclusion is obtained through a detailed discussion and understanding that has been carried out and presented by the researcher.

#### d. Coding

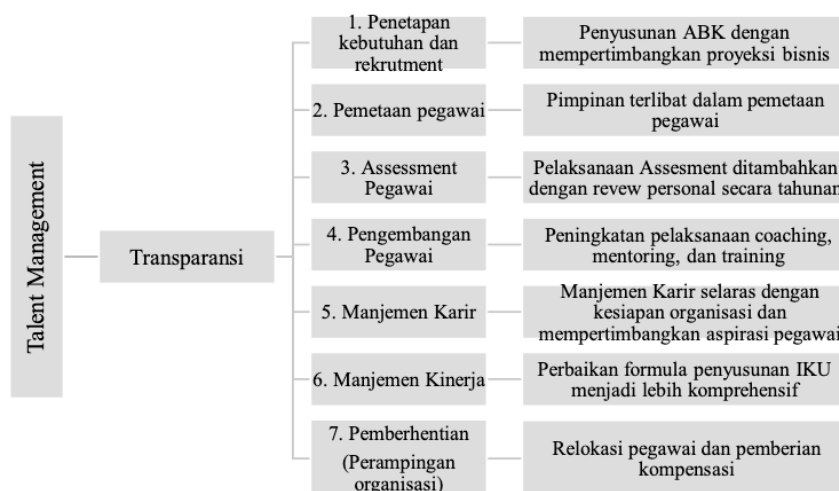

At this stage, the researcher examines the interview data by providing a label/type of code or category in the form of a phrase/sentence to be further linked. with theoretical concepts or ideas based on the available literature. There are several ways of coding, namely: open coding, axial coding, and selective coding. Open coding is the coding stage by describing, examining and conceptualizing the things found from the results of interviews and documentation. In this open coding, the stages carried out include: labelling phenomena, discovering and naming categories, and compiling categories.

#### e. GAP Analysis

After analysing the findings of the data obtained through interviews, the next researcher also analysed the results of the data by using analytical instruments. Pol and Paturkar (2011:2) define GAP analysis as a methodology used by comparing business processes and functions/systems which will then be evaluated to see any potential gaps or gaps, in other words the gap analysis is used to measure the level of discrepancy between actual conditions with the expected ideal conditions. Through this analysis, the corrective steps that can be taken will be determined to get to the desired condition in the future. In this study, the ideal conditions were determined based on the literature review and the results of interviews conducted by the author as a researcher.

## IV. RESULT / FINDING

Based on the data collection and analysis that has been carried out, the authors obtain or identify findings from each aspect of the

implementation of the existing LMAN Talent Management Model, with the results of identification and mapping as follows:

Fig. 2. Findings (Thematic) Map

Referring to the results of the mapping, it can be seen that each aspects have gaps or problems and recommendations for improvement as a means of continuous improvement. In aspect 1, which is related to determining needs and recruitment, LMAN needs to make improvements in terms of the ABK preparation formula Talent Management (Workload Analysis) which is used as the basis for determining the number of additional employees. Based on the interview findings, it is known that the preparation of crew members is recommended to be carried out by considering aspects of business projections or projected income targets. This is in line with the theory put forward in Armstrong (2014) which describes that the approaches used in manpower/talent planning include: business plans, forecast activity levels, plan scenarios, demand level predictions, supply level predictions, future demand predictions, action planning, implementation, monitoring and evaluation.

In the second aspect, namely employee mapping, employee mapping into the talent pool in the LMAN environment does not involve the Division Head as a leader who is directly charged with talent. The findings state that the implementation of the mapping of employees is expected to involve the Head of Division, this is in line with the theory of Deters (2017) which describes that the parties involved in Talent Management, especially in the aspect of Employee Mapping, are not only talent acquisition professionals but line managers (Division Head). which has a significant involvement and impact on the talent pool, especially in terms of talent formation. Furthermore, Farkhani (2018) also explains that managers (leaders) in organizations/companies are advised to be involved in meritocracy, namely by providing equal opportunities to every individual/talent to lead based on ability or achievement.

The third aspect is the implementation of the Assessment, where the implementation of the Assessment in the LMAN environment has been carried out quite objectively, namely by using a third party, but the majority of interviewees are of the opinion that in terms of performance appraisals that have an impact on promotions or promotions, it is better not to use only one assessment process. only, but also supported by additional implementation of Performance Appraisal. This is to accommodate career acceleration for employees or talents who show outstanding performance, so that talent can be promoted without having to wait for an assessment every 2 years. This is in line with the opinion expressed by Armstrong (2017) which states that Supervisors / Managers have an important role in carrying out performance appraisals. Furthermore, you can It is known that the frequency of performance appraisal can also be carried out with a more frequent frequency. According to Shield (2007) there are several methods in conducting Performance Appraisal, namely: peer appraisal, team appraisal, sub- ordinate feedback, self-appraisal, 360-degree appraisal, individual annual appraisal, biannual appraisal, rolling appraisal, continuous assessment.

In the fourth aspect, namely employee development, employee development within LMAN still requires improvement and improvement, especially in more varied employee development programs, not only through training or coaching & mentoring. Armstrong (2014) recommends that the implementation of employee

development can also be carried out by other methods such as knowledge management, formal off the job training, leadership development, etc. The improvement of the employee development program is expected to be a supporting factor in implementing career management. The implementation of career management within LMAN has not been in line with the readiness of the organization to accommodate this, where the implementation of career management has not accommodated or considered the aspirations of employees. To form a career management that is in accordance with talent aspirations, LMAN can first identify the performance and potential of the talent or individual. This identification can be done through assessment. After that, succession planning can be arranged, namely career planning from talents or individuals which will then be followed up with the preparation of development programs.

The next aspect is the aspect of performance management. Measurement of talent performance in the LMAN environment is carried out using the KPI (Key Performance Indicators), where in practice, the preparation of the KPI formula requires improvement. According to Armstrong (2014), it is known that performance/performance assessment can be carried out using several aspects as components of the assessment, namely: objectives or division goals or targets, competencies, action steps taken by the talent for these three things. This is predicted to provide a wider scope of assessment compared to performance measurement based on several representative work activities.

The 7th aspect is the stopping aspect, which in this case is assumed there will be a downsizing of the organization. Employee relocation and compensation in the form of severance pay are recommended to LMAN if LMAN will carry out organizational streamlining. The employee relocation can be in the form of giving a letter of recommendation by LMAN to BLU or other agencies to be able to accept the talent in question. On the other hand, organizations or companies can also provide several additional alternatives such as: training related to finance, insurance, health rights and benefits, as well as other assistance as assistance. Based on Law No. 13 of 2003 Article 157, in addition to severance pay, organizations or companies are required to provide service pay, compensation for entitlements, and all other forms of fixed benefits.

## V. DISCUSSION

As has been done on the analysis of each aspect of the existing LMAN Talent Management Model, several findings were found in each aspect that was deemed to need improvement. From the results of the analysis and findings The analysis has been carried out and provided suggestions/recommendations for improvement. Following up on this, the researchers used the results of the analysis as a reference to develop a new Talent Management Model for LMAN which could be used as a reference by LMAN in implementing HR management in accordance with the characteristics of LMAN as a BLU and non-echelon organization. The proposals for the Talent Management Model are as follows:

Fig. 3. New (proposed) Talent Management Model

## VI. CONCLUSION AND RECOMMENDATION

### A. Conclusion

1. The implementation of Talent Management within LMAN is currently carried out using the Talent Management Model which consists of 7 (seven) activities, namely: determination of needs & recruitment, employee mapping, assessment, employee development, career management, performance management and termination. These seven aspects are applied to the three categories of employees in LMAN (PNS, Non-PNS, and Supporting/Honorary Personnel) and are stipulated in the President Director Regulation Number 5 of 2020 and the President Director's Regulation Number 2 of 2020. The existing condition of LMAN Talent Management implementation shows that at each stage of Talent Management there are issues/gaps that need improvement.

2. Based on the findings and analysis of the findings, the perception of implementation is obtained each aspect of LMAN Talent Management is as follows:
  - a. The formula for preparing ABK is still not able to accommodate all work activities.
  - b. The implementation of employee mapping does not involve the Head of Division / Manager
  - c. In addition to assessment, additional measuring tools/instruments are needed as supporting indicators in the implementation of talent performance assessment.
  - d. The implementation of employee development activities is still limited to coaching, mentoring, and training activities, LMAN does not yet have a mechanism for implementing other employee development.
  - e. The implementation of career management within LMAN has not taken into account the aspirations of employees.
  - f. The formula for the preparation of the KPI has not been able to describe the scope of work in detail so that the performance measurement using the KPI is considered to be still inaccurate.
  - g. LMAN has not considered or developed a plan for employee retention programs and risk mitigation plans in the event of downsizing.
3. Regarding the perception of implementation above, several proposals/recommendations were obtained as a means of improvement or follow-up steps on these perceptions. The follow-up steps include:
  - a. Before carrying out the process of preparing ABK which will be used as the basis for the proposed addition of employees, LMAN should be able to prepare first strategic business plan. The strategic business plan can be in the form of an action plan or projected income target / financial close to be achieved by LMAN.
  - b. Supervision of the implementation of activities / work on a daily basis is the responsibility of the Division Head, so that the Division Head in general is more familiar with and knows the competencies and abilities of the talents. Considering this, then the implementation of employee mapping into 9 quadrants (Talent Pool), LMAN should be able to involve the Division Head to participate in evaluating individual performance.
  - c. In addition to going through an assessment carried out every 2 years, performance appraisal can be done with a shorter frequency (every year) but the results of the performance appraisal are carried out as an additional instrument for support the assessment results. The addition of the frequency of performance appraisals is also carried out to accommodate or provide opportunities for increase positions/promotions to talents who show outstanding performance compared to other talents
  - d. The implementation of employee development activities can be carried out in the following ways: varied not only in the form of coaching, mentoring, training, or on job training, but also through knowledge management, formal off-job, etc.
  - e. The implementation of career management at LMAN can be arranged by considering the aspirations of employees, where these aspirations can be identified by the organization or company through implementation assessment. Through the implementation of the assessment, the company can identify the potential of each talent and develop an appropriate and appropriate career management plan.
  - f. The formula for the preparation of the KPI can be modified by adding aspects in the form of individual targets and the arrangement of action plans from the individual targets in detail, so that the calculation of the KPI is not only based on daily activities but is more strategic in nature.
  - g. In the event of organizational downsizing, LMAN can relocate employees by providing a letter of recommendation to the BLU or other agencies.

#### *B. Recommendation*

The suggestions that can be given through this research include:

- a. For LMAN, this research can be used as material for LMAN in knowing the perception of talent or individuals within LMAN regarding the implementation of existing Talent Management, which can then be followed up in the form of improving the Talent Management mechanism.
- b. For further research, it is possible to analyze the effectiveness of Talent Management implementation within the Ministry/Agency to be used as a reference/evaluation tool in developing a Talent Management Program with a wider scope.

- c. For similar Public Service Bodies (BLU), through this research, each BLU of its kind can review the current talent management implementation and can adopt several aspects contained in the proposed new Talent Management Model.

## The Optimization of Campus Website in Knowledge Management System

Nana Darna<sup>1</sup>, Iwan Setiawan<sup>2</sup>, Ade Risma<sup>3</sup>

<sup>1,2</sup>Lecturer of the Faculty of Economics. Galuh University, Ciamis, Indonesia

<sup>3</sup>Student of the Faculty of Economics. Galuh University, Ciamis, Indonesia

### Abstract

*This study aims to describe website optimization for KMS at unigal.ac.id WEB by comparing the ideal criteria. The demand for higher education encourages lecturers and education staff to cover these expectations and be able to adapt to a constantly changing environment. Higher education managers need to accelerate the creation and dissemination of knowledge to all employees as part of Knowledge management. In its implementation required a system that can provide convenience. One of them is through KMS. Referring to previous research, the practice of knowledge transfer in higher education is an important process in the academic field. Its implementation requires a system that meets technical, human and scientific components. There are no results from previous researchers regarding the Website as a tool in KMS. The method used is a case study on the Galuh University Website by analyzing more deeply whether the current Website can be used as a tool for the Knowledge Management system. The implementation of KM sharing practices at Galuh University which is an important process in creating new knowledge is outlined in the form of a KMS establishment policy which is published in the form of a website. The information section and the service section are two parts of the Galuh university website. In the implementation of KMS, Galuh University strives to be able to provide data storage media that can be reused by the organization. Then, they can transfer knowledge to employees who need it. Currently the unigal.ac.id website used by Galuh University still needs development. Practically, the university web is important to support the quality of KMS, although there is no standard regarding the website, especially in universities. The development of the Galuh University Website is expected to lead to KMS, not only focusing on the learning system.*

*Keywords—Knowledge Management (KM); Knowledge Management System (KMS), Website*

---

## I. INTRODUCTION

The implementation of higher education today cannot be conducted just to meet the community demands for the presence of local higher education institutions in the regions that can help reduce the cost of education in terms of community affordability, but there are many demands related to changing environmental conditions. The demands for service quality in the implementation of education felt by students are accreditation as a guarantee for graduates and graduate users, challenges to the sustainability of higher education institutions caused by the Covid-19 pandemic, and other handled problems that need to be focused on. From this condition, human resources in higher education consist of lecturers and education staff who are required to meet community expectations and adapt to a constantly changing environment. Furthermore, higher education managers are also required to accelerate the creation and knowledge dissemination to all employees as part of knowledge management.

The practice of knowledge transfer in higher education is an important process in the academic field (Chugh, 2013; Enakrire & Uloma, 2012). Practically, Knowledge Management (KM) requires technology that can be used in the process of creating, collecting, and sharing knowledge by human resources. The need for technology in knowledge management often comes out as a knowledge management system (KMS). The four components of knowledge management systems are associated with four interdependent facets, namely; a technological facet, a human resources facet, a process facet, and a context facet that help describe their characteristics and identify the drivers of their efficiency (Zouari & Dakhli, 2018 ). KMS can be used in information technology as studied by Badpa et. al. (2013) and most universities have a website as part of information technology. However, there are no results from researchers regarding the Website as a tool in KMS. This makes researchers conduct the research on Campus Website Implementation in Knowledge Management Systems

## II. LITERATURE REVIEW

### A. Knowledge Management (KM) Definitions

According to Daft (2007) "Knowledge management is a new way to think about organizing and sharing an organization's intellectual and creative resources". Knowledge management is managed by how the knowledge possessed by the best employees is shared with other employees through dissemination, and utilization of knowledge as stated by Gupta et al. (2008) There are many definitions of knowledge management. At a generic level, it can be defined as the collection of processes that govern the creation, dissemination, and utilization of knowledge.

KM activities require tools as stated by Jones (2010) "Knowledge management is, therefore, an important tool for increasing the level of integration within an organization, among people, functions, and even divisions." This tool is used in the KM process, namely; creation, dissemination, and utilization. Furthermore, Jones (2010) divides KM into two categories. First explicit knowledge and second tacit knowledge. In KM activities Organizations, an IT system is used to facilitate person-to-person conversations that share experiences, insights, and ideas to generate tacit knowledge and knowledge collection and store databases that are easily accessed and used by anyone in the organization as explicit knowledge.

#### *B. Knowledge Management (KM) Dimension and Indicator*

From Draft's perspective (2007), Gupta (2008), and Jones (2010) KM management has the following dimensions and indicators:

- a. Dimensions of creation, with indicators; a) coding, b) capturing, c) converting, d) storing,
- b. Dissemination dimensions, with indicators; a) explaining, b) sharing, c) transferring,
- c. Dimensions of utilization, with indicators: a) applying, b) using.
- d. Renew dimension with indicators: a) learning b) acquiring

The indicators above underlie KM on gradual and continuous activities that are beneficial for the organization in maintaining the continuity of the organization itself.

#### *C. Knowledge Management System (KMS)*

The following definitions deal with the knowledge management system;

- a. KMS is a system created to facilitate the capture, storage, search, transfer, and reuse of tacit and explicit knowledge in an organization (Nainar B, 2016; Metaxiotis K, Ergazakis K, Psarras J, 2005; Gourova E, Toteva K;2014 in Iskandar et al. 2017).
- b. KMS is a collection of techniques and strategies to analyze, organize, improve, distribute, maintain, and share knowledge and experience in an organization (Alavi M 2001; Subramanian, 2009; Singh TR, 2016 in Iskandar et. al. 2017).
- c. Knowledge management is one of the hottest topics in management [5-6]. A knowledge management system (KMS) becomes a useful tool to manage knowledge as most knowledge exists in the form of the digital document today (Peng, Jiang & Zhang, 2013)
- d. The purpose of KMS is to create and develop an information system through information technology that can aid the organization to transform tacit knowledge into explicit knowledge (Iskandar et. al. 2017).
- e. From the definition and purpose of KMS, it is clear that what is meant by KMS is a tool in KM to change tacit knowledge to explicit knowledge. Benefits of KMS according to Iskandar et. al. (2017) The benefits of KMS implementation in an organization are:
- f. Organizations can more quickly establish decisions on problems that occur based on existing knowledge and even novel knowledge of the organization:
  1. Organizations can create new knowledge during the learning process in which such knowledge represents A reasonable and valuable way to solve problems for the organization,
  2. There is a system that provides a reusable data storage medium for the organization,
  3. Organizations can distribute knowledge to employees who need it, wherever and whenever.

### III. RESEARCH METHODOLOGY

The method used is a case study on Galuh University Website (<https://unigal.ac.id>) by means of a detailed analysis of whether the Website can be used as a tool for Knowledge Management to change from tacit to explicit knowledge by the manager. The steps in the research are as follows;

- a. Determining the Website indicators that can meet the requirements used in the knowledge management system
- b. Comparing the Unigal Website with standard Website indicators that can be used in the knowledge management system
- c. Finding the shortcomings of the Unigal web if it is used as a knowledge management system
- d. Recommending suitable websites used as a knowledge management system

The key informants in this study were the Unigal management consisting of the Chancellor and co-rector and the Unigal ICT team through FGDs, interviews, and observations in collecting the data needed in the study.

#### IV. RESULT / FINDING

Galuh University is one of the universities that is important in accumulating and disseminating knowledge. The implementation of the need for KM sharing practices at Galuh University which is an important process in creating new knowledge is outlined in the form of a policy to develop a KM system. One of Galuh University's policies in conducting KM sharing activities is stated in the form of a website.

Universitas Galuh website unigal.ac.id consists of two parts. They are the information section and the service section. The information section has a menu consisting of the profile, student, institutional, academic, and work information, while the service section has a menu consisting of Galuh University Academic System (SIKAD), Publication of Student and Lecturer research results (E-journal), Alumni survey (Tracer Study), Management of e-mail with domain@unigal.ac.id (e-mail), Repository and New Student Admission. The available menu shows that E-Jurnal and Repository can be used as KM which are intended for students and lecturers related to research and service. Sharing knowledge of e-learning learning process activities is outlined in Galuh e-learning and Instruction System (GeLis) subdomain.

Facilities for sharing KM for employees, both tacit knowledge and explicit personnel knowledge, do not yet have a menu or subdomain that can facilitate them. In implementing KMS, Galuh University strives to be able to provide data storage media that can be reused for organizations. Then, they can distribute knowledge to employees who need it, wherever and whenever they need it. The commitment of Galuh University to create new knowledge for both students and lecturers as well as for employees can be obtained through the policy of developing a KM management system. Unigal.ac.id website, which is used by Galuh University, currently requires better development. Based on web quality criteria, in practice, there hasn't been a standard regarding websites, especially in higher education.

#### V. DISCUSSION

Knowledge Management System (KMS) is a system intended for public services. KMS was developed to answer questions and solve problems. In principle, KMS as a system created by Galuh University is used to facilitate the capture, storage, search, transfer, and reuse of knowledge to the entire academic community.

The Knowledge Management System can help universities to share knowledge about the tridharma process of higher education. Problems occur starting from academic life until sharing experiences about tridharma that are beneficial for the development of knowledge among students, lecturers, and education staff. Knowledge Management is a process that helps organizations identify, select, organize, disseminate, and transfer important information and experiences that are part of the organization (Viju Matthew, 2011). Managing this knowledge management, of course, needs a system. Developing an effective knowledge management system needs a technical, human, and scientific context to support it. The research results of Shirvani, A and Mehrabani, S.E. (2010) on Exploring the Application of Knowledge Management Factors in Esfahan University's Medical College (EUMC) provide an explanation that developing a knowledge management system needs a technical, human, and scientific context to support knowledge identification, knowledge acquisition, knowledge development, knowledge distribution, knowledge preservation, and use of knowledge.

Developing knowledge in the educational environment needs to be supported by information technology (Omar and Udin, 2016). This is expected to facilitate the culture of accessing and improving the quality of knowledge sharing and knowledge management which leads to improving the quality and competitiveness of the organization. A knowledge management system (KMS) functions as a planned and systematic approach to ensure the good application of higher education knowledge. Higher education, as the institution to accommodate knowledge, has an important role in supporting and disseminating knowledge development. KMS is expected to be able to improve ideas, innovation, thinking, competence, and expertise.

Intellectual asset management through a knowledge management system is intended to improve the organization's ability to manage its intellectual assets in the form of knowledge and experience. The practice of KMS in utilizing these assets is intended to achieve better organizational performance as well as to accelerate the achievement of the objectives of implementing bureaucratic services and improving university performance and competitiveness.

The implementation of a knowledge management system in higher education is considered strategic. The implementation of KMS in universities must involve human resources, actions, and technology functions in an effort to respond to challenges. So must public demands. It focuses on sharing information. The research results (Omar and Udin, 2016) explain that the implementation of knowledge management systems in universities is considered strategic that involves people (people), processes (processes), and technology functions (technology) that respond to challenges and demands. information-sharing community.

In a wider context, it is necessary to apply knowledge management system strategies and practices to share information among the academic community related to accountability and the quality of university services. The implementation of the knowledge management system in higher education needs to be aligned with the focus on improving higher education tridharma services. The web-based system can make universities gather data used as a source of information in making policy decisions, as well as a system that can provide knowledge exchange services to the academic community of Galuh University.

The implementation of KMS for the aforementioned policy is outlined in the form of a website. University websites can be used as an effort to manage universities to be more focused, effective, and efficient. According to CNET quoted by Ifadah on its site.google.com, it provides requirements that a good web has seven criteria. They are 1). Usability, 2) navigation system 3) graphic design, 4) content, 5) compatibility 6) loading time, and 7) functionality. In addition, a qualified website on the website.Whelo.id provides an illustration that a quality website has the criteria of 1) Responsive Web. 2) Simple and easy to use design 3) fast website speed and 4) interesting and relevant content. These criteria are expected to be able to assist in supporting the improvement of knowledge transfer services to the public.

Based on the existing conditions, the university's website is still heading in the expected way which is in line with the criteria. The responsive web still needs improvement and concentration along with other systems so that data collection can be more effective. The research results (Peng, Jiang & Zhang, 2013) showed that the university website used as KMS consists of the present service layer, web-based learning platform layer, knowledge management service layer, and infrastructure service layer. This component used for Discussion or sharing knowledge in a class is often valuable for both teachers and students in learning, research, and service activities. Then, it is used to support the creation, storage, acquisition, and transfer of knowledge in organizations consisting of individual knowledge management, group knowledge management, and public management. Another important thing is that it is used for Web-based learning platforms. The use of the Web as a means of KMS application is used for the knowledge conversion process (combination) in universities. The use of KMS in internal universities is related to human resources, where all documents, data, and information that have been stored through the organization's database can be read and utilized by everyone, and access to this knowledge can be done through the website media. The data information which is compiled in KMS in universities outlined on the university website can combine various knowledge, both tacit and explicit knowledge.

Implementation of KMS through a Web system can provide benefits in creating more accurate decision making, improving services to the academic community, and increasing knowledge assets. As stated by (Marakas, 2010), KMS can support the creation, regulation, and dissemination of knowledge, of course to parties in the public environment. Shirvani, A and Mehrabani, S.E. (2010) said that technical, human, and scientific operations are important points needed in building a knowledge Management System. The technical operation in question is the operationalization of how the Knowledge Management System runs, starting from the input of information which is then processed in the process, and to the output that leads to knowledge information. SKM operations will run well if it is carried out with adequate resources. Humans are an important factor in implementing KMS followed by science which is the core of the information that will be developed and disseminated to the public.

Technical problems that can be carried out in Higher Education are parts or technical units that function to maintain facilities that assist in the implementation of KMS. Under the leader appointment, this can be done by establishing a unit that specifically maintains technical physical facilities.

The role of humans in operating this KMS is important. KMS operations can run if human or human resources as the implementers of the system management have the ability in the same field of expertise. Efforts that can be made by the University are to provide opportunities for IT experts to manage it.

Then, KMS users proposed that science is supposed to be the material for development and dissemination to the public. KMS users who use Unigal. ac. id Website is willing and able to provide and exchange knowledge set by the system. The information will be stored on a server that is owned and can then be used as a source of information for other people who are using the web. Thus, a process like this can increase the productivity and organizational performance of Galuh University. This is in line with the opinion of Christin (2006) who showed that the successful implementation of a Knowledge Management System (KMS) can increase organizational productivity in various fields. To support all of this, Unigal.ac.id website must be able to facilitate these activities, based on the ideal criteria of a web, so that knowledge sharing activities can occur.

## VI. CONCLUSION AND RECOMMENDATION

Knowledge Management System is a planned and systematic approach to ensure the good application of organizational knowledge. In education, the Knowledge Management System plays an important role in helping to identify, absorb and disseminate knowledge related to data on the development of the Tridharma of Higher Education. The implementation of the KMS (knowledge management system) at Galuh University has been carried out but it is necessary to further develop the management system, especially in the aspect of intellectual asset management, knowledge transfer, knowledge creation, and knowledge-based system which are still partial.

Currently, the learning knowledge sharing through KMS on the web is still not concentrated. It is not yet integrated among people. Processes and technology systems are still varied.

There is still no uniform standard regarding the Knowledge Management System development model in higher education. So, it allows the university to keep innovating to achieve the ideal web criteria, namely those that meet user expectations and KM implementation.

## ACKNOWLEDGMENT

Highly Gratitude is conveyed to Galuh University Rector, Dr. Yat Rospia Barata, Drs., M.Si, and the Dean of the Faculty of Economics, Dr. Nurdiana Mulyatini, S.E., M.M. who has given full support to the research so far.

I also convey to the Galuh University ICT Team for the information and cooperation so far. Hopefully, in the future, Unigal Website will be more optimally used for KMS.

## Virtual Tourism: Virtual Reality as Reference Sustainable Tourism

Aflit Nuryulia Praswati<sup>1</sup>, Dina Nur Yahya<sup>2</sup>, Helmia Khalifah Sina<sup>3</sup>

<sup>1,2,3</sup> Faculty of Economics and Business, University of Muhammadiyah Surakarta

### Abstract

*Sustainable tourism is a country's economic recovery strategy after the Pandemic. the tourism industry during the Covid-19 pandemic experienced a decline in line with the implementation of policies to deal with the impact of the Covid-19 Pandemic. Virtual Tourism is an attractive option for tourists who want to travel during a pandemic without the risk of being exposed to Covid-19. Virtual Tourism involves Virtual Reality technology, which depends on the quality of travel content, which of course involves stimulation, flow experience, tourist satisfaction, and visit intentions to tourist destinations. New tourism habits will continue to develop so that virtual tourism becomes one of the references for sustainable digital tourism. after the pandemic ends, people use virtual tourism as a new way to go on vacation to visit tourist destinations. The SOR (Stimulus-Organism-Response) model explains the psychological process during the virtual reality journey that is associated with flow experience and visit intention.. are virtual tourism connoisseurs. Sampling using purposive sampling technique. Sense, Quality Information has a significant positive effect on the Flow Experience on the Indonesia Virtual Tour. Sense, Quality Information has a positive and insignificant effect on Visit Intention on the Indonesia Virtual Tour. Flow Experience has a significant positive effect on Visit Intention on the Indonesia Virtual Tour. Flow Experience mediates the influence of Sense on Visit Intention on the Indonesia Virtual Tour. Flow Experience mediates the influence of Quality Information on the Indonesia Virtual Tour. The weakness of this research is the shift in the virtual tourism trend from using virtual reality to using the YouTube platform. The concept of virtual tourism is used as a medium for promoting tourist destinations to attract investors without having to visit tourist destinations directly.*

*Keywords— Virtual Reality; Sustainability Tourism; Visit Intentions;*

---

## I. INTRODUCTION

Corona virus with type new, namely Covid-19 is spreading to all over the world. Covid-19 at first only plague, however develop become a pandemic. The Covid-19 pandemic brought challenge big for sector tourism. Control of the Covid-19 pandemic through application habit new or called with the 'new normal era' containing regarding health protocols, consisting of from wear masks, non-cash payments, keep your distance, always wash hand or squirt hand sanitizer and restrictions social. Policy restrictions social, make the place tourist no can operate normally. Especially when peak Covid-19 cases in each country. This thing make sector tourist must closed temporary (Schiopu et al., 2021).

Sector tourist be one \_ source state income. Sector tourist capable create more from ten percent Product Domestic Global Gross (GDP). Sector tourist be one industry largest in the world. Moment this technology develop with fast, just with utilise cell phone smart and internet, have change style life society. The Covid-19 pandemic demands digitalization in industry tourism, which is currently this already develop be one biggest online industry in the world. Internet users through information websites such as social media, and virtual communities for express experience and opinion about service or product (Chen et al., 2021).

Manager tourist currently arrange return room communication consumer through digital transformation. *Virtual tourism* be one alternative from tour physique for give beautiful picture about destination travel. *Virtual tourism* appear as opportunity new for change score tourism. *Virtual reality* is navigation interactive and credible from something place. Utilization *Virtual reality* on *virtual tourism* Becomes opportunity new sector tourism. *Virtual reality* offer Thing new not yet there is before, user could To do activity tourist without feel afraid will exposure to Covid-19. So virtual tourism with virtual reality becomes entertainment Public in the midst of the Covid-19 pandemic.

User *virtual reality* will get impression moment used. Great virtual reality will create presence and flow experience for users. User will feel is in the place shown in virtual reality, focus on the show and will feel happy (Aboubaker Ettis, 2017; Csikszentmihalyi & LeFevre, 1989; Lee & Jeong, 2012). Users who got virtual reality impression is expected will increase intention traveler for visit destination tour by physical. Intention visit traveler will determined by the sense and quality of information that goes through the user experience flow on the place travel. Study previous work done by Donovan and Rossiter resulted in influential Sense positive on visit intention. Temporary results research conducted by ( An et al., 2021), Virtual reality effective bring up a sense of location destination so that will increase intention traveler for visit destination tourism, and quality information has an effect positive against flows. However, in a study conducted by (Aboubaker Ettis, 2017) confirm that flow experience is related positive with visit intentions. Then research conducted by ( Kabadayı & Alan, 2012) produce two results positive and negative, where feeling visitors take effect positive on visit intention, and negative emotions have negative effect on visit intention. One thing will contribute for produce experience positive virtual reality journey will increase visit intention on the mechanism. Study this aim for researching big the influence of sense and quality information in increase visit intention mediated by flow experience.

## II. LITERATURE REVIEW

### A. Sense

Sense is component important from marketing *Virtual Reality*, for awaken visual and audio stimulation with give immersive experience (An et al., 2021). Loaded components in virtual reality consists of from interactivity, which will determine the sense felt by the user (Shih, 1998). More virtual reality visual and sound stimulation strong for give effect in convey information if compared with other media (Dinh et al., 1999). User man have ability hearing for estimate distance and angle sound. Virtual reality provides experience new for user through sense will sophistication tool.

Sense is something feeling or turmoil emerging soul in the self somebody effect from existence stimulation, good from in self alone nor from outside. Emotions are very close relationship with condition psychology and atmosphere heart someone declared in form behavior certain. Feeling emotion can in the form of emotion positive ( good emotions ), and can negative emotions ( bad emotions ). On research this sense is very influential to visit intentions. This thing influenced when somebody feel happy in virtual reality journey, then possibility traveler the will visit return destination tour that. Influential sense by significant on experience tour (Kuo et al., 2009).

H1. Influential sense positive on flow experience

H3. Influential sense positive significant to visit intention

### B. Quality Information

*Quality information* is how far is the information by consistent could Fulfill requirements and expectations everyone in need information the for perform the meaning process. Quality information fundamentally related with level product system information in convey meaning. Approach dimensions quality information namely : intrinsic quality, quality contextual, quality representation, and quality accessibility. Quality information have attributes like information obtained from a system, accuracy information, relevance information, accuracy time, and equipment information. Quality information often thank you dimensions key because regarding the satisfaction instrument user. Quality information is degree where individual consider message the current, precise, good, and useful.

*Quality Information* is something declared size how much far has fulfilled various requirements, specifications

and expectations from a activity for collect, store data, facts and messages, opinions and comments, so that people can knowing the situation that happened outside himself. *Quality information* take effect to *visit intention*, where when somebody get quality good information so somebody will interested for visit the place the even recommend to others. Virtual reality tourism provides mediating experience in explore the real world. So that quality information and content journey Becomes key main from good experience. quality lack of information good mediated with experience real will make user no focus so that damage quality journey (Gao & Bai, 2014).

H2. Quality Information matters positive and significant on flow experience

H4. Quality Information matters positive and significant to visit intention

C. *Flow Experience*

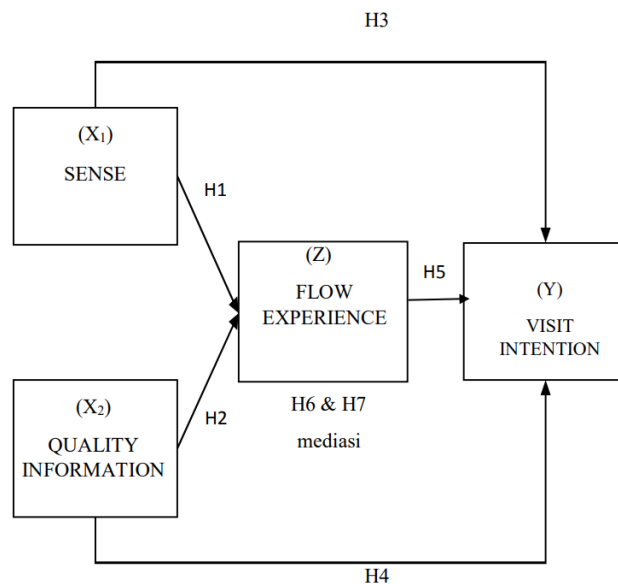

Flow experience is emotion positive feeling individual moment To do activity with involvement full. Emotion positive in related flow with enhancement capabilities and performance. Flow experience in surfing the website affects satisfaction users and intentions buy (Ali, 2016). Flow marked with narrowing focus realized, lost awareness self, responsive to clear goals and not ambiguous bait return, and a sense of control on environment as well as noted by a high sense of play (Csikszentmihalyi & LeFevre, 1989). If individual experience high flow, they tend do something because they feel more involved in activity with other people during experience journey them. In particular, this flow experience could formed by various sources include guide travel, attitude traveler others, and presence population local in group.

On study tourist previously, flow experience is positioned as construction undimensional (Choi et al., 2018). The flow experience in Virtual Reality consists of from a number of dimensions, such as Telepresence, Focused Attention and Temporal Distortion. Only telepresence and focused attention positive produce level high satisfaction. Effect of temporal distortion on satisfaction no significant . Satisfaction with experience Virtual Reality tours also positive cause visit to destination main Virtual Reality journey. because of that, flow experience is used as base for develop interesting experience .

H5. Flow experience matters positive and significant to visit intention

H6. Flow experience matters positive and significant mediate between sense and visit intention,

H7. Flow experience matters positive and significant mediate between quality information and visit intention

#### D. Visit Intention

Visit Intention is possibility traveler for repeat activity or visit repeat to something destination travel. If reviewed from consumption process perspective, behavior visitors shared Becomes three stages, namely pre-visit, during visit and post visit. Behavior tourist including choice visit, evaluate next, and future intentions behavior visitors. Temporary from perspective tourism, intention visit return is something condition traveler feel satisfied with experience visit previously (Guthrie & Anderson, 2010), at the same time as consequence from attitude emotional and satisfaction traveler to what they earn from the place goals ( Hosany & Prayag , 2011). Interest traveler Becomes part from draft Act behavior. The more strong interest for visit return will reflected from Act behavior of tourists.

User will feel satisfaction based on experience private. satisfaction user rated by cognitive and effective from service. Satisfaction refers to evaluation user by whole about experience During use product / service. Quality service tall will produce satisfaction user, and will increase visit back. This thing reinforced by emotions and aspects cognitive satisfaction influence intention visit return festival (Mason & Paggiaro, 2012).

#### E. Virtual Reality

Virtual reality or virtual tourism basically as draft hybrid that combines definition virtual reality and tourism . Virtual tourism facilitates experience travel, without must To do journey anywhere. Technology used for gather information and improve interaction social with user others interested in the destination tourism ( Sigala , 2009). Virtual tourism in form simple consist from the destination video travel. Tourists who watched the video involve sense hearing and sight them. Virtual tourism includes spectrum large from mediated reality digitally which includes virtual reality.

Virtual reality refers to technology appearance interactive that provides experience deep to user in explore the virtual world with respond visual, motion, and audio cues. Virtual reality application that depicts destination travel in the real world called “VR Travel” or “VR Tourism” (Kim et al., 2020). Three visual images dimension (3D) controlled by the user 's kinetic movement supported by audio enable traveler accept information rich sensory and more understand aspect spatial and cultural from something destination (Guttentag, 2010). Experience Virtual reality journey in explore something destination could by positive influence actual (Cho & Fesenmaier, 2000).

### III. RESEARCH METHODOLOGY

Study this is study quantitative with primary data source through technique questionnaire. Population in research this that is Indonesia Virtual Tour visitors. Determination number of samples using formula slovin with a margin of error of 10% as many as 100 respondents. Taking sample using purposive *sampling technique*. How to take this sample whole member population assumed have same opportunity for selected Becomes sample research. Purpose of *purposive sampling technique* chosen for get detailed data about all things on parts different inside something agency. Following amount visitors on the Indonesia Virtual Tour.

Table 1. Population

No	App Name	Object	Amount Visitors
1.	Indonesia Virtual Tour	Istiqlal Mosque	2740
2.	Indonesia Virtual Tour	Puppet Museum	1606
3.	Indonesia Virtual Tour	Jakarta History Museum	961
4.	Indonesia Virtual Tour	Jakarta Art Building	272
5.	Indonesia Virtual Tour	National Monument	7092
6.	Indonesia Virtual Tour	Jakarta Theater	1502
7.	Indonesia Virtual Tour	Planetarium Jakarta	3446
8.	Indonesia Virtual Tour	Fatahillah Park	1850
9.	Indonesia Virtual Tour	Youth Oath Museum	4991
10.	Indonesia Virtual Tour	monument Proclamation	1589
11.	Indonesia Virtual Tour	Sentul City	1351
12.	Indonesia Virtual Tour	Aston Kartika Grogol	1064

13.	Indonesia Virtual Tour	Bobobox Juanda Jakarta	1581
-----	------------------------	------------------------	------

Study this use Structural Equation Modeling (SEM) approach with use path diagrams that allow for enter all observed variables match with the theoretical model built. SEM analysis used namely Partial Least Square (PLS) with the calculation process use tool analysis SmartPLS 3.0. Partial Least Square (PLS) one of the method based SEM statistics designed variant for complete regression multiple when occur problem specific to data such as size sample study small, there are missing data ( *missing values* ) and multicollinearity. Evaluation of the Partial Least Square (PLS) model is carried out with evaluation *outer model* and evaluation *inner model*.

#### IV. RESULT / FINDING

Indonesia Virtual Tour is a work program from State Children's Visual company for promote Indonesian tourism through content *Virtual Reality*, already stand up since 2018. One of the The advantages of Indonesia Virtual Tour are: being the first media to display Virtual Reality in Indonesia and the world, can accessed via the *indonesiavirtual.com* website without collected cost . the weakness of the current Indonesia Virtual Tour this that is lack of content location tourism in Indonesia and when this in production process. Experimental marketing strategy for Indonesia Virtual Tour with method educate government, party private sector, students, and all Public about benefit Virtual Reality content for Fulfill needs information, promotion, digital recreation, and documentation. Development process Indonesia Virtual Tour innovations, namely with give information more deep from existing content. On the picture will given a visual if picture the clicked will appear explanation and description about image. Impact positive experienced by Indonesia Virtual Tour since Covid-19 pandemic due to The content provided by Indonesia Virtual Tour contains: education, so that people who haven't once visit something the place tour Becomes know about the place tour through content provided by Indonesia Virtual Tour without must visit the place tour by straight away.

Characteristic results respondent from study this is as following. Respondents who filled in questionnaire consist of 100 divided respondents to 48 respondents man male (48%), and 52 respondents women (52%). According to range age , majority age respondent in 17-24 years old as many as 55 respondents (55%), age in span of 24-27 years as many as 29 respondents (29%), age in 27-30 years old as many as 12 respondents (12%), age > 30 years as many as 4 respondents (4%).

Analysis using SEM-PLS via application SmartPLS 3.0. Step first analyze evaluation *outer model* is measurement for evaluate validity and reliability of the model. Evaluate this model conducted through validity tests (convergent validity and discriminant validity), reliability tests ( Cronbach's alpha and composite reliability) and multicollinearity tests. Outer model analysis is done for ensure that measurement used already worthy for made measurement (valid and reliable ) through the following outer model picture this.

Fig 2. Outer Model

Based on Fig 2. Outer model above, every indicator show score *outer loading* > 0.7 by *communality* > 0.5 and not show existence indicator with score *outer loading* < 0.5. Thing this show that every indicator study this could said to be valid *convergent validity* .

Table 2. Outer Model

	AVE	Cronbach's Alpha	Composite Reliability
SENSE (X1)	0.646	0.644	0.775
QUALITY (X2)	0.603	0.585	0.751
VISIT (Y)	0.623	0.642	0.773
FLOW (Z)	0.745	0.723	0.817

Validity discriminant be measured from Average Variance Extracted (AVE) value for each construct. Every indicator must correlated tall to the construct so that is said to be valid if AVE value > 0.5. based on table 2. on every variable show AVE value > 0.5 with score Sense variable (X1) is 0.646, the value of Quality variable (X2) is 0.603, the value of Visit variable (Y) is 0.623, and the value of Flow variable (Z) is 0.745. so could concluded that every variable study said to be valid *discriminant validity*.

Reliability rated from score cronbach's alpha or composite reliability on each construct. Variable said *reliable* if have score cronbach's alpha or composite reliability is > 0.7 but 0.6 is still accepted. Based on table 2. above, every variable show score cronbach's alpha sense variable (X1) is 0.644, the value of Quality variable (X2) is 0.585, the value of variable Flow (Z) of 0.723, the value of Visit variable (Y) is 0.642 . temporary score *composite reliability* with score Sense variable (X1) is 0.775, the value of Quality variable (X2) is 0.751, the value of Flow variable (Z) is 0.817 and the value of Visit variable (Y) is 0.773. so could concluded that every variable study this said *reliable*.

Multicollinearity tested through value of VIF (Variance Inflation Factor) < 5 which means regression model free from multicollinearity . Based on table 2. multicollinearity test results show VIF value on each variable. VIF value on the Sense variable (X1) against variable Flow (Z) of 1.475, the value of variable Quality (X2) against variable Flow (Z) of 1.475, the value of Sense variable (X1) against Visit variable (Y) is 1,676 , value variable Flow (Z) to Visit variable (Y) is 1,687, and the value of variable Quality (X2) against Visit variable (Y) is 1,713. so could concluded that all variable free from multicollinearity.

*Inner model* is a structural model for predict connection causality between latent variable. Evaluation *inner model* use *Coefficient Determination* ( $R^2$ )· *Goodness test* ( *Godness of Fit* ), *Effect Size test* ( $f^2$ ), and Hypothesis Testing (T-test, *Direct Effect* and *Indirect Effect* ).

Table 3. Inner Model

	VIF	f Square	t Statistics	t Table	Original Sample	P Values
SENSE (X1) → FLOW (Z)	1.475	0.136	3.943	1988	0.345	0.000
QUALITY (X2) → FLOW (Z)	1.475	0.161	3.606	1988	0.376	0.000
SENSE (X1) → VISIT (Y)	1,676	0.011	0.958	1988 TD	0.117	0.338
QUALITY (X2) → VISIT (Y)	1,713	0.035	1,612	1988 TD	0.211	0.108
FLOW (Z) → VISIT (Y)	1,687	0.064	1990	1988	0.290	0.049

Table 4. Coefficient Determination

	R Square	R Square Adjusted
VISIT (Y)	0.269	0.246
FLOW (Z)	0.407	0.395

*Determination coefficient* value expected between 0 and 1 with criteria score *R Square* below 0.33 – 0.19 stated have score low, then 0.33 – 0.67 has score medium, for value 0.67 and above have score strong. Based on table 4. above, *R Square* used for see big the effect of SENSE (X1) and QUALITY (X2) on VISIT (Y) with score is 0.269 then declared weak. Then *R Square* used for see big the effect of SENSE (X1) and QUALITY (X2) on FLOW (Z) with score of 0.407 then declared have score medium.

Test of goodness ( Godness of Fit) is measured from score quantity *Q Square*. If the quantity *Q Square* have score with range  $0 < Q^2 < 1$ . Here Q Square calculation of construct study this :

$$\begin{aligned} Q \text{ Square} &= 1 - [(1 - R^2_1) \times (1 - R^2_2)] \\ &= 1 - [(1 - 0.269) \times (1 - 0.407)] \\ &= 1 - (0.731 \times 0.593) \\ &= 1 - 0.433483 \\ &= 0.56617 \end{aligned}$$

*Q Square* Nilai of 0.56617 or 56% who meet quantity range *Q Square* that is with range  $0 < Q^2 < 1$ . It means level the variety of models shown independent variable in explain variable dependent by 56% and the rest by 44% still influenced factors other. In other words result calculation show that research model declared have *predictive relevance*.

Test *effect size* with score *f square* for evaluate big influence between variable with criteria value 0.02 declared have score small, criteria value 0.15 declared score medium, and criteria value 0.35 declared score big. Based on table 3. on score *f square* on the Sense variable (X1) against variable Flow (Z) of 0.136 is stated small, value influence variable Quality (X2) against Flow variable (Z) of 0.161 is stated medium, value influence Sense variable (X1) against Visit variable (Y) of 0.011 is declared small, value the effect of Quality (X2) on Visit (Y) of 0.035 is stated small and value the effect of Flow (Z) on Visit (Y) of 0.064 is stated small.

Hypothesis test is method taking decisions based on data analysis. Hypothesis test using the T test ( *T-test* ), the effect of direct ( *direct effects* ) and influence no direct ( *indirect effects* ).

#### H1. Sense of flow experience

Influential sense positive significant to the flow experience, according to with hypothesis test results from score *T Statistics* 3,943 > 1,988 and result direct effect analysis influential positive significant seen from score *Original samples* of 0.345 and *P Values* 0.000 < 0.05. Thing this describe that the more good sense then the more good flow experience too.

#### H2. Quality Information on Flow Experience

Quality Information matters positive significant to the flow experience according to with the results of the hypothesis test shown from score *T Statistics* 3.606 or > 1,988 (t- table ) and the result direct effect analysis which has influence positive significant proved with score *original sample* is 0.376 and *P Values* 0.000 < 0.05.

#### H3. Sense of visit intention

Influential sense positive no significant to visit intentions. In accordance with the results of hypothesis testing that show results the t-statistic value is 0.958 or <1.988 (t-table) and the results stated direct effect analysis have negative influence no significant proved with the original sample value is 0.117 and *p values* are 0.338 > 0.05.

#### H4. Quality information on visit intention

Quality information has an effect positive no significant to visit intention, p this in accordance with the results of the hypothesis test shown from score *T Statistics* 1.612 or < 1.988 (t-table) and results direct effect analysis stated have influence positive significant proved with the original sample value is 0.211 and the P values are 0.108 > 0.05.

#### H5. Flow Experience on Visit Intention

Flow experience matters positive significant to the appropriate visit intention with the results of hypothesis testing that show T Statistics value 1.990 or > 1.988 (t-table) and the result direct effects analysis stated have influence positive significant proved the original sample value is 0.290 and P values are 0.049 < 0.05.

#### H6. Flow Experience as mediation Among sense of visit intention.

Flow experience mediates influence sense of visit intention. This thing in accordance with results analysis of both stated indirect effects same same positive significant proved with results Sense analysis (X1) → Flow (Z) → Visit (Y) show score *original sample* of 0.097 with *P Values*  $0.31 < 0.05$ .

#### H7. Flow Experience as Mediation Quality information on Visit Intention

Flow experience mediates influence *Quality information* to *Visit Intention* proved with Analysis of Quality (X2) → Flow (Z) → Visit (Y) shows the original sample value is 0.105 with *P values*  $0.041 < 0.05$ .

## V. DISCUSSION

Visualization in virtual reality becomes key for promote destination travel. Study this researching flow on the virtual experience felt by tourists, to convey the effect of sense, flow experience and quality of information obtained. Component main in virtual tourism that affects experience tourists, namely sense and quality information. Second component this relate with psychological tourists, so that the sense and flow experience will increase satisfaction tourists. If satisfaction traveler tall so will increase interest traveler for explore destination tour more continued. Virtual reality can used as tool effective marketing ( Huang et al 2013, Kim Lee & Jung 2020).

future development of virtual reality, we recommend for give experience quality sensory height, from side diversity and depth senses that feel, as well as information sensory will accepted by tourists. This thing means no only quality visual images high, but also accompanied by with audio and experience sense smell or different touch, so user will get description situational on a virtual reality tour. Besides virtual reality development, quality information loaded could add information that is influenced by time, season, and weather. So that aspects entered diverse and detailed from destination travel.

## VI. CONCLUSION AND RECOMMENDATION

Innovation technology in industry tourist as one method for Fulfill needs with give experience great tour ordinary. Innovation technology give opportunity new along development internet technology. Innovation technology tourist moment it's on development global network and reservation, marketing and management electronics and design virtual tourism. Moment this has many give birth to tourism virtual community such as TripAdvisor, Ctrip, Mafengwo (Chen et al., 2021; Chiao et al., 2018; Voronkova, 2018) tourism design using virtual reality is becoming a opportunity potential in industry sustainable tourism. Virtual reality will revolutionize experience consumer with cost affordable. This thing make virtual tourism an opportunity big in the future come (Verma et al., 2022).

Study this produce that Sense matters positive significant on flow experience, Quality Information has an effect positive significant on flow experience, Sense has an effect positive no significant on visit intention, quality information has an effect positive no significant on visit intention, Flow experience has an effect positive significant to visit intention, Flow experience mediates the influence of sense on visit intention, Flow experience mediates influence *Quality information* to *Visit Intention*.

Limitations study this is respondents used only ever using the Indonesia Virtual Tour, in addition to that there is cubic360, and atlasvirtual.id. for future study, need existence research on video based virtual tours from youtube, like tourism vlogs. More steps advanced must developed for catch component technical and experience unique from virtual reality technology. Studies in Century front must researching about things that affect experience trip that is individual, as well as add source respondent similar.

## The Leadership In Indonesia: Students' Perception

Nana Darna<sup>1</sup>, Mukhtar Abdul Kader<sup>2</sup>, Wiwin Setianingsing<sup>3</sup>, Wahyu Wahyudin<sup>4</sup>, Destia Isro Mirajanti<sup>5</sup>.

<sup>1,2,3</sup> Lecturers of Management Study Program, Galuh University, Ciamis, Indonesia

<sup>4</sup> Lecturers of Accounting Study Program, Galuh University, Ciamis, Indonesia

<sup>5</sup> Scudents of Management Study Program, Galuh University, Ciamis, Indonesia

### Abstract

*Since its independence in 1945, Indonesia has experienced several changes in President, beginning with the demands of students and the public for the President to step down as leader of the state and government. These demands are driven by political tensions and economic conditions, which make it enjoyable to examine from the perspective of leadership in Indonesia based on student perceptions. The research method was carried out by surveying students from the 2018 class of the Management study program, Faculty of Economics, Galuh University. Analysis of the data used is descriptive analysis taken from 106 questionnaires as research samples. Based on student perceptions so far, leadership in Indonesia concludes; they agree that the leader has a vision to improve the fate of the people, that the leader is not selfish, doubts that the leader pays attention to the chance of the people, doubts that the leader knows the condition of society, doubts that the leader has a clear mission to achieve the vision, doubts that the leader has a clear goal of achieving the vision, doubt the leader has a clear strategic plan to achieve the vision doubts that the leader is committed to achieving the vision suspects that the leader is consistent in achieving the vision doubts the leader keeps his promises to attain the vision doubts that the leader can achieve the vision doubts that the leader has the skills to achieve the vision. They suspect that the leader has experience in achieving the vision.*

Keywords— *Leadership; Students' perception*

---

## I. INTRODUCTION

Indonesian state, which adheres to a presidential system, is led by a president as an executive elected through a general election and assisted by a vice president and ministers in the cabinet. The President is the head of the state and the head of the government who must fight for a just and prosperous people's life per the 1945 Constitution and Pancasila mandate. The President, as head of the state and the head of the government, is a state leader who is obliged to uphold national, religious, and cultural values prevailing in society. In the provision of the Presidential Constitution, special requirements have not been set for having the ability to lead, even though carrying out his duties and responsibilities. A president has the highest power of the executive institution by the mechanisms regulated by the legislation.

A leader has advantages over others in ability, trait, and attitude. A leader with various benefits will develop a behavior of influencing others to achieve a common goal. This is what is meant by leadership according to (Hutahaean & SE, 2021) "*Community leadership helps to develop a 'new shared vision for the future to reflect the collective needs of the group.*"

A leader is also the best person who is chosen to be able to direct all available resources to achieve a common goal elected by all members both formally and informally. The common goal deals with the group's plan, and the broader goal deals with the organization's vision.

Within the interaction among group members, a leader will generate leadership behavior. This follows the opinion of (Terry, 2021), who stated, "The leadership is activities to influence people willing to work together to achieve group goal voluntarily."

Based on the definition above of leadership, it can be concluded that the administration is:

- a. A leader is a person with a vision with a broader future plan or visionary who is concerned with their interests and the fate and condition of the people they lead in the long term.

- b. People with clear direction to achieve the vision. a leader has a clear path to achieving the image that is described through goals and objectives, as well as a strategic plan that can be implemented properly
- c. People who commit to achieving the vision. A leader who is determined to achieve the vision and always keeps the promises has made himself to realize a common goal.
- d. People who have the skill to achieve the vision. A leader certainly has the competence and skill to lead in achieving the vision he has made.

Several Presidents in Indonesia had to step down before the end of their office term due to the people's demand who were dissatisfied with their leadership. This signals how important it is to have a future presidential candidate with a leadership quality that is by the community's noble values and understands the community's wishes. Indonesian people's disappointment with their leaders peaked in 1965 and 1998, which resulted in student demonstrations demanding the resignation of the state leadership. So far, the President, either directly elected by the people or in office due to the transition of power, has not been able to solve the problem of corruption in Indonesia. This is important to find a leadership format in the future that is to the expectation of the Indonesian people to be able to make a just and prosperous nation as well as a developed country. In this era of globalization, it has unwittingly threatened the awareness of human "spirituality ."One of its forms is a justification for an action that harms others, such as corruption. Based on a quote from Tempo Magazine (27 January 2016) that in 2015 there were 168 countries observed by the CPI (Corruption Perception Index).

The countries in the top ranking are Denmark, Finland, Sweden, New Zealand, Netherlands, and Norway. Meanwhile, the countries at the bottom are South Sudan, Sudan, Afghanistan, North Korea, and Somalia. Indonesia ranks 88th with a CPI score of 36. This means that Indonesian people still tend to commit acts of corruption. (Agustina, 2016). The information achieved by Indonesian people dealing with the increased crime in the governance decreased public trust in the government. The leaders in Indonesia have not been able to manage the nation's problems until now, and it is not clear yet whether the cause is from the leadership, power, legitimacy, or other things. This makes the author interested in examining more deeply the leadership in Indonesia.

This research is expected to be helpful for those who are given the mandate to lead the Indonesian nation, both from the highest to the lowest leadership in the community in the administration of the Indonesian state, to have a reference or guide about Indonesia's Future Leaders who bring Justice and People's Welfare. Furthermore, in addition to the aforementioned practical benefit, this research is also helpful in developing knowledge in the field of Management Science, particularly in the area of leader and leadership.

## II. LITERATURE REVIEW

The leader and the leadership have different meanings. The leader focuses more on people as the subject, while the leadership focuses more on the issue's nature, attitude, and behavior. A leader arises because there is interaction in a group with a common goal, either formally or informally chosen. It is during the exchange in the group that the leadership grows, and it can be observed that various theories about leadership emerge.

### A. Leader

The leader, according to "*In the broadest, one who leads by initiating social behavior; by directing, organizing, or controlling the efforts of others; or by prestige, power or position. The effective stimulus giver in social behavior*" (Northouse, 2021). The leader, according to Gage Allee. (1969:214) in Winardi (2012:304), "*In a restricted sense, one who leaders using persuasive qualities and voluntary acceptance on the part of follower.*"

The formal leader, according to Winardi (2012:331), is "a person (male or female) who is appointed by a certain organization (private or government) to hold a position (based on the letter of appointment from the organization concerned) in its organizational structure with all rights and obligations related to it to achieve the organization goals that were originally set."

The informal leader, according to Winardi (2012:337), is "an individual (male and female) who has some qualities (objective or subjective although they did not receive a formal juridical appointment as a leader that enable to reach the position as persons that give the influence to such a community group's action and behavior either in a positive or negative meaning."

Tampubolon (2012:115) states that "the leaders must provide direction, encourage, and represent group members based on their respective levels. They should understand what is being done and what is being done by coordinating all efforts in the group towards one direction, namely the target to be achieved."

Tampubolon (2012:117) lists some essential traits for a leader: integrity, intelligence and knowledge, sincere human sympathy, and self-awareness.

According to Ivancevich et al. (2008:413): *Leadership is defined as the process of influencing others to facilitate the attainment of the organizationally relevant goal. Leadership uses influence in an organizational setting or situation, produces meaningful effects, and directly impacts accomplishing a challenging goal.*

Leadership is said to be a process of influencing others to facilitate the achievement of relevant organizational goals. The administration uses the influence within an organizational framework or situation to produce a meaningful effect and directly impact the achievement of challenging goals.

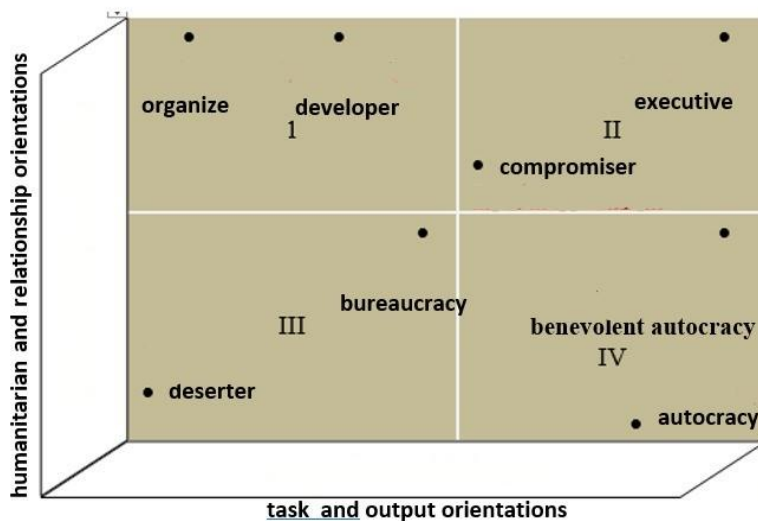

*Leadership is about influencing, motivating, and enabling others to contribute toward the effectiveness and success of the organizations they are members of.* (McShane, 2010:360). Therefore, it implies that leadership is about influencing, motivating, and enabling others to contribute to the effectiveness and success of an organization.

Flippo's leadership style (1984:122) can be formulated as a behavior pattern that combines organizational and personal interests to pursue several goals. Furthermore, Flippo divides leadership styles into (1) coercive autocracy. If necessary, the leader gives orders and threatens (2) benevolent despotism. The leader provides order and explanation and gives positive encouragement if the desired behavior is carried out, (3) manipulative leader. The leader drives subordinates to think that they are highly participative when the leader is pulling the strings behind the scenes, which results in a sophisticated leader, (4) consultative leadership makes employees feel and believe that their inputs are wanted. It can impact the decision in question, and (5) a laissez-faire approach. An approach in which the leader wants to join the group as a fellow participant and do what the group wants to do.

A leader may adopt more than one leadership style to run the organization because a leader's leadership style is influenced by the strengths of subordinates, leaders, and situations. According to Flippo (1984:123), the theory on the situational framework of leadership style concludes:

**B. Theory 3-D Reddin**

Theory 3-D Reddin revealed that initiating and considering are the two most important leadership behaviors. Reddin introduces a mix of styles in four types of main situations using task orientation and relationship orientation dimensions. The division of the entire field into four cells results in cases in which the manager can be (1) detached from both human and task consideration, (2) highly task-oriented and less concerned with people, and (3) highly human-minded with little concern for tasks, and (4) very concerned about the integration between tasks and humanitarian goals.

The situation I - Work with a humanitarian orientation, e.g., personnel department.

Situation II - Work with an integrated orientation, e.g., top management  
Situation III - Somewhat separate work, e.g., financial data processing  
Situation IV - highly task-oriented work, e.g., production.

The figure of Leadership style  
Framework (Reddin)  
Source: (Flippo, 1984:124)

In situation I, the "missionary" style is too extreme, and the more effective manner is "development" (developer), where the orientation is more directed at helping humans describe skills that will be useful in completing tasks. Managers who work in personnel units tend to have styles within this area.

Situation II is typical for top positions in the organization. In this situation, long-term achievement demands task integration and human values. The executive style, which is more effective, tries to maximize both value sets. At the same time, the "compromiser" is willing to plan a political exchange through a trade-off approach and a "minimizing difference" approach. The work related to enforcing procedures, data processing, and finance tend to place more emphasis on the technique than the goal. This is covered in situation III, where the more effective style is called "bureaucrat," and the less effective is called a deserter. Finally, situation IV relates to the work where the priority is task completion. Benevolent autocrats try to "buy" cooperation through appeals, paternalism, benefits, and executive justice. The more extreme "autocratic" style leads to resistance and disobedience.

According to Reddin, the situational framework of the leadership style means if all good ones or only effective ones are taken, then a leader is;

- a. a developer who always helps his subordinates to have skills that will be useful in completing tasks,
- b. an executive who always puts a priority on human values and task values
- c. a bureaucrat who always tries to optimize the way of work, procedures, and processes with a clear hierarchy.
- d. a benevolent autocrat who always cooperates and provides benefits and justice.

### C. Fiedler Contingency Theory

This leadership theory approach uses a situational system composed of eight very different situations and two main leadership styles. In identifying the eight situations, three main elements were analyzed: (1) leader-member relationship, (2) task structure, and (3) positional power of the leader. The measurement of member-relationship is carried out on a group atmosphere scale, indicating the level of recognition of subordinates towards the leader. Task structure is measured by evaluating the clarity of objectives, the verifiability of the decisions taken, the firmness of the solution, and the number of options available for problem-solving. Finally, the strength of a leadership position is determined by its influence on reward and punishment and by the amount of official authority.

Two leadership styles proposed by Fiedler are task-oriented leadership and relationship-oriented leadership. The first style will be effective if the situation is straightforward (1,2, and 3) or the problem is complicated (8). The second style will be more effective in a medium or intermediate situation with moderate difficulty.

According to James A.F. Stoner & R. Edward Freeman (1994: 538), power is obtained not only from one's level in the organizational hierarchy but also based on five sources or power bases according to John French and Bertam Raven. Each can occur at all levels.

- a. Reward power: is based on the ability of an influencer who can reward other people who are influenced to carry out orders or fulfill additional requests.
- b. Coercive power: is based on the ability to influence to punish influencers for not complying with requests which is a negative side of reward power.
- c. Legitimate power: deals with the term authority, which occurs when subordinates or those receiving influence acknowledge that the influencer has the right to influence within certain limits. It also means that the influence recipient must recognize this power.
- d. Expert power: is based on the opinion or belief that the influencer has relevant expertise or knowledge that the influencer does not have.
- e. Referent power: which a person or group can have, is based on the desire of the influencer to imitate the influencer.

III. RESEARCH METHODOLOGY

This study uses a survey method on students of the Management Study Program, Faculty of Economics, Galuh University, by distributing perception questionnaires online. The online questionnaire link is distributed through the Whatsapp Class Group. Of the 376 active students in the 2018 or seventh-semester population, 106 questionnaires were collected using incidental random sampling of the sample in the study. According to Sugiyono (2016; 124), Incidental Sampling is a sampling technique based on chance; that is, any patient who coincidentally meets the researcher can be used as a sample if it is deemed that the person who happened to be completed is suitable as a data source. Data analysis techniques using descriptive statistics, which include; average score, lowest score, highest score, frequency, total score, and Graph.

IV. RESULT / FINDING

So far, the measurement result of the leadership in Indonesia is based on students' perceptions consisting of the vision of the leader to improve the fate of the people, the leader is not selfish, or he thinks about his group, the leader cares about the future of the people, the leader knows the condition of the people, the leader has a clear mission to achieve the vision, the leader has a clear goal to achieve the invention, the leader has a clear strategic plan to achieve the image, the leader has a commitment to achieve the vision, the leader is firm to attain the invention, the leader keeps promises in achieving the picture, the leader can reach the image, the leader has the skills to achieve the vision and has experience in achieving the vision. Further explanation is as follows;

The survey result shows that 52% of students agree that leaders in Indonesia have the vision to improve the fate of the people. Each presidential period, the President's vision is reflected in the National Long Term Development Plan (NLTP). In the NLTP, the economic development goal is essential in reducing poverty.

Leaders in Indonesia have not prioritized their interests or one group's interests so far.

Source: Kuesioner

The result shows that 39% of students agree that leaders do not care about themselves and their groups. Therefore, the people can feel that the leadership in Indonesia is not concerned with their interests or for one group. This is evidenced by the people having equal opportunities or the absence of discrimination against them to obtain their rights as citizens.

Leaders in Indonesia have cared about their people's fate so far.

Source: Kuesioner

The survey results show that 51% of students are doubtful that leaders in Indonesia care about the fate of their people. Programs for alleviating poverty, improving welfare, reducing illiteracy, a program of empowering the community, and gender equality to improve the human development index are still sustained every year. This is a kind of government concern for its people's fate. However, the students' perception revealed that they are still doubtful about the programs put forward as a kind of leaders' concern for the future of their people.

Leaders in Indonesia know their people's condition so far.

Source: Kuesioner

The survey result showed that 37% of students are doubtful that leaders in Indonesia know the condition of their people. Population and economic census, conducted by the Central Statistics Agency and the SDGs of Bappenas, are data sources for leaders to make decisions regarding sustainable development plans.

Leaders in Indonesia have a clear mission so far to achieve the vision.

The survey result showed that 41% of students are doubtful that leaders in Indonesia have a clear mission in achieving their vision. There is planning that involves many parties and the emergence of various interests of individuals and groups that can distort the task of leaders to achieve their vision.

Leaders in Indonesia have a clear goal so far to achieve their vision.

Source: Kuesioner

The survey result showed that 45% of students are doubtful that leaders in Indonesia have clear goals in achieving their vision. Bias in planning shows that the purpose of performing the invention is hampered. The reality of state conditions can change the plans that have been previously determined.

Leaders in Indonesia have precise strategic planning so far to achieve their vision.

Source: Kuesioner

The survey results showed that 44% of students are doubtful that leaders in Indonesia have a clear strategic plan to achieve their vision. Strategic plans that affect the achievement of the invention, the pattern of short-term planning to facilitate the evaluation of the results of the implementation of the program is still unable to describe the achievement of the vision.

Leaders in Indonesia have committed so far to achieving the vision.

Source: Kuesioner

The survey results showed that 49% of students are doubtful that leaders in Indonesia commit to achieving their vision. The hard work to realize the nation's ideals to become a competitive nation has not been enough to describe the leader's commitment.

Leaders in Indonesia have firm principles so far to achieve their vision.

Source: Kuesioner

The survey results showed that 51% of students are doubtful that leaders in Indonesia are firm in their stance to achieve their vision. Therefore, the implementation of supervision and control or supervision of the leader is implemented so that the image they make is achieved, as a kind of firm stance.

Leaders in Indonesia have kept their promise so far to achieve their vision.

Source: Kuesioner

The survey results showed that 46% of students are doubtful that leaders in Indonesia fulfill their promises to achieve their vision. This is because many political commitments that are not realized have resulted in people's doubt that their leaders can fulfill their promises to attain their idea or not.

Leaders in Indonesia can achieve their vision.

Source: Kuesioner

A survey showed that 46% of students doubt that leaders in Indonesia can achieve their vision. However, the minimum requirement for high school education for prospective presidents reflects that academic ability is not essential for future leaders.

Source: Kuesioner

The survey results showed that 52% of students doubt that leaders in Indonesia have the skill to achieve their vision. The outcome of a democratic election that does not require specific competencies for a leader becomes a measurement bias of a person's skill to become a leader.

Source: Kuesioner

The survey result showed that 45% of students doubt that Indonesian leaders have the experience to achieve their vision. The length of the office term is not the experience standard of a leader.

The leadership condition, based on the survey, is not in line with the concept of Leader Self-efficacy from Rehm, Rehm & DeVona (2021) stated that "A leader's assessment of their ability to organize and carry out the action necessary to achieve the type of determined leadership outcome."

## V. DISCUSSION

In Indonesia, in this case, state leaders are needed leaders who have a vision of the fate of their people, do not care about themselves or groups, know the future of the people, have a clear mission, and have goals to achieve the vision, have a strategic plan, high commitment to achieving the vision, have Leaders who are firm in their stance in achieving the vision, always keep promises, have the ability and skills to achieve the dream, and are experienced.

## VI. CONCLUSION AND RECOMMENDATION

Indonesian leaders have the vision to improve the fate of the people, do not prioritize their interests and specific groups, pay less attention to the future of the people, do not know the fate of the people, and lack a clear mission in achieving the vision, lack clear goals to attain the vision, lack a clear strategic plan in achieving the vision, achieve the vision, lack of commitment to achieve the vision, lack of firm principle in achieving the vision, lack of promise in achieving the vision, lack of skills to achieve the dream, and lack of experience in fulfilling the vision.

Leaders and potential leaders in Indonesia should be able to self-assess their ability to achieve their vision (the concept of Leader Self-efficacy).

#### ACKNOWLEDGEMENT

I would to express my special thanks of gratitude to Fakultas Ekonomi Universitas and Universitas Telkom for the opportunity to undertake this extraordinary project entitled The Leadership In Indonesia: Students' Perception.

### **Abstract**

*The COVID-19 pandemic has had an impact to economy of Indonesia. The sector of transportation, tourism, trade, health and other sectors had experience a decline. The decline of economic growth occurred in all regions including Garut which is the object of this research. The potential tourist attraction of Garut in the form of biodiversity, uniqueness and authenticity of regional culture, the beauty of landscape and historical heritage is a source of original local government revenue and becomes opportunity for recovery of economic growth and implementation of economic development. The purpose of this study to analyze the role of local revenue on economic growth of Garut where tourism is a moderating variable. This research method is qualitative with a case study approach. The results showed that Covid-19 pandemic had an impact on decreasing the original local government revenue and economic growth of Garut, while the opportunity to increase local revenue was through the tourism sector with new infrastructure and a more comprehensive classification to increase economic growth.*

*Keywords— Original Local Government Revenue; Economic Growth; Economic Development; Tourism*

---

### **I. INTRODUCTION**

An economic development plan can be based on several aspects of consideration, one of them is normatively and taken from the results of scientific studies, then be positively implemented in certain development patterns. Economic development can work from the results of economic growth as capital to implement it, where economic development and economic growth are two of main economic analysis agendas for realizing prosperity (Muhamad Ferdy Firmansyah, 2021). Economic growth is a process of increasing output per capita in a long term (Ika Novita, 2014). The formation of economic growth isn't instantaneous there must be a process that leads to per capita output.

The COVID-19 pandemic impacted to the economy of Indonesia, there was a decline on transportation's sector, tourism, trade, health and other sectors and the most affected sector by COVID-19 is the household sector (Susilawati Susilawati, Reinpal Falefi, Agus Purwoko, 2020). There are several strategies of government in countries of Southeast Asia to maintain economic stability in the midst of the crisis due to the COVID-19, first carry out massive spending to reduce the economic contraction, then forming a Covid-19 Handling Committee and National Economic Recovery, providing low-interest credit assistance, and preparing various programs for MSMEs could revive, placing funds in bank to turn the wheels of the economy and the government guarantees working capital loans for corporations (Inadha Rahma Nidya, 2020).

Economic growth experienced a decline in all regions of Indonesia, including Garut which was the object of this research. The economic growth of Garut for 2020 turned out to be minus around 1.3 percent, while the economic growth for 2022 reached 3.67 but still far below the West Java average and the national average. One of the efforts to solve this problem by developing the tourism potential in Garut (Garut Regional Government, 2021). Tourism is traveling from a certain place to one or several places, stopping or staying for a while without intending to stay, and then returning to the place of origin (Soebagy, 2012). Tourism has a positive effect for quality of life, economic growth, job creation, cultural development, and infrastructure development. Infrastructure and facilities are the key of factors tourism development in a region or country (Abdullah et al., 2014).

The potential tourist attractions of Garut are biodiversity, the uniqueness and authenticity of regional culture, the beauty of landscape and historical heritage (Desi Qoriah, Marti Dewi Ungkari, Husni Muharam, 2019). Garut Tourism and Culture Office (Disparbud) noted, in the span of 2019 there were approximately 2.8 million who visited to Garut. Of this amount, only about 5 percent of tourists are from foreign countries, while the target for 2020 is 3.1 million tourists (Disparbud Garut: 2020). The tourism sector can develop Micro, Small and Medium Enterprises (MSMEs) which have the potential to absorb labor (Hani Siti Hanifah, Deri Alan Kurniawan, Rostiena Pasciana, 2018). The level of visitor to Garut is still low due to the impact of the COVID-19 outbreak. In general, there has been decline about 50 percent (Antara, 2020).

The government carried out several strategies such as massive spending to reduce the economic contraction due to the Covid-19 pandemic, forming the Covid-19 Handling Committee and National Economic Recovery (T. Tetep, 2021). The original local government revenue (PAD) is regional income sourced from regional tax results, regional retribution results, separated regional wealth management results, and other legitimate regional original income, which provide for regions to exploring the funds in the implementation of autonomy as the embodiment principle of decentralization (Rudy Badrudin, 2021). Below is the Realization Report of Original Local Government Revenue in terms of taxes and levies for Garut:

Table 1. Report Realization of Original Local Government Revenue from Garut Taxes and Levies (Rupiah)

Number	Year	Realization of Taxes	Realization of Retribution	Amount
1	2018	128.132,223,278	22,839,731,670	150,971,954,948
2	2019	131.675,124,090	17,001,093,720	148,676,217,810
3	2020	116.413,508,912	11,970,216,330	128,383,725,242

BAPENDA Garut, 2021

Table 1 shows a decline from year to year where the total number cannot exceed the figure in 2018, causes delays in the realization of welfare programs and economic growth (Fajar Andriansyah, Amalia Risti Rahayu, Maulfy Aulia Putri, Khumairah Khumairah, 2021). The purpose of this study was to analyze the role of local revenue on economic growth in Garut Regency: Tourism Moderating Variables.

## II. LITERATURE REVIEW

### A. *Original Local Government Revenue (PAD)*

Original local government Revenue (PAD) is all regional revenue sourced from the original regional economy (Halim & Kusufi, 2014) which comes from regional taxes, regional retribution, local revenue which separated and other regional original revenues that legitimate. The tourism sector is generates regional retribution.

PAD as the main source of regional income is intended for the implementation of development by the Regional Government so the results of development can be enjoyed for the whole of community. This means, the greater PAD funds obtained by the region will be proportional to the rate of development in the area (Muhamad Safar Nasir, 2019).

### B. *Economic Growth*

Economic growth is defined as the development of economy activities that causes increased of produce goods and services in the community and increase the prosperity of society (Sukirno, 2011) natural resources (SDA), human resources (HR), capital accumulation of managerial staff and production organization as supporting factors.

### C. *Tourist*

According to Kurniansah (2019), tourism is a temporary journey from one place to another, carried out by individuals or groups, as an effort to find balance or harmony and happiness with the environment in the socio-cultural, natural and scientific dimensions. The supporting factors for tourism are accessibility, Infrastructure and Accommodation (Fitria Crli Wiseza, 2017).

## III. RESEARCH METHODOLOGY

The research method of this paper used qualitative descriptive method, with the type of library research using library data collection methods, reading and processing research materials. The research design was carried out through several stages. First stage is tracing, recording, and reading various findings for each discussion of research results, articles, news, website of official government institutions, international institutions and other sources relevant to this study. Second stage is combining all of findings, both of theories, models and research concepts. Third stage is analyze each finding from various readings, both in term of advantages, disadvantages and the relationship between the writings discussed. The last stage is to provide a critical review by elaborating models and approaches that are different from the findings in the previous article (Zed, 2004). The research model described as follows:

Fig 1. Research Model

IV. RESULT/ FINDING

Based on survey and interview equipped with data, reveal that economy development of Garut experiencing a decline due to the contraction of economic growth as an impact of Covid-19 pandemic. On the other hand, the tourism sector from all the existing potential is an opportunity for economic recovery to increase local revenue as a sources for economic development.

V. DISCUSSION

The Economic Growth Rate (LPE) of Garut For 2020 is minus 1.6 percent. However, based on data from the Central Statistics Agency (BPS) for 2021 the rate growth is 3.67 percent, means need to be improved by exploring sources of local revenue such as the tourism sector. Economic growth as a source of economic development in Garut still heavily subsidized from the center. At the beginning of the Covid-19 pandemic, original local government revenue of Garut (PAD) decreased as well as Local Revenue and Expenditure Budget Draft (RAPBD) for 2022 which was lower than expenditure due to various factors, one of which was the impact of the COVID-19 pandemic. Garut local revenue only contributes 7 percent, the remaining 93 percent comes from the central government and funds from the West Java Provincial Government (Antara, 2022). The largest decline occurred in the regional income sector from taxes and regional levies, with the largest contribution to the decline is hotel, restaurant and entertainment tax revenue. The decline in this sector is related to the existence of social restriction policy (PSBB) which has an impact on domestic and international tourist visits entering to Garut and affecting the economic chain, especially providers of accommodation, food and beverage for tourists. The decline in trading volume and activity has an impact on unachieved targets and decreased PAD for Regional Retribution Revenue Sector, especially for market service fees and retribution for recreation and sports (Garut Regional Government, 2020).

The opportunities to increase local revenue through the tourism sector by developing at various weak points of this sector. Should pay attention to influencing factors such as the number of tourism object that offered, the number of tourist both domestically and internationally, hotel occupancy rates, per capita income, the size of hotel taxes. and restaurants, and the size of the tourist attraction fees for help growth of regional revenue by increasing development of tourism sector (Sely Pratyka, 2020). The Tourism & Transport/TTF Forum (2012), stated that tourism infrastructure is a tourism supply chain consisting of three domains/regions, namely Transportation Infrastructure, Environmental Infrastructure and Social Infrastructure which is described as follows:

Fig 2. Supply Chain Interaction 3 Tourism Infrastructure

The correlation between the three domains can be a strategic step in efforts to improve the tourism sector which has contribution to PAD in terms of transportation, supporting environment and social infrastructure of the

community. In this case the government’s role is very dominant in forming policies. Consequently, as an example of tourism infrastructure need more comprehensive classification as illustrated in the following chart (Yoga Pratama, Bima (2019):

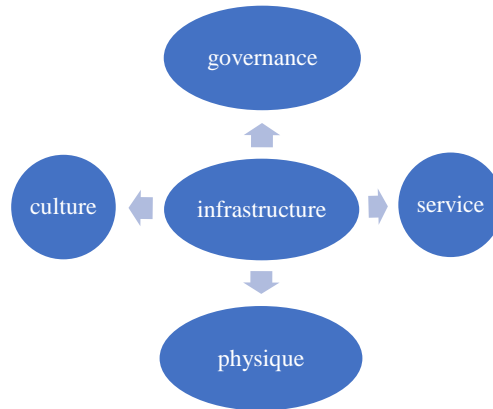

Figure 3. Comprehensive Tourism Infrastructure

Comprehensive efforts can also be made with a resource-based tourism approach, including: (a) Ecotourism; (b) Adventure tourism (Adventure Tourism); and (c) Cultural tourism. The tourism resources are mapped as follows:

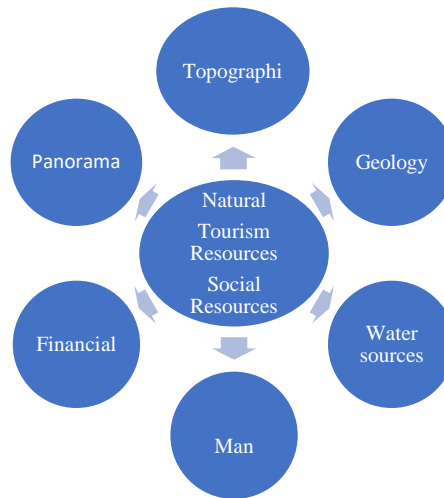

Figure 4. Tourism Resources

Through this effort, it is expected to increase PAD which has a positive impact on economic growth of Garut. There is a unidirectional causal relationship running from tourism to economic growth, confirming the tourism-led growth hypothesis. To increase Indonesia's economic growth, the tourism sector should be further promoted by making it more attractive, supported by sophisticated IT facilities, warm hospitality, and diverse tourist attractions (Mardhani, M., Majid, M.S.A., Jamal, A., & Muhammad, S. 2021). Through a comprehensive infrastructure, it is expected to optimize tourism which will increase regional revenue and economic growth of Garut.

## VI. CONCLUSION AND RECOMMENDATION

The research conclusion and recommendation as follows:

- a. The Covid-19 pandemic has an impact on the decline of regional revenue and economic growth in Garut.
- b. Opportunities to increase regional revenue through the tourism sector with new infrastructure and a more comprehensive classification to increase economic growth.

There are recommendations, including:

- c. Improving the tourism sector with a comprehensive tourism infrastructure through a resource based tourism approach
- d. Strengthening factors that support economic growth and reduce constraints.

## Analysis of the Effect of Population, GRDP Growth, and Unemployment on Poverty in the Ex Residency of Pati in 2017-2020

A.Fany Putri Agustina<sup>1</sup> and B. Eni Setyowati<sup>2</sup>

<sup>1,2</sup>Economic Development, Muhammadiyah Surakarta University, Surakarta, Indonesia

### **Abstract**

*Poverty is a fundamental problem that is often faced by every country, including developing countries like Indonesia. This study aims to determine the effect of population, GDP growth, and unemployment on poverty in the former Pati residency of Central Java in 2017-2020. In this study, how is the influence of the poverty factors studied. The sample of this research was conducted in 6 districts/cities in the former residency of Pati. The data used in this study is secondary data obtained from the Central Statistics Agency (BPS). The data analysis method used is panel data regression which is a combination of time series data and cross section data. The best model in this study is the Fixed Effect Model (FEM). Based on the results of data analysis shows that there is a significant effect of population on poverty in the former Pati residency, while GRDP growth has no significant effect on poverty in the former Pati residency. The f test results show that the estimation model used in this study exists, with a coefficient of determination of 0.982526. This means that 98.25% of the variation in Poverty change (KMS) in the former Pati Residency is explained by variations in population (JP), GRDP growth (PPDRB), movement (UNP). While the rest, which is 1.75%, is explained by variations of other variables that are not included in the model.*

*Keywords— Poverty; Population; GRDP Growth; Unemployment.*

### I. INTRODUCTION

One of Indonesia's national development goals is to promote general welfare. General welfare is a condition of meeting the material, spiritual and social needs of the country's population so that they can live properly and be able to develop themselves, so that they can carry out their social and economic functions (BPS, 2016) . Public welfare in Indonesia can be described, one of which is based on the level of poverty in Indonesia.

Poverty is a fundamental problem that is often faced by every country so that it becomes the center of attention of the government in any country, including developing countries such as Indonesia. The term poverty arises when a person or group of people is unable to meet the level of economic prosperity which is considered the minimum requirement of a certain standard of living. Poverty is one of the factors causing various problems regarding welfare, such as the inability to meet basic needs, remoteness, alienation, dependence, and limitations in accessing social services. (Nisbah, 2018) . According to Kuncoro (2010) the existence of poverty is a very complex problem caused by the inequality of resource ownership patterns that lead to an unequal distribution of income, Poverty arises due to differences in the quality of human resources (HR), low quality of human resources means low productivity This will ultimately result in lower wages. The condition of the low quality of human resources is caused by the low level of education among the poor, in addition there are factors of discrimination or heredity and differences in access to capital. If not handled properly, it will result in the emergence of other social problems. Therefore, poverty alleviation efforts must be carried out comprehensively, because it involves various aspects of people's lives. For this reason, the government's role in taking policies to reduce poverty is very much needed.

In the case of poverty , the population also has an effect. In each year the number of residents in a place / area will increase depending on the number of births. The population will be a problem for the government if it cannot be controlled, because if the population is increasing every year it will also cause high poverty rates. Population growth can reduce poverty depending on people getting jobs that can meet their needs. It is difficult for the government to provide jobs for the community if the population is high (Azizah et al., 2018) .

Another factor that also affects poverty is unemployment. Unemployment is the number of workers in the economy who are actively looking for work but have not yet found one. One of the elements that determine the prosperity of society is the level of income. The high unemployment rate shows the low level of income in the community. With low incomes, people will find it difficult to access goods and services, resulting in a decrease in welfare levels. The

increasing unemployment rate will hamper economic growth, as a result it will increase the poverty rate (Azizah et al., 2018)

GRDP is also a factor that influences poverty. GRDP is the amount of added value produced by all business units in a certain area and can also be said to be the sum of the value of final goods and services produced by all economic units (BPS, 2016) . The increasing GRDP in each region indicates that the government is able to improve the welfare of its people, thereby reducing poverty. The following data on poverty in Indonesia in 2017-2020 is shown in table 1.1.

Fig 1. Number of Poor People in Indonesia in 2017-2020 (Source: Central Bureau of Statistics, 2022)

Fig 1. shows the poverty rate in Indonesia from 2017-2020. It can be seen that from year to year the poverty rate continues to decline, but the decline in the poverty rate in Indonesia can be said to be slow and the number of poor people in Indonesia is still large.

Fig 2. Number of Poor People in the Ex Residency of Pati Tahun 2017-2020 (Source: Central Bureau of Statistics, 2022)

The uneven number of poor people in the former Pati Residency reflects the lack of an even distribution of people's income. Figure 1.2 shows that the poverty rate in the former Pati Residency in 2017-2019 tends to decrease, but will increase in 2020. In this case, the problem of poverty is something that the government needs to pay attention to. If the number of poor people is still large, it will have a negative impact on the welfare of the community. When viewed

from the aspect of previous research, research on poverty in an area has been widely carried out and has shown mixed results.

Andhykha et al. (2018) , this study uses panel regression model data. The results of this study are GRDP and the Unemployment Rate have a positive effect on the Poverty Level in 35 Regencies/Cities in Central Java Province, while HDI has a negative effect on Poverty Levels in 35 Regencies/Cities in Central Java Province.

Azizah et al. (2018) , this study uses a panel data regression model. The results of this study are that the variables of education and income per capita have a negative and significant effect on poverty in the districts and cities of East Java Province, while the population variable has a positive and significant effect on poverty.

Yacoub (2012) , states that the results of this study are the unemployment rate has a significant effect on the poverty level of districts/cities in West Kalimantan Province. Empirical data shows a pattern of relationship that is not always unidirectional between the unemployment rate and the poverty rate. The unemployed in the household do not automatically become poor because there are other family members who have sufficient income to keep their family living above the poverty line.

Hassan (2015) , stated that GDP growth has not had a positive impact on the poor through the creation of sufficient employment to reduce the percentage of unemployment and the incidence of poverty during the study period.

Setyowati & Rahayu (2020) , the results of this study indicate that the variables that have a significant and significant effect on poverty are income, number of dependents, and training attended. Factors that affect poverty in this study are training, number of dependents, age and loan money.

Based on the description above, in order to reduce poverty in the former Pati Residency, this study aims to examine and analyze the Effect of Population, GRDP Growth, and Unemployment on Poverty in the Ex Residency of Pati.

## II. LITERATURE REVIEW

### A. Poverty

According to the Central Statistics Agency (BPS) poverty is the inability to meet the minimum standard of basic needs, which includes both food and non-food needs. The poor are people who are unable to obtain sufficient resources to meet basic needs. They live below the minimum real income level or below the poverty line (Nehen, 2012) . Poverty is a condition in which a person cannot enjoy all kinds of choices and opportunities in fulfilling his basic needs, such as not being able to meet health, decent living standards, freedom, self-respect, and a sense of respect like other people, as well as a bleak future for the nation and state. Poverty is a problem faced by all countries, especially in developing countries like Indonesia. This is because poverty is multidimensional, meaning that because human needs vary, poverty also has many primary aspects in the form of being poor in assets, socio-political organization, knowledge, and skills as well as secondary aspects in the form of being poor in social networks, resources. finance, and information (Wiguna, 2013) .

Living in poverty is not only living in a lack of money and low income levels, but also many other things, such as health, low education, unfair treatment in law, vulnerability to the threat of crime, powerlessness in determining their own way of life (Suryawati, 2005) .

### B. Characteristics of the Poor

Poverty is a general term, characterized by the inability of a person to meet the minimum necessities of life that are considered decent, but poverty has different characteristics between regions. This difference is related to the poverty of natural resources (SDA), human resources (HR), and local institutions.

The characteristics of the group (poor people) are as follows:

- a. On average, they do not have their own production factors, such as land, capital, work equipment, and skills.
- b. Have a low level of education.
- c. Most work or are self-employed and are small businesses (informal sector), underemployed or unemployed (not working).
- d. Most are in rural areas or certain urban areas (slum areas).
- e. Lack of opportunity to obtain (in sufficient quantities) basic necessities, clothing, housing, other social health facilities (Suryawati, 2005) .

### *C. Poverty Measure*

Arsyad (2004) in measuring poverty is divided into two ways, namely absolute poverty and relative poverty:

- a. Absolute Poverty
- b. That is a measure that links poverty with income levels and needs. If the income does not reach the minimum requirement, then people can be said to be poor. The main difficulty in the concept of absolute poverty measurement is to determine the composition and level of minimum needs because they are not only influenced by cultural factors but also by climate and other economic factors.
- c. Relative Poverty
- d. This poverty is caused by the inequality of income distribution. According to some experts, if a person's income has reached the level of minimum basic needs, but in fact that person's income is still much lower than the income of the surrounding environment, then that person is included in the category of poor people.

### *D. Relationship between Population and Poverty*

According to the Central Statistics Agency (BPS) Population is all people who live in the geographical area of the Republic of Indonesia for 6 months or more and or those who live less than 6 months but aim to settle down. The number of residents in the economic development of an area is a fundamental problem, because uncontrolled population growth can result in not achieving the goals of economic development, namely people's welfare and reducing poverty.

There is a direct influence between population growth and the level of community welfare. Nelson and Leibstein show that rapid population growth in developing countries causes the level of community welfare to not experience a significant improvement and in the long term will experience a decline in welfare and increase the number of poor people (Sukirno, 2010) . According to Silastri et al. (2017) , in his research that population has a negative and significant effect on poverty, meaning that by increasing the population as a driver of development so that it will drive various kinds of economic activities and in the end it will improve people's welfare so that the poverty rate will decrease.

### *E. The Relationship between GRDP Growth and Poverty*

According to Sukirno (2000) , the rate of economic growth is an increase in GDP regardless of whether the increase is larger or smaller. Furthermore, economic development is not solely measured based on the growth of the gross regional domestic product (GRDP) as a whole, but must pay attention to the extent to which income distribution has spread to all layers of society and who has enjoyed the results. So that the decline in the GRDP of an area has an impact on the quality of household consumption. And if the income level of the population is very limited, many poor households are forced to change their basic food pattern to the cheapest goods with a reduced number of goods.

Meanwhile, according to Saputra (2011) , growth and poverty have a very strong correlation, because in the early stages of the development process the poverty rate tends to increase and as it approaches the final stage of development, the number of poor people gradually decreases. Thus, economic growth has a negative effect on poverty.

### *F. The Relationship of Unemployment to Poverty*

Unemployment is someone who has been classified in the workforce who is actively looking for work at a certain wage level, but cannot get the job he wants (Sukirno, 2010) . Unemployment is generally caused because the number of labor force or job seekers is not proportional to the number of available jobs. Unemployment is often a problem in the economy, because with unemployment the productivity and income of the community will decrease so that it can cause poverty and other social problems.

Unemployment has a very close relationship in influencing the level of poverty. Low standards of living are implemented in the form of low income levels, inadequate housing, poor health, minimal or even non-existent education provision, high infant mortality rates, relatively short life expectancy and opportunities. to get a low job. In terms of opportunity to get a job low means unemployment. High unemployment will cause income to decrease so that it cannot meet daily needs which will ultimately lead to poverty. Thus the number of unemployed has a positive relationship to poverty (Todaro & Smith, 2004) . Efforts to expand employment opportunities are carried out to create jobs so that the poverty rate will decrease (Ashcroft & Cavanaugh, 2008) .

## III. RESEARCH METHODOLOGY

The analytical method used in this research is quantitative descriptive analysis . The data used in this study is secondary data, namely data obtained based on information that has been compiled and published by certain agencies.

The secondary data used is a combination of *cross section data* from 6 regencies/cities in the former Pati Residency and the *times series* from 2017 to 2020. The data in question are population data, GRDP growth, unemployment, and poverty in the former residency. Starch. The source of the data was obtained from the Central Statistics Agency (BPS) of Central Java.

*A. Operational Definition of Research Variables*

This study uses one dependent variable, namely poverty in the former Pati residency and three independent variables, namely population, GRDP growth, and unemployment.

- a. Poverty (KMS)  
Poverty is a state of inability to meet the minimum standard of basic needs which includes food and non-food needs. The data used in this study is data on the number of poor residents of the former Pati Residency in 2017-2020 (in thousand inhabitants).
- b. Total Population (JP)  
The population is the number of people who live or domiciled in an area and have a permanent livelihood in that area and are legally registered based on the regulations in force in the area. The data used in the research is the population of the former Pati Residency in 2017-2020 (in million people).
- c. Growth of Gross Regional Domestic Product (GRDP)  
GRDP is the amount of added value generated for all business units in a certain region/region or is the total value of goods and services produced by all units of economic activity in a region in a certain period. The GRDP data used in this study is GRDP data based on constant prices of the former Pati Residency in 2017-2020 (in percent% ).
- d. Unemployment (UNP)  
Unemployed are those who can and often desperately want to work but there are no suitable jobs for them. In this study, the unemployment rate was measured based on the annual open unemployment rate ( TPT) in the former Pati Residency in 2017-2020 (in percent).

*B. Analysis Techniques*

This study analyzed the data by statistically testing the variables used. To analyze the effect of population, GRDP growth, and unemployment on poverty, a regression analysis tool with panel data model is used, which is a combination of *time series* and *cross section data* with the following econometric model :

$$KMS_{it} = \beta_0 + \beta_1JP_{it} + \beta_2PPDRB_{it} + \beta_3UNP_{it} + \varepsilon_{it}$$

where :

- KMS = Poverty
- JP = Total Population
- PPDRB = Gross Regional Domestic Product Growth
- UNP = Unemployment
- $\beta_0$  = Constant
- $\beta_1, \beta_2, \beta_3$  = Regression coefficient
- $\varepsilon$  = element of error (error term)
- i = Regency/City (1 ,2,3 ,...,6)
- t = year (2017-2020)

The estimation stage of the econometric model above will include: parameter estimation of the panel data model using the Pooled Least Square (PLS) approach, Fixed Effect Model (FEM), and Random Effect Model (REM); selection of the best estimated model using the Chow test and Hausman test; test the goodness of the model on the selected model; and test the validity of the influence of independent variables on the selected model.

IV. RESULT/FINDINGS

The results of the research using the Pooled Least Square (PLS), Fixed Effect Model (FEM) and Random Effect Model (REM) approach along with the results of the model selection test are summarized in table 1.

Table 1. Estimation Results of Panel Data Regression Econometric Model – Cross Section

Variable	Regression Coefficient		
	PLS	FEM	REM
C	4.86634	0,903733	1,046984
Log(JP)	-0,002669	0,262511	0,252322
PPDRB	0,005895	0,002358	0,002638
UNP	-0,052468	0,017487	0,017008
R2	0,0465	0,982526	0,29169
Adjusted R2	-0,096525	0,973207	0,185444
F-Stat	0,325115	105,4275	2,745413
Prob.F Stat	0,807171	0	0.069964
Model Selection Test			
Chow			
Cross-section F(5,15) = 160,700711; Prob.F(5,15) = 0.0000			
Hausman			
Cross section random $\chi^2(3) = 12,687540$ ; Prob. $\chi^2(3) = 0.0045$			

Source : Eviews, processed.

The Chow test is used to select the Pooled Least Square (PLS) or Fixed Effect Model (FEM) estimated model. Chow's test shows that the model chosen in this study is the Fixed Effect Model (FEM) with an empirical statistical significance value of F of ( 0.00000 ) (0.01).

While the Hausman test is used to select the estimated Fixed Effects Model (FEM) or Random Effects Model (REM). Hausman test shows that the model chosen in this study is the Fixed Effect Model (FEM) with an empirical statistical significance value  $\chi^2$  of 0.0054 (0.01). From the Chow test and the Hausman test in advance, the Fixed Effect Model (FEM) was chosen as the best estimated model. The complete estimation results of the Fixed Effect Model (FEM) are presented in Table 4.2.

Table 2. Fixed Effect Model (FEM) Estimation Model

$\text{Log}(\widehat{\text{KMS}})_{it} = 0,903733 + 0,262511 \text{Log}(\text{JP})_{it} + 0,002358\text{PPDRB}_{it} + 0,017487\text{UNP}_{it}$ (0.0062)* (0.7466) (0.5169)
R2 = 0.982526; DW = 1.886051 ; F-statistic = 105,4275; Prob. F = 0.000000
Information:
*Significant at = 0.01
**Significant at = 0.05
***Significant at = 0.10
The number in brackets is the t-statistical probability value

Source : Eviews, processed

The model exists at least one independent variable affects the dependent variable (not all regression coefficients are zero). The model existence test is the F test. The goodness of the model statistic shows that the model exists, it can be seen from the probability value or the empirical significance of the F statistic is 0.0000 (< 0.01).

Meanwhile , the t-test shows that the variable that significantly affects poverty is the population with an empirical t-statistical probability of 0.0062 (<0.01). Meanwhile, the variables of GRDP growth and unemployment have no effect on poverty with t-statistical empirical probability values of 0.7466 (> 0.10) and 0.5169 (> 0.10) .

The coefficient of determination ( R<sup>2</sup>) indicates the predictability or goodness of the estimated model. It can be seen that R<sup>2</sup>the estimated model, namely the Fixed Effect Model ( FEM) is 0.982526. This means that 98.25 % variation in changes in Poverty in the former Pati Residency is explained by variations in the log of population, GRDP growth, unemployment. While the remaining 1.75 % is explained by variations of other variables that are not included in the model.

Table 3. Area Constants and Effects

Region	Effect	Constant
--------	--------	----------

1	Grobogan District	0.456332	1.360065
2	Blora Kabupaten Regency	0.048946	0.952679
3	Rembang Regency	-0.067979	0.835754
4	Pati . District	0.247868	1.151601
5	Kudus District	-0.570971	0.332762
6	Jebara Regency	-0.114196	0.789537

Source: Eviews, processed

The constant values for each district/city are shown in table 4.3. The low constant value is in Kudus Regency with a constant value of 0.332762 , which means that Kudus Regency has the lowest poverty rate compared to other regions. Meanwhile, the highest constant is in Grobogan Regency with a constant value of 1.360065, which means that Grobogan Regency has the highest poverty rate compared to other regions.

## V. DISCUSSION

The results of this study indicate that the Population Log (JP) has an effect on the Poverty Log (KMS) in the former Pati Residency. Meanwhile, the Growth of Gross Regional Domestic Product (PPDRB) and Unemployment (UNP) proven to have no effect on the Poverty Log (KMS) in the former Pati Residency. Variable Number of Population (JP) has a regression coefficient of 0.2625, where the relationship pattern between Total Population ( JP ) and Poverty (KMS) are logarithms, so that if the Total Population (JP) increases by 1% then Poverty will increase by 0.2625 % , as well as if JP decreases by 1 % then Poverty (KMS) will decrease by 0.2625 %. The results of this study indicate that the population has a positive effect on poverty in the former Pati Residency, meaning that the higher the population, the higher the poverty rate, and vice versa. The lower the population, the lower the poverty rate. These results are not in accordance with the hypothesis of this study that population has a negative effect on poverty. According to Silastri et al. (2017) , by increasing the population as a driver of development so that it will drive various kinds of economic activities and in the end it will improve the welfare of the community so that the poverty level will decrease.

Azizah et al. (2018) , said that this is because the growth in food supplies cannot keep up with the very fast and high population growth, the per capita income will tend to fall very low, which causes the population to be unstable.

The results of the panel data estimation show that the GRDP growth variable has a regression coefficient of 0.0023 with a statistical empirical probability value  $t$  of 0.7466 ( $> 0.10$ ), meaning that GRDP growth has no effect on poverty in the former Pati Residency. These results are not in accordance with the hypothesis of this study which states that GRDP growth has a negative effect on poverty. Growth and poverty have a very strong correlation, because in the early stages of the development process the poverty rate tends to increase and as it approaches the final stage of development, the number of poor people gradually decreases (Saputra, 2011) .

Astuti (2018) and Harefa (2021) , state that economic growth has no effect on poverty. This can identify that the quality of economic growth that occurred was relatively poor, partly because most of the economic growth was supported by the consumption sector. In addition, the aspect of income distribution in economic growth is less than optimal, so that the increase in income tends to be enjoyed by only some groups.

The results of the panel data estimation show that the unemployment variable has a regression coefficient of 0.0174 with a statistical empirical probability value  $t$  of 0.5169 ( $> 0.10$ ), meaning that the unemployment rate has no effect on poverty in the former Pati Residency. These results are not in accordance with the hypothesis. This study states that the unemployment rate affects poverty. High unemployment will cause income to decrease so that it cannot meet daily needs which in turn will experience poverty (Todaro & Smith, 2004) .

Zuhdiyaty & Kaluge (2018) and Giovanni (2018) , state that people who fall into the unemployment category are not necessarily poor people if in their household there are family members who work with high incomes so that it will be enough to support unemployment. In relation to poverty, the unemployed in the household do not automatically become poor because there are other family members who have sufficient income to keep their family hidden above the poverty line.

## VI. CONCLUSIONS AND RECOMMENDATIONS

This study was conducted with the aim of knowing the influence of population, GRDP growth, and unemployment on poverty in the former Pati residency in 2017-2020, using panel data regression analysis tools. Based on the results of the regression in this study the selected model is the Fixed Effect Model (FEM). The coefficient of determination (R<sup>2</sup>) is 0.982526. This means that 98.25% of the variation in Poverty changes (KMS) in the former Pati Residency is explained by variations in Population (JP), GRDP Growth (PPDRB), Unemployment (UNP). While the remaining 1.75 % is explained by variations of other variables that are not included in the model. Population has an effect on poverty in the former Pati Residency with a regression coefficient of 0.262511. While the GRDP and Unemployment growth variables have no effect on Poverty in the former Pati Residency with a regression coefficient of 0.002358 and 0.017487.

Based on the results of the analysis and conclusions, the suggestions that can be given for this research are specifically for the district/city government of the former Pati residency which is expected to be able to reduce the problem of poverty by making maximum use of the population, GRDP growth, unemployment in the regency/city tisp in the former Pati residency by utilizing a qualified workforce. Meanwhile, it is hoped that for future researchers, this research can be used as a reference for conducting research to be carried out and so that in the future they can use more complete data with a longer period of time so that broad identification can be carried out.

## Accuracy Analysis Of Government Program In Poverty Reduction In Sukoharjo Bulu District 2017-2021

Zainufiqh Ali Mukti<sup>1</sup> and Eni Setyowati<sup>2</sup>

<sup>1,2</sup>Economic Development, Economics and Business, Muhammadiyah Surakarta University, Sukoharjo, Indonesia

### Abstract

*Poverty is a problem related to the inability to access economic, socio-cultural, political and participation in society. This study aims to determine the effect of the influence, population, and literacy rate on poverty in Indonesia in 2016-2020. In this study reveals how the influence of poverty affects the factors studied. In this study the data used were secondary data in the form of time series (2016-2020) and cross sections (34 provinces in Indonesia). The selection of the best method in this study using the Fixed Effect Model (FEM). By using panel data analysis tool using eviews 9. The results of this study indicate that the population and literacy rate have a significant effect on poverty in Indonesia. Meanwhile, the movement has proven to have no effect on poverty in Indonesia. This study shows that the estimated model, namely the Fixed Effect Model (FEM) is 0.642049. This means that 64.20 percent of the variation in poverty changes in Indonesia is explained by variations in composition, population, and literacy rates. While the remaining 35.8 percent is explained by variations of other variables not included in the model. The conclusion shows that poverty has a positive effect on the total population, population, and literacy rate in Indonesia..*

*Keywords—poverty rate; Family Hope Program (PKH); National Community Empowerment Program (PNPM); Village Fund Allocation*

### I. INTRODUCTION

Poverty is one of the most serious problems in economic development faced by the People of Indonesia and and it is not easy to get out of the problem of poverty. Efforts have been made by the government, among others, through poverty alleviation programs such as, Family Hope Program (PKH), National Community Empowerment Program (PNPM), Village Fund Allocation and so on which cost the state budget reaching Rp.17 trillion (TNP2K, 2014).

Related to the problem of poverty in Bulu District is the lack of jobs that are in accordance with the potential of the community in Bulu Subdistrict, lack of socialization of community empowerment for ability development, geographical location, low level of education, individual factors of the community itself (prestige), expectations with high income, hard-to-reach transportation routes.

Table 1. Percentage of Poor Population of Bulu Sukoharjo Subdistrict (Percent) 2017-2021

Village/Year	2017	2018	2019	2020	2021
BULU	6,34	7,74	7,01	7,02	7,08
LENGKING	6,07	5,97	7,55	7,36	7,41
PURON	7,01	6,83	6,30	6,50	6,59
KARANGASEM	6,12	6,39	6,34	6,35	6,45
MALANGAN	8,17	7,87	6,59	6,76	6,84
KUNDEN	6,43	6,64	7,58	7,39	7,44
GENTAN	7,66	7,83	8,12	7,77	7,80
KEDUNGSONO	15,39	15,43	15,37	15,47	15,10
MALANGAN	11,15	11,12	10,55	10,21	10,11
KAMAL	7,46	7,50	7,80	7,86	7,88
SANGGANG	9,30	8,97	7,36	7,93	7,95
TIYARAN	8,90	9,06	9,42	9,38	9,33

Source: Bulu Subdistrict in Numbers

In the table above the high percentage of poverty is Kedungsono Village, Malangan Village and Sanggang Village. Because in the village, the geographical location of some highlands, the difficulty of transportation, the lack of processing and utilization of the agricultural sector, some of the people are factory workers who earn at least wage so that the per capita income of the area is less.

In general, poverty reduction is mainly caused by ineffective socialization in both members of the community who are targeted by the program itself. And the program includes PNPM Mandiri (National Program for Independent Community Empowerment), BLT (Cash Direct Assistance), PKH (Family Hope Program), BOS (School Operational Assistance). Most programs do not actively participate in the wider community. Thus many cases are found that the program implemented is not on target both the type of activity and the target group of members.

The allocation of village funds is part of the village finance obtained from the central and regional financial results received by the district for the village of at least 10%. According to Rozaki et al (2005, h.120) actually the village fund allocation policy that has been implemented has a big goal that is more or less the same, namely overhauling the orthodoxy of the district government in providing authority, services and financial assistance to the lower level government (village).

The National Program for Independent Community Empowerment (PNPM Mandiri) is a focused and intensive program to overcome the problem of poverty and community lag. Through PNPM Mandiri, it was formulated about the mechanism of poverty reduction efforts involving elements of society, ranging from the planning, implementation, to monitoring and evaluation stages. Through the process of participatory development, critical awareness and independence of the community, especially the poor, can be grown so that the poor are not as objects but as subjects of poverty reduction efforts.

The Family Hope Program (PKH) is one of the poverty reduction programs in 2007 launched by the government. The target or recipient of PKH assistance is a Very Poor Household (RTSM) that has family members consisting of children aged 0-15 years and / or pregnant women / nifas and are in a selected location. The main objective of PKH is to reduce poverty and improve the quality of human resources, especially in the poor. In the short term, this assistance helps reduce the burden of RTSM expenditure, while in the long term, by requiring the recipient's family to send their children to school, immunize toddlers, check the womb for pregnant women and improve nutrition, it is hoped that it will break the chain of poverty between generations.

## II. LITERATURE REVIEW

### A. *Definition of Poverty*

Poverty is an urgent nation problem and requires comprehensive, integrated and systemic steps and approaches. Research conducted by Wahyudin, et al (2019) entitled Effectiveness of Village Fund Utilization in Alleviating Poverty in Kec Kuala Nagan Raya Regency. The study used panel data regression with the random effect model (REM) method. The results showed that the variable of village funds had a positive and significant effect on poverty, while the variable allocation of village funds had a negative effect on poverty.

### B. *Definition of Village Funds against Poverty Alleviation*

Village funds are used to finance government administration, development implementation, community development, and community empowerment. Allocating budgets in the village is carried out by someone who has authority and is useful in accelerating infrastructure development plans to be comparable to the rapid growth of the community. Research conducted by Wahyudin, et al (2019) entitled Effectiveness of Utilization of Village Funds in Alleviating Poverty in Kec Kuala Nagan Raya Regency. The study used panel data regression with the random effect model (REM) method. The results showed that the variable of village funds had a positive and significant effect on poverty, while the variable allocation of village funds had a negative and significant effect on poverty.

### C. *Relationship Between Family Hope Program (PKH) Against Poverty Alleviation*

Assistance in reducing the burden of RTSM expenditure, while in the long term, by requiring the recipient's family to send their children to school, immunize toddlers, check the womb for pregnant women and improve nutrition, it is hoped that it will break the chain of poverty between generations. The main objective of PKH is to reduce poverty and improve the quality of human resources, especially in the poor. Research conducted by Sarifah, Ulfah, and Genjik (2020) entitled Pengaruh Family Hope Program (PKH) towards Poverty Alleviation in Sepauk District, Sintang Regency. This research uses descriptive methods with a form of relationship study research. The results showed that there is an influence between the Family Hope Program (PKH) in poverty alleviation.

#### D. Relationship Between Independent PNPM to Poverty Alleviation

PNPM participatory development process, critical awareness and independence of the community, especially the poor, can be grown so that the poor are not as objects but as subjects of poverty reduction efforts. Research conducted by Fuad Muchlis (2009) entitled Analysis of participatory communication in community empowerment programs (case studies on the implementation of deliberations in rural PNPM Mandiri in rural district bays).

#### E. Equations

This study will observe the effectiveness of the Village Fund, Family Hope Program (PKH), and the National Program for Independent Community Empowerment (PNPM Mandiri) towards poverty alleviation in Bulu District in 2017-2021 using panel data regression analysis, which formulated the estimator model is:

$$POV_{it} = \beta_0 + \beta_1 \log DD_{it} + \log PKH_{it} + \log PNPM_{it} + \epsilon_{it}$$

Where:

Y : Poverty (%)

$\beta_0$  : Constant

$\beta_1 \beta_2 \beta_3$  : Independent variable regression coefficient

DD : Village Fund (million rupiah)

PKH : Family Hope Program (million rupiah)

PNPM : National Program for Independent Community Empowerment (million rupiah)

$\epsilon$  : *Error Term* (error factor)

I : 1st Village (*cross section*)

t : Year (*time series*)

### III. RESEARCH METHODOLOGY

In estimating the econometric model of data regression panels required the following steps:

- a. Estimate the *Common Effect Model* (CEM) panel data model is the simplest model. By combining *time series* data and cross section data into panel data and then regress using the OLS (*Ordinary Least Square*) method. In his estimation it is assumed that each individual unit has the same interception and *slope* (there is no difference in the dimensions of time). Or it can be said, the regression of the resulting data panel will apply to each individual (Juanda and Junaidi, 2012).
- b. *Fixed Effect Model* (FEM) Panel data model *Fixed Effect Model* (FEM) or *Least Square Dummy Variable* (LSDV) allows heterogeneity between subjects with members in each entity to have different intercept values. The term *fixed effect* is that although the intercept varies for each subject, but the interception of each entity does not change over time (time invariant). This can be interpreted that *the Fixed Effect Model*

is able to show the coefficient of magnitude of influence on each variable in a different region (Gujarati, 2012).

- c. *Random Effect Model (REM)* In the *Random Effect Model (REM)* method it is assumed that the difference in intercepts and constants is caused by residual / error as a result of differences between units and between time periods that occur randomly (Sriyana, 2015). With the REM model can save the use of degrees of freedom and not reduce the number. This has implications for parameters that are the result of estimates to be more efficient. To find out if the REM model is better than the PLS model, it can be used the Lagrange Multiplier (LM) test developed by Bruesch-Pagan. This test is based on the residual value of the PLS model (Juanda and Junaidi, 2012).
- d. *Chow Test* Chow Test is a model testing stage to determine the most appropriate model between *Common Effect Model (CEM)* or *Fixed Effect Model (FEM)*.
- e. *Hausman test* stages to determine the best model between *fixed effect* and *random effect*. The test measures are as follows (Sriyana, 2015).
- f. Test the goodness of selected panel data models and *R-square interpretations*
- g. Effect validity test (partial)  
The t test is a hypothesis test performed to determine the significance and absence of the influence of independent variables in the model.

The F test is performed to test whether independent variables are jointly or thoroughly affecting the dependent variable. The conclusion drawn from the F test is to look at prob-F statistics with the provision whether it is larger or smaller than alpha ( $\alpha$ ).

The coefficient of determination ( $R^2$ ) is a *goodness of fit* measurement of the regression line against the data used in the study.  $R^2$  describes what percentage of the total dependent variables are described by independent variables. A value of  $R^2$  that is close to 1 means that an independent variable is able to explain the dependent variable well. A value of  $R^2$  close to 0 means that independent variables are less good at describing dependent variables (Widarjono, 2013).

#### IV.RESULT / FINDING

##### F. Estimation Model Testing

The data analysis panel was examined by choosing between three methods: *Common Effect Model (CEM)*, *Fixed Effect Model (FEM)* and *Random Effect Model (REM)*. To select a *Common Effect Model (CEM)* with a *Fixed Effect Model (FEM)*, do the Chow test first. Hausman test to consider *the Fixed Effect Model (FEM)* model with *the Random Effect Model (REM)* model if the selected model is then the selected is then *the Fixed Effect Model (FEM)*. Chow test results shown in Table 2.

Table 2. Chow Test

Effects Test	Statistics	d.f.	Prob.
Cross-section F	31.499604	(10,41)	0.0000
Cross-section Chi-square	118.874115	10	0.0000

Source: Appendix 2

The chow test hypothesis states that  $H_0 =$  The exact CEM model and  $H_A =$  FEM model that remains Chow testing results in a probability of Chi-square 0.0000, which is smaller than  $\alpha$  (0.05) proving that  $H_0$  is rejected. Then it can be concluded that the selected model is *the Fixed Effect Model (FEM)*. Furthermore, the hausman test was used to choose the optimal model in this study. Hausma test regression results are shown in Table 3.

Table 3.. Hausman Test

Test Summary	Chi-Sq. Statistics	Chi-Sq. d.f.	Prob.
Random cross-section	9.589415	3	0.0224

Source: Appendix 2

The hausman test hypothesis states that  $H_0$  = The corresponding model of the *Random Effect Model* (REM) and  $H_A$  = the corresponding Model *fixed effect model* (FEM). In table 3 indicates that the value of prob. Chi-Sq is 0.0224, a value smaller than  $\alpha$  (0.005) then  $H_0$  is rejected this states that the best model used is the *Fixed Effect Model* (FEM).

### G. Determination Coefficient Analysis

The selected model is the *Fixed Effect Model* (FEM) model then the Table shows the regression of the *Fixed Effect Model* (FEM) model model.

Table 4.. FEM

Variable	Coefficient	Prob.
C	23.13803	0.1611
LOG(DD)	-1.387761	0.0859
LOG(PKH)	0.128617	0.2274
LOG(PNPM)	0.539251	0.0246
R-squared	0.901688	
Prob. F-Statistic	0.000000	

The magnitude of  $r^2$  is indicated in Table 0.90 or 90%. This figure shows that the ability of free variables, namely DD, PKH, and PNPM, explains the dependent variables, namely poverty by 90%, the remaining 10% is explained by variables outside this research model.

### H. Simultaneous Test ( $uj F$ )

Regression results that have been performed Simultaneous Significant Test (Test F) get a prob value.  $F$   $0.00000 < 0.05$ . This explains that the variables) DD, PKH, PNPM jointly affect poverty or the model used by existing research.

### I. Effect Validity Test ( $test t$ )

Table 5. Independent Variable Influence Validity Test Results

Variable	Sig.t	Criterion	Conclusion
DD	0.0859	< 0.10	Significant Effect on $\alpha = 0.10$
PKH	0.2274	> 0.10	No Significant Effect
PNPM	0.0246	< 0,05	Significant Effect on $\alpha = 0.05$

Source: Appendix 1

## V. DISCUSSION

The Village Fund variable has a regression coefficient of -1.387761. The pattern of the relationship between the poverty variable and the Village Fund is linear-logarithm, meaning that if the Village Fund increases by 1 percent, the poverty will decrease by  $1.387761 / 100 = 0.139$  million rupiah. Conversely, if the Village Fund decreases by 1 percent, then Inflation will also decrease by 0.139 million rupiah.

The PNPM variable has a regression coefficient of 0.539251. The pattern of relationship between the poverty variable and PNPM is linear-logarithm, meaning that if PNPM increases by 1 percent then poverty will also increase by  $0.539251 / 100 = 0.005$  million rupiah. Conversely, if PNPM decreases by 1 percent, then poverty will also decrease by 0.005 million rupiah.

In line with research from Wahyudin, *et al.* (2019), which states that village funds have a negative effect on poverty. This is because village funds are aimed at infrastructure development that is considered to be able to boost the rural economy. The more advanced infrastructure in the village can have an impact on income equality, increased employment opportunities, and business opportunities for rural communities. Thus, village funding assistance can reduce poverty in rural areas.

PKH has no effect on poverty. This can happen because PKH itself is a social protection scheme for very poor households to improve access and quality of education and health and preferably for women or housewives. Where they are not very productive, so the assistance provided is only useful to increase non-productive consumption, so as not to help reduce their poverty.

In line with research from Jemadi (2013), which states that PNPM has a positive effect on poverty. This is because the general purpose of pnpm is to increase the welfare and employment opportunities of the poor independently. So that poverty reduction depends on the quality of human resources in the village, if the village community does not utilize the assistance program properly and correctly then PNPM fails in tackling existing poverty.

## VI. CONCLUSION AND RECOMMENDATION

To achieve the research objectives, a regression of panel data is performed with the selected *Fixed Effects Model (FEM)* model. The results of Test *F* showed that together, the Village Fund, PKH, and PNPM had a real effect on the poor. While partially, the Village Fund and PNPM proved to have a positive effect on poverty, while PKH was not shown to have an effect on the poor.

Based on the determination coefficient test, it shows that the ability of free variables, namely Village Funds, PKH, and PNPM, explains the dependent variables, namely poverty by 90%, the remaining 10% is explained by other variables outside the model.

Based on the results of the study, the government is expected to increase the receipt of domestic income, so that it will increase the amount of balance funds that will be sent to villages as village funds. In addition, the government is also expected to increase government spending to focus on building villages, such as sending PKH and PNPM assistance to provide capital to rural communities so that more and more village communities are prosperous and can reduce poverty. With high aid funds can improve the quality of human resources through trainings held by the village government using assistance funds from the central government, so it will be easier for people to get jobs then will improve their welfare and poverty down.

## ACKNOWLEDGMENT

We would like to thank Sustainable Collaboration in Business of Telkom University in Indonesia, who give me the opportunity to attend this international conference.

## The Importance Of Digital Product Presentation To Drive Behavioral Intention In The Context Of Digital Commerce

Indah Abudiman, B.BA<sup>1</sup> and Dr.Nurdin Sobari<sup>2</sup>

<sup>1,2</sup> Faculty of Economic and Business, University of Indonesia

### Abstract

*The pandemic has changed the shopping behavior of consumers, especially with the role of digitalization in facilitating the process. Even though there is an increase in online shopping, the purchases that occur are still categorized as low. One of the reasons is that the right formulation has not been found on how to sell a product online by displaying the right image and description. The purpose of this experimental study was to examine the effect of digital product presentation on consumer information processing and behavioral intentions in the context of the beauty product category. The Stimulus-Organism-Response Model and Multiple Coding Theory are used as theoretical frameworks. This study uses a factorial experimental design of 2 (visual: large vs. Small) x 2 (verbal: concrete vs. Abstract) by visualizing the stimuli given to 195 respondents. Based on the experimental results, visual factors (large and small) and verbal (concrete and abstract) have significant results on the three dependent variables including imagery processing, discursive processing, and behavioral intention with large visual variations and concrete verbal having the highest average results. The findings of this study provide new input related to the application of the best presentation product between visual and verbal to influence consumer buying intentions in terms of online shopping in Indonesia.*

*Keywords— Concreteness, Digital commerce, Information processing, Picture size, Productpresentation*

### I.INTRODUCTION

The pandemic has largely impacted Indonesia in various aspects. One of those is how it helps to accelerate the growth of digitalization in Indonesia. The outbreak has brought new phenomena in new shopping behavior (Butu et al., 2020; Donthu & Gustafsson, 2020; Shafi et al., 2020; Shehth 2020a, Sheth 2020b) in which gives sudden shift in consumer behavior toward their new way of buying or consuming products (Biswas, 2020; Diebner et al., 2020; Lowe, 2020). The condition where people need to stay at home during lockdown have limited the ability of people to commute and do their traditional way of shopping. As visits to physical stores were restricted, and many were running low on money, consumers went online to shop, causing online purchases to grow higher and higher (J.Theor, 2021). Then next, online shopping became the primary method to do daily transaction and occupy their basic needs, subsequently, change consumer purchase behavior (Crispell, 2020; Deloitte Monitor, 2020; Kim, 2020; Sheth, 2020a, Sheth, 2020b).

In Southeast Asia, Indonesia has ranked as the largest digital economy as it covered 40% of the total regional market share. It is also becoming a home of big unicorns for example Gojek, Tokopedia, Bukalapak & Traveloka. Beyond e-commerce, food delivery and omnichannel also got positive impact from this situation (IndonesiaAHK, 2021). Given this huge opportunity, not only small-medium enterprises jumped into the trend but also big companies such as retail and FMCG started to explore various ways to win the peak. Although retail stores in a minimarket form such Indomaret and Alfamart still place as the biggest one, but Shopee is now in the 4th rank with 7.3% penetration surpassing Superindo, Matahari, etc (Kantar, 2021). Digital commerce still has poor conversion rates compared to offline retail conversion rates despite its excellent growth rates (Neufeld and Roghanizad, 2018), which suggests that the consumer experience may not live up to expectations.

Indeed, with the push demand from market where consumers expectation raised while doing online shopping, retailer that shifted to online also has revolutionized their way to consumer interaction (Algharabat and Shatnawi, 2014; Algharabat and Zamil, 2013; Parket al., 2016; Kim et al., 2011; Liao and Keng, 2013). According to Algharabat and Shatnawi (2014) ; Lee (2012), retailers has put their focus on extensively integrated their business

online and offline, combining their platform and traditional brick and mortar stores to remain competitive in the market. Moreover, where the competition is increasing in online market, retailers are actively looking to have new opportunities to match their customers' expectations and find a way to enhance their loyalty and directly-indirectly will link to strengthen their brand identity and profitability. The step starts from on how a platform can give more contribution to their customer's day to day activity by providing facilities and access to information, products, services without restriction such time or place (Bilgihan, 2016; Hung et al., 2012; Kokkinoua and Cranage, 2013; Lin and Lian, 2008; Zhu et al., 2013). However, their success in implementing the strategies it all depends on two factors which are presented products and website experience ( Luan et al., 2016; Chen et al., 2015). This needs of finding best mechanism in winning online have pushed researchs to dig deeper in understanding about factors to boost customer's attitudes and expectation. According to Algharabat and Shatnawi, 2014; Luan et al., 2016, the quality of platform in this case website or application is one of the most fundamental factors that is considered by customers to evaluate their online shopping experience.

Various aspects of digital product presentation have been studied in academic studies, including picture size (Kim and Lennon, 2008; Song and Kim, 2012), the number of views (Song and Kim, 2012), verbal product information (Kim and Lennon, 2008), the model's face (Yoo and Kim, 2012), product display modes (Kim, Kim, and Lennon, 2009), screen size (Kim and Sundar, 2016), 3D views (Kim and Forsythe, 2008), video (Kim and Sundar, 2016), site interactivity (Xu and Sundar 2014), image interactivity (Beuckels and Hudders, 2016), image backgrounds (Maier and Dost, 2018; Yoo and Kim, 2014) and virtual fitting room (Beck and Crié, 2018) and their impact on consumer behaviors. However, empirical results on the topic of digital product presentation have been a bit contradictory, and several empirical questions remain open. For instance, despite strong empirical support for picture superiority in advertising research, investigations on verbal and visual information in e-commerce indicated verbal dominance (Childers and Houston, 1984; Mitchell and Olson, 1981; Rossiter and Percy, 1978). Additionally, a study by Song and Kim (2012) indicated that, despite the fact that four large product photographs (different viewpoints of the same object) were more successful at reducing mental intangibility than one large photo, e-shoppers received more information from a single large product photo. Additional research on digital product presentation is necessary in light of these conflicting findings, particularly in light of the growing significance of digital sites as the initial point of contact of today's consumers (Think with Google.com, 2016).

Furthermore, with its limitation of evaluating a product through visuals only during online shopping, product information plays an essential role in driving consumer purchase decisions (Kim & Lennon, 2000; Mitchell & Boustani, 1994). Consumers demand adequate information to make a decision (Fiore, Jin, & Kim, 2005). There has been very little research about how a business can create the right product information that can influence consumer decision-making.

Therefore, the focus of this study is to examine how the mixed combination of two basic factors in product presentation, visual (image) and verbal (text), can influence consumer behavioral intention toward the beauty product category. This research employed a 2 (visual: large vs. small)  $\times$  2 (verbal: concrete vs. abstract) between-subjects factorial design which will explain more in the methodology chapter. The study will choose the beauty category as the object study because of two reasons, in pure e-commerce, the beauty category has the highest penetration compared to other categories and the revenues are projected to reach \$7.5 billion in 2021 and will be expected to grow at 6.5% compound annual growth rate through 2025 (Statista, 2021).

## II. LITERATURE REVIEW

The Stimulus-Organism-Response (S-O-R) paradigm by Mehrabian and Russell (1974) and Dual Coding Theory by Paivio (1971) provide theoretical frameworks to explain the relationships among digital product presentation (visual and verbal), types of information processing (imagery and discursive), and behavioral intent.

### A. *Stimulus-Organism-Response model*

Several online marketing studies have employed the Stimulus-Organism-Response (S-O-R) theory (Mehrabian and Russell, 1974) to clarify the connections between the quality of a product or service and the consumer's actions and attitudes (Chan, Cheung, & Lee, 2017; Chen and Yao, 2018).

According to the S-O-R hypothesis, external inputs from service settings (stimulus) start and stir up inside feelings (Organism), which then cause subsequent behaviors (Response). Bagozzi (1986) argues that these stimuli are external to the consumer when mapping online consumer interactive reactions under the S-O-R paradigm in consumer behavior and e-marketing research. In this study of beauty category context, the S-O-R paradigm is being applied. It is proposed that digital product presentation in visual and verbal forms (S) elicits various types of information processing (O) in response to visual and verbal stimuli, which in turn induces behavioral intent (R) as an avoidance/approach response. According to a different study, the SOR framework, which consists of three sections, is a developed model of the traditional stimulus-organism-response (SOR) method (Chan et al., 2017). (1) a stimulus: a factor that prompts the consumer, (2) an organism: the consumer's internal evaluation, and (3) a response: the result of the customer's response to factors that prompt online impulsive buying and their internal evaluations (Chen and Yao, 2018; Zhang, Pang, and Wan, 2018b; Zhu et al., 2020). When consumers connect with drivers, mental processes known as cognitive reactions take place (Chan et al., 2017). Positive cognitive reactions, including pleasure, serve as motivators, whereas negative cognitive responses serve as deterrents and prevent customers from making purchases (Amarnath and Jaidev, 2020; C. Lin and Liu, 2019). (Cui and Lai, 2013; Vieira, 2013). Customers' emotional responses when interacting with an environment are known as affective responses. When consumers are aware of positive emotional responses like desire and stimulation, they respond to online impulse purchases (Bigne et al., 2020; Goi et al., 2018; Tang et al., 2019)

### *B. Dual Coding Theory*

According to the dual coding theory, people's cognitive processes involve two distinct but related systems: a verbal system focused on language (spoken and written) and a nonverbal system that processes visual pictures (Paivio 1986; 1991). According to the hypothesis, visual cues are encoded through the non-verbal system, whereas text in a message is encoded through the verbal system. Since the two systems are interconnected, each system can stimulate one another (Paivio, 2013). As a result, when both verbal and visual information is provided, rather than just visual or just verbal information, customers can have a more thorough grasp of a product or issue. The representational, referential, and associative levels of encoding processing are further explained by the dual coding theory. A visual input is coded using an imaginal system, whereas a verbal stimulus is processed using a verbal system, making representational processing the most fundamental level of processing. Referential processing, the subsequent stage of processing, links the verbal and imaginal systems. When an image is made for a verbal stimulus or when a visual stimulus is given a name, something happens. When incoming visual and verbal cues are linked to other verbal and imaginal codes that have been stored in memory, the most complicated associative processing takes place. The picture superiority effect is supported by the dual coding theory.

### *C. Digital Product Representation*

In order to present products for online sales, more visualization technology, such as zoom, enlarged views, and video, has been developed (Kim et al., 2018). Nevertheless, the core components of digital product presentation—product images and descriptions—remained unchanged (verbal)..

The results of the study demonstrate that presentations using periphery visual cues in ecommerce might be more convincing and attract attention. Formats for visual presentations support verbal descriptions and eliminate uncertainty regarding product performance. Videos that are lively and moving grab viewers' attention by vividly providing inputs for several processing pathways that improve cognition. Getting people to pay attention is difficult in electronic WOM and more generally in e-commerce environments; visual cues might be helpful. Moving pictures and visual signals may draw attention, but depending on the situation, they can also divert it or divide it. Rich presentation formats may therefore be ineffective.

More verbal product information and a larger visual representation of the product had a greater impact in eliciting favorable affective and cognitive attitudes than less product information and a smaller visual representation, according to Kim and Lennon's (2008) research. Kim and Sundar (2016) said large screen size and video mode were effective in eliciting greater affective and behavioral trust and purchase intentions through eliciting heuristic information processing. Stronger imagery processing was elicited by a concrete visual display of a relevant consumption

background than by a solid background, which in turn resulted in more positive emotional responses and behavioral intent (Song and Kim, 2012).

The current study focuses on visual and verbal cues and their distinct effects on information processing methods, extending the findings from earlier digital presentation studies to concreteness and product presentation. Size-variant product photos are operationalized as visual stimuli (large vs. small). Product descriptions in the text that vary in their level of concreteness are operationalized as verbal cues (concrete vs. abstract).

#### *D. Information Processing Style*

Discursive processing (such as verbal retrieval, cognitive response, and verbal encoding) and imagery processing are two independent categories of information processing. Discursive processing is described as "passing from premises to conclusions; proceeding by reasoning or argument," whereas imagery processing is described as a process by which "sensory information is represented in working memory" and is "very like picturing" (Fodor, 1981, p. 76) or creating mental images of a stimulus (Aylwin, 1990).

Although much of this tradition's research has concentrated on how consumers react to advertising copy (e.g., Olson et al., 1982), it has been discovered that images and pictures in advertisements can also trigger discursive processing because of their capacity to infer verbal information (Mitchell & Olson, 1981; Rossiter & Percy, 1980). Thus, both text (such as ad copy) and visual stimuli can start a discursive process (e.g., pictures and images). Imagery processing, which incorporates a nonverbal representation of perceptions and sensory events in memory, contrasts discursive processing (Baddeley, 1986). When imaging is effective, less negative cognitive responding, the experience's reality, and the resulting emotional responses all contribute to persuasion (Green & Brock, 2000). This method of information processing constitutes a fundamentally distinct process from a discursive process, where logical thought is essential for persuasion and is therefore unrelated to cognitive elaboration<sup>1</sup>. (Green & Brock, 2000; Schlosser, 2003; Escalas, 2004)

#### *E. Behavioral Intention*

Consumers' behavioral intentions in relation to virtual settings, such as a virtual community, have been investigated as a key factor of loyalty to the virtual environment (Lin, 2006). This is due to the behavioral intention construct causing users' actual behaviors, such as active involvement and constant consumption of its digital information in daily life, to contribute to the virtual world (Kim, 2021). As a result, consumers' higher degrees of commitment to a virtual world tend to be communicated through positive behavioral intentions, such as a readiness to pay more and good word of mouth (Kim, 2021). This study operationalizes behavioral intent as the most referenced digital behavioral intent: operationalized as the intention to visit and make purchases from a website without going to another retailer. Although behavioral intent and actual behavior are not the same thing, actual behavior is well predicted by behavioral intent (Jamieson and Bass, 1989).

#### *F. Hypothesis Development*

##### *Visual and Verbal Stimuli*

The digital product presentation environment must include both verbal and visual cues because both are intended to cause customers to absorb information internally. Processing of imagery is automatically produced by visual stimuli. Kim and Lennon (2008) discovered that in the context of beauty, larger images were more successful at evoking favorable emotive and cognitive responses than smaller images. Large product photos were also shown by Song and Kim (2012) to be more helpful in boosting the mental tangibility of handbag products in e-commerce. Researchers also hypothesized that when people interpret visual stimuli by naming or categorizing them in words, this could similarly trigger discursive thinking (Rossiter and Percy, 1978). Because large images draw more attention to an image and filter out competing stimuli, Percy and Rossiter (1983) hypothesized that large images promote greater discursive processing elaboration. Based on the review of literature and theoretical frameworks, the following hypotheses are proposed:

H1a. In the context of beauty products, consumers experience greater imagery processing when exposed to large visual stimuli, in comparison to small visual stimuli.

H1b. In the context of beauty products, consumers experience greater discursive processing when exposed to large visual stimuli, in comparison to small visual stimuli.

#### *Imagery Processing and Discursive Processing*

Kim and Lennon's (2008) study found that reactions from online shoppers were significantly influenced by the amount of spoken information. More knowledge about clothes products increased positive affective and cognitive reactions and increased purchase intent for the apparel products that were on display. In that study, affective (imagery) and cognitive (discursive) attitudes were examined, and different types of information processing were postulated as a function of types of stimuli. However, their findings imply that spoken product information may have stimulated both types of information processing. However, there was no effect of verbal information when focusing on verbal descriptions of backdrop pictures rather than product descriptions (Yoo and Kim, 2014).

In the current study, verbal stimuli vary in their level of concreteness by including or excluding concrete style descriptions to examine which types of information processing are triggered as a function of verbal stimuli. Based on the review of literature and theoretical frameworks discussed, the following hypotheses are proposed.

H2a. In the context of beauty products, consumers experience greater imagery processing when exposed to concrete verbal descriptions, in comparison to abstract verbal descriptions

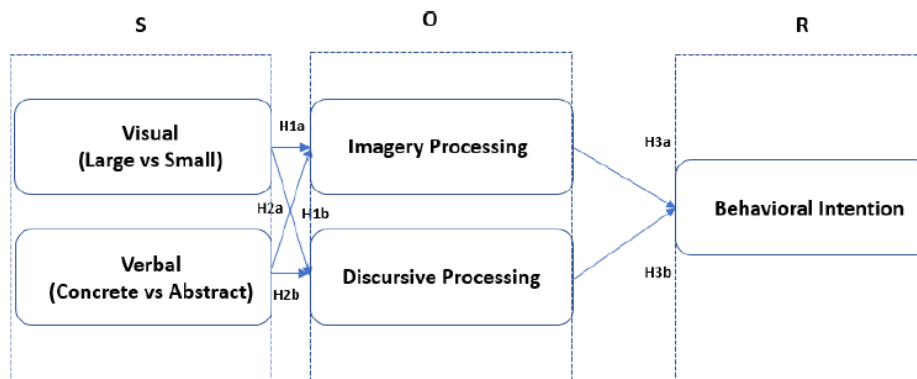

H2b. In the context of beauty products, consumers experience greater discursive processing when exposed to concrete verbal descriptions, in comparison to abstract verbal descriptions

#### *Behavior Intention*

Research from the past generally suggests that visual processing has more of an impact on behavioral change or behavioral intent than discursive processing. It is generally known how imagery processing affects how people behave (Taylor and Pham, 1996). The higher impact of imagery processing over discursive processing is explained by the sensory and emotional responses that occur from imagery processing (Taylor and Pham, 1996). Cautela and McCullough (1978) showed that visual processing affected behavioral intent more strongly in clinical settings than did discursive processing. Based on the review of literature and theoretical frameworks discussed, the following hypotheses are proposed.

H3a. In the context of beauty products, imagery processing is positively correlated with behavioral intent.

H3b. In the context of beauty products, discursive processing is positively correlated with behavioral intent

### III. RESEARCH METHODOLOGY

This research employed a 2 (visual: large vs. small) × 2 (verbal: concrete vs. abstract) between-subjects factorial design and took out the need for cognition for moderation since the relevancy to beauty products in Indonesian consumers hasn't really seen that far. This study will go for experimental research design to have a controlled environment before taking it to the market. The author will have a detailed observation on the subject to predict action taking the chosen phenomena with the purpose that this study will be beneficial for brands to take marketing decisions in the future.

#### A. Stimulus Development

*Visual Stimuli* - Pilot test was first conducted to check visual stimuli using pictures of various types of bottles. These bottles were evaluated by their fitness to shampoo bottle. Ten different types of bottles were initially selected included different types of size, cap, pump which usually found on the market. To avoid extraneous factors, only blank bottles which previously made by Adobe Photoshop without branding were selected. All bottles were evaluated using Likert Scale from 1-5 (highly incompatible – highly compatible) as bottle shampoo. Consistency in background, color angles, and size were made to control other variables that might be distract the result of evaluation. Along with the quality of pictures were achieved as well through a careful sampling process and touch-up using Photoshop. For this experiment, the result of mock up bottle that was chosen need to go through manipulation check, to evaluate the perceived size of bottle (small and large) to vary visual information. This research using the rule of thumb to maximize the variance. Large bottle will have 700x700 pixel as that is the highest resolution that can be found in e- retailer, while small bottle will have 300x300 pixel as that is the smallest resolution that can be found in e- retailer.

*Verbal Stimuli* – According to Eckman, Damhorst and Kadolph (1990), there are two criteria refer to product attributes which are intrinsic and extrinsic attributes. Intrinsic refer to product attributed that cannot be changed or manipulated without changing physical characteristic while extrinsic refers to product attribute that are not component parts of physical products but are created by retailer such brand name and description. Both intrinsic and extrinsic are used for this experiment although according to prior research, intrinsic attributes are more important to consumers that the extrinsic ones. In this study, the pilot test was first conducted to see what elements are important to consumers when they are buying a shampoo. Three answers are categorized which resulted in: attractive packaging, perceived benefit and ingredients. These elements will be included in the main experiments in order to increase the purchase intention of consumers. Then, on mockup page, intrinsic verbal that are included in all stimuli are (1) size (2) construction detail (3) design features (4) care instruction (5) color while the extrinsic one are (6) price and (7) product description which will be main element to evaluate using manipulation check towards perceived of concreteness. Perceived of concreteness is comparing abstract style of description and concrete style of description. Abstract in English Oxford dictionary is translated as existing in thought or as an idea but not having a physical or concrete existence – unmeasurable while concrete is translated as existing in a material or physical form; not abstract – measurable. For a long time, cognitive scientists have claimed that words can also encourage the processing of imagery. Concrete words, for instance, cause the brain to process images (Paivio et al., 1968; Richardson, 1980). According to Paivio et al. (1968), judgments of the value of imagery were positively correlated with the concreteness of words. The level of concreteness of the verbal stimuli used in the current study is varied by including or deleting concrete style descriptors in order to evaluate the forms of information processing that are sparked by verbal stimuli.

#### B. Instrument Development

This study has several instrument that need to be measured accordingly which are imagery which are imagery processing, discursive processing and behavioral intention. Two different forms of information processing were examined in this study. The 4-item mental imagery scale developed by Schlosser (2003) was used for imagery processing (Cronbach's alpha = 0.82). In order to measure discursive information processing, two items from Kim and Lennon (2008) were used (Cronbach's alpha = 0.96). Kim and Lennon's (2011) 4-item behavioral intent scale was used to measure behavioral intent (Cronbach's alpha = 0.96). All these items used a 5-point scale (1= not at all, 5= a lot).

#### C. Procedure

Participants were recruited from a social media invitation. They were invited to visit a mock beauty website

using the URL included in the recruitment message. When participants logged onto the mock website, they were randomly assigned to one of four experimental conditions. Because this study focused on product presentation in beauty e-retailing, the mock website simulated beauty product pages. On the mock website, participants viewed page displaying one shampoo item at a time. Following a typical product page layout in beauty e-retailing, a product image was shown on the left-hand side, and product descriptions in the text were shown on the right-hand side. After browsing shampoo items and selecting items to purchase, participants were asked to complete the survey questionnaire. Participants were instructed to assume that they were given a gift certificate to shop from the site.

#### IV. RESULT/FINDING

##### A. *Sample Description*

A total of 200 men and women participated in the online experiment. The mean age of the participants was 22.3 (SD = 6.0), with a range of 18–56. About 90% of participants were aged between 18 and 24 live in Jabodetabek. About two thirds of the participants considered themselves frequent or very frequent digital shoppers.

##### B. *Manipulation Check*

During the pre-test, a manipulation check for two items: perceived size of picture for visual stimuli and perceived concreteness of product information for verbal stimuli. Participants were shown two different sizes of pictures: 300x300 pixel and 700x700 pixel. 300x300 pixel is the minimum size of picture available in e-commerce and 700x700 is the maximum size of picture available in e-commerce. As anticipated, ANOVA showed that the actual size of picture had a significant effect on perceived picture size,  $F(1, 31) = 158.09$ ,  $P < 0.0001$ . Participants in the large picture condition ( $M = 4.87$ ,  $SD = 0.34$ ) perceived product photos to be larger than those in the small picture condition ( $M = 3.45$ ,  $SD = 0.56$ ). Then, the participants were also needed to evaluate the concreteness of three concrete and abstract sentences which compare three sentences of concrete benefit perceived and three sentences of emotional benefit perceived. They were given a sentence to give a context related to hair care. ANOVA further revealed that the amount of concrete product descriptions had a significant effect on the perceived concreteness of product information,  $F(1, 31) = 158.09$ ,  $P < 0.0001$ . Participants in the concrete verbal condition ( $M = 4.22$ ,  $SD = 0.84$ ) perceived product information to be more concrete than those in the abstract verbal condition ( $M = 4.03$ ,  $SD = 0.96$ ).

##### C. *Preliminary Analysis And Evaluation Of Measures*

A pre test was conducted before main experiment to 30 young adults range between 18-35 years old using google survey form to check on reliabilities. Reliabilities were assessed using Cronbach's alpha. All dependent measures had adequate reliabilities; imagery processing ( $\alpha = 0.75$  acceptable), discursive processing ( $\alpha = 0.74$  acceptable) and behavioral intent ( $\alpha = 0.85$  good). Based on established reliabilities, composite scores were developed for hypotheses testing

##### D. *Hypothesis Testing*

For imagery processing, based on the descriptive table above, it is known that the highest average is in the large visual imagery variable and the concrete verbal which is 21.68 with a standard deviation of 2.743. While the lowest average is in the small visual and verbal abstract that is equal to 18.42 with a standard deviation of 3.962. For discursive processing, based on the descriptive table above, it is known that the highest average is in the large visual and concrete verbal discursive variables, namely 22.11 with a standard deviation of 2.581. While the lowest average is in the small visual and verbal abstract that is equal to 18.69 with a standard deviation of 4.318. For behavioral intention, based on the descriptive table above, it is known that the highest average is in the large visual and verbal behavioral variables, which are 16.86 with a standard deviation of 2.866. While the lowest average is in the small visual and verbal abstract that is equal to 14.71 with a standard deviation of 3.637.

	Visual	Verbal	Mean	Std Deviation	N
	Large	Concrete	21,68	2,743	44

<b>Imagery Processing</b>		Abstract	21,14	2,979	49
	Small	Concrete	20,04	3,110	50
		Abstract	18,42	3,962	52
<b>Discursive Processing</b>	Visual	Verbal	Mean	Std Deviation	N
	Large	Concrete	22,11	2,581	44
		Abstract	19,96	4,359	49
	Small	Concrete	20,96	2,892	50
		Abstract	18,69	4,318	52
	<b>Behavioral Intention</b>	Visual	Verbal	Mean	Std Deviation
Large		Concrete	16,86	2,866	44
		Abstract	16,08	3,148	49
Small		Concrete	15,82	2,561	50
		Abstract	14,71	3,637	52

The ANOVA test results obtained a calculated F value of 21.794 and a significance of  $0.000 < 0.05$  so it can be concluded that there is an effect of the presence of visuals consisting of (large and small) on Imagery. The calculated F value is 5.325 and the significance is  $0.022 < 0.05$ , so it can be concluded that there is an influence of the presence of verbal consisting of (concrete and abstract) on Imagery.

The results of the ANOVA test obtained a calculated F value of 5.308 and a significance of  $0.022 < 0.05$  so it can be concluded that there is an effect of the presence of visuals consisting of (large and small) on Discurve. The calculated F value is 17.718 and the significance is  $0.000 < 0.05$ , so it can be concluded that there is an effect of the presence of verbal consisting of (concrete and abstract) on Discurve.

The results of the ANOVA test obtained a calculated F value of 7.403 and a significance of  $0.07 < 0.05$ , so it can be concluded that there is an effect of the presence of visuals consisting of (large and small) on behavior. The calculated F value is 4.541 and the significance is  $0.034 < 0.05$ , so it can be concluded that there is an influence of the presence of verbal consisting of (concrete and abstract) on behavioral.

Multiple regression analysis was conducted to assess relationships among imagery processing, discursive processing, and behavioral intent.

Dependent Variable	Unstandardized Coefficients		Standardized Coefficients	t	Sig.
	B	Std. Error	Beta		
Imagery	.311	.071	.340	4,405	.000
Discursive	.299	.064	.364	4,706	.000

- a. On the imagery variable with a significance level of 95% ( $\alpha = 0.05$ ). The significance number (P Value) is  $0.000 < 0.05$ . On the basis of this comparison, then  $H_0$  is rejected or means that the imagery variable has a significant influence on the behavioral variable (Y).
- b. On the Discursive variable with a significance level of 95% ( $\alpha = 0.05$ ). The significance number (P Value) is  $0.000 < 0.05$ . On the basis of this comparison,  $H_0$  is rejected or means that the Discursive variable has a significant influence on the behavioral variable (Y).

#### E. Hypothesis Result

According to data analysis above, the hypothesis results are obtained as below:

Hypothesis	Conclusion	Description
<ul style="list-style-type: none"> <li>• H1a. In the context of beauty products, consumers experience greater imagery processing when exposed to large visual stimuli, in comparison to small visual stimuli.</li> </ul>	Accepted	Same result as previous research (Kim Minjeong, 2019)
<ul style="list-style-type: none"> <li>• H1b. In the context of beauty products, consumers experience greater discursive processing when exposed to large visual stimuli, in comparison to small visual stimuli.</li> </ul>	Accepted	Same result as previous research (Kim Minjeong, 2019)
H2a. In the context of beauty products, consumers experience greater imagery processing when exposed to concrete verbal descriptions, in comparison to abstract verbal descriptions	Accepted	Same result as previous research (Kim Minjeong, 2019)
<ul style="list-style-type: none"> <li>• H2b. In the context of beauty products, consumers experience greater discursive processing when exposed to concrete verbal descriptions, in comparison to concrete verbal descriptions</li> </ul>	Accepted	Same result as previous research (Kim Minjeong, 2019)
<ul style="list-style-type: none"> <li>• H3a. In the context of beauty products, imagery processing is positively associated with behavioral intent.</li> </ul>	Accepted	Same result as previous research (Kim Minjeong, 2019)
<ul style="list-style-type: none"> <li>• H3b. In the context of beauty products, discursive processing is positively associated with behavioral intent.</li> </ul>	Accepted	Different result as previous research (Kim Minjeong, 2019)

The paper could conclude that in all dependent variables, visual with large picture and verbal with concrete product description have greater effect on both dependent variables such imagery processing and discursive processing. In addition to that, both imagery processing and discursive processing are also positively associated with behavioral intention.

## V. DISCUSSION

The findings of this study provide empirical support for the S-O-R model in the context of digital commerce. Digital product presentation which visualize in image and product description a stimuli influence how potential consumer respond to the digital environment (Kim et al., 2009; Richard and Chebat, 2016). In Indonesia beauty product category, it is also supported S-O-R model where this study found that size of visual image and concreteness of product description (S) influence the level of imagery processing and discursive processing elicited (O). According to the descriptive analysis on the previous chapter, large visual imagery with the most concrete product description has greater imagery processing and discursive processing as compared to small visual and verbal abstract respectively. While between imagery processing and discursive processing (O), both has significantly related to behavioral intention (R).

The result of this experiment emphasizes the importance of having high quality of visual and concrete description of product on the e-retailer page since both have significant effect to imagery processing, discursive processing and behavioral intention. This study offers empirical support for the claims made by Holbrook and Moore (1981) and Rossiter and Percy (1978) regarding the dynamic relationships between visual and linguistic inputs and information processing. Visual stimuli elicited both discourse and imagery processing, indicating that there may have been some labeling or naming of visuals (Rossiter and Percy, 1978). Furthermore, different levels of concreteness in linguistic stimuli elicited processing of both imagery and discourse. According to researchers, concrete words stimulate the processing of pictures (Biehal and Chakravarti, 1982; Bower, 1972). According to Bipedal and Chakravarti (1982), thorough product descriptions can aid in envisioning a product and activate imagery processing. Both visual and verbal stimuli elicit not only imagery processing but also discursive processing. As a result, it is possible that the verbal and visual stimuli used in this research elicited the referential or associative processing suggested by the Dual Coding theory.

Dual coding theory explains human behavior and experience in terms of dynamic associative processes that operate on a rich network of modality-specific verbal and nonverbal representations (Clark & Paivio, 1991). According to the dual coding theory, language and mental images are encoded in verbal code and nonverbal code, respectively (Sadoski, 2005). Information can be processed through both the verbal and nonverbal channels. For this experiment, images and product description complement each other since the image gives us the clear benefit of its product while the product description convinces with more concrete result. According to dual coding theory, words are typically coded verbally rather than visually, but images are more likely to be both visually and vocally coded. According to these presumptions, learners would have twice as many chances to learn something if the information needed to be processed was coded vocally and visually since it is physically presented as a whole.

Large image helps consumers to know about the product information better than small ones as consumers tend to zoom into the image presentation. Especially with beauty product itself, they tend to read what kind of ingredients are included and make sure that it fits with their hair, skin or body type. As consumers don't have product on their hand, product presentation that have better visualization for consumers to image can help them to decide their purchase decision. According to previous study as well, the most well-known predictor of visuals is a picture (Paivio, 1971; Shepard, 1967). The imagery created by visual information has been compared to discursive information processing by verbal information as the reason for visual information's supremacy (Childers & Houston, 1984; Lutz & Lutz, 1977; Paivio, 1971). Concrete linguistic inputs can also activate imagery processing in addition to images (Paivio & Csapo, 1973; Paivio & Foth, 1970; Richardson, 1980). It was discovered that the value of images was highly correlated with the level of concreteness of words (Pavio, Yuille, & Madigan, 1968).

While for concreteness of the product itself, it resulted higher in discursive processing. The assumption is in pilot test, as we know, that perceived benefit is the top element for purchase decision in beauty product category. The potential consumers would like to know in advance what kind of benefit they could get when they buy and later try the product. With the concrete product description, giving the detail functional effect after trying the product, could enhance the visualization of consumers and feel convinced with the promises. It is better than putting the abstract message where emotional message is put upfront, due to that shampoo is basic product

category where consumers tend to put importance of functional to fix their problem than emotional which are most likely used in product where self-actualization is more needed.

The findings further explained that although both visual and verbal information had a significant effect on imagery processing, verbal information has a weaker impact compared to visual information. While for discursive processing itself, the verbal information has a more dominant effect compared to visual information. Regarding behavioral intentions, visual information had a more significant effect than verbal information.

This finding also aligned with numerous previous studies. Paivio introduced the picture superiority effect for the first time (1971). In particular, this theory contended that because pictures have more symbolic connotations than words, they help people remember things longer than descriptions do. The dual coding theory (Paivio, 1986) and sensory semantic theory can be used to expound on this theory in more detail online (Nelson et al., 1977). That image is effective in dealing with the lowest amount of time to send information to people for them to understand is supported by both dual coding theory and sensory semantic theory (Nelson et al., 1977). As the time spent to decide what to purchase online is tend to shorter compared to offline shopping due to many available options for consumers in one website. How the business convinced through image is needed as the first step to influence purchase behavior.

Moreover, the favorable association between mental images and behavioral intent is also supported by earlier research (Elder and Krishna, 2012; Kim, 2019; Roggeveen et al., 2015; Yim and Yoo, 2020). Because vivid mental picture was more similar to the actual experience than cognitive elaboration, it increased behavioral intentions (MacInnis and Price, 1987). In a similar vein, Kim (2019) discovered that processing visuals positively influences behavioral intent when shopping online. Additionally, Schlosser (2003) offered empirical support for a strong correlation between mental imagery and behavioral purpose.

Another thing that can explain why visual works better than verbal for this beauty category because according to the reasons to purchase, attractive packaging in one of the top elements that can influence consumer decision. How packaging looks and the information included in packaging is first stopped to take a look, while product description can play a role as supplementary information. The verbal superiority effect was effectively eliminated in the current study because visual and verbal information may have conveyed redundant product information, particularly concerning ingredients and perceived benefit. The results of the current study provide fresh perspectives on how consumer decision-making is influenced by digital product display in the context of beauty product e-retailing. This study shows how the growing digital environment's visual and verbal cues affect how people interpret this information, ultimately affecting their approach/avoidance behavior.

#### *Managerial Implication*

The findings of this study offer digital commerce companies useful information to take into account as they continue to develop and produce efficient digital product presentations that meet the expectations of online consumers. Larger graphics and more descriptive text were proven to be more successful, as was previously believed. This study made the conclusion that one of the underlying factors influencing customers' behavioral intent is the type of information processing. The processing of imagery prompted by verbal and visual stimuli in the context of cosmetics was positively correlated with behavior. Both verbal and visual inputs might trigger discursive thinking, which equally affected behavioral intent. The size of visual stimuli and the concreteness of verbal stimuli both contributed to the processing of imagery.

There is ongoing demand on digital companies, particularly e-retailers, to adopt new visualization technology to improve their product presentation. The results of this study do not suggest that online shops in the beauty sector should spend less on visualization technologies, but rather that they should pay attention to the specificity of the linguistic descriptions they provide on their websites and optimize them to speed up image processing. Beauty product e-retailers can easily use the effective and inexpensive digital marketing technique of optimizing vocal product descriptions.

To enhance more product visualization, online retailers may adopt a higher level of dynamic visual, such as a 3D virtual model. As the need to visualize the benefit of product become essential to convinced potential consumers. It believed that high quality and communicative visual can improve consumer perceptions of the product or e-retailer page, which may in turn affect enjoyment from and involvement with the online shopping process. It can lead to positive approach responses towards the product.

The 3D virtual model feature's experiential elements may entice more customers to peruse products at the online store, ultimately boosting online sales. In order to improve perception of an indirect (virtual) product

experience online, Li et al. (2003) found that 3D product presentations outperformed 2D pictorial presentations. By giving customers better tools for studying product characteristics (such as zooming in and displaying various perspectives of a single item on a virtual model), retailers may encourage customers to stay on their website longer and make more purchases there.

Users are more likely to be satisfied with a website if they have a good attitude (both toward the website and/or the product being offered). Online retail managers should therefore be aware of the key components that result in consumer happiness when applying fresh stimuli. The level of contentment may vary from one nation to the next. In order to provide fresh and inventive designs for the 3D product presentation and boost user satisfaction with the websites, managers should regularly perform customer satisfaction surveys.

## VI. LIMITATION AND FUTURE RESEARCH

Given the nature of experimental research, this study lacks external validity, and thus generalization to other contexts needs caution. This research used Tokopedia as mock up website, can give effect of personal bias and previous knowledge. Future study is suggested to examine deeper between internal factors such demographic (age, gender, or education) and its relationship to each dependent variables. Moreover, future research also can research how the stimuli and information processing can be resulted in different attitude such affection, cognition, and conation. It is seen as behavioral intention can be too early to show up as a result with few stimuli. Future research also can dig deeper on other digital platforms, such as creating own mockup websites to decrease personal bias or explore other category, to increase our knowledge of consumer experiences in the digital space. Additionally, a comparison of men and women could advance this area of study. The results of the current study are anticipated to be expanded by similar m-commerce studies. Future studies must assess the different forms of information processing elicited by various stimuli. Such details will help shed light on the mechanism by which various stimuli affect customer opinions.

## The Impact Of Covid19 On Firm Investment: Evidence From Indonesia

Resmi Afifah Fadilah<sup>1</sup>, Mochamad Romdhon<sup>2</sup>, Winda Ningsih<sup>3</sup>  
<sup>1,2,3</sup>Faculty of Economics, Garut University, Garut, Indonesia.

### Abstract

*This paper investigates the impact of COVID-19 on corporate investments. COVID-19 has had a significant impact on business and investment activities. This study uses data from Indonesia for pre-covid 19 period (2017 to 2019) to classification high flexibility of companies and (2020 to 2021) during covid 19. Number observation are 298, and total observation are 596. Using panel data and regression analysis. We find that companies that have high cash flexibility are able to withstand and resist adverse external shocks caused by COVID-19. These results indicate that the company's high cash flexibility is an important thing that must be owned by the company.*

*Keywords— Cash flexibility; Investment.*

---

### I. INTRODUCTION

Corona virus (covid-19) is a viral outbreak that was first declared a global pandemic on March 27, 2020 (World Health Organization, 2021). Covid19 was first in wuhan (china) which has infected more than one million people and more than 60,000 deaths globally in almost 100 days, until August 22, 2021 it was reported to have infected 211 million with a total death of 4.4 million. This epidemic is clearly having a significant impact. Some countries choose a lock-down or very strict policy, even economic activity is very limited, causing new problems for companies economically. The negative COVID-19 gave rise to several policies one of which, as a very significant impact on business, without much choice, individuals have no room to react only to be "reaction takers.", thus, we are guided in our interpretation of stock price behavior by theory. investors underreaction and overreaction (Daniels & Mead, 1998; Hong & Stein, 2005; Hong, Torous, & Valkanov, 2007).

Talking about the business sector, investors are predicted to suffer a lot of losses as a result of this crisis. This pandemic is said to be an external shock for the company. Cash flow risks posed by adverse external shocks were also found to have a greater impact on cash flows. (Kaplan & Zingales, 1995; Opler, Pinkowitz, Stulz, & Williamson, 1997) revealed that when companies face financing constraints, cash flow risk has a significant positive effect on cash holdings. Agency and trade-off theory claims that firms will be more likely to hold cash during a pandemic for preventive motivation or to take advantage of profitable investment opportunities (Keynes, 1936). However, companies with less cash flexibility will have difficulty repaying their loan principal and interest, will face large external financing constraints, and will face barriers to refinancing, which will result in less spending on technology, employees, and equipment. capital (Campello, Graham, & Harvey, 2010; Campello, Giambona, Graham, & Harvey, 2011). Therefore, companies with low leverage and high cash holdings have much better anti-risk capabilities when facing sudden shocks because they can take advantage of cash investment opportunities and maintain or increase firm value (Ge Jiashu, 2008). Due to the pandemic, causing a sharp decline in capital assets, the value of companies suffering from financial crises and bankruptcies fell. However, while the crisis also provides good opportunities for growth for companies that have cash flexibility, companies that do not have cash flexibility miss out on investment opportunities (Zingales, 1998).

Companies that have higher cash flexibility are more able to take on various investment opportunities than companies with low cash flexibility. companies can maintain future stability by having a low leverage ratio and high cash holdings are expected to be able to invest more consistently and take investment opportunities. Arslan et.al (2014) stated that firm could reach financial flexibility by maintaining quite large cash reserves. This study is replication of research conducted by Jiang Jie et.al (2021) in China. Compared to previous studies, this study was conducted in Indonesia. Where there were many policies that have been made during covid19 that effect on economy, especially investment activities And considering that capital flow volatility in developing countries such as indonesia could be a significant disturbance to corporate external financing, with financial flexibility had greater chances to acquire investment opportunities during financial crises that affected developing countries. and this study want to know inclination of financial flexible firms to apply cash holding policies. Therefore, based on the previous study, researcher want to know the effect of cash flexibility during the pandemic in Indonesia.

## II. LITERATURE REVIEW

Financial flexibility is a company's capacity to manage internal finances by taking actions that will have an effect both in the long term and as an optimal allocation of financial resource reserves and effective financial risk management, such as buffering capacity (Buzacott, 1982). The availability of excess cash, or cash flexibility during a pandemic, is considered to function as a buffer mechanism for companies facing uncertainty. Holding cash can reduce the negative impact of policy uncertainty on the economic activity of companies (Duong, Nguyen, Nguyen, & Rhee, 2020). When there is policy uncertainty, firms tend to hold more cash to reduce the negative impact on capital investment and innovation. When financing becomes difficult, internal cash flow then becomes the main source of corporate funds and can effectively reduce investment shortfalls due to financing difficulties and/or restrictions (Kaplan & Zingales, 1995).

Previous research in developed countries has shown consistent results that financially flexible companies have higher capital expenditures compared to financially inflexible companies (De Jong et al. 2012; Fernando et al., 2014; Marchica & Mura, 2010). Research in developing countries also shows similar results, although companies in these countries are generally very vulnerable to external turbulence, and their stock markets are characterized by high capital volatility (Bekaert & Harvey, 2003; Joyce & Nabar, 2009). Yung et al. (2015) stated that exogenous shocks can damage corporate viability, profitability, and cash flow, they can also create opportunities for firms with investment ability.

Zeng et al. (2011) explained that companies with high cash flexibility and regularity in storing cash before the crisis, they have more cash reserves, and it is said that it is better to use it for things like a crisis that occurs, compared to being used directly for investment purposes. Qianxi (2016) examined a firm's cash excess and cash flexibility reserves, and found that the negative impact of financing constraints on investment activities weakened when the firm had a large excess of cash holdings. Yung, Li, and Jian (2015) analyzed firms in 33 developing countries and found that firms' cash flexibility increased investment capability, reduced investment sensitivity to cash flows, reduced equity payments, and increased cash holdings, and during the 2008 financial crisis, cash flexibility increased firm value, with flexible firms suffering less from adverse external shocks and having smaller reductions in investment and equity spending. Moreover, Arslan-Ayaydin et al. (2014) found that firms with financial flexibility had greater chances to acquire investment opportunities during financial crises that affected developing countries. Financial flexibility also allows firms to avoid financial difficulties when facing negative obstacles, allowing financially flexible firms in developing countries to increase their investment abilities since financial flexibility makes it possible for them to invest more consistently and to chase suddenly appearing opportunities. Furthermore, the investment ability of financially flexible firms does not depend solely on internal financing because their unused debt capacity makes it easier to gain external financing to fund their projects.

Based on previous research, it was stated that the availability of flexible cash was able to help companies, one of which was during a crisis. Further research will be conducted in Indonesia to see how the influence of companies that have high cash availability will be.

H1: High-cash-flexibility reduces the adverse effect on corporate investment activities during a crisis.

## III. RESEARCH METHODOLOGY

### A. Data

This study uses financial data of companies listed in Indonesia obtained from Thomson Reuters. Using panel data and regression analysis. This research sample from 2017 – 2019 as pre-Covid19, was carried out to calculate the company's cash flexibility by dividing it into two classifications, namely high cash availability, and low cash availability. Then, data for 2020-2021 was taken to see how conditions were during a pandemic.

Cash flexibility is the company's way of securing its cash funds to be allocated through an appropriate financial policy (DeAngelo & DeAngelo, 2007; Ma, 2010). In the theory of financing priorities (Myers and Majluf, 1984) the presence of a large amount of cash is able to secure the company from issuing shares when undervalued. The measurement of cash availability is based on Zeng et al. (2011) revealed that cash flexibility is at most 30% of all companies classified as financially flexible. In this study it was determined that cash flexibility was 3 years before Covid19 spread in Indonesia (2017-2019). Based on these criteria, 269 firms in the sample are classified as high cash flexibility firms. The investment measurement based on Jiang Jie et al. (2020) is by dividing the current capital expenditure of the firm by the total assets of the previous period. The control variables are Debt, Roa, Roe, Size, Net cash flow. The models in this study are:

$$Invest: \alpha + \beta_1 Post_{it} + \beta_2 Debt_{it} + \beta_3 Roa_{it} + \beta_4 Roe_{it} + \beta_5 Size_{it} + \beta_6 NCF_{it} + \epsilon_{it}$$

## VII. RESULT / FINDING

Table 1 Hypothesis Testing

Variable	Coef	P>z
Post	0,0025657	0,093*
Debt	0,012178	0,3975
Roa	0,172868	0,062*
Roe	0,010773	0,37755
Size	0,002087	0,000***
NCF	2,501115	0,2425
cons		

Based on table 1, shows the results of the basic estimation for the impact of COVID-19 on company investment spending. The post coefficient was found to be significantly positive at the 10% level, indicating that investment spending in Indonesian listed companies with high cash flexibility reduces the adverse effect on the investment activities of companies during the crisis. This result is consistent with Hypothesis 1.

## IV. DISCUSSION

These results suggest that at the same time, existing research also finds that both opportunity and crisis coexist. If firms can access sufficient funds when valuable investment opportunities arise, they can increase the value of their firms, which suggests that cash flexibility is critical for firm development (DeAngelo & DeAngelo, 2007; Zeng et al., 2011). Therefore, studies have confirmed that financial flexibility through excess cash and a low debt ratio is beneficial when external funds are not available or borrowing costs are high (Ma, 2010). In short, companies with high cash flexibility can use more cash reserves to provide funds for their investment activities during a crisis. Existing research on cash flexibility mainly focuses on the quantitative dimensions and cash resources that companies may need to acquire or use in the future (Zeng & Wei, 2013).

## V. CONCLUSION AND RECOMMENDATION

This paper investigates the impact of COVID-19 on corporate investments. COVID-19 has had a significant impact on business and investment activities. This study uses data from Indonesia for pre-covid 19 period (2017 to 2019) to classification high flexibility of companies and (2020 to 2021) during covid 19. Number observation are 298, and total observation are 596. We find that companies that have high cash flexibility are able to withstand and resist adverse external shocks caused by COVID-19. These results indicate that the company's high cash flexibility is an important thing that must be owned by the company. The results show that the impact of COVID-19 on corporate investment spending. The post coefficient was found to be significantly positive at the 10% level, indicating that investment spending in Indonesian listed companies with high cash flexibility reduces the adverse effect on the investment activities of companies during the crisis. The limitations of this study cannot be generalized to the world scope because this research was only conducted in Indonesia. Future research can add a research period to see the situation when it is endemic, and post-covid19.

### Abstract

*Compensation is used to motivate management to improve firm performance. There is a debate that the compensation received by executives is not by the resulting firm performance, so this becomes a conflict, especially for the parties involved. Therefore, the purpose of this paper is to examine the effect of firm size (SIZE), leverage (DER), and profitability (ROE), whether simultaneously and/or partially toward executive compensation in mining firms listed on the Indonesian Stock Exchange. Data was collected from annual reports from 2016 to 2020. The sample collection used a purposive sampling technique with a total of 145 firms' data. However, 26 outlier data were found, so the total research sample was 119 samples. The research method used is panel data regression analysis. This study's findings are that firm size and leverage have a significant positive effect on management compensation, while profitability does not affect management compensation. However, simultaneously show that firm size, leverage, and profitability significantly affect executive compensation. This study's conclusions provide some support and consideration for the board of directors in evaluating the proportion of compensation to motivate managers in industries.*

### I. INTRODUCTION

In achieving the right alignment, incentives usually feature a combination of salary, bonuses, and equity-based compensation such as stocks and options. The compensation component is usually based on several performance measures—individual achievement, net income, and share price. This is a reflected measure of the future results of the manager's efforts in the current period (Scott, 2015). There is a recent study by Al-azhary et al., (2022) evidence from Indonesia that states that corporate profitability and debt affect executive compensation. In addition, according to Khursheed & Sheikh (2022), evidence in Pakistan stated that firm size, profitability, leverage, growth opportunities, and age are some of the key firm-specific factors that influence (i.e., plus/minus) CEO compensation differently in different industries. However, according to the firm's annual report data for the last 5 years (2016-2020) the highest average remuneration or executive compensation for mining firms occurred in 2019, reaching a value of IDR 28 billion, while in the same year, the average profitability and leverage of mining firms it was the lowest value in other years. Then, in 2018 when the average profitability and leverage reached a fairly good value compared to previous years, the remuneration value received by the CEO was also quite high, reaching Rp25 billion. This becomes a big question, what is the determinants of executive compensation? Does firm performance affect executive compensation? We examine this with broader year data (2016-2020) and specifically on mining firms because mining firms make a big contribution to state revenue in Indonesia.

Scott (2015) stated that an executive compensation plan is an agency contract between the firm and the manager that attempts to align the interests of the firm's owners and manager by focusing the manager's compensation on one or more measures of the manager's performance in running the firm. According to agency theory, the contract between the owner and the manager of the firm creates a relationship due to one or more (owners) employing a party or agent (in this case, the manager) so that there is a delegation of decision-making authority from the owner of the firm to the manager. The relationship between the manager and the owner of the firm has a consequence in the form of an agency problem where the agent will maximize his interests to prosper himself both economically and mentally, while the owner will have an interest in his welfare by adding to the value of the firm. Executive compensation can be a means that can help control agency problems by trying to get both parties to benefit and gain their respective interests without compromising the interests of the other.

Based on prior studies, the determinants of executive compensation are mixed. First, Fernando & Thevaranjan (2017) finds that the impact of auditor specialization has waned in the post-SOX period. There are two possible explanations for this result. The first explanation is that post-SOX, quality differences among auditors have diminished to the point where cross-sectional differences in audit quality do not affect accounting-related research variables as much as they did previously, and the second possibility is that there are still differences in auditor

quality, but that specialization is no longer a reliable proxy for testing national-level audit quality differences. Indeed, audit quality research appears to have shifted from national-level to office- and partner-level variations. Then, Focke et al., (2017) find that the negative effect of prestigious firm compensation concentrate on well-regulated firms, only strong directors can pay the CEO less, and weaker directors take advantage of the benefits of working in firms that are directed at the CEO. Also, Jong & Ho (2018) have further found that domestic and foreign institutional investors could negatively impact executive remuneration when the firm CEOs have no affiliation with the controlling shareholders. Khursheed & Sheikh (2022) stated that firm size has positive relation to executive compensation, because complex and large firms need managers that are qualified and high-quality, also the executive compensation can motivate the CEO to expand the business. Bigger firms are more able to pay bigger executive compensation (Long et al., 2022). Meanwhile, Ghasemi et al., (2020), Khursheed & Sheikh (2022), Rahman & Mustafa (2018) discovered that firm size is related positively to firm compensation. Bouteska & Mefteh-Wali (2021) found that leverage has a negative significant to executive compensation. Firms with high debt will leave the firm with fewer resources, which may not be enough to offer a profitable package to CEO (Khursheed & Sheikh, 2022).

This research uses a sample of Indonesian mining firms listed on the Indonesian Stock Exchange from 2016 to 2020. This study aimed to obtain empirical evidence of the effect of firm size, leverage, and profitability on executive compensation. First, we examine the executive compensation of mining firms in Indonesia and analyze the effect of firm size, leverage, and profitability on executive compensation. Then, we hypothesize that the firm size and profitability have a positive significant effect on executive compensation, meanwhile leverage has a significant negative effect on the executive compensation. We tested 118 samples from 29 mining firms listed on the Indonesian Stock Exchange with the year of observation during 2018-2020.

Our results obtained through data panel regression indicate that firm size and profitability significantly positively affect the executive compensation, while leverage has no effect on the executive compensation. This study makes several contributions. The first is knowledge. For details, this is the first paper to examine the determinants of the executive compensation in Indonesia, specifically for mining firms. Second, it will not only fill a gap in the literature, but will also help the board of directors and regulatory authorities in developing policies that determine the CEO pay slice in accordance with qualifications and performance.

The rest of the paper proceeds as follows. Section II presents the literature review. Section III describes the research methodology. Section IV presents the result/finding of the study. Section V presents a discussion (interpreting the results of data processing). Section VI presents the conclusion and recommendations, a brief summary of the study's results, and a discussion).

## II. LITERATURE REVIEW

### A. Agency Theory

Jensen and Meckling (1976) presented agency theory as a way to explain the link between CEO pay and firm success. The principal-agent relationship may be seen in a variety of firms in today's economy. It's a contractual agreement that covers any transaction that involves asymmetric knowledge. First, the cost of supervision by the principal, which is the cost of the principal stimulating the agent in order to get the latter to work for the benefit of the former; second, the cost of guaranteeing the agent, which is the cost of the agent ensuring that he or she does not engage in behavior that harms the principal, as well as the cost of compensation if that behavior is adopted; and third, the cost of compensation if that behavior is adopted.

In most businesses, the owners leave the firm's management to professional managers. The owner is the principal, and the manager is the agent in such a relationship. According to agency theory, the most important game between them is information asymmetry. Managers have a lot of information about the firm because of their direct managerial power and professional skill, but stockholders have a lot less. The information asymmetry makes it difficult for shareholders to determine if management is acting in their best interests. According to the rational economic man hypothesis, managers are self-interested, which is also adopted from the agency theory, and they may cut down the firm's (shareholders) interests to pursue personal gain. The agency's costs would rise as a result of this (Jensen & Meckling, 1976).

### B. Firm Size

Firm size is a scale that describes how big or small a firm. Firm size is seen from total assets, sales, and market capitalization (Sudarmadji & Sularto in Hery, 2017). Firm size can affect the firm's funding structure because larger firms will use larger funds compared to smaller firms (Astuti et al., 2017). Based on Murhadi (2011), firm size significantly affects executive compensation. This is in line with the results of Rahman and Mustafa's research (2018) that firm size positively affects executive compensation. By using the total assets of the firm to show a picture of the size of the firm. If the assets of a firm are large, then the firm can be classified as a large firm. That way, large firms will increase incentives for earnings management. So that it can attract the attention of investors because of better earnings management practices than small firms. We propose the following hypothesis:

H<sub>1</sub>: Firm size has a significant positive effect on executive compensation.

#### C. Leverage

Financial management is required to manage solvency ratios properly so as to be able to balance high returns with the level of risk faced. The size of this ratio is very dependent on the firm's loans, in addition to its assets (equity). The higher the solvency ratio, the higher the risk of the firm, and vice versa. According to Ghasemi and Razak (2020), leverage has a negative effect on executive compensation. The greater the debt level of a firm, the lower the compensation given to executives. Based on the above thoughts, the second hypothesis in this study is:

H<sub>2</sub>: Leverage has a significant negative effect on executive compensation.

#### D. Profitability

Profitability is the firm's ability to generate profits in a certain period. The firm's goal, in general, is to get the maximum profit that can be achieved in the short and long term. Firms that have a high level of profitability will have greater internal funds. The greater the funds that can be returned shows the amount of net profit obtained from the firm's equity. Equity is the capital owned by the firm, the greater the funds that can be returned from equity into profit, meaning the greater the profit obtained from its own capital. According to Khursheed and Sheik (2022), profitability significantly affects executive compensation. High ROE will cause the position of the owner of the firm's capital to be stronger. Firm performance as proxied using ROE can also affect executive compensation, meaning that compensation given to executives can come from the profits generated by the firm. We thus propose the following hypothesis:

H<sub>3</sub>: Profitability has a significant positive effect on total executive compensation.

### III. RESEARCH METHODOLOGY

#### A. Sample Selection

We collected detailed CEO compensation data from the IDX (Indonesia Stock Exchange) database for the period 2016-2020. The Executive Compensation database contains data on CEO & commissioner compensation (ranked annually by salary and bonus) at each firm. Examples of related research using the ExecuComp database include Long et al. (2022) and Bick & Flugum (2022). Since the executive compensation is the key variable of this study, we first download all firm data from the IDX (Indonesia Stock Exchange) database. Since the CEO characteristics and director & commissioner information are required, and they have been relatively complete since 2016, we set the starting sample period as 2016. We examined only the mining sector, which amounted to 47 firms. This research used purposive sampling. the criteria for the sample under study are based on:

Table 1. Sample Selection Process

Mining firm listed on the IDX for the 2016-2020 period	47
Less :	
Delisted Mining firm during the 2016 – 2020 period	(3)
New Mining firms have IPOs 2016-2020 period	(6)
Mining firm whose financial reports are not complete for the 2016-2020 period	(2)
Mining sector firms aren't issuing executive compensation in the 2016-2020 annual financial statements of mining sector firms	(7)
The sample used in this study	29
Sample during the 2016 – 2020 period	145
Less :	
Outlier data	(27)

Table 2. Variables

Name	Symbol	Definition
Compensation	$COMP_{it}$	Natural log of the total executive compensation
Firm Size	$TA_{it}$	Natural log of total assets
Profitability	$ROE_{it}$	Comparison of net profit after tax and the firm's total equity
Leverage	$DER_{it}$	Total liabilities to total equity

### B. Empirical Models

As the main focus is on payment performance, we measure the sensitivity of payment performance. This means that compensation changes must be made based on changes in firm performance. For example, a high return on equity (ROE) does not always mean that the compensation received by top management is significant. A large firm size does not always mean that the compensation received is significant, and the solvency ratio is not always large, so the compensation received is small. The analysis in this study is panel data analysis. The equation for the analysis of the panel data regression model in this study is as follows:

$$COMP_{it} = \alpha + \beta_1 TA_{it} + \beta_2 ROE_{it} + \beta_3 DER_{it} + e$$

Where the dependent variable is executive compensation is the natural logarithm. Compensation is the total compensation of the CEO & commissioner (salary, bonus, limited stock grant, long-term incentive plan, payment, all other remuneration, and option value) received by the CEO of the firm in the year  $t$ .

The first test variable is Firm Size which is proxy by the natural logarithm of the firm's Total Assets, Bhuyan et al., (2020) suppose the results of total assets are in accordance with  $H_1$ . The positive coefficient indicates the alignment between executive compensation and larger firm size. The second test variable is the Profitability Ratio, proxied by Return to Equity (ROE), which is a comparison of net profit after tax and the firm's total equity. The use of ROE in measuring profitability in this study because ROE can describe the firm's ability to provide financial compensation to shareholders through an equity firm. Suppose the results of ROE are in accordance with  $H_2$ . A positive coefficient indicates the alignment between executive compensation and higher profitability ratios. The third test variable is leverage which is proxied by the Debt to Equity Ratio (DER), which is a measure of how much the firm's assets are covered by the debt. In other words, the leverage ratio is a metric used to measure the amount of debt a firm must bear to replenish an asset. Suppose the result of DER is in accordance with  $H_3$ . The negative coefficient shows that leverage is inversely proportional to the compensation received by executives.

Table 3. Measurement of Variables

Name	Symbol	Definition
Compensation	COMP it	Natural log of total the total executive compensation
Firm Size	TAit	Natural log of total assets
Profitability	ROEit	Comparison of net profit after tax and the firm's total equity
Leverage	DERit	Total liabilities to total equity

Table 4. Summary Statistics

	Compensation	Firm Size	DER	ROE
Mean	23.87701	30.12816	0.912471	-0.301180
Median	23.83057	30.10604	0.695500	0.042100
Maximum	26.62790	33.36413	11.32540	8.370000
Minimum	19.98930	24.95236	-6.670000	-19.670000
Std.Dev	1.185479	1.831606	1.737027	2.114576

## IV. RESULT / FINDING

### A. Classic Assumption Test

The model used in this study is a fixed effect model (FEM) that uses the ordinary least square (OLS) approach. The classic assumption tests that need to be done in the OLS approach are the heteroscedasticity test and the multicollinearity test (Basuki et al., 2016).

### 1. Multicollinearity Test

The multicollinearity test was carried out with the aim of testing the correlation between independent variables in the regression model. According to Basuki & Yuliadi (2016:63), Multicollinearity detection can be seen through the value of the correlation coefficient between the independent variables. This study uses the results of the multicollinearity test using Eviews 12 software.

Table 5. Multicollinearity Test

Variable	Firm Size	DER	ROE
Firm Size	1	-0.199495443	0.024902691
DER	-0.199495443	1	-0.001448708
ROE	0.024902691	-0.001448708	1

Based on Table 5, the correlation value between the variables of the firm size represented by total assets (X1), leverage represented by DER (X2), and Profitability represented by ROE (X3), is less than 0.9. This means that there is no relationship between independent variables or there is no multicollinearity in this study.

### 2. Heteroscedasticity Test

The purpose of the test heteroscedasticity is to test the variance inequality of the residual one observation to other observations in the regression model. Then, this inequality symptom is called heteroscedasticity (Basuki & Yuliadi, 2016:63). The results of the heteroscedasticity test using Eviews 12 software as below.

Table 6. Heteroscedasticity Test

F-Statistic	1.650336	Prob. F (9,108)	0.1101
Obs*R-squared	14.26629	Prob. Chi-Square (9)	0.1132
Scaled explained SS	14.68594	Prob. Chi-Square (9)	0.0999

Based on Table 6, the Prob.Chi-square value of Obs\*R-squared is 0.1132. This means that in this regression model, there is no heteroscedasticity because it is greater than 0.05.

### 3. Panel Data Regression Equation with Random Effect Model

Table 7. Panel Data Regression Test

Variable	Coefficient	Std. Error	t-Statistic	Prob.
C	2.692417	7.978234	0.337470	0.7366
Firm Size	0.695950	0.264826	2.627947	0.0102
DER	0.236310	0.043027	5.492069	0.0000
ROE	-0.004288	0.025688	-0.166941	0.8678

Based on Table 7, the test results from the fixed effect model can be formulated in the panel data regression equation as below :

$$Y = 2.692417 + 0.695950 \text{ Size} + 0.236310 \text{ DER} - 0.004288 \text{ ROE} + e$$

The panel data regression equation of this study can explain partially and simultaneously. Partially can be seen in Table 7. First, the constant value is 2.692417, indicate that if the independent variable in the regression (firm size, profitability, and leverage) is 0, then the dependent variable on regression (executive compensation) is 2.692417. Second, the coefficient of firm size in this study is 0.695950, which indicates that for every one unit increase with the assumption that the other variables are zero, then the Y variable in this study (executive compensation) will also increase by 0.695950. Third, the regression coefficient of leverage in this study is 0.236310, indicating that every occurrence of an increase of one unit with the assumption that the variable is 0, then on the contrary in the Y variable in this study, namely executive compensation will decrease by 0.236310. Last, the profitability regression coefficient in this study is -0.004288, indicating that each the occurrence of an

increase of one unit with the assumption that the variable is 0, then the Y variable in this study, namely executive compensation will also increase by -0.004288. And Simultaneous Significance Test (Statistical Test F) can be seen in Table 5. It shows a probability value (F-statistic) of 0.000000, this value is smaller than the significance level of 0.05 (5%). Based on the conditions to take hypothesis decision, it can be concluded that the independent variables in this study, namely firm size, profitability, and leverage, simultaneously affect the dependent variable, namely executive compensation.

### Hypothesis Test

Table 8. Coefficient of Determination Test

R-squared	0.918562	Mean dependent var	23.87701
Adjusted R-squared	0.889206	S.D. dependent var	1.185479
S.E. of regression	0.394595	Akaike info criterion	1.204123
Sum squared resid	13.39066	Schwarz criterion	1.955495
Log-likelihood	-39.04326	Hannan-Quinn criter.	1.509202
F-statistic	31.29082	Durbin-Watson stat	1.349114
Prob(F-statistic)	0.000000		

Based on table 8, the results of the Adjusted R-squared show a number of 0.889206 or 88%, it can be concluded that the independent variables in this study are firm size, profitability, and leverage can explain the dependent variable of 88%, while the remaining is 11% can be explained by other variables not included in this research.

### V. DISCUSSION

This article uses the panel data regression method for robustness testing, shown in the Appendix. First, firm size has a significant positive effect on executive compensation, supported by research conducted by Mehran (1995), which explains that firm size has a positive effect in his research. This is because the larger the size of the firm, the greater the executive compensation. Total assets are used as firm size variables, because firms with large total assets tend to be more stable and able to maximize their performance by generating significant returns to attract investors. Firm size can also be used to see the growth of a firm, by increasing sales and assets owned by the firm. Management has done a great job, and corporate governance is correct. This can be a factor in management's assessment as the basis for choosing an executive compensation package

Furthermore, profitability, as proxied by return on equity (ROE), has insignificant positive effect on executive compensation. This is supported by Suherman et al., (2016), who explain that profitability has insignificant positive effect in their research. This is because the firm can get the maximum profit that can be achieved in the short and long term. Firms that have a high level of profitability will have greater internal funds, the greater the funds that can be returned. High ROE will cause the position of the owner of capital to be stronger so that it can affect executive compensation, so the compensation given to executives can come from the profits generated by the firm.

The last variable, leverage as a proxy for debt to equity ratio (DER) has a significant negative effect on executive compensation. This is supported by research by Malik & Shim, (2019) who explain that leverage influences their research. This is because firms are fine at managing existing debt solvency ratios so they can balance it well with the level of challenges faced. The size of this ratio is very valuable from the credit owned by the firm, in addition to the assets offered (equity).

### VI. CONCLUSION AND RECOMMENDATION

Our study provides the first systematic evidence of how firm size, leverage, and profitability relate to executive compensation in the mining sector in Indonesia. Overall, our results show that firm size, leverage, and profitability simultaneously affect executive compensation. This finding is strong because it uses panel regression test data able to provide more data so that it will produce greater degrees of freedom and panel data provides more informative data, more variation, less collinearity between variables, and better efficiency

This finding partially shows that firm size and leverage can positively affect executive compensation. Meanwhile, profitability has no effect on executive compensation. There is no effect on profitability because the firm does not have a high level of profitability, so the internal funds are smaller. The smaller the funds obtained by the firm, the smaller the rate of return will be a low ROE will cause the firm's capital owner position to weaken. Thus, in this study profitability has no effect. This shows that a lower level of corporate debt increases the amount of executive compensation. Hence, the firm does not have pressure on debt interest can provide higher compensation to executives. This is in line with the research that has been done by Agarwal (2021).

The limitation on this research that the executive compensation consist of basic salary, allowances and bonuses reported in the annual report. Furthermore, we have problems in finding international journals that have the same variable influence as this study because executive compensation journals are very rare to find. We suggest, in further research, enlarging the scope of firms. We expect that it can make a difference in selecting variables, selecting research objects, and research years other than mining firms in 2016-2020 which are expected to obtain better results for future study. Further research is expected to add other factors that appear to affect executive compensation, such as firm performance as measured by firm value, price changes, or stock returns. Other variables that can be added include firm-specific characteristics that can be seen from the number of business segments of each firms.

## Green Marketing Segmentation Across Emerging Economies

A.Diyan Fariha Rosyidah<sup>1</sup>,  
<sup>1</sup>Telkom University, MMPJJ, Bandung, Indonesia

### Abstract

*This is a review paper aiming to study the green marketing practice in emerging economies by investigating segmentation patterns based on the prior literature survey. This paper is synthesizing the prior study to find the pattern and gap between green segmentation and the variables. Emerging nations have been a center of manufacturing and consumption with high populations and potential economic growth. Marketing acts as a doubled-edge sword, either can accelerate consumption and lifestyle aggressively or able to stimulate sustainable consumption with so named Green Marketing. Green segmentation is crucial as a tactical strategy in green marketing. Marketing mix needs particular segmentation and therefore to determine, variables are significantly investigated. However, the variables pattern in developing countries has not been synthesized.: Psychographic and behavioral variables have been extensively used; however, the mediating role of price and enterprise profitability has not been studied yet to find the gap between environmental awareness and purchase intention. Literature review sources are article journals in the marketing field with sampling and populations in emerging nations. The results show various perspectives of segmentation variables and results. Behavioral and psychographics variables-based research has a deeper and wider topic due to current consumer behavior. The mediating role of price and enterprise profitability in developing economies is recommended for further research to gain better insights into green marketing practices, particularly in developing nations.*

*Keywords—Emerging Economies; Green marketing; Green Segmentation*

---

### I. INTRODUCTION

Environment degradation as the consequence of technological, and industrial expansion and growing demographic is inevitable. Nature is being exploited for raw material explorations, and the environment ironically burdens the waste and pollution from goods production and consumption. Earth faces the threats of climate change, ozone layer depletion, environmental damage, air land water pollution, high-scale consumption of raw material, and increased product dumped (Costanza et al, 2014; Nekmahmud et al 2020). Particularly in emerging countries that are identified by IMF based on attributes such as progress in reaching middle-income levels, market access, and greater global financial relevance (Duttagupta et al, 2021). Furthermore, the reason that four-fifths of the world's population is in developing economies (UNCTAD, 2017), the contribution to the application of green practices is undoubtedly crucial.

According to Amoako et al., (2020), as the profit growth of multinational corporations is by some means stagnant in developed countries, they are shifting to emerging economies (Sheth et al 2016). The emerging nations in the manufacturer's perspective offer abundant natural resources, and lower wages, whereas a demographically, dense population is to be targeted as potential customers. However, many studies underlined the lack of information about ecological attitudes and behaviors in emerging countries (McEntee and Brust, 2011; Nguyen et al., 2016; Pham et al., 2018).

Green marketing also referred to as sustainable marketing considered to resolve the problems. The necessity is as crucial as to support business and the environment, especially for emerging countries that mentioned previously hold four-fifth world's population and future potential that MNC shift to emerging economies. In this respect, literature notes that green marketing will enhance brand equity, and company performance (Van Yperen, 2006; Bonini and Oppenheim, 2008;), however according to Dean & Pacheco (2014), for numerous entities, the practice of environmental marketing has delivered unsatisfactory outcomes. For example, Sari & Firmanzah (2011) notes that the market share of environmentally friendly products in Indonesia as one emerging country is still low, and its growth is still noticeably slow. Nguyen-Viet (2022) discovered the finding that a green marketing mix positively influences green consumer-based brand equity creation and thus becomes a strategy for captivating the market. However, attention to the importance of green marketing strategies has been fairly limited, and this happens, mainly in developing nations. Consequently, the green marketing strategies in developing countries are not fully recognized (Agustini et al.,2019)

This paper has the objective to support marketers, researchers, and policymakers to establish green marketing with essential tools; by summarizing and synthesis the previous research on segmentation, particularly on the descriptor variables, and suggesting marketing mix based on the segmentation findings based on prior literature.

Especially, the emerging market should have unique green segmentation due to demographic, psychographic, and behavioral market characteristics. Additionally, variables in segmentation are correspondingly analyzed. Hence, this paper is investigating and synthesizing the literature on segmentation across countries in emerging economies to improve business performances and accordingly save nature.

## II. LITERATURE REVIEW

### A. *Green Marketing in Emerging Countries Context*

The literature stated that the Green Marketing issue appeared in 1970s. However officially drawn as vital issue since The American Marketing Association (AMA) published a proceeding titled "Ecological Marketing". Kotler and Keller (2008) describe green marketing as marketing of products that are environmentally safe or responsible for the environment.

Nekmahmud et al., (2020) highlighted that distinguished researcher have been confirming the benefits of green marketing, for example, promoting awareness of ecological and social issues, and the most remarkable is creating sustainable growth, simultaneously earning profit for the companies. Although some issues such as greenwashing should be regulated to avoid misuse of green terms toward the benefits of raising the brand equity and cost reduction purpose camouflaged in the green promotion. Green Marketing is believed to help countries to realize the indicator Sustainable Development Goals (SDG).

Emerging countries might have various definitions based on the organization associated with the given criteria. For instance, IMF identified emerging countries based on characteristics such as sustained market access, progress in reaching middle-income levels, and greater global economic relevance (Duttagupta et al, 2021). Hoskisson et al (2000) defined an emerging economy as a low-income country, experiencing rapid economic growth because of government policies are eager to liberate the economy. Meanwhile, MSCI Market Classification Framework (2014) grouped into the following three criteria: size, economic development, and liquidity as well as accessibility to market, created three categories; frontier, emerging, and developed market. Emerging market has substantial openness to foreign ownership and ease of capital flows. The reason that four-fifths of the world's population is in developing economies (UNCTAD, 2017), therefore the application of green practices is vital.

Duttagupta&Pazarbasioglu (2021) in Quarterly Publication of IMF classified advanced, emerging market and developing economies among nations. IMF identifies the following countries in the emerging market group: Russia, Argentina, Brazil, Malaysia, China, Colombia, Egypt, Thailand, India, Indonesia, Iran, Chile, Mexico, the Philippines, Poland, Saudi Arabia, South Africa, Hungary, Turkey, and the United Arab Emirates. Those countries account for 34 percent of the world's GDP and 46 percent in purchasing-power-parity terms. Emerging countries are in transition to an advanced economy which potentially rapidly growing due to socio-demographic conditions. This paper will analyze market segmentation results among mentioned countries in various contexts, including; Iran, Turkey, and India.

Oluwasola (2014) stated that in developing countries, the effect of pollution and environmental problems is more serious. Unlike the developed nations, developing countries have less technology, and fewer aware citizens to combat environmental destruction. The necessity and research of greener practices including green segmentation are crucial to be applied in a country other than developed nations, including emerging states.

### B. *Descriptor Variables in Segmentation*

The history of segmentation started in 1964 by sociologist Daniel Yankelovich who proposed a segmentation analysis method to help marketing directors evaluate viable strengths and weaknesses, to plan the product feature, decide their selling strategy and advertising, and set accurate marketing objectives. Additionally, cited from Harvard Business Review, Yankelovich (1964) stated that each brand is better to sell only a to the certain market segment, not to the whole market. The firms are not feasibly to target every person. Aiming for the whole word is impractical, as Kotler et al. (2009) pointed out because consumers fundamentally have different tastes, preferences, and buying patterns. Consequently, a strategic approach to delivering the message and promotion material effectively is required. The Green marketing segmentation is determined, followed by green targeting and green positioning.

Segmentation is the method of clustering a group of customers with similar characteristics, behaviors and other variables. A good segmentation will identify potential customers and distinguish them from other members of the segment who do not have similar needs (Dahlstrom and Crosno, 2018). When creating a segment, the consumer is first segmented based on the segmentation variable. Each of the segments must then be described in detail using descriptor variables (Dolnicar et al., 2018).

Kotler et al., (2005) revealed four types of variables to investigate the segmentation, namely demographic, socioeconomic, psychographic, and behavioral. While Laroche et al., (2001) designated five types; demographic, knowledge, values, attitudes, and behavior. Yankelovich in early 1964 has mentioned that conventional demographic methods such as; age, sex, geography, and income level are not expected to provide as considerable direction for marketing approach, non-demographical factors such as values, lifestyle preferences are believed to influence the purchase behavior more than the demographic factors. To be concise, green marketing research has not provided consistent results in particular consumer descriptor variable in determining the segmentation pattern. In the early 1980s and 1990s, marketers were using sociodemographic segmentation criteria such as age, gender, income education level, etc. Nevertheless, studies showed mixed results and have failed to provide clear insights to grasp the underlying factors as demographic measures are not as precise as psychographics (Straughan and Roberts, 1999) and might only help to recognize who purchases the green goods (Paladino, 2005).

Yi (2008) elucidated there are many segmentation approaches, and it might be required more than one to achieve distinguishing segments, however common variables are following:

*Demographic variables:* divide the market into segments based on variables such as age, gender, income, education, religion, ethnicity, and generation. Diamantopouset (2003) explained that demographics have been widely used as the main variables for segmentation. Daniel Yankelovich (1964) as the pioneer of market segmentation stated that non-demographical factors such as values, lifestyle preferences believed to influence the purchase behavior more than the demographic factors.

Anderson & Cunningham (1972) discovered demographics is to distinguish between socially conscious and unconscious customers. Prior literature stated the importance of demographics in the segmentation of green consumers, but the findings are far from conclusive.

*Psychographic variables:* divide a market into different segments based on social class, lifestyle, or personality characteristics; Verma (2014) suggested that psychographic factor like attitude plays a key role in driving consumer choice of sustainable product option.

*Behavioral variables:* divide a market into segments based on consumer knowledge, attitude, uses, or responses to a product (Kotler & Armstrong, 2014, pp. 193–198; Kotler and Keller, 2009). Environmental attitudes, as one of the behavioral variable has been highlighted as the most significant variable in predicting behavior and behavioral intentions (Kotchen et al : 2000).

Table 1. is summarizing the variables literature in a table derived from the descriptive narration from Verma(2017) and Bideh(2020) . Categorization is sorted on item under Demographic, Psychographics and Behavioral categories

Table 1. Segmentation Variables

Demographic Variables

Three Segmentation in Emerging countries put in the table. The segmentation context, research sample dan population is diverse

Fig 1. Green Segmentation across Emerging Nations

Based on Coskun et al. (2019), below are the segmentation steps:

- Identify the segmentation variables aligned with the objectives of the research (Hair et al.2010)
- Decide the number of segments based on the cluster resulted from variables similarity
- After the number of segments is decided, label those segments based on the scores on the variables
- After finding the segments, implement the descriptor variables to describe the segments in detail.

After labeling each segment, segmentation is determined and descriptor character or variables is defined, marketers can plan for a further efficient marketing mix, hence it can boost performance and accordingly profitability as the accurate customer profiling is determined (Mostafa, 2009)

Marketing Mix is a strategy that initiates marketing plans to achieve sustainable marketing outcomes to create value and manageable marketing variable that able to stimulate customers consciously (Amoako et al, 2020). Additionally, it is elucidated that in a green marketing context, when a firm failed to carry out the green mission, the segmentation concept should be carried out to evaluate which segmentations the market belongs to. It will lead to optimum evaluation that the customer green level may develop based on the segmentation level. Otherwise, businesses without clear segmentation information in emerging markets will capitulate. Segmentation can give a

clear vision on customer clusters and significantly, the characteristics is able to be described. Marketing mix may include price, product, and promotion, hence to determine the marketing mix, depends on the segmentation outcome (Bideh:2020)

### III. RESEARCH METHODOLOGY

To investigate the green marketing segmentation and marketing mix, Vom Brocke et al., (2009) stated that literature reviews play an important role as knowledge continues a cumulative endeavour. Review of literature on the topic of research and review journals is conducted and specifically identified the segmentation in emerging countries. Relevant article correspondingly has been studied and synthesized in the paper. Comparison and analysing each segment variables and marketing mix illustration related to discovered segmentation is conducted as precious tools to deploy the strategies in other emerging countries. We collect segmentation paper and marketing mix in emerging countries, to synthesize the contents of many conceptual and empirical papers. Paré, Trudel, Jaana, & Kitsiou (2015), stated that literature reviews are critical (a) to identify what has been investigated on a subject; (b) to determine the extent to which a specific research area reveals any interpretable patterns; (c) to collect empirical findings related to a certain research question to support evidence-based practice; (d) to generate new theories and conceptual frameworks; and (e) to identify topics or inquiries that need more research. On that basis, we are occupied all of the mentioned scope to thoroughly find the pattern of segmentation variables and related marketing strategies. We are synthesizing:

- a. Segmentation variables
- b. Segmentation steps
- c. Marketing mix related to the segmentation

### IV. RESULT / FINDING

Narula & Desore (2015) set the scope of the green marketing pyramid as including; Reverse Logistics, Green Advertisement & Promotion, Green Logistics and Distribution, Green Manufacturing, and Green Product Development. In other words, green marketing actually covers almost business activities. Additionally, it is addressed that marketing can change consumer behavior and lifestyle, worldwide supply chains, and regulatory scope. Like a double-edged sword, marketing strategies are also sometimes blamed for increased product cost, unnecessary packaging causing waste production and increased transportation expenses responding to delivery need, everything related to environmental demolition. In short, marketing potentially can change the market, in this context of pursuing green marketing.

Based on the evaluated and presented segmentation variables; there can be so wide-ranging variables related to demographics, psychographic or behavioral issues. There is no certain rule about specific characteristics. Yenkovlevich (1964) argued that the key to segmentation investigation is that the marketer should never consider in advance that there is only one method of segmentation works best. Marketers should be to gathering all possible segmentation and choose the most relevant one. Instead, based on given variables, some variables have almost a position in having positive relationships with segmentation. Thus, our findings:

- a. In common, segmentation variables include demographic, psychographic, and behavioral. Three variables inherited various detailed characters. Each of the variables should be considered based on the predicted market characteristics, one context should be various from the others.
- b. Based on the customer profiling resulting from segmentation, from respectively three countries in emerging countries, the number of greener has existed significant number. The right marketing strategy should be able to target the greener segment.
- c. The research regarding willingness to pay or price has not been addressed intensively in previous research. It may be the reason why environmental attitude is not correlatively linear to purchase behavior (Coskun et al,2019)

### V. DISCUSSION

Segmentation variables in an emerging country such as the demographic, psychographic, and behavioral variables have been extensively investigated. However, as the emerging country has unique characteristic, and one of them is the purchasing power that might be different, we suggest that price sensitivity, willingness to pay and profitability regarding the price constrain should be further investigated. Laroche et al (2001) has investigated the willingness to pay and segment relation that found that the segment who are willing to pay more for environmentally friendly products were more likely to be women, married and with at least one child living at home. However, this issue is not intense compared to other psychographic and behavioral variables. Moreover,

there is still a gap between environmental awareness and purchase intention. What's behind the gap. Even in England, consumers showed their higher EC and assure to choose to environment-friendly products, however actual purchase behavior was in contrast to British stores (Pearce, 1990)

With the term price and willingness to pay (Martins, 2021), organizations and marketers can affect consumers and society by using sustainable marketing strategies in product development. Marketers, indeed have the capacity to promote sustainable consumption habits and design the products that have a minimum negative effect to the nature and segment the market to address the required needs of the identified cluster with well-designed marketing strategies. simultaneously realizing the company's objectives at the same time (Dahlstrom and Crosno, 2018). Narula & Desore (2016) notes the consumers' willingness to pay for green attributes related to conventional attributes need to be worked out. Even in Lithuania and Ireland, Cekanavicius et al (2014) stated that the survey has also indicated that in those countries reluctance to enter the "green" path is generally caused by the uncertainties that such green movement might be too pricy.

Green Purchase intention and profitability should be addressed to balance how consumers afford to buy and accordingly how the company should earn the revenue. Therefore, the segmentation research focuses on how purchase intention research toward green products in green marketing should be enhanced. For the sake of the environment, the organization is advised to bring the environmental issues for their cost reduction. Green products should not be associated with a high price for the low-income segment in emerging countries. This is for nature preservation purposes.

## VI. CONCLUSION AND RECOMMENDATION

The importance of green marketing in emerging countries is crucial. Both quantitatively and qualitatively, potential and important in realizing a sustainable environment. Considering that the environmental destruction has been severe these years. To realize the green marketing strategy, segmentation is critically needed to have effective and right strategies, targeting the right segment as the discovered characters. According to Ziaei-Bideh& Namakshenas-Jahromi (2020) consumers' green awareness varies and the levels of their willingness to purchase green products are not identical. Therefore, to market the green products effectively, it is essential to implement targeted marketing strategies compared to mass marketing. The basic marketing mix of Segmentation, Targeting and Positioning will help firms to adopt effective marketing strategies. The initial step of implementing targeted marketing strategy is market segmentation and determination of the certain characteristics of each segment. Profitability, and performance of market segmentation depend on the accuracy of consumer profiling in each segment. The imprecise prediction of market segment will result in inefficient marketing strategies, resulting in wasting the marketing budget. The variables in prior research have been presented to help marketers, researchers and policymaker to be able to understand various segmentation descriptor variables.

Martins (2021) reveal that environmental knowledge, environmental concern, green price, green advertising and green product of green marketing distinctively have significant positive effect on perceived Small Medium Enterprise profitability as well as green purchase behavior.

Our recommendation suggests that the price, willingness to pay should be investigated more in emerging economies context. According to Dangelico et al. (2017), understanding the main characteristics of green products, identifying factors affecting their price and consumers' willingness to pay more for them and promotional tools would be very useful for companies aiming at developing and marketing green products.

## **Analysis of The Influence of Foreign Investment, Domestic Investment, Agglomeration and Labor on Economic Growth In The Province of West Java In 2018-2020**

A.Citta Prastyani Putri<sup>1</sup>, B.Maulidyah Indira Hasmarini<sup>2</sup>,

<sup>1,2</sup>Economic Development, Muhammadiyah Surakarta University, Surakarta, Indonesia.

### **Abstract**

*Economic growth is the holder of an important role in the economy, this is because economic growth is one of the indicators in determining the success of a country's economic development to achieve optimal economic growth within a certain time. This study aims to determine the magnitude of the influence of the variables of Foreign Investment, Domestic Investment, Agglomeration and Labor on Economic Growth of West Java Province in 2018-2020. The data used in this study is secondary data that is quantitative in the form of panel data obtained from the Central Statistics Agency (BPS), the Industry and Trade Office (DISPERINDAG), the Investment and One Stop Service Office. West Java province. The analytical method used is panel data regression analysis (a combination of time series and cross section), with cross section covering 27 districts/cities in West Java Province and time series starting from 2018-2020. Based on the results of this study, it was stated that the model chosen was the Fixed Effect Model (FEM). The results of the effect validity test show that partially the Domestic Investment, Agglomeration and Labor variables have a significant effect on economic growth. Meanwhile, the foreign investment variable has no effect on economic growth in West Java Province.*

*Keywords: Economic Growth, FI, DI, Labor, Agglomeration*

---

### **I. INTRODUCTION**

Economic development is basically an effort carried out in order to realize a better and more sustainable state of a region as well as making efforts to stimulate equitable development to improve the welfare of a region. Observing the growth rate achieved from year to year is a possibility in evaluating the achievements and success of a region in controlling short-term economic activity and for developing long-term economic growth. Comparisons can also be made between and how successful a country is in controlling and developing its economy compared to other regions (Sukirno, 2013).

Basically every economic development is expected to encourage economic growth by increasing national income by or per capita income. With economic development, economic growth will be experienced, namely the process of increasing the production of goods and services in community economic activities. Therefore, it can indicate the success of economic growth (Pure, 2016). Sustainable economic growth is the main goal in the process of economic development and is one of the unrealized goals for some countries. Development planning as an appropriate and effective means of encouraging economic development. Planning that is carried out as a whole can produce institutional and organizational mechanisms in broad national planning, so that it can overcome the main obstacles and challenges of development and ensure a high and sustainable level of economic growth (Todaro & Smith, 2014).

West Java Province is one of the provinces in Indonesia which has a fairly rapid economic activity. West Java Province consists of 27 regencies/cities with various natural, economic and socio-cultural resources which are challenges and obstacles in achieving equitable economic development in regencies/cities of West Java Province. The increase in the economy in West Java Province can be seen by several factors including foreign investment (FI), domestic investment (DI), agglomeration and the number of workers. Investment, both foreign and domestic, is a form of sacrificing wealth in the present to gain future profits with a certain level of risk. In general, in economic theory, investment means the purchase of production goods from capital (Karya and Syamsyuddin, 2016). The economy of a country depends on investment to solve several economic problems, crises and challenges. This is due to the fact that investing in certain sectors of the economy can quickly change the various economic challenges we face as a country. Investments, both domestic and foreign, come with many benefits such as job creation, increased income per capita, reduced poverty levels, increased living standards, increased Gross Domestic Product, and others (Ilegbinosa, et al., 2015). Investments can be made by the private sector either by foreign investment or by domestic investment. Investments in the regions also play a role in the economic development of a region as a supply of capital that participates in sustaining the course of the economy. Table 1.1 shows the growth rate of Gross Regional Domestic Product at constant prices in West Java Province.

Table 1.1 Growth Rate of GRDP at 2010 Constant Prices in West Java Province in 2018-2020 (Percent)

Year	Growth
2018	5,65
2019	5,02
2020	-2,52

Sumber: BPS Jawa Barat, diolah

Based on Table 1-1, it describes the development of the economic growth rate of the districts and cities of West Java Province in 2018 to 2020 which experienced a very drastic decline. Where in 2020 the rate of economic growth experienced a decline due to the covid-19 pandemic that attacked the whole world, one of the affected countries was Indonesia. One of the economic indicators is said to be good if economic growth increases from the previous year. The increase in economic growth occurs because of an increase in activity in the area, on the contrary if growth decreases, economic activity will decrease. In general, economic growth shows that economic activity will generate additional people's income in a certain period which will later be able to lead to improvements in increasing production in a certain year (Karya and Syamsuddin, 2016).

Besides that, to increase economic growth in the region, agglomeration or centralization patterns are needed, which means that there are clusters of various industries into a certain place so that there is new economic growth in that place (Pambudi and Miyasto, 2013). As well as labor, including factors that affect economic growth as one of the factors of production that will affect the level of national income both in terms of quantity or amount.

Based on the background described above, this research will focus on analyzing the influence of foreign investment, domestic investment, agglomeration and the number of workers on the economic growth of districts and cities in West Java Province in 2018-2020.

## II. LITERATURE REVIEW

Economic growth is one of the important indicators to assess an economy, especially to analyze the results of economic development that has been carried out by a country or region. According to Sukirno (2013) economic growth is the development of activities in the economy which causes the goods and services produced by the community to increase and the prosperity of the community to increase. Economic growth can also be interpreted as a process of increasing the production capacity of an economy which is manifested in the form of an increase in national income. The ability of a country to produce goods and services will increase, this increased ability is caused by the growth of production factors both in quantity and quality.

According to Jhingan (2004) in Agma (2015) Foreign Investment is important to help accelerate its economic growth because the role of foreign capital is to assist in the industrialization and renewal of technology used in these developing countries. Domestic investment as well as foreign investment which, if right on purpose, will provide benefits in improving the country's economy. There are direct investments such as the purchase of assets or the formation of new businesses as well as indirect investments such as investments in the money market and capital market. The significance of investment formation is that people do not use all of their income for consumption but some of it is saved for investment formation. With the formation of investment has been seen as one of the main factors of economic development. For example, investment in the form of capital not only increases production or economic growth but also provides employment opportunities for the community. Thus there is a positive relationship between investment and economic growth in a country. (Prasetyo, 2009)

Domestic investment is an investment that has an important place in a country's economy because it is very important in achieving economic development (Bakari, 2017). According to Putra (2018), Domestic Investment (PMDN) has an important role for the country's economic growth. The most important position of Domestic Investment is national income because it can take advantage of the wealth owned by the state.

The unequal distribution of resources creates disparities in the rate of economic growth between regions. This inequality is only concentrated in certain regional economic activities. In this case, agglomeration is an externality resulting from the geographical proximity of economic activities. With the agglomeration economy, it can have a positive influence on the rate of economic growth, as a result, areas that are included in the agglomeration generally have higher growth than areas that are not agglomeration.

Population growth and labor force growth are traditionally regarded as one of the positive factors that spur economic growth. A larger number of workers means an increase in the number of productive workers, while a large population growth means an increase in the size of its domestic market. However, it is still questionable whether the rapid rate of population growth will actually have a positive or negative impact on economic growth. (Todaro, 2013).

Rif'ah, Zakaria & Hasbi (2019), the analytical model used in this study is descriptive statistics with multiple linear regression analysis. Based on this research, it is known that the inflation variable has a positive but not significant effect, domestic investment also has a negative and insignificant effect, and foreign investment has a positive and insignificant effect on economic growth in Makassar.

Eko Prasetyo (2011), the analytical model used in this study is Ordinary Least Square. This study states that domestic investment has a positive and significant effect, foreign investment has a positive and insignificant effect, labor has a positive and significant effect, and exports have a positive and significant effect on economic growth in Central Java.

Ardyan & Mulyo (2012), the analytical model used in this study is to use multiple linear regression with the method of least squares or Ordinary Least Square. Based on the regression results, it shows that agglomeration and labor have a positive effect, while the population has a negative effect on the economic growth of Kendal Regency.

Nugroho (2017), using a multiple regression analysis model, shows that the wage variable has a positive and significant relationship, the number of unemployed is positively and significantly related to economic growth, while foreign capital companies have a negative and significant effect, domestic capital companies have a positive and significant relationship and the variable Employment opportunities have a negative and insignificant effect on the unemployment rate.

During the period 1996-2010, in Eastern Europe, Africa, Asia, and Australia, using panel data regression analysis, the Government Expenditure variable was found to have an effect on Economic Growth and its significance. The relationship pattern used to relate these variables to Economic Growth is linear. (D'Agostino et al., 2016).

Putu & Nyoman (2020), The results of this study indicate that the variable number of workers has a positive and significant effect on economic growth, and the Domestic Investment Variable has no significant effect on economic growth.

### III. RESEARCH METHODOLOGY

The type of data used in this research method is secondary data that is quantitative in the form of panel data, combining *cross section* and *time series data in 27 districts/cities of West Java Province*. According to Kuncoro (2003) the quantitative method is a method that starts from numerical data that will be processed into information. So that the quantitative method is a method in the form of numbers and statistical analysis and then processed into information. The variable used is Economic Growth as the dependent variable, while the independent variables are Foreign Investment, Domestic Investment, Agglomeration and Manpower in West Java Province in 2018-2020. To determine the effect of these variables, Panel Data Regression Analysis can be used with the econometric model as follows:

$$GROWTH_{it} = \beta_0 + \beta_1 FI_{it} + \beta_2 DI_{it} + \beta_3 AGLO_{it} + \beta_4 Labor_{it} + \varepsilon_t$$

di mana:

*GROWTH* : Growth

*FI* : Foreign Investment

*DI* : Domestic Investment

*AGLO* : Agglomeration

*Labor* : Labor

*i* : Data *cross section*

*t* : Data *time series*

$\beta_0$  : Constant

$\beta_1 \beta_2 \beta_3 \beta_4$  : Independent variable regression coefficient

$\varepsilon$  : Error term

#### IV. RESULT / FINDING

The estimation results of the econometric model above are carried out using the Pooled Least Square (PLS) or Common Effect Model (CEM), Random Effect Model (REM), and Fixed Effect Model (FEM) approaches. And to determine the right estimation model, several tests are needed, such as the Chow test, Hausman test, and the Lagrange Multiplier test.

Chow Test and Hausman Test will be used to select the best estimated model *Pooled Least Square* (PLS), *Fixed Effect Model* (FEM) and *Random Effect Model* (REM). If it turns out that in the Chow test, *Pooled Least Square* (PLS) is chosen and the Hausman test is *Random Effect Model* (REM), then an additional test must be carried out, namely the *Lagrange Multiplier* (LM) test to choose the best estimated model between *Pooled Least Square* (PLS) and *Random Effect Model* (REM).

Table 1. Estimation Results of Panel Data Regression Econometric Model – Cross Section

Variabel	Koefisien Regresi		
	PLS	FEM	REM

##### A. The Chow

Test The Chow test is used to select the *Pooled Least Square* (PLS) or *Fixed Effect Model* (FEM) estimated model. chow test: the estimated model is *Pooled Least Square* (PLS), and his: the estimated model is *Fixed Effect Model* (FEM). accepted if the *p-value* (*p-value*), probability or empirical statistical significance ; rejected if the *p-value* (*p-value*), probability or statistical empirical significance .

From Table 4.1, it can be seen that the *p-value* (*p-value*), probability or empirical statistical significance is 0.0000 (<0.01), so it is rejected. In conclusion, the estimated model is the *Fixed Effect Model* (FEM).

##### B. The Hausman

Hausman test is used to select the estimated *Fixed Effect Model* (FEM) or *Random Effect Model* (REM). Hausman test: the estimated model is the *Random Effect Model* (REM), and the estimated model is the *Fixed Effect Model* (FEM). accepted if the *p-value* (*p-value*), probability or empirical statistical significance ; rejected if the *p-value* (*p-value*), probability or statistical empirical significance .

Table 2.  
Hausman test results

Test Summary	Chi-Sq.Statistic	Chi-Sq.d.f.	Prob
Cross-section random	50,3838	4	0,0000

Sumber: Lampiran 1

From Table 4.2, it can be seen that the p-value (p-value), probability or empirical statistical significance is 0.0000 (<0.01), so it is rejected. In conclusion, the estimated model is the Fixed Effect Model (FEM).

From the Chow test and the Hausman test in advance, the Fixed Effect Model (FEM) was chosen as the best estimated model. The complete estimation results of the Fixed Effect Model (FEM) are presented in Table 4.3. and Table 4.4.

Table 3.  
Estimation Fixed Effect Model (FEM)

$\widehat{GROWTH}_{it} = 42793,96 + 2,72E05 FI_{it} + 0,000490 DI_{it} - 17198,87AGLO_{it}$			
	(0,6349)	(0,0034)*	(0,0061)*
		+ 0,035938 Labor <sub>it</sub>	
		(0,0000)*	
$R^2 = 0,9954; DW = 3,5731; F = 3688,571; Prob. F = 0,0000$			

Source: Appendix 1. Information: \*Significant at = 0.01; \*\*Significant at = 0.05; \*\*\* Significant at = 0.10; The number in brackets is the probability value of the t statistic.

### C. Test of Goodness of the Model

#### Existence Test of the FEM Estimated Model

The model exists when at least one independent variable affects the dependent variable (not all regression coefficients are zero). The existence of the model is the F test. Since there are five independent variables in the econometric model, the formulation of the hypothesis is: (regression coefficients are all zero or the model does not exist); (at least one regression coefficient is not equal to zero or the model exists). will be accepted if the p-value (p-value), probability or statistical empirical significance ; will be rejected if the p-value (p-value), probability or empirical statistical significance .

From Table 4.3. it can be seen that the p-value (p-value), probability or empirical statistical significance is 0.0000 (< 0.01); so it is rejected, the conclusion is that the Fixed Effect Model (FEM) estimated model exists.

#### Interpretation of the Coefficient of Determination

Coefficient of determinant ( $R^2$ ) shows that the predictive power of the estimated model from table 4.3 shows the  $R^2$  value 0.99548, meaning that 99.5% of the variation in the variable Economic Growth can be explained by variations in the variables of Foreign Investment, Investment Domestic Capital, Agglomeration, and Number of Workers. The remaining explained by variations in variables or other factors that cannot be included in the estimated model.

27	Banjar City	-40330.84	2463,12

Source: BPS, processed

The constant value of each regency/city in West Java Province can be seen in Table 4.4. The highest constant value is owned by Bekasi Regency, which is 188,856.36. This means that related to the variables of Domestic Investment (PMDN), Agglomeration (AGLO), Number of Workers (TK) to Gross Regional Domestic Product, Bekasi Regency tends to have a higher Gross Regional Domestic Product compared to other Regencies/Cities in West Java Province. After Bekasi Regency, there are four regencies/cities with the largest constants, namely Bandung City, Karawang Regency, Bogor Regency, and Indramayu Regency.

The lowest constant value is Pangandaran Regency, which is 494.26. Associated with the influence of Domestic Investment (PMDN), Agglomeration (AGLO), Number of Labor (TK) on Gross Regional Domestic Product, Pangandaran Regency tends to have a lower Gross Regional Domestic Product compared to other Regencies/Cities in West Java Province. Before Pangandaran Regency, there were four regencies/cities with the lowest constants, namely Banjar City, Sukabumi City, Kuningan Regency, and Majalengka Regency.

## V. DISCUSSION

Foreign investment has no significant effect on the economic growth of districts/cities in West Java Province in 2018-2020. This means that the realization of foreign investment will have an impact on increasing economic growth but the influence of the two is not direct. This can be caused by fluctuating investment conditions in Indonesia as well as barriers to entry for foreign investors as well as unsupportive infrastructure causing a lack of foreign investors to invest their capital. The results of this study are in line with the research of Rif'ah, Zakaria & Hasbi (2019) research, "Analysis of the Effect of Inflation, Domestic Investment, Foreign Investment on Economic Growth in Makassar City", Based on this research it is known that foreign investment has a positive and insignificant effect on economic growth in Makassar.

Domestic Investment has a regression coefficient of 0.000490, with a linear-linear relationship pattern that has a positive and significant impact on Regency/City Economic Growth in West Java Province in 2018-2020. This

means that the realization of domestic investment will have an impact on increasing economic growth and have a real effect, where if domestic investment in West Java Province experiences an increase in the level of economic growth, GDP also increases. The results of this study are in accordance with research conducted by Rosalendro (2017) "Analysis of Factors Affecting Economic Growth in Banten Province" where this study states that domestic investment (PMDN) has a positive and significant effect on economic growth in Banten Province.

Agglomeration has a regression coefficient of 17198.87, with a linear-linear relationship pattern that has a negative and significant impact on the Economic Growth of Regency/City in West Java Province. This is not in line with the hypothesis and theory in the research. Where in theory agglomeration arises because one of them there are differences in resources, both natural and human. Regions that have been able to determine regional potential can experience agglomeration with positive impacts. Generally, agglomerated areas develop faster due to interactions between adjacent areas so that economic activity also develops. In this case, the provincial agglomeration areas in West Java are located in Bekasi City, Bandung City and surrounding areas because of the economic activities that support economic growth in the Regency/City of West Java Province. The results of this study are in line with research conducted by Anastasia (2020) "The Effect of Agglomeration, Human Development Index, and Investment on Economic Growth in East Java Province in 2010-2019" This study states that agglomeration has a negative and significant effect on economic growth in Java Province. East.

The number of workers who have a regression coefficient of 0.035938, with a linear-linear relationship pattern, has a positive and significant effect on the Economic Growth of Regency / City in West Java Province. This means that the higher the number of workers, the economic growth will also increase. This is because when the number of workers absorbed is increasing, the output of goods and services produced will also increase so as to increase economic growth in West Java Province. The results of this study are in line with the research conducted by Putu and Nyoman (2020) "The Influence of the Number of Labor and Domestic Investment on Economic Growth and Poverty Levels" This study states that the number of workers has a positive and significant effect on economic growth in the Regency / City of the Province of Bali.

## VI. CONCLUSION AND RECOMMENDATION

Based on the results of panel data regression analysis on the effect of foreign investment, domestic investment, agglomeration, and the number of workers on the economic growth of districts/cities in West Java Province in 2018-2020, it can be concluded as follows:

- a. The results of the model selection test from the best estimator prove that the *Fixed Effect Model (FEM)* is the chosen model.
- b. Based on the goodness of the model on the Fixed Effect Model (FEM) model, it shows that the value of the determinant coefficient ( $R^2$ ) is 0.9954, meaning that the variation of the Gross Regional Domestic Product variable which can be explained by the variation of the variable Foreign Investment, Domestic Investment, Agglomeration, and Number of Workers. of 99.54%. The remaining is explained by variations in variables or other factors that cannot be included in the model.
- c. Based on the effect validity test (t test) shows that partially the Domestic Investment, Agglomeration, and Number of Labor variables have a significant effect on Economic Growth. While the foreign investment variable has no effect on economic growth.
- d. Based on the existence of the model test (F test) shows that the estimated Fixed Effect Model (FEM)

Based on the results of the research that has been done, the suggestions obtained are given by writing are as follows:

- a. 1. The government is expected to play a role as a facilitator to pay more attention to and improve the quality of infrastructure in regencies and cities in West Java Province to encourage foreign and domestic investors to invest their capital in order to increase economic growth in West Java Province.

- b. 2.Regions in West Java Province need to pay attention to areas that are not agglomerated by increasing the potential of the area. In addition, there is also a need for more discussion and action to turn negative impacts into positive impacts for regions that have not been agglomerated.
- c. 3. For researchers, it is hoped that this research can be used as a reference related to economic growth, and further researchers can use other variables or other areas to provide insight and information about economic growth. This study focuses more on analyzing the influence of foreign investment, domestic investment, agglomeration and number of workers on economic growth in West Java.

## Effect of e-Service Quality and Perceived Risk on Customer e-Loyalty : Mobile Apps Familiarity Moderation

Rut Cahaya Hutapea<sup>1</sup>, T. Ezni Balqiah<sup>2</sup>,

<sup>1,2</sup>Faculty of Economics & Business, Universitas Indonesia, Jakarta, Indonesia

### Abstract

*Along with the development of the Covid-19 pandemic, the need for information about health is increasing. Territorial restrictions make face-to-face consultations difficult. Telemedicine is the answer to the limitations of existing services and information. The gap in the ratio of doctors, and the covid-19 pandemic has changed the Consultation Pattern which has a direct or indirect effect on the attitudes of service users. The purpose of this study was to examine the elements that influence loyalty to telemedicine services for mobile app users by using a purposive sampling approach through primary data, namely an online survey to analyze 444 respondents who use telemedicine and test six hypotheses on e-Service Quality, Customer e-service Satisfaction, Perceived Risk, and Customer e-Loyalty, moderated by Mobile Apps. The Structural Equation Model-Partial Least Square (SEM-PLS) data processing method was used as an analysis tool. The findings of this study prove that there is a relationship between ESQ and CES variables that affect CEL with 4 accepted hypotheses while PR does not affect CEL with 4 rejected hypotheses. Where Financial Risk is an accepted hypothesis due to cost effectiveness, besides that MAF Moderation, namely ESQ against CES and ESQ against CEL, has been proven to be rejected with weakening moderation results. While MAF Moderation moderates the positive influence between Customer e-Satisfaction (CES) on Customer e-Loyalty (CEL), which was found in this study that satisfaction is a factor that supports loyalty where the successful pattern of digital transformation depends on the effectiveness and quality of digital products and user satisfaction towards service.*

### I. INTRODUCTION

As of 2019, the world economy has been paralyzed by the 2019 coronavirus disease, which first surfaced in China and killed hundreds of thousands of people (Ministry of Finance, 2021). Urbanization, migration, and the development of modern transportation all contributed to the rapid global spread of this virus, making it simple and easy to disseminate (Jin et al., 2020). Through Government Regulation (PP) Number 21, President Jokowi establishes guidelines for Large-Scale Social Restrictions. Presidential Decree Number 11 of 2020 concerning the Determination of the Covid-19 Public Health Emergency was also released in the year 2020 regarding Large-Scale Social Restrictions (PSBB) in the Context of Accelerating the Handling of Covid-19. Indonesia has the second-lowest number of doctors per 1,000 people in Southeast Asia, with a doctor-to-population ratio of 0.4. (WHO). According to data from Badan Pusat Statistik (BPS) in 2019, the distribution of doctors in Indonesia is not evenly distributed. The data states that more than half of the number of doctors in Indonesia are concentrated on the island of Java (BPS, 2019). The pandemic brought about a period of change in the healthcare sector's service delivery as a result of people's higher expectations for service, technological advancements, improved online and digital access to health information, and a comprehensive strategy for addressing health and wellbeing issues. The lack of physical space compels people to alter their behavior patterns in favor of online services, including telemedicine, a new style of healthcare. (Permenkes, 2020). Telemedicine in mobile apps is a safe and effective technique to evaluate suspected instances and aids in guiding patient diagnosis and treatment, reducing the danger of disease transmission, along with the deployment of digital health technologies. (Tandon, et al., 2021). According to HKDC (2021) data, popular platforms include Halodoc (Indonesia), MyDoc (Singapore and Vietnam), Doctoroncall (Malaysia), Medgate (Philippines), and Raksa (Thailand). Francis (2010) and Akbar et al. (2017) By taking into account frameworks like WEBQUAL and E-SERVQUAL to evaluate different aspects of service quality that may be applied to digital by managing experiences digital customers, the existence of the application must give relevance and a fulfilling digital customer experience for customers. (Dave Chaffey dan Fiona Ellis-Chadwick, 2019 : Chapter 7) Technology integration with high-quality e-services is anticipated to improve customer happiness and lead to loyalty (Polites et al., 2012; Rodgers, Negash, & Suk, 2005). In today's competitive market, loyalty refers to a promise to continue purchasing goods or services from the same vendor without switching (Oliver 2014). The effectiveness, quality, and user happiness of digital products, as well as the success of the digital transition, all depend on loyalty (Mustafa et

al. 2020).

## II. LITERATURE REVIEW

### A. Online Service Marketing

In order to sell and deliver services, service providers no longer only use conventional techniques. Service providers can discover new ways to manage their operations that can help their profitability and growth thanks to the quick development of internet-based technologies (Akkura et al., 2015; Campbell and Frei, 2010; Etzion and Pang, 2014; Wymbs, 2000). Aspects for integrating information processes, computing, and communication technology are referred to as the development of information and communication technology, according to Wang (2013) (Kebbede, 2018) This is consistent with the capability of information and communication technology in the health sector, which has an impact on improving aspects of clinical action, developing the delivery of health services, and improving communication between health workers so that they are able to provide a decision-making process through the exchange of information more efficiently. Time and space can be transcended by information and communication technology (Rowe, 2014). It's crucial for most businesses to consider frameworks like WEBQUAL and E-SERVQUAL to evaluate various elements of service quality that can be applied when optimizing interactions through websites and mobile applications in the form of desktop and mobile where the presence of such interactions must be effective by providing relevance and satisfaction to its users.

Previous research analyzed how e-service quality generates effective responses from customer satisfaction and loyalty; and website familiarity reinforces the strength of this association (Kaya et al, 2019). In previous studies, the importance of measuring and controlling the quality of e-service quality from the growth of e-tailing has become phenomenal. The quality of electronic services is associated with web services over the Internet which is defined in terms of how websites enable customers to shop, purchase, and deliver products and services efficiently and effectively (Zeithaml, Parasuraman, and Malhotra 2002). The quality of electronic services in previous studies includes the presentation or in this case a description of the appropriate products and services, the bidding process, sales by e-tailers, and e-tailing customer support and service, as well as service delivery (Rowley 2006). The service quality mentioned consists of 4 dimensions, Web design, Security, Fulfillment and Customer Service. (Wolfinger and Gilly, 2003)

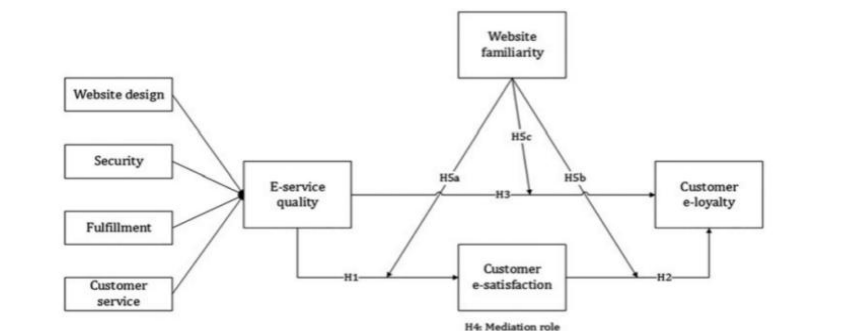

Fig 1. Research Framework Kaya et.al (2019)

The Industrial Revolution 4.0, which is the development of the technology industry in the world, focuses on digital technologies. Industry 4.0 and Internet of Things (IoT) is a concept that aims to expand internet connectivity between objects around us and activities/work automatically through very fast data exchange. The entire system is connected in cyber and physical networks by utilizing cloud computing. The sophistication of IoT technology currently available enables electronic devices to always be connected to the internet and will automatically run commands according to the program the user wants (Kemenkeu, 2021). In addition, research facts prove that in 2019, more than 5 billion people around the world will use mobile devices, and it is estimated that around half will use smartphones (Silver, 2019). By enabling automation of equipment with combined systems that can work together with each other, Technology helps solve problems and track processes, while increasing productivity in a business, therefore the rapid increase in smartphone penetration and high-speed network work services has enabled business enterprises to provide information to consumers more quickly and efficiently than ever before, also enabling consumers to use a variety of service information beyond the constraints of space and time (Cho et al., 2019; Dinh et al., 2013; S.W. Lee et al., 2019; Liu et al., 2019; Liu et al., 2017). Therefore, this research changes the first dimension in e-service quality into mobile applications or more familiar with mobile apps. The change in the first dimension of website design to mobile apps design in e-service quality is supported by Javier Cuello & José Vittone (2013) in Designing Mobile Apps, which states that mobile apps and websites provide the same screen information, a significant difference. is where applications must be downloaded and installed before use whereas websites can be accessed directly via an internet browser. But due to the different sizes of mobile screens, many websites cannot be visualized properly on those devices. A mobile website that adapts specifically to mobile devices is called a responsive website with content and information as needed. Thus, entire columns, blocks of text, and graphics from a website can adapt to a given space differently—or even disappear—according to whether they are accessed from a phone, tablet, or desktop computer.

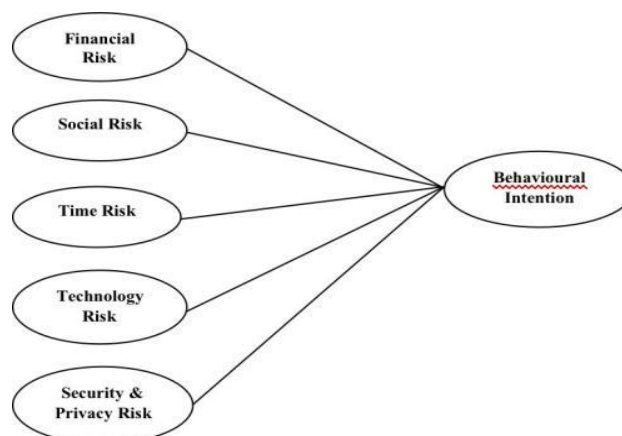

Fig 2. Research Framework for Bakshi & Tandon (2022)

Meanwhile, in the second study, namely Bakshi & Tandon (2021), they analyzed various aspects of Perceived Risk which in the existing literature explain and validate the impact on intentions to adopt Telemedicine. (Bali et al., 2016). Perceived Risk is defined as the possibility of loss arising related to how the service is provided, Perceived Risk also acts as a barrier to behavior in purchasing (Peter & Ryan, 1976). Featherman and Pavlou (2003) define Perceived Risk as the potential loss in pursuing the desired outcome from the use of electronic services. Someone will make a reasonable decision where the decision is based on beliefs that will produce attitudes that will also lead to behavioral intentions even to actual behavior (McKnight et al., 2002). Risk factors influence in shaping customer loyalty (Canan Eryiğit & Yanrong Fan, 2021). The research model that the researcher compiled consists of five constructs: e-service quality, customer e-satisfaction, customer e-loyalty, perceived risk and mobile apps familiarity as moderating. Based on a literature review on e-service quality (ESQ), customer e-satisfaction (CES), customer e-loyalty (CEL), perceived risk (PR) and Mobile Apps familiarity (MAF), the effect of loyalty can be formed from several direct factors. or indirectly, e-service quality in forming e-loyalty either directly or through mediation of

customer e-satisfaction and perceived risk has a direct effect on Customer E-Loyalty (CEL). In addition, Mobile Apps Familiarity moderates the relationship of ESQ to CES, CES to CEL, ESQ to CEL, therefore a research concept framework can be drawn up which is described as follows:

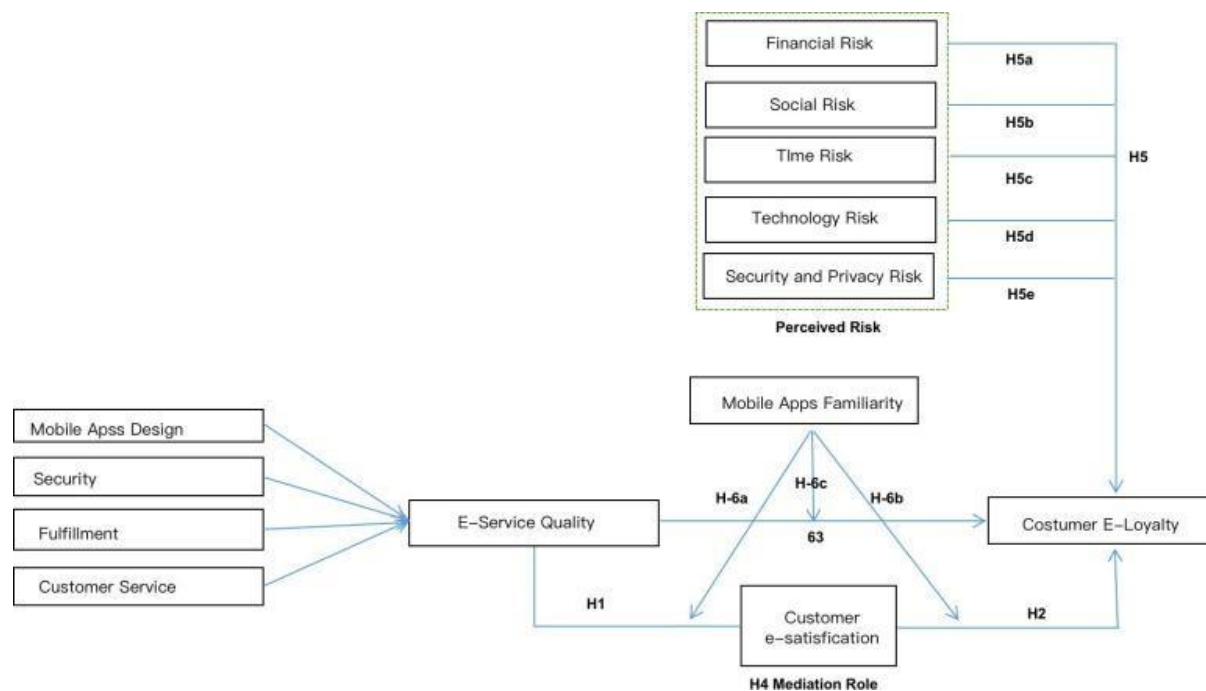

Fig 3. Research Concept Framework (Source: Adaptation Model Kaya et al. 2019, Bakshi, Tandon 2019, processed by researchers)

In accordance with the conceptual framework above, the variables of this study consist of the e-service quality variable, the Customer e-Satisfaction variable as a mediating variable. Meanwhile, Customer e-Loyalty is the variable that becomes the output in the assessment being assessed. In addition, Customer e-Loyalty is also analyzed through a direct relationship with the Perceived Risk Variable. Perceived Risk is an important variable to analyze because Fear such as a sense of uncertainty, health anxiety, risks for loved ones, has raised two important issues, namely: excessive levels of worry and high likelihood of being exposed to the COVID-19 virus. when sensing and facing danger (ALHUMAID et al, 2021). So that fear is analyzed through the Perceived Risk Variable. In addition, Mobile Apps Familiarity acts as a moderator in the relationship between Service Quality, Customer e-Satisfaction and Customer e-Loyalty.

#### *Effect of E-Service Quality on Customer E-Satisfaction and Customer e-Loyalty*

Positive perceptions of websites and their content increase online satisfaction levels (eg, Polites et al., 2012; Rodgers, Negash, & Suk, 2005). Customer satisfaction is a person's feelings of pleasure or disappointment that arise after comparing their perceptions or impressions of performance. If the impression is below expectations, it will result in dissatisfied customers. However, if the performance exceeds expectations, the customer is very satisfied and happy (Kotler, 2009). If the performance of the product or service produced by the company is the same as what the consumer imagines, the consumer will be very satisfied. Then if the performance provided by the company to consumers exceeds expectations, the level of consumer satisfaction will be higher (Kotler and Keller, 2017). In this hypothesis, the researcher aims to determine the variable relationship between e-service quality which has a positive influence on customer e-satisfaction which has a meaning or understanding of how the quality of a service relates to the satisfaction of Telemedicine Service users, therefore the following hypothesis is concluded:

H1 : E- Service Quality (ESQ) has a positive effect on customer e-satisfaction (CES)

*Customer e-satisfaction (CES) has a positive effect on customer e-loyalty (CEL).*

Customer satisfaction is an important aspect and is the key to running a successful business (Krivobokova, 2009). Customer satisfaction often refers to specific transaction satisfaction or overall satisfaction (Jones and Suh, 2000). Customer satisfaction relates to whether happy or disappointed which is the result of comparing the service or product consumed in accordance with customer expectations. If the performance of the product or service produced by the company is the same as what the consumer imagines, the consumer will be very satisfied. Then if the performance provided by the company to consumers exceeds expectations, the level of consumer satisfaction will be higher (Kotler and Keller, 2017). The dimensions of consumer satisfaction consist of: Conformance of Expectations: The level of conformity between consumer expectations and product performance perceived by consumers; Repurchase: consumer's willingness to repurchase related products/services; Willingness to Recommend: the willingness of consumers to recommend products that they have felt to friends/relatives/family (Hawkins and Lonney cited in (Tjiptono, 2015) (Puti Queenszya De Fritz, 2020). In this hypothesis the researcher will look at the relationship between the variables Customer e- satisfaction (CES) which has a positive effect on customer e-loyalty (CEL) the use of Telemedicine Services, therefore the following hypothesis is concluded:

H2 : Customer e-satisfaction (CES) has a positive effect on customer e-loyalty (CEL).

*E-Service Quality (ESQ) has a positive effect on Customer E-loyalty (CEL)*

E-Service Quality is defined as a system that is different from traditional service quality systems, where e-service quality emphasizes the ease of obtaining information from electronic-based service providers, and consumers also have a contribution to service delivery responsibilities (Bressolles et al., 2014). ). E-service quality covers all aspects of interaction between customers and companies, and is used to facilitate shopping activities to service delivery of products or services through the website effectively and efficiently (Come et al., 2016; Parasuraman et al., 2005). The advantage of using services in an electronic business, will lead to return visit behavior and repurchase behavior which then forms an electronic loyalty (Srinivasan et al., 2002; Yoo et al., 2015). Customers will develop a desire to visit the website and make purchases through the same site, and even encourage other consumers to make purchases from the site (Kaya et al., 2019). E-loyalty will be seen in the customer's emotional attachment to repeat purchasing activities. e-loyalty, they will usually recommend other consumers to visit certain sites or applications. This can contribute to the binding of purchasing decisions. (Jeon and Jeong, 2017). E-customer loyalty can be defined as the tendency of customers to continue to use a particular site, frequent visits, and high interest in the long term (Srinivasan et al., 2002; Amin, 2016). Maintaining a long-term customer relationship is more valuable than a one-time exchange of products or services. In recent decades the notion of brand loyalty is known as e-loyalty or online loyalty (Valvi and Fragkos, 2012). Loyalty plays an important role in evaluating service outcomes from consumers, including satisfaction (Morgan and Hunt, 1994). Therefore, the following hypothesis is concluded:

H3: E-Service Quality (ESQ) has a positive effect on Customer E-loyalty (CEL).

*Customer e-satisfaction (CES) as a mediation of the relationship between E-Service Quality (ESQ) and Customer e-Satisfaction (CES)*

Service quality significantly affects personal value, where perceived value is the main factor of consumer satisfaction that affects consumer behavior (Wu, 2014). In this hypothesis, the researcher found a relationship between Customer e-satisfaction (CES) variables as a mediating relationship between E-Service Quality (ESQ) and Customer e-Satisfaction (CES) in using Telemedicine Services. Satisfaction implies evaluation of product acquisition and/or consumption experience. Thus, customer satisfaction is an evaluation based on their personal experience with respect to their needs and expectations (Oliver, 2010). In the context of online shopping, the concept of e-satisfaction emerged as an important behavioral outcome (Bansal et al., 2004). Therefore, the following hypothesis is concluded:

H4: Customer e-satisfaction (CES) partially mediates the relationship between E-Service Quality (ESQ) and Customer e-Satisfaction (CES).

*Effect of Perceived Risk on Customer e-Loyalty*

Featherman and Pavlou (2003) define PR as the potential disadvantage of pursuing desired outcomes from the use of electronic services. The selection of the type of risk aspect was based on previous

research by Featherman and Pavlou (2003) as well as interviews with doctors who practice telemedicine. Various types of risks (social, technological, time, security and privacy risks) have been identified and validated as barriers in the adoption of any technology that affect individual behavior (Bakshi et al., 2019). As well as the effects of Covid-19 which raises the fear of incomplete health information, where the existence of fears such as a sense of uncertainty, health anxiety, risks to loved ones, has raised two important issues, namely: the level of excessive worry and the possibility of being exposed to the virus. High COVID-19 Fear is a stimulus when feeling and facing danger (ALHUMAID et al, 2021). Therefore, it is concluded that the 5-point hypothesis is attached.

H5a: Perceived Financial Risk (FR) has a negative effect on Customer e-Loyalty (CEL). H5b: Perceived Social Risk (SR) has a negative effect on Customer e-Loyalty (CEL).

H5c: Perceived Time Risk (TR) has a negative effect on Customer e-Loyalty (CEL).

H5d: Perceived Technology Risk (TER) has a negative effect on Customer e-Loyalty (CEL).

H5e: Perceived Security and Privacy Risk (SPR) has a negative effect on Customer e-Loyalty (CEL).

*Moderation Effect of Mobile Apps Familiarity on e-Service Quality, Customer e-Satisfaction and Customer e-Loyalty*

The more a person is aware of a brand, the higher the likelihood that the brand will be chosen (Ilyas., et al., 2020; Moisescu, 2009; Shahid et al., 2017). Dabbous & Barakat (2020) states that well-known brands can win the competition where brand awareness will make customers think about making products/services a choice and increase purchase intention more to buy. Previous studies confirmed the effect of brand awareness on purchase intention (Ilyas et al., 2020; Novansa & Ali, 2017; Petahiang et al., 2015; Shahid et al., 2017). However, Wu & Ho (2014) stated that brand awareness cannot directly increase purchase intention. It was further explained that consumers are not interested in buying a product just because the brand of the product is well known. Consumers also tend to ignore brands even though many products have the same benefits (Jean, 2015). Therefore, the following hypothesis was built where brand awareness was analyzed to see the effect on ESQ, CES and CEL. Hypothesis 6 proposes a moderating effect of the familiarity of Mobile Apps therefore the following hypothesis is concluded :

H6a regarding the relationship between electronic service quality (ESQ) and electronic satisfaction (CES),

H6b regarding electronic satisfaction (CES) and electronic loyalty (CEL), while H6c regarding electronic service quality and electronic loyalty.

### III. RESEARCH METHODOLOGY

Data were obtained, using a purposive sampling technique, from respondents upper 18 years old whose using telemedicine on mobile app. For the purpose of this study, 5-point Likert type scales were utilized, ranking from 1 = strongly disagree, to 5 = strongly agree. Participants were asked to rate their level of agreement with statements based on their recent Using Telemedicine experience. We specifically used this scale based on the latest meta-analysis of Blut et al. (2015), who found it to be better than other available scales for measuring e-service quality. It consists of four dimensions, website design, fulfillment, security and customer service. The scale for customer e-satisfaction was adopted from Anderson and Srinivasan (2003); To measure degree of familiarity with a telemedicine, we used five items adopted from Kaya et. al. (2000). Customer e-loyalty was measured with four items adopted from Kaya et, al (2019), and To measure degree of Perceived Risk we used 28 items adopted from Featherman & Pavlou, (2003)

### IV. RESULT / FINDING

Of the 444 respondents, females made up 67.8% of the total. A total of 55.9% (248) of respondents have an age range of 18-28 years, 39.6% (176) of respondents are aged >28-38, 43.5% of 193 respondents work as private employees and 36.9% (164) respondents are students, 61.9% (275) of respondents are domiciled in DKI Jakarta, 19.1% (85) of respondents are in West Java. Telemedicine in Mobile Apps that is often used by respondents, namely the first Covid-19 59.7% (265) second 23.3%

(103) Allergy consultation respondents, third 2.3% (10) obstetrics and gynecology consultation respondents fourth rank, 1.8% (8) Respondents fourth 1.6% (7) Respondents for dental and mouth consultation.

H1: The results of hypothesis testing, original sample of 0.3910, t-statistics of 11.4115, p-values of 0.0000 concluded that H1 is accepted, the existence of digital health technology provides easy services, and saves time because activities are carried out online and efficiently as well as helping users quickly and providing satisfaction to users (Jeffrey, 2018) and being cost-effective for patients because there is no need to pay for transportation costs and other costs. (Annisa, 2018). Therefore ESQ resulted in a positive relationship on CES.

H2: The results of hypothesis testing, original sample of 0.3654, t-statistics of 4.9367, p-values of 0.0000, concluded that H2 is accepted, Telemedicine in Mobile Apps has a positive influence such as recommending services and using it in the future if experiencing problems in health. The results of the study illustrate that patient satisfaction indicates that the use of telemedicine is feasible as an alternative to replace direct visits. (Ashwin et al, 2020). If the performance provided by service providers to consumers exceeds expectations, the level of consumer satisfaction will be higher (Kotler and Keller, 2017)

H3: Hypothesis test results, original sample value of 0.3654, t-statistics of 4.9367 p-values of 0, 0000 concluded that H3 is accepted. The increase in telemedicine users shows that the COVID-19 pandemic affects people's interest in using telemedicine services, it can be seen in 2020 there is a surge in visits to the Telemedicine application by up to 600% with the increase in users, of course telemedicine service providers must continue to improve the quality of their services, so that users feel comfortable and well serviced. (Ministry of Health Research and Development, 2019). Raffan et al (2021) found that patients responded well to virtual care in the context of a pandemic. Patients feel technology improves access to care, and they feel confident knowing their symptoms are being monitored virtually

H4 : Hypothesis test results, original sample value of 0.10211, t-statistics of 3.4319 p-values 0.006 can be concluded that H4 is accepted. Hentati, F. et al. (2021) stated that telemedicine has been proven to be effective in meeting patient needs and satisfaction both in terms of time efficiency, cost-effectiveness, and providing a sense of security for patients and doctors for virtual appointments, especially since COVID-19 can be concluded from the results of this hypothesis test that CES mediation affects the relationship between ESQ and CES.

H5a: hypothesis test results, original sample of -0.3045, t-statistics of 3.8201, p-values of 0.0001 It can be concluded that H5a is accepted, Mishra's research (2021) states that the factors that support telemedicine are factors finances and the COVID-19 pandemic factor where policies were imposed on regional restrictions as well as traveling. Based on preliminary literacy studies from several journal articles from Kruse, Atkins, Baker, Gonzales, Paul, Brooks (2018), telemedicine supports minimizing the risk of costs because telemedicine reduces treatment costs. This can be seen from the results of the respondent's profile where the costs incurred when using Telemedicine Services on Mobile Apps are not a problem, which is explained through existing data that as many as 282 respondents spent costs >Rp. 100,000 - Rp. 250,000 for consultation while a total of 291 respondents spent > Rp. 50,000

- Rp. 100,000 for transportation (motorcycle or car) when conducting a doctor's consultation directly to a hospital, clinic or private practice.

H5b : Hypothesis test results, original sample of -0.0992, t-statistics of 1.1543, p-values of 0.248 concluded that H5b is rejected. Helou et al. (2020), stated that a large amount of skepticism and uncertainty regarding Telemedicine remains, particularly regarding the efficiency, safety and adequacy of existing regulations. A recent study has highlighted the importance of beliefs, subjective norms, perceived benefits and habits in promoting the adoption of online health consulting services in China (Gong, Han, Li, Yu, & Reinhardt, 2019)

H5c : original sample of -0.0234, t-statistics of 0.1841, p-values of 0.8540 can be concluded that H5c is rejected. Li (2020) emphasizes interactivity, perceived personalization and privacy issues and emphasizes that these have a significant impact on users' perceptions of services in the form of ease of

use, usability, and trust in medical care services via mobile. The convenience in this case can be seen through the waiting time between purchase and consumption and the experience of delayed delivery decreases repurchase intention. When consumers know the products provided, and users are familiar with applications, websites and other technology systems, then they will tend to search for information that is more efficient and saves time than having to browse again, and they will quickly get the desired order and reduce the risk of online shopping (Change). al., 2016; Van Slyke et al., 2006). It is possible that there are other factors that prevent service users from being loyal, one of which is the error of HR, after the user has finished using Telemedicine or consulting a doctor. Third parties such as pharmacies, drug delivery drivers are also application errors where errors in providing drug delivery locations to service users, also for new users. The information provided by the mobile apps is also the same as in urban areas but it is not possible for some regions to get the appropriate right of access to the hospital. Therefore, this is an obstacle for the community and users who live and live in remote and difficult areas. to get drugs and services (Erictpol, 2015).

H5d: hypothesis test results, original sample of -0.0994, t-statistics of 0.9317, p-values of 0.3517 it can be concluded that H5d is rejected, Technology from mobile apps helps users and doctors to interact on mobile apps so that it will minimize the risk of misunderstanding, because a poor understanding of technology and its application in providing health care can be a major obstacle in the use of telemedicine (Bali, 2018). However, in some cases in Telemedicine, it cannot be beaten evenly. Research according to Singh (2018) states that mobile apps services are used only for preventive actions or preventive measures and not to carry out an intense healing and overall

H5e : results from hypothesis testing, the original sample is 0.3586, t-statistics of 3.9512, p-values of 0.0001 it can be concluded that H5e is rejected, the results of the hypothesis test show the original sample value of 0.3586, meaning that the direction of this test is not in accordance with the proposed hypothesis with the value of t- statistics is equal to 3.9512, p-values of 0.0001 can be concluded that H5e is rejected. Studies by Luciano, Mahmood, and Mansouri Rad (2020) confirm that telemedicine adoption is influenced by policies, culture and security and privacy. Casalo et al. (2007) define securityas technical assurance that legal and ethical practices are met (Chiu et al., 2017). Even though the Mobile Apps service is deemed unsafe, users believe that Telemedicine during the pandemic is able to provide services that are quite helpful, even though the risk of Security and Privacy Risk is high. Thisis due to circumstances that require users to comply with Government Regulation of the Republic of Indonesia No. 21 of 2020 which emphasizes Large-Scale Social Restrictions in the Context of Accelerating the Handling of Coronavirus Disease 2019 (COVID-19) where restrictions are imposedon going out of the house, the User prefers the risk of a high SPR rather than choosing to conduct an offline consultation.

H6a: Hypothesis test results, original value of -0.1372, t-statistics of 5.5149, p-values of 0.0000. so it can be concluded that H6a is rejected. When the user uses the Telemedicine Service and fills in complete and clear data information and is known by the Application, it provides an opportunity for the possibility of misuse of the patient's personal data (Wahyuni Bahar, 2019). The absence of privacy protection has been proven to be one of the factors influencing the acceptance and adoption of IoT (Padyab and Ståhlbröst, 2018) Doubts about this are natural because the health aspect is a sensitive matter. According to Vibilarasati (2019), if there are no relevant documents along with medical records and without patient examination, medical personnel will have difficulty making a precise and accurate diagnosis. In addition, patient anxiety increases because of the possibility that medical records, both personal, confidential or sensitive user data can be misused by others outside and within the network (Malik et al., 2020). According to Fournier and Mick (1999), the impact of service quality (ESQ) can be increased or exacerbated through various factors (mood, situational factors) and not necessarily by a high level of familiarity because satisfaction depends on the given context not on familiarity. Therefore,site familiarity (MAF) does not increase the relationship between service quality (ESQ) and satisfaction (CES).

H6b: The results of hypothesis testing, original sample of 0.1829, t-statistics of 2.2668, p-values of 0.0236. It can be concluded that H6b is accepted, it can be said that Mobile Apps Familiarity (MAF) moderates the positive relationship between Customer e-satisfaction (CES) and Customer e-Loyalty (CEL), so the relationship is stronger when Mobile Apps Familiarity is high. This is in line with the

research of Kaya et.al (2019) which states that the relationship between satisfaction and loyalty becomes stronger with increasing levels of website familiarity. Wilson et al (2016) stated that customers will be effective in a service if customers are relatively satisfied. In line with the research of Casalo, Flavian, and Guinal u (2008) which found that consumer familiarity with a product moderates the relationship between perceived usefulness and the process of forming loyalty, familiarity is also one of the determinants of users not switching (Ju, 2020).

H6c: The results of hypothesis testing, the original sample is -0.1727, the t-statistics is 2.6532 and the p-value is 0.0081. It is concluded that H6c is rejected. The appearance of a professional website provides a sense of comfort to customers, so customers can be more confident and comfortable in choosing services. Founder & chairman Center for healthcare policy and reform studies (chapters) Indonesia, Luthfi Mardiansyah(2019) stated that mobile apps not only provide convenience for users, the role of health applications is a threat to the development of digital health applications and requires evaluation in its implementation, such as data protection. patient privacy, then the lack of communication from both parties between doctors and patients, then the presence of incompetent and inexperienced doctors and the lack of legality in health applications makes regulatory protection regarding technology in the health sector a polemic (Mardiansyah, 2019).

## V. DISCUSSION

### A. *Relationship of ESQ, CES, and CEL and MAF Moderation*

It can be seen that the Telemedicine Service in Mobile Apps answers existing problems regarding the need for health information where this service is not limited by space and time. Direct meetings between health workers and patients that originally took place in the practice room are now turned into virtual meetings via telecommunication devices, and the Telemedicine system shows a very important role during the COVID-19 pandemic. This is evidenced by as many as 59.7% of patients who perform telemedicine are Covid-19 sufferers. Where it explains that Telemedicine concretely helps Covid-19 patients to keep their distance and can do ISOMAN from home. From the results of the study, it is known that the majority of respondents are represented by respondents from DKI Jakarta, as many as 61.9% or a total of 275 respondents, which indicates that the adaptation carried out by the City of Jakarta is quite fast and good because it is the first city in the implementation of the PSBB. also shows that the development of Telemedicine services in Mobile Apps proves that respondents tend to be loyal to using telemedicine with data that is 55.2% or 245 respondents consulted 2-3 times, 32.2% and 143 people did telemedicine 4-5 times. it was accumulated that as many as 87.4% or as many as 388 respondents used Telemedicine Services more than once. Meanwhile, in other cities, such as in Central Java, East Java, Sulawesi, Sumatra, Telemedicine Services in Mobile Apps do not have a significant effect in helping people increase their knowledge about health as evidenced by data where there are 3.40% or 15 users who use Telemedicine Services in Mobile Apps. In addition, with the existence of Telemedicine, it helps in carrying out long-distance treatment where Government Regulation requires space boundaries. Performance expectancy occurs where consumers have expectations for the application by providing consumer benefits in utilizing digital application performance (Venkatesh et al., 2003). Therefore, if Alodokter's health application service can meet expectations and provide convenience and increase confidence that health application services are able to positively influence interest in usage behavior. The results of Mujiyana's research (2019) that trust has a positive and significant effect on repurchase intention. In addition, according to the data that the researchers processed, where MAF moderates strongly and increases the positive relationship between CES and CEL, it can be said that only users who feel satisfaction from the service will loyally use Telemedicine services. Mobile Apps Familiarity (MAF) moderates the positive relationship between Customer e- Satisfaction (CES) and Customer e-Loyalty (CEL) so that the relationship is stronger when Mobile Apps Familiarity is high. This proves that user satisfaction with Telemedicine Services and Service User Loyalty has a positive effect due to e-WOM or WOM carried out by users, both given through ratings in mobile apps and comments given in the use of Telemedical Services. So, Mobile Apps are able to moderate strongly because the relationship between satisfaction and loyalty occurs as a result of the positive response of previous Telemedicine service users which gives a Loyalty effect, either using it for the second time when you need the Service or in providing recommendations to other people or friends. So it is proven that the relationship is stronger when the MAF is high. In the research of Augusta, et al (2019) it was found that the possibility of respondents buying Etude House products because of the high level of familiarity with the brand and the more familiar the consumer with a brand, the greater the purchase intention due to satisfaction with the product that directs consumer attention to the brand.

### B. *Direct Influence Factors Percieved Risk on Customer e-Loyalty*

The preservation of security in the application and use of health applications is a risk element that is crucial to talk about, particularly because there are many health applications that permit using patient personal information for financial gain (Kevinpho, 2015) The government does not yet provide regulatory protection for technology in the health sector due to the absence of legality in health applications (Mardiansyah, 2019). The acceptability of telemedicine services is the issue that is most obvious, as stated by SR 2 with the highest outer loading of 0.9, which claims that relatives are unaware of the possibilities of telemedicine services in mobile apps because they are not yet known. How users can perceive big changes in applications due to social impact (Venkatesh et al., 2003). In addition, the public's initial perception and suggestion regarding digital health applications that they are afraid and anxious about the role of doctors on mobile apps is false, as well as public assumptions about available doctors, namely only the role of a student who does not have a letter (STR), or bots. who answered the community's questions in the chat at the time of consultation (Felicia, 2019). This risk needs to be considered by Hospital Management, Clinics and Applications because this triggers Loyalty from Service users. Public health services are influenced by the use of digital technology, the application of health interventions in the development of digital technology is very effective in serving the community (Manganello et al., 2015). As for a study from Rusfian (2020) there is telemedicine which is used for consultation to exchange information about the condition of pregnant women. These barriers are in the form of internal factors of midwives such as access to learning by midwives, access to skills, access to use, and access to motivation (Dalton et al., 2014). On the other hand, conventional visits to doctors are still considered an unpleasant experience, apart from being ineffective in terms of time and cost constraints, which are an obstacle for patients (Annisa, 2018). From the results of this study, in terms of Financial Risk, the costs incurred when using Telemedicine Services on Mobile Apps are not a problem, which is explained through existing data that as many as 282 respondents incur costs for >Rp. 100,000 - Rp. 250,000 and a total of 291 respondents incur expenses for transportation (motorcycle or car) when conducting a doctor's consultation directly to a hospital, clinic or private practice for > Rp. 50,000 - Rp. 100,000 as many as 291 respondents. This explains that the Telemedicine Service when viewed in terms of price is quite helpful in overcoming the problem of user curiosity about health because the total costs incurred are almost equivalent to the costs that users provide when or will conduct face-to-face consultations. So that in all Percieved Risk hypotheses only H5a is accepted.

## V. CONCLUSION AND RECOMMENDATION

From this study, it can be explained that the majority of telemedicine users are service users with Covid-19 status where at that time service users need direction and handling through online consulting services. Due to the Covid-19 virus forcing everyone who is exposed to maintain a distance in accordance with government regulations, patients who experience the Covid-19 disease directly use telemedicine applications for early treatment. In addition, as it is known that Go-Jek partnered with HaloDoc, where in this study a number of 75 316 Respondents or 71.2% Telemedical users use HaloDoc services, this helps service users to be able to buy medicines prescribed by doctors in the same application channel, making it easier for patients who are sick. The COVID-19 pandemic resulted in a 40-fold increase in the number of telemedicine patient visits (Mouchtouris et.al 2020). This increase occurred due to regional restrictions by the Government of Indonesia where Government Regulation of the Republic of Indonesia No. 21 of 2020 which emphasizes Large-Scale Social Restrictions in the Context of Accelerating the Handling of Coronavirus Disease 2019 (COVID-19),

In addition, this is supported by a statement submitted by the Minister of Health (2021) which reveals that if there are patients who are indicated to be COVID-19 good Those who are asymptomatic and have mild symptoms can self-isolate or quarantine, by providing free services, namely consultation in an application that is integrated with the Ministry of Health so that patients get health services. The use of telemedicine by medical personnel and patients can make services more effective and efficient, both in monitoring, evaluating and educating during this pandemic. Patients can report their symptoms and get advice and direction regarding their illness. (Chang & Boudier-Révérét, 2020; Cottrell & Russell, 2020)

#### VI. RESEARCH LIMITATIONS

- a. Respondents Are Limited To The Scope Of Jakarta And West Java With The Highest Percentage Being Undergraduates And Still Students. The Number Of Samples Of 444 Needs To Be Expanded By Conducting A Minimum Representative Sample Of Each Existing Telemedicine Service To Represent Respondents Equally. This Difference In
- b. Standardization Can Cause A Bias In The Evaluation Results Of Respondents Using Telemedicine Services, Besides That Of Course This Can Be An Influence In The Evaluation Of The Adaptation Process Of Telemedicine Services. Standards In Subsequent Studies Such As The Number Of Samples And Regional Distribution Are Important Things To Note.
- c. Consumers Who Have Direct Experience Using Telemedicine Services Because The Satisfaction Factor Analyzed Refers To Personal Satisfaction.
- d. This Research Is Limited To Applications That Already Exist In Mobile Applications In 2021-March 2022. New Mobile Applications That Are Present After That Month Are Not Included In The Scope Of The Study.

#### SUGGESTION :

- e. The Use Of Qualitative Methods Is Considered To Be Able To Provide Results And Contributions And Can Provide Knowledge Regarding The Actual Perceptions Of Service Users On The Use Of The Service And This Can Be Achieved By Using An Open Ended Questionnaire Or Conducting Interviews With Telemedicine Service Users. This Research Exploration Is Also Expected To Help In Particular To Determine The Characteristics Of Differences In Adaptation In Cities And In Villages As A Whole Within The Scope Of Indonesia
- f. Fair Comparison Between The Conditions Of Users Of Telemedicine Services Between Applications.
- g. Conduct Further Research To Find Out How Respondents Think About Telemedical Services And The Adaptations That Have Been Obtained Pre And Post Covid-19 Pandemic Before And After The Pandemic.
- h. Using Security And Privacy Risk As Moderation In Research
- i. Conduct Research Considerations By Evaluating The Dki And Papua Regions With A Representative Sample

## Challenges and Obstacles to Implementing Gender Mainstreaming Policies in Building Gender Equality

A. Mayangsari Wilandini<sup>1</sup> and B. Budi. W. Soetjipto<sup>2</sup>

<sup>1,2</sup>Faculty of Economic and Business, Universitas Indonesia, Depok, Indonesia

### Abstract

*Massive technological developments today are often referred to as digital transformation. One of the industries affected by this massive digital transformation is the television industry. One of the digital transformation processes in Indonesian television is marked by the Analog Switch Off (ASO) program, namely the cessation of analog television programs and switching to digital television broadcasts. The existence of digitalization causes major changes that have an impact on the company's internal television stations, some of which are organizational culture, digital technology self-efficacy, agility, resistance to change, and digital innovation. There is still a limited of research and information on how the Organizational Culture has an impact on Innovativeness in the domain of digital technology. Using a quantitative approach, this study involved 220 employees of Indonesian television stations who are actively working at state-owned television stations. The findings in this study indicate that organizational culture has a positive influence on digital innovativeness through digital technology self-efficacy, agility, and resistance to change as mediating variables.: Despite from the organizational culture that is considered slow, the organizational culture in this company actually supports its employees to work in digital technology*

---

### I. INTRODUCTION

Current technological developments are often referred to as digital transformation, digital transformation is a consequence of the massive era of disruption or better known as the Industrial Era 4.0, resulting in changes in business models, overhauling the existing ecosystem into a new ecosystem that is more innovative, complex and dynamic. Digital transformation does not only apply in one aspect, but also occurs in several aspects such as technology in business, various industries, government, to small units such as MSMEs (Micro, Small and Medium Enterprises). One of the industries affected by this massive digital transformation is the television industry. One of the digital transformation processes in Indonesian television is marked by the Analog Switch Off (ASO) program, namely the cessation of analog television programs to then switch to digital television broadcasts (Oktari, 2021).

In this case, agility is considered to be related to innovation which is then considered an important factor to maintain competitiveness and in the end it functions for the survival of the company. Through agility, the steps that occur in the organization are developed and also changed through a new, more agile framework. This new, agile framework offers the opportunity to be innovative in itself and mobilize entrepreneurial forces to take advantage of the dynamic market opportunities and new technologies in the enterprise of the future (Carsten, 2014). Another preparation that must be prepared by television stations in Indonesia is that there will be a change in the culture at work. Among other contextual factors, organizational culture is recognized as one of the important factors that can increase or decrease an individual's readiness to change (Haffar, Al-Karaghoul, & Ghoneim, 2014). In terms of individual change readiness, cultures characterized as externally focused and those that emphasize rule or stability have a tendency to resist. Research has shown that organizational culture is the key to successful change implementation, so a better understanding of the culture that supports individual readiness to change is needed (Johansson, Astrom, Kauffeldt, Helldinc & Carlstromd, 2014; Olafsen, Nilsen, Smedsrud & Kamaric, 2020).

Changing work rhythms participate in changing work culture, this can disturb employee comfort which then needs to be watched out for because one of the factors that affect resistance to change in individuals can occur because employees do not receive comprehensive information about these changes (Sembiring, 2009). In several studies, it was found that the contribution of employee resistance to failure in corporate change efforts is very large. This finding confirms that employee resistance becomes a challenge when the company has the initiative to change. Resistance to change is generally found in companies, including in Indonesia (Yulianti, 2020).

Still regarding innovation, according to Bandura (1989) innovation can occur if employees have high self-efficacy. By having high self-efficacy, employees can solve problems that occur creatively (Bandura, 1989). According to research adapted through <http://news.unair.ac.id/>, the freedom provided by the company can also reduce employee resistance to change, in addition, the freedom to work also provides self-confidence or also known as self-efficacy. With self-confidence, employees can more easily manage the work stress they experience, especially those that occur due to changes. Employees with a high level of self-confidence will always be optimistic that even though there are changes, they can still complete the job well.

From various studies that examine the various determinants of digital innovation that can support digital transformation, these factors then become the basis for research to further examine the role of dimensions such as corporate culture, digital technology self-efficacy, agility, resistance. to change towards digital innovativeness in the state-owned television station, LPP TVRI, and to find out whether organizational culture has an influence on digital

technology self-efficacy, agility, and resistance to change. then to find out whether there is an effect of digital technology self-efficacy and resistance to change on agility. Then whether digital technology self-efficacy, agility, and resistance to change mediate the effect of organizational culture on digital innovativeness

## II. LITERATURE REVIEW

### A. *Organizational Culture*

According to Edgar Schein in Wibowo (2010), who argues that organizational culture is the philosophy that underlies organizational policies, the rules of the game to get along, and the feelings or climate brought about by the physical preparation of the organization. Organizational culture according to Stephen Robbins in Wibowo (2010), is a general perception held by members of the organization, a system of shared meaning. Meanwhile, according to Mangkunegara (2009) which states that organizational culture is a set of assumptions or belief systems, values, and norms developed in organizations that are used as behavioral guidelines for members of its members to overcome external and internal adaptation problems.

### B. *Agility*

Agility is classically defined as the ability to change direction quickly (Bloomfield, Ackland, & Elliot, 1994; Clarke, 1959; Mathews, 1973) followed by the ability to change direction quickly and accurately (Barrow & McGee, 1971; Johnson & Nelson, 1969). According to Ismaryati (2008) Agility is a person's ability to be able to change direction quickly and precisely when moving without losing balance. While slightly different from the previous definition, according to Toho Cholik Mutohir and Ali Maksun (2007: 56) Agility is the ability of the body or body part to change the direction of movement suddenly at high speed. For example, being able to run in turns, running back and forth within a certain distance and time, or the ability to dodge quickly in a stable standing position.

### C. *Resistance to Change*

Resistance to change is widely recognized as a major reason for the failure of change initiatives. Resistance to change can be classified at the organizational level, group level and also at the individual level. At the organizational level, resistance to change includes conflicts and strengths, differences in functional orientation, mechanistic structures and organizational culture (Thomas & Hardy, 2012). At the group level, resistance to change includes group norms, cohesive norms, and group thinking and the level of commitment given (Nadim & Singh, 2019). The dimension of resistance to change was originally proposed by Piderit (1998). Dimensions include affective, cognitive and behavioral. Affective describes the expression of each individual's feelings towards a change (eg anger, anxiety and others). Behavior describes the range of actions taken to respond to changes. Next, cognitive reflects the individual's mindset and the decisions made regarding change.

### D. *Self Efficacy*

Self-efficacy or self-efficacy comes from Bandura's Social Cognitive Theory (1986) which explains how a person evaluates himself to execute an action needed to solve a problem in a situation. In this theory, self-efficacy is believed to be the key determinant of the success of a performance.

### E. *Computer Self-Efficacy*

Computer self-efficacy is defined as a person's confidence in his ability to perform tasks successfully related to the use of computers (John, 2013). Meanwhile, according to Indriantoro (2000), a person's computer skills are the ability to use computer applications, operating systems, file and hardware handling, data storage and use of keyboard keys. The ability to use a computer is not a measure of a person's skills, but represents what individuals believe they can do based on their abilities or skills (John, 2013). From the several notions of computer self-efficacy above, it can be concluded that computer self-efficacy is an assessment of an individual's ability or capability in using computers, where the assessment is not only on individual skills but also on decisions that will be taken by individuals related to the use of computers. future use of computers.

### F. *Digital Technology Self-Efficacy*

Digital Technology Self-Efficacy (DTSE) was originally studied as computer user self-efficacy (CUSE), this notion of Digital Technology Self-Efficacy identifies self-efficacy as a contributing factor to success in technological tasks. Cassidy and Eachus (2002) developed computer user self-efficacy to measure an individual's self-efficacy in the context of computer-related tasks.

### G. *Innovation*

Pervaiz K. Ahmed and Charles D. Shepherd (2010) say that innovation is not only limited to objects or goods

produced, but also includes attitudes to life, behavior, or movements towards a process of change in all forms of community life. So, in general, innovation means an idea, product, information technology, institution, behavior, values, and new practices that are not yet widely known, accepted, and used or applied by most of the community members in a particular locality, which can be used or encourage changes in all aspects of people's lives for the realization of improving the quality of each individual and all members of the community concerned.

#### *H. Innovativeness*

Innovativeness means the organization is willing to pursue new ideas and concepts in process, product, or service development. Proactive refers to an organization with characteristics that are forward-looking and responsive in the industry environment involved (Green, Covin, & Slevin, 2008). From a macro perspective, innovativeness is the capacity of new innovations to create a paradigm shift in science and technology and/or market structures within an industry. From a micro perspective, innovativeness is the capacity of a new innovation to influence a firm's marketing resources, technological resources, skills, knowledge, capabilities, or strategy (Garcia & Calantone, 2002). Innovativeness implies a willingness to be proactive in letting go of old habits and to try out experimental ideas by seeking new opportunities rather than taking advantage of current strengths (Panayides & Lun, 2009).

### III. RESEARCH METHODOLOGY

#### *A. Data collection*

Data collection was carried out by distributing structured questionnaires conducted online via Google Form and distributed through internal communication media in the company. for the main test stage, the samples obtained were 230 respondents. To find out the specific sample, the researcher gave a screening question in which only individuals who matched the specified sample criteria became respondents in this study.

#### *B. Analysis method*

This research design uses quantitative methods. Saunders, Lewis and Thornhill (2012) stated that quantitative methods are data collection techniques or data analysis procedures that produce or use numerical data. Martin and Bridgmon (2012) convey that quantitative research involves interactions between variables after they are operationalized, enabling researchers to measure study results.

### IV. RESULT / FINDING

The findings in this study can answer all research questions posed by researchers

- a. Organizational Culture has a positive effect on Digital Technology Self-Efficacy
- b. Organizational Culture has a positive effect on Agility
- c. Organizational Culture has a positive effect on Resistance to Change
- d. Digital Technology Self-Efficacy has a positive effect on Agility
- e. Resistance to Change has a negative effect on Agility
- f. Digital Technology Self Efficacy mediates the relationship between Organizational Culture and Digital Innovativeness
- g. Agility mediates the relationship between Organizational Culture and Digital Innovativeness
- h. Resistance to Change memediasi hubungan antara Organizational Culture terhadap Digital Innovativeness

### V. DISCUSSION

The findings indicate that organizational culture has a positive influence on digital technology self-efficacy, agility, and resistance to change. Data processing results show that of the three mediating variables, organizational culture has the greatest influence on agility. Then other results state that digital technology self-efficacy and resistance to change have an influence on agility. The digital technology self-efficacy variable has a positive influence on agility. While the variable resistance to change has a negative effect on agility. Further results show that digital technology self-efficacy, agility, and resistance to change mediate the effect of organizational culture on digital innovativeness.

This study shows that organizational culture has an influence on the digital innovativeness of employees, which in this case is LPP TVRI employees. It can be said that organizational culture can increase or decrease the digital innovativeness of LPP TVRI employees. The existence of ASO as a marker of digital transformation in the television sector makes employees in the television sector, in this case LPP TVRI employees, become more innovative

### VI. CONCLUSION AND RECOMMENDATION

#### *Conclusion*

- a. The results showed that organizational culture has a positive influence on digital technology self-efficacy. These results indicate that the higher the culture in the organization, the higher the employee's self-efficacy in digital technology.
- b. The results showed that organizational culture has a positive effect on agility. These results indicate that the higher the culture in the organization, the higher the agility in employees.
- c. The results showed that organizational culture has a positive effect on resistance to change. These results indicate that the higher the culture owned by the employee, the higher the resistance to change of an employee.
- d. The results show that digital self-efficacy has a positive effect on agility. These results indicate that the higher a person's self-efficacy in digital technology, the higher the agility of the employee.
- e. The results show that resistance to change has a negative effect on agility. These results indicate that the higher the resistance of the employee, the lower the level of agility of the employee.
- f. The results showed that digital technology self-efficacy positively mediated the relationship between organizational culture and digital innovativeness.
- g. The results showed that agility positively mediated the relationship between organizational culture and digital innovativeness.
- h. The results show that resistance to change mediates the relationship between organizational culture and digital innovativeness negatively.

#### *Recommendation*

- a. Renewing organizational culture can be an option so that LPP TVRI employees can be more agile in dealing with this digital transformation, and so that LPP TVRI can be said to be on par with other television stations.
- b. Making the community of employees as agents of change who encourage/influence the target of change to be able to behave/behavior by adopting new innovations/policies related to organizational culture renewal.
- c. training programs related to innovation in digital technology so that the basic skills already possessed by employees can be honed even better.
- d. it is necessary to hold a workshop on agility to be able to sustain competitive advantage

## Analysis Of Factors Affecting Economic Growth In Lampung Province 1999-2020

A.Dia Mekar Sari<sup>1</sup> and B.Eni Setyowati<sup>2</sup>

<sup>1</sup>Economic Development, Muhammadiyah Surakarta University, Surakarta, Indonesia

### Abstract

*Economic growth is an increase in the production of goods or services which is seen by comparing economic conditions from one period to other. This study aims to analyze the factors that influence economic growth in Lampung Province. The analytical method used is Ordinary Least Square (OLS) regression with time-series data starting from 1999-2020. Education had a positive effect on economic growth in Lampung Province. Education is an indicator that can affect the occurrence of economic growth which can increase people's income, where education encourages economic growth and vice versa economic growth facilitates education in a region or village.*

*Keywords— Economic Growth*

### I. INTRODUCTION

Economic growth is the process of changing the economic conditions of a country gradually towards a better time within a certain period of time. Economic growth can be interpreted as an increase in the production capacity of an economy that comes from an increase in national income. Kuznets (Jhingan, 2001) defines economic growth as a long-term increase in the ability of a country to provide many economic goods to its population. This ability grows according to technological advances, institutional adjustments, and the ideology it requires. One measure that is used as the basis for calculating the rate of regional economic growth is the Gross Regional Domestic Product (GRDP).

Fig 1. Graph of Economic growth development in Lampung Province (Source: BPS 2019, data processed)

In the picture above, it can be seen that the largest increase in the development of economic growth in 2010-2020 occurred in 2011 by 6.56 percent. This is most of the economic sectors in Lampung Province in 2011 experienced positive growth, expect for the forestry sector, which experienced the highest growth in Lampung Province to 13.13 percent and clean water 9.86 percent. The services sector occupies the third position with a growth rate of 8.24 percent (Lampung Province in figures, 2012)

Meanwhile, the largest decline in economic growth occurred in 2020 by -4.15 percent. The development of economic growth for the years 2010-2020 is volatile, this is because there are several sectors which in their development are also experiencing in creases and decreases. This fluctuating nature can be controlled if GRDP is

more stable. To maintain GRDP stability, the government needs to encourage the agriculture sector to continue to grow because this sector is resistant to turmoil and absorbs a large number of workers (Lampung Province in Figures, 2020)

Another factor influencing economic growth is labor. Which analyzes the relationship between labor and economic growth in Central Java, the results show that labor affects economic growth. Therefore, it is necessary to pay attention to the development of labor absorption, especially workers aged 15 years and over. Economic growth is also inseparable from education. Education is an indicator that can affect the occurrence of economic growth that can increase people's income, where education encourages economic growth and vice versa economic growth facilitates the education of an area (Supriyanto and Henny, 2020)

## II. LITERATURE REVIEW

Sukirno (2006) states that the existence of economic growth needs to be developed for success in economic development. The demand for labor is the amount of labor required by a particular company/institution and is a combination of other available inputs, closely related to the level of wages and salaries (Sutomo, 2015).

### A. Short-term Labor Demand

The production function shows the relationship that occurs between various inputs of production factors and the company's output. In the short term, the company in maximizing profits cannot change the amount of capital, so that an increase in output can only be done through an increase in the number of workers (Sutomo, 2015).

### B. Short-Run Labor Demand Curve

Illustrates the combined effect of increasing the number of workers with the amount of capital on the level of output. When the ratio of the cost of labor to the cost of capital changes, the optimal combination of labor and capital for each of the highest outputs produced changes as well. For example, if there is an increase in wages, the company will reduce the number of workers and increase the use of capital

### C. Long Run Labor Demand Curve

Shows the firm can produce 19 tonnes of goods with various combinations of labor and capital. in the long run the entrepreneur is free to choose the combination of labor and capital in order to maximize profits at the lowest cost. The Relationship Between Economic Growth and Labor Labor is an important factor in the production process compared to other production facilities such as raw materials, land, water and so on. Because it is humans who move all these sources to produce goods and services (Simanjuntak, 2005).

## III. RESEARCH METHODOLOGY

Analysis Tools and Models As mentioned earlier, this study will examine the effect of Manpower (TK), Regional Original Income (PAD), Education (EDU) and Net-Exports (NX) on Economic Growth (PE) in Lampung Province using the Ordinary Least Square (OLS) regression analysis tool, which the formulation of the econometric model or the estimator model is:

$$PE_t = \beta_0 + \beta_1 TK_t + \beta_2 PAD_t + \beta_3 EDU_t + \beta_4 NX_t + \epsilon_t$$

PE = Economic Growth (%)

TK = Labor (life)

PAD = Regional Original Income (billion rupiah)

EDU = Education (years) NX = Net-Exports (million Rupiah) 0 = Constant 1..... β4 = Independent Variable

Regression Coefficient = Element of Error (Error Term) t = Year t

log = Natural Logarithmic Operator (ln)

The estimation steps of the above econometric model will include: estimator model parameter estimation, classical assumption test, model goodness test, and influence validity test.

## IV. RESULT/FINDING

Based on the estimation results selected in this study is the Fixed Effect Model (FEM). The results of the estimation in this study indicate that the human development index has a significant effect on income inequality in the province of South Kalimantan, the open unemployment rate and Based on table 2 shows that the probability value of F statistic is  $0.00093 < 5\%$  (0.05) meaning that (Ho) is rejected and (Ha) is accepted. The results of the F test explain that the human development index, the open unemployment rate and the number of residents simultaneously have a significant simultaneous effect on income inequality which is expressed by the Gini ratio.

## V. DISCUSSION

Effect of Human Development Index on Income Inequality. The results of hypothesis testing in this study indicate that the HDI variable is significant to income inequality in South Kalimantan Province in 2017-2020. This is evidenced by a significant value  $< 5\%$  (0.05) with a probability value of 0.0271 and a coefficient value of -0.027881, meaning that if every person's HDI increases by 1 person, it will reduce income inequality by -0.027881 percent. These results mean that every increase in HDI will be followed by one of the factors that can further widen inequality in the province of South Kalimantan. The test results in the human development index research have a significant effect on income inequality. These results support

## Exploring Indonesian Consumers' Attention Toward Online Food Delivery Service Usage During COVID-19 Pandemic: A Topic Modeling Approach.

T. Nugroho<sup>1</sup> and A. Hananto<sup>2</sup>

<sup>1</sup>Faculty of Economics and Business, Universitas Indonesia, Jakarta, Indonesia

<sup>2</sup>Management Department Faculty of Economics and Business, Universitas Indonesia, Jakarta, Indonesia

### Abstract

*The aim of this study is to explore the issues that consumers are focusing on regarding online food delivery services during the COVID-19 pandemic in Indonesia through social media data. With the accelerated digital transformation in the food and culinary industry, discussions about food delivery have emerged on social media. Especially during the COVID-19 pandemic in Indonesia has changed consumer habits from on-site dining to ordering food from home or anywhere. This study applied the topic modeling approach to understand consumers' perspectives on online food delivery services.: Consumers' social media comments and tweets (Instagram and Twitter) related to online food delivery services between 2020 and 2021 were collected using a text mining approach. The data were analyzed using topic modeling with Latent Dirichlet Allocation (LDA) implemented with Python. The results of this study found three major themes from the topics conducted with the LDA model, which are Price-Saving Benefit (Theme 1), Time-Saving Benefit (Theme 2), and Trustworthiness (Theme 3). This study discovered that regarding usage intention of online food delivery services, the perception of price and e-service quality's dimensions overweight the perceived risk regarding the effect of COVID-19 like food quality and safety risk. Insights from this study will be useful for evaluating service quality and further research in the food delivery industry.*

*Keywords— covid-19 pandemic; e-service quality; latent dirichlet allocation; online food delivery services; topic modeling*

---

### I. INTRODUCTION

Food delivery services have risen in popularity in Indonesia, thanks to the rise of the middle class and the large number of city dwellers who prefer convenience when it comes to eating. This phenomenon is shown in the report from Google Temasek (2020), which explained that there was a shift in usage behavior by Southeast Asian users during the COVID-19 pandemic in 2020, which moved online for food delivery platforms. In addition to the two application platforms, there are various types of food delivery services like direct delivery services from restaurants to consumers, food aggregator applications, marketplaces, and food delivery services by contacting companies directly via social media or social messaging. All of these services compete with one another in their marketing methods in order to acquire customers. However, in order to truly make the best judgments, service providers must first identify their target customers and align their service offerings to meet their needs. As a result, customer perspectives and input as users of food-delivery services are required.

There are essential elements that need to be considered in food delivery service transactions, based on consumer viewpoints and studies from numerous prior researchers, like a) consumers are looking for better promos, offers, and discounts; b) consumers prefer good service, efficient delivery, and responsive customer care; c) consumers pay attention to safety and cleanliness and also food quality; e) consumers prefer platforms that are easy to use (Elvandari et al., 2017; Kundu & Chatterjee, 2018; Maimaiti et al., 2018; Sjahroeddin et al., 2018; Suhartanto et al., 2019; Ray & Bala, 2021). Consumers who frequently use food delivery services share their thoughts and experiences on social media networks. Consumers' or other potential users' trust will be affected, and their purchasing patterns may be affected as a result. By taking advantage of this dramatic shift in consumer behavior regarding the increased usage of online food delivery, the field of online marketing may target both new and loyal users (Singh & Verma, 2020). Decisions about marketing strategy, consumer behavior analysis, and boosting brand reputation can all be influenced by social media. Furthermore, social media may assist customers in learning about the quality of certain products and services, after-sales services, and company reputation based on the experiences and opinions of other users, which can enhance trust and interest from users. As a result, online meal delivery service firms must advertise online, promoting their products and services and boosting their brand images on various social media platforms (Vernier et al., 2018).

The fast-growing food delivery industry generally has the same delivery model for all food delivery companies or service providers. However, the difference is that their policies and strategies can vary from one company to another. A resilient online food delivery company is highly competitive and adaptable to various inevitable contingencies. For this reason, companies need to develop appropriate strategies and make business decisions to adapt and deliver services to maintain their sustainability. The internet and technological advancements have made it a common habit for today's society to share stories and daily activities on social media, which can be very useful for any online food delivery service company (Yeo et al., 2017). The more open access for others to interact in the post, the more users that will be involved to share more things. More consumers engaged as users will help e-commerce businesses and online food delivery companies to know more about the products and services of various businesses or competitors and to know better about consumers so that they can make informed and appropriate business decisions. Social media can also help consumers as users to know about the quality of certain products and services, post-sales services, and company reputation based on experiences and opinions shared by other users, which can increase trust and purchase an interest in users. So online food delivery service businesses need to maintain their brand images on various social media platforms (Vernier et al., 2018).

A web data-driven approach or platform can be used to study consumer opinions to help study people's overall perceptions about a service product and how it is received in the market. Moreover, the help from the exponential growth of social media illustrates the daily life of people sharing their experiences about various products and services through reviews or comments, which can be considered as a consumer's opinion or view of a product or service because consumers as users can freely and voluntarily express their thoughts in posts, reviews, or comments. That is why reviews, comments, or posts on social media can also be a source of data for analyzing consumer/user perceptions about online food delivery services. The contribution that online reviews can make to measuring service quality is that textual data provides a wealth of customer service information that can be used to measure the quality offered by service providers, not only from quantitative ratings. Palese & Piccoli (2016) also shows that the distribution of topics in opinion can differ significantly in any kind of review.

Therefore, this study is chosen to examine the consumers' point of view on the changes caused by the COVID-19 pandemic to the use of food delivery services. The method used in this study follows the method used by Ray & Bala (2021), who analyzed text data from reviews and posts on social media using the Latent Dirichlet Allocation (LDA) technique to find topics of discussion that affect consumer interest in food delivery services in India. In this exploratory study, the research question that emerged in engagement with the research data is about how can the opinions of the public and Indonesian consumers regarding the usage of online food delivery services during the COVID-19 pandemic be grouped?. This study uses the same method as Blei et al. (2003) and Ray & Bala (2021) in exploring Indonesia consumers' perspectives, focusing on online food delivery services that are commonly used in Indonesia.

## II. LITERATURE REVIEW

### A. *Online Food Delivery Services*

Previous research on online food delivery services in terms of food delivery has tried to define the factors that influence consumer interest and behavior. The thematic analysis reveals that consumers like attractive discounts and offers when using online food delivery services. Other essential themes/sub-themes are the vast choices of food products, previous experience, food packaging, food quality, convenience, health concerns, frugality, and customer service (Ray & Bala, 2021). Also, Suhartanto et al. (2019) noted that food quality influenced consumer loyalty in online food delivery services. Elvandari et al. (2017), in their research, noted that order conformity, politeness, and friendliness of delivery staff affect consumers' interest in using online food delivery services. In addition, the researchers also noted that consumers value the cleanliness of packaged food and the quality of the food received when using a food delivery service. The researchers also note that service providers need to provide delivery staff with skills-related training and periodic service performance evaluations to improve their delivery operations. Pigatto et al. (2017) examined the feasibility of sites/platforms based on content, functionality, and usability to conduct business transactions. The researchers found that in this digital era, social media platforms help increase the visibility of brands and businesses that companies present. and also help service providers to engage with customers better. The researchers also found that content, functionality, and usability are essential when designing platform/sites for online food delivery services.

Hong et al. (2021) stated that there are factors that continue to play a role in determining user intention to use (customer intention to use) and are not changed by the Covid-19 pandemic situation. These factors are perceived usefulness, trust, price saving benefit, time saving benefit, and perceived food safety risk. Yeo et al. (2017)

assessed the relationship between various factors such as convenience motivation, post-use benefits, hedonic motivation, price savings, the time-saving, online purchasing experience, attitudes, and behavioral interest in the intention to use online food delivery services. They found that customer experiences (both before and after) with food delivery services influenced attitudes and behavioral interests. Therefore, in the service industry, service providers need to reduce service gaps and solve existing service problems as early as possible. Kundu & Chatterjee (2018) investigated the impact of digitization on the online food delivery sector. They found that consumer behavior was influenced by factors such as offer, variety, free shipping, and ease of use. The variables used by the researchers were: price, variety, quality, website compatibility, proximity to home, offers/discounts and payment options, and intention to use online food delivery services. Ray et al. (2019) researched customer experience, ease-of-use, and search-of-restaurants are the important factors that affect intention to use this service. Meanwhile, Kaur et al. (2021) examined that trust issues have a significant negative impact on the intention to use food delivery applications, which negatively impacted by the tradition barrier in the form of a lack of trust.

### *B. Topic Modeling*

To understand more deeply about consumer experience through online reviews, a collection of texts is not enough because of its unstructured nature (Xiang et al., 2015). Although there is a rating system on online review sites, the ratings are purely quantitative representations of a collection of qualitative inputs (Lak & Tureken, 2014). User-generated content serves as a good source of information and influences the views of other potential customers (Chatterjee, 2019). Therefore, a process of extracting textual data from various online-based platforms is required by utilizing a web-mining process or text mining from the site (Crooks et al., 2013; Ray & Bala, 2020; Sakaki et al., 2010). Text mining is done to extract meaningful information from user-generated data. This information can be helpful for various managerial decisions. The text mining technique followed to extract the essential themes from the textual data is the topic modeling technique. Topic modeling is preferred because it builds a topic structure from a set of documents by using the principle that a collection of documents representing a corpus belongs to a particular topic (Kunimoto & Saga, 2014).

The process of analyzing textual data online using various techniques can also be referred to as content analysis. The popularity of online textual data content analysis is increasing due to the accessibility of vast volumes of data (Neuendorf, 2017) and since content analysis helps provide new insights from the captured data. Topic modeling using the Latent Dirichlet Allocation (LDA) technique is beneficial in generating estimates of the probability of a document represented by a topic and the probability of a word used to represent a topic (Blei et al., 2003; Blei, 2012; Hagen, 2018). It also helps identify new themes from textual data without possibly biased perspectives (Hopkins & King, 2010; Jelveh et al., 2014). Reviews given by people on social media can be explored to find essential themes or topics influencing consumer intentions.

Topic analysis is used to determine the topic structure of the text, creating a representation that shows what topics are included in the text and how those topics change in the text. Topic analysis consists of two main tasks: topic identification and text segmentation. For example, the research conducted by (Song et al., 2020), in looking at food safety trends in takeaway food, analyzed the words on Weibo posts for four years. Overall, the discussion around the topic of takeaway food safety changes from time to time with the development and progress of the community. The top 10 words associated with each topic were obtained using the LDA technique to extract topics. Then after classification, five topics were obtained; namely, the first topic shows public concerns about the takeaway industry, the second topic concerns students, especially about the discussion and influence of this group on takeaway attendance, the third topic is about supervision and management, which shows public attention to take away industry oversight mechanism, the fourth topic has more objects of concern, such as platforms, journalists, consumers, and many more, and shows the breadth of public participation from different user perspectives, then the fifth topic focuses on regulatory bodies, so this topic reflects the concerned public on the administration and governance of the food safety industry

### *C. Service Quality and E-Service Quality*

Measures for service products are complex to be directly identified compared to goods that have a concrete form. However, there are dimensions or criteria in determining service quality standards, namely: Tangibles (physical evidence); Reliability; Responsiveness; Competence; Access; Understanding Consumers; Courtesy; Communication; Credibility; and Security (Parasuraman et al., 1988). Then there are also electronic services (e-service) where a platform or website functions to facilitate search activities, purchases/transactions, and delivery of products and services to consumers. Therefore, the quality of electronic services (e-service quality) is the ability of a platform or website to be able to facilitate all of this. Regarding the quality of electronic services, the dimensions that need to be considered are efficiency (ease and speed of use), system availability (availability of

systems related to functionality), fulfillment (fulfillment of offer promises), privacy (security and protection of customer information), responsiveness (responsiveness to difficulties/problems), compensation (compensating for customer problems), and contact (availability of assistance). All of them build relationship with customers or potential customers in forming loyalty to the services offered (Zehir & Narcikara, 2016).

### III. RESEARCH METHODOLOGY

The research design analysis must be comprehensive and involve appropriate and effective methods to achieve the research objectives (Sekaran et al., 2016). This study involves a research design that uses exploratory and qualitative research methods to find new insights and processes using big data analytics. The period that is the focus of primary data collection starts from March 2, 2020, since the COVID-19 case entered Indonesia based on the WHO reference (2020a), until December 31, 2021, according to the latest date when researchers conducted research and the COVID-19 pandemic is still ongoing in Indonesia.

#### A. *Sample and Data Collection*

Instagram and Twitter data collection only be carried out with focusing on food and beverages (Ready-to-Eat, Ready-to-Cook, and Ready-to-Drink) in online delivery services during the COVID-19 pandemic in Indonesia. This study uses data obtained from the reviews, opinions, and comments of online users on the Twitter and Instagram platforms. The search filter used in the keywords in this data collection stage is limited to a more specific location only in the territory of Indonesia.

One of the sampling techniques used for collecting data from the Twitter platform is marker-based sampling which collects data based on a shared language, in this case, Indonesian (Rieder, 2012; Pervin et al., 2016). Other than that, search queries or pre-defined keywords also help select the data for the Twitter platform through Twitter API; therefore, a topic-based sampling to group around the shared use of the term “online food delivery services” (Gerlitz & Rieder, 2013). Data collection from Twitter is obtained with the help of Twitter API (Application Program Interface) provided on the official website of Twitter for developers. API Key, API Key Secret, Bearer Token, Access Token, and Access Token Secret are provided to the researcher. Meanwhile, for the Instagram platform, the technique used to gather textual comments from official food aggregators or food delivery companies’ posts was by manually determining the relevance of comments from the public or consumers with this study. For every food aggregators’ Instagram posts, like posts from @gofoodindonesia, @grabfoodid, @shopeefoodid, and @traveloka eats, are listed within the predetermined time range and consumers’ comments from each post are then gathered. Data like comments are parsed using the Instaloader package in Python (Fricke & Bodendorf, 2020). The search filters in this data collection stage are a predetermined time range, language, and keywords that match the research topic. Furthermore, all these datasets are cleaned up to remove information that will not be used, and things that are irrelevant, in the form of advertisements, images, or videos, would only become noise and cannot be used for textual analysis.

#### B. *Stage of Data Pre-processing*

Data preprocessing stage is carried out with the Google Colab with Python language and the help from several Gensim packages. Data firstly needs to be cleaned from duplicates or identical data (Rajaraman & Ullman, 2011), then tokenized into word tokens (Manning & Schütze, 2003; Manning et al., 2009). Then special characters and marks can be removed at this stage, and all letters are converted to lowercase (lower or case folding). After that, converting or standardizing it into standard words in Indonesian through normalization. The next step is stop-words removal, which removes words with no informational meaning or influence to reduce the dimensionality of terms and focus more on significant words (Bird et al., 2009; Hidayatullah & Ma’Arif, 2017). Finally, a lemmatization step to convert each word into actual words or words based on a dictionary (Manning et al., 2009; Suhartono et al., 2014). After these steps are carried out, all of them are combined into a preprocessed dataframe and saved in CSV format.

#### C. *Stage of Topic Modeling and Data Analysis*

The core analysis stage of the data is topic modeling using Latent Dirichlet Allocation (LDA), following the method of Blei et al. (2003). The data that has gone through preprocessing needs to be formed into a dictionary and corpus. Then in the formation of the corpus of the dictionary, this stage is assisted by processing text data (tokens) according to the bag-of-words format. While the TF-IDF process is carried out to transform the dictionary into a corpus. Furthermore, in bridging the LDA process, the topic calculation process is carried out where the best coherence value from the graph plot will show the largest value. In the LDA process with several different topics, this Coherence Value (c\_v) aims to get the highest value on the topic coherence function of a data. Then,

the LDA process is carried out by using the LdaModel module from gensim.model to produce words related to each other in specific topics accompanied by the number of frequencies. Then the PyLDAvis module is used to visualize the topic modeling. Later, cross-case analysis is used to see the relationship between the topics obtained from Instagram data and Twitter data so that the exact meaning is identified and grouped into a topic group that can explain specific issues or themes.

#### IV. RESULTS / FINDINGS

The total cleaned data in the form of words (textual) was successfully obtained and cleaned from the results of scraping comments on Instagram (5,304 comments as cleaned data) and tweets from Twitter (33,504 tweets as cleaned data). Comments and tweets as data/documents used in this research are valid because they are based on consumers' perspectives or user generated content (UGC), removing all other company generated content (CGC). The data was collected only in the time range of the COVID-19 pandemic, with the discussion revolves around online food delivery services in Indonesia and originating from Indonesian users/consumers, as the language was collected only in the standard Indonesian language. All cleaned data has already filtered out from ads, identical data, posts from official accounts, other irrelevant data, and has been through the pre-processing stage, therefore making them all valid for the topic modeling process (Manning & Schütze, 2003; Denny & Spirling, 2017; Maier et al., 2018).

##### A. Result of Data Pre-processing

The need for preprocessing stages in the right order because they significantly affect the next process to the topic modeling results (Hopkins & King, 2010; Denny & Spirling, 2018; Maier et al., 2018). In pre-processing, there are stages that are interconnected with each other after cleaning the initial data, namely filtering duplicate or identical data, removing irrelevant language, tokenizing (tokenization), lowercase, removing punctuation marks, emoticons, emoji, URLs, numbers, and non-ASCII characters, and other certain characters, changing words not standard words (slang words) into standard words (normalization), removing meaningless words (stop-words), correcting typos (typo correction), and converting them into basic words (lemmatization) (Hidayatullah & Ma'Arif, 2017; Maier et al., 2018).

Table 1. Data Pre-processing Result.

Before Pre-processing	After Pre-processing
@*** min mau nnya saya mesen dri jam 6 kurng ud di trima sma restony pas jam 7 gk ad kbrin , dapet kabar tiba" restony tutup smpe jam 8 blom ada kelanjutanny lg , saldo blom balik , ini gmna ya kelanjutanny , minta pencerahanny min <a href="https://t.co/OHtG">https://t.co/OHtG</a>	pesan jam kurang terima restoran jam kabar kabar restoran tutup jam lanjut saldo balik lanjut minta pencerahan

##### B. Preparation of the Topic Modeling Process

Then in the formation of the corpus of the dictionary, this stage is assisted by processing text data (tokens) according to the bag-of-words format. The word tokens obtained from the preprocessing results are declared as unique features in a document by this bag-of-words analysis to produce Term Document Matrices. Neither the order of language nor the order in token words matter in this bag-of-words analysis (Deepu et al., 2016). Bag-of-words analysis practically counts the number of occurrences of each distinct word, converts the word to an integer word and returns the result as a sparse vector. The collection of words from each document becomes the content of the resulting Term Document Matrices. Meanwhile, the TF-IDF process is carried out to transform the dictionary into a corpus. TF-IDF can assess the importance of a particular word to a particular document, or to a corpus, or a collection of documents. So that it can serve to reduce the effect of terms that occur more often but are less meaningful and increase the influence of terms that are less frequent but more meaningful (Zhao et al., 2018). TF or Term Frequency means how often a certain word appears in a document. Meanwhile, IDF or Inverse Document Frequency indicates how often a particular word appears in the entire dataset or the entire document set (Nugroho et al., 2021). Below in Fig 1. are the result of word frequency analysis and ranking based on TF-IDF for Instagram data and Twitter data.

Fig. 1. Term frequencies of Instagram data (left) and Twitter data (right)

C. Topic Modeling of Instagram Data

Topic modeling was carried out to identify topics from public comments about online food delivery services during the COVID-19 pandemic. Coherence score metric used is coherence value (c\_v), this metric is available in the Gensim topic coherence module. Based on the coherence value, for the comments taken from the Instagram platform, it was found that the best number of topics were three topics with the largest Coherence Value of 0.533693. Therefore, it is decided k = 3 topics for the LDA model. The eight sets of topics in Table 2. contain terms/words which were translated from Indonesian to English. All terms were evaluated to label the name of each topic and the interpretability. The approach used for this naming process of the topics is by reviewing the top 10 words from each topic model with their respective top 20 documents with the highest probabilities for each topic.

Table 2. Topic summaries from Instagram data.

Topic 0: Pricing	Topic 1: Transparency	Topic 2: Limitation
Voucher	Difficult	Error
Promo	Search	Cancel
Apply	Lost	Application
Fee	Promo	Help
Delivery	Order	Use
Pay	Discount	Help
Cost	Apply	Customer [service]
Code	Eat	Order
Eat	Ovo	Halal
Hour	Restaurant	Eat

Several sample documents were randomly read, which contained a relatively large proportion of representative words from their respective topics. The meaning for every sample document that represents topics is then written into a topic label. The specific aspect of the sample documents that comprehensively describes an issue would help give the topic a label or name.

D. Topic Modeling of Twitter Data

Meanwhile, for data from Twitter tweets, this study wants to group public tweets about their opinion of online food delivery services during the pandemic COVID-19 with LDA. Based on the coherence data, for the data from Twitter platform, the best number of topics are 7 topics with the largest Coherence Value of 0.540887. The LDA model was made with 7 topics (k).

Table 3. Topic summaries from Twitter data.

Topic 0: Partners	Topic 1: Delivery	Topic 2: Availability	Topic 3: Restaurant
Service	Error	Hour	Eat
Deliver	Order	Affordable	Variety
Eat	City	Search	Online
Order	Take	Open	Product

Rain	Driver	Online	Cash
Recommend	Online	Close	Afternoon
Online	Wait	Choose	Delicious
Compassion	Track	[Runs] Out	Recommend
Promo	Complete	Entice	Menu
Advice	Route	Night	Confused
Topic 4: Deals/Offers	Topic 5: Convenience	Topic 6: Value	
Discount	Online	Promo	
Deliver	Fail	Scheduled	
Service	Name	Order	
Economical	User	Online	
Error	End	Scroll	
Promo	Order	Apply	
Willing	Gojek	Great	
Order	Open	Buy	
Apply	City	Voucher	
Balance	Different	Choose	

The eight sets of topics in Table 2., which already translated to English, were evaluated to label the name of each topic and the interpretability. The approach used for this naming process of the topics is the same with Instagram data, by reviewing the top 10 words with their respective top 20 documents, and several sample documents were randomly read to find the meaning or some aspect of the sample documents that would help giving label or name to the topic.

## V. DISCUSSION

The interpretability of every topic is discussed. The topics of the three themes are closely related to the dimensions of electronic service quality (e-service quality), namely Contact, Fulfillment, and System Availability (Zehir & Narcikara, 2016). And also, the dimensions of service quality, namely Responsiveness, Competence, Credibility, and Reliability (Parasuraman et al., 1988).

Firstly, words or terms identified in each topic are reviewed through their respective documents. It is found that some certain words or terms are the same and spread across several topics. For example, the term 'promo' in the distribution of the topics "Deals/Offers", "Value", "Pricing", and "Transparency". It can be traced from reading related documents that the topic "Deals/Offers" raises the issue of offers from service providers that provide various attractive prices for consumers, as well as on the topic "Pricing", and the topic "Value" discussed about the advantages of features in offering promos provide value for money for consumers. However, there is a difference in the meaning of 'promo' on the topic of "Transparency" which is related to the issue of implementing promos by consumers/users and not emphasizing the issue of price, therefore the presence of other words or terms in a particular topic can distinguish the meaning from other topics that may have one or more words in common.

The meaning of saving in cost as the value that consumers perceive has also represented in the topics "Value" and "Pricing" which both have the term 'use', where the use of services that provide superior features and desired pricing options can make consumers feel the value. And also on the two topics "Value" and "Deals/Offers" contain the term 'order' which means that consumers in determining their ordering steps, consider the cost factor that they feel is commensurate with the advantages of services or offers/deals they can get. Meanwhile, the topics "Transparency" and "Limitation" also contain the term 'use' but with the meaning that consumers expect a clear implementation of transparency and the service provider can reliably provide solutions to problems experienced by consumers. Then the term 'order' which is also contained in the topics of "Partners" and "Transparency" has the meaning of cognitive and affective trust where consumers tend to place orders on services or sales partners they already trust or who they feel can be trusted (Stouthuysen et al., 2019). Consumer trust is also implicitly

found in the term 'eat' contained in the topics "Partners", "Restaurant", "Transparency", and "Limitation", where consumers entrust the best quality of food provided by the service and its partners. While the topic "Pricing" also contains the term 'eat' but the implication in the document is that consumers seek information on social media related to eating activities using restaurant services or partners that provide the best prices desired by consumers.

Meanwhile, there is also the term 'discount' on the topic "Deals/Offers" and "Transparency", the term 'deliver' on the topic "Partners" and "Deals/Offers", and the term 'error' on the topic "Delivery", "Deals/Offers", and "Transparency", where these terms or words do not link one topic to another with the same word content. This is because even though certain words are found in several topics and have closeness to each other, there is no implication of a relevant relationship. As is the case with the word 'online' in the topics "Partners", "Restaurants", "Delivery", "Availability", "Convenience", and "Value" have too broad a meaning that it is difficult to see the relevance that describes the relationship between one or more topics with other topics explicitly. Therefore, it is necessary to understand the context of each topic that contains these words to find the relationship, such as on the topics "Delivery", "Availability", and "Convenience", it is found from the context of each document that contains the term 'online' means that consumers pay attention to the time factor in using this service online, which is reflected in the speed of delivery, in terms of service and information platforms being available and responsive, and also in terms of practicality and ease of use by consumers as users.

Apart from identifying certain terms or words contained in several topics, a comparison of documents representing each topic is also carried out to clarify the results of cross-case analysis on topics from Instagram and Twitter data. The results of this cross-case analysis of similarity or relationship can allow for the grouping several topics, and the differences can be separated from one topic or a group of topics to another. A similarity or relationship that groups some of the topics in this study divides them into three topic groups or three themes from the whole topic. From the cross-case analysis process, it was found from the comparison of Instagram data and Twitter data based on each topic generated that Instagram data was quite few in discussing efficiency and was dominant in discussions related to trustworthiness and cost factors. Furthermore, on Twitter's data, there is little discussion about trustworthiness and more about time and cost factors in using the service.

Based on cross-case analysis of Twitter data and Instagram data, new understanding is obtained that the results of topics can be grouped together into a topic group or theme that contains several topics in it. In this collection of topics, both from Twitter data and Instagram data, they can be grouped together into three topic groups or themes. In the first topic group, with the theme of Price-Saving Benefit, it has topics such as the "Pricing" topic which shows user/consumer demand for the desired price aspects and the efforts of service providers to fulfill them. And then the "Deals/Offers" topic raises the issue of evaluation from consumers regarding the price offers provided by service providers, which emphasize that low price value is the best offer that a food delivery service can provide. Furthermore, the topic of "Value", where aspects of the advantages possessed by service providers provide a sense of benefits that are commensurate with the costs incurred by consumers. In this theme, there are dimensions of Fulfillment of e-service quality and dimensions of Competence of service quality that need to be met because service providers must be able to deliver capabilities, either online (application) or offline (direct/delivery staff), so that consumers feel the benefits of cost savings from using this service (Marimon et al., 2009).

Then in the second group topic, namely with the theme Time-Saving Benefit, the topic "Delivery" shows consumers' attention to the expected delivery time as efficiently as possible, which is essential in ensuring consumers continue using the service. Timeliness and efficiency factors support food delivery services to not disappear easily from consumers' minds as a superior value that service can provide. The topic "Availability" shows concern for service providers and their partners in providing the benefits of timeliness, so it is essential to maintain and improve customer satisfaction based on the quality of application system, and the "Convenience" topic where the ease of using the features and advantages offered by the service provider provides the benefit of saving time for users/consumers. The three represent the System Availability dimension of e-service quality and the Responsiveness and Reliability dimensions of service quality (Fuentes-Blasco et al., 2010).

In the third group topic with the theme of Trustworthiness, it has topics such as the "Transparency" topic, namely communication and information that is in line with the implementation of users/consumers and regarding promotions/deals that are given and often get the attention of consumers, it is necessary to be exact and accurate that it can be used as expected by consumers. And then the "Limitation" topic which refers to the problems

experienced by users/consumers and how consumers expect assistance from service providers, the topic “Partners” which describes the concern of users/consumers on the credibility of the relationship between service providers and their partners, and the topic “Restaurants” which shows the reliability of restaurant partners and service providers in delivering products according to user/consumer expectations, it is also important for food delivery service providers to expand their customer base and offer new forms of foods and services, like modifying their menus and offerings to make them more diverse and attractive. These four topics show the Contact and System Availability dimensions of e-service quality that must be met, and the Responsiveness, Credibility, and Reliability dimensions of service quality that must also be met from service providers for users/consumers (Jiang & Lau, 2021; Hasan et al., 2021; Li & Tsai, 2022).

Regarding the impact on the use of food delivery services during the COVID-19 pandemic, other terms and discussions related to the safety and quality risks of food caused by COVID-19 have received less attention from Indonesian consumers. By reviewing the overall cleaned data, it was found that the issue raised through this UGC (Instagram and Twitter data) is regarding the impact of the pandemic on consumer habits as users in the intensity of online food delivery services usage. However, in this study, the topic modeling results did not explicitly state a particular topic related to the COVID-19 pandemic. Communication from online food delivery service companies or providers or from other sources to consumers regarding services during the COVID-19 pandemic had very little feedback from consumers where which implies that related facts or information has been communicated effectively but still needs to be improved to influence consumer trust as service users. This is similar to the results of research conducted by Hong et al. (2021) for consumers in the United States, where perceptions of food safety risk, severity, or vulnerability due to COVID-19 do not significantly affect consumer use of this service.

## VI. CONCLUSION AND RECOMMENDATION

Exploratory research using the Latent Dirichlet Allocation topic modeling technique has been carried out to identify issues that Indonesian consumers pay attention to regarding online food delivery services during COVID-19. The conclusion from this study is that collections of Instagram comments and tweets from Twitter provide research results that conclude some topics from the overall words obtained, namely Pricing, Transparency, Limitation, Partners, Delivery Time, Availability, Restaurant, Deals/Offer, Convenience, and Value, where they are related to several dimensions of e-service quality and service quality that can be provided by online food delivery service provider platform. The topics can be grouped into three themes which are Price-Saving benefit (Pricing, Deals/Offer, and Value), Time-Saving Benefit (Delivery Time, Availability, and Convenience), and Trustworthiness (Transparency, Limitation, Partners, and Restaurant). It is also concluded that the perception of price and service quality’s dimensions overweight the perceived risk regarding the effect of COVID-19, like food quality and safety risk.

This study will be helpful in the evaluation of service quality in making business decisions in the food delivery industry. In the end, the topics in this research can be seen as aspects considered by consumers of online food delivery services in Indonesia. The impact of accelerated digitalization and also from the restrictions on mobility during the COVID-19 pandemic have made changes in the usage behavior of Indonesian consumers where they focus quite a lot on the use of this online food delivery service so that the issues that are the topic of consumer attention deserve to be continuously reviewed and improved. Gaining a better understanding of the consumers through the insights from this study and focusing on consumers’ attention will help better-personalized service to improve business performance. From a managerial aspect, this study implies that many stakeholders in the food delivery industry should encourage the consumers to provide more unbiased posts and comments on social media that focus on service characteristics rather than emotional reactions. This study has some limitations. First, there may be a subjective judgment based on the topics’ interpretability (Blei, 2012). Second, this study does not differentiate the use of GoFood, GrabFood, ShopeeFood, and TravelokaEats service platforms because categorically, they are in the same ecosystem of online food delivery services. It is also recommended to conduct more research using the LDA technique from other perspectives, like merchants, partners, or other stakeholders in the industry, or also with many more methods like expert interview method or focus group discussion.

## Generation-Z Behavior: Social Media Marketing vs Brand Image

R.Nurhasan<sup>1</sup>, T.Hermina<sup>2</sup> and H.Fauziah<sup>3</sup>

<sup>1,2,3</sup>Management. Faculty of Economy, Universitas Garut, Garut, Indonesia

### Abstract

*Social media platforms are commonly used to strengthen the identity of a brand. The image of a brand will strengthen the perception that consumers have about the product as a result of the reflection of the consumer's thoughts. The image attached to an object will be stronger and better, depending on the delivery of promotions through social media marketing carried out properly. Conversely, when product information is not good, the image of an object is also not good. This study aims to analyze the effect of social media marketing on brand image among Z-generation students in Garut, Indonesia. This research obtains data by distributing questionnaires with the purposive sampling technique to Z-generation students. The data using validity and reliability test were then analyzed by simple linear regression. The results indicate that social media marketing influence positively on brand image of generation Z students. Z-Generation are the most active Instagram users. Therefore, social media can create a high and positive brand in the minds of consumers. Thus, the company improve the image of a product, hit can be communicated through Instagram intensely because most Instagram users are Z-Generation consumers who encourage the brand image positively*

*Keywords— Brand image; digital marketing; generation-Z; social media marketing.*

---

### I.INTRODUCTION

The marketing sector encourages increasingly fierce competition between businesses and creates other issues such as product developments, new products appearing, and shifting consumer tastes (Charm et al., 2020). Even though the company provides the best products, it may not necessarily attract consumers' interest because each consumer has different perceptions (Peña-García, Gil-Saura, Rodríguez-Orejuela, & Siqueira-Junior, 2020), intentions, and purchasing abilities. Competition and marketing problems occur in the hijab industry due to the high demand for hijab products, thus stimulating business development in the Muslim fashion industry. The emergence of new businesses in the hijab industry is a threat to existing businesses, so one way to survive is to strengthen the product's brand image. Competitors do not hesitate to take customers' attention when the brand image of a product is weak. Brands have the function of building social bonds without revealing their identities. The strong communication between brand and consumer will impact the consumer's preference for the brand (Bilgin, 2018). The main about branding is to establish strong relationships with consumers to have the power to attract consumers to choose and increase consumer loyalty. Therefore businesses always conduct studies about consumers' perceptions to create a positive brand image by applying all communication channels to build brand value (Bilgin, 2018; ElAydi, 2018). Brand image is the perception of the brand or a set of beliefs, ideas, and impressions that customers have about the brand.

The best way to build and maintain a brand image effectively is using a multidisciplinary approach that combines elements of various media instruments as objects in a digital or online ecosystem with the marketing of the subject (Notarantonio & Quigley, 2013). Marketing activities through social media are more in brand image shaping. According to Gunelius (2011), social media marketing is direct or indirect marketing to build awareness, recognition, memory, and action for brands, businesses, products, people, or other entities by using tools from the social web such as blogging, microblogging, and content share. Most businesses use Instagram to market various products or services. Marketing through Instagram requires an online admin to rebrand, provide information, pursue consumers, and directly communicate with consumers (Tsimonis & Dimitriadis, 2014). Research has shown that social media influences trust and purchase intentions and facilitates knowledge and experience sharing among consumers (Lu & Hsiao, 2010). Social media pushes the boundaries of time and space in business interactions with potential customers and promotes relationships with consumers (So, Wu, Xiong, & King, 2017).

The recording of statistical data about internet users rose from 1998 until today. In 2019 there were 171.17 million Indonesians who actively use the internet and 99.1 million Instagram users (Statista, 2022). The increasing of social media users since the growth of the population in each cohort (the Y-generation, Millennial generation, and now Z-generation). The APJII survey (2018) shows that internet users are in the age range of generation-Z

itself by 29.94% (Statista, 2022), hence at the present time it can be said that most of the internet users are Generation-Z as much as 16.83% is used for online buying and selling activities (Charm et al., 2020).

## II. LITERATURE REVIEW

### A. Social Media Marketing

According to Kotler & Keller (2015) social media is a means for consumers to share text, images, audio, and video in the form of information with each other and the company and vice versa. (Gunelius, 2011), social media marketing is a form of direct or indirect marketing to build awareness, recognition, memory, and action for brands. The companies use tools from the social web such as blogging, microblogging, and content sharing (Hajli, 2014). The social media marketing variable adopts the concept of Kim & Ko (2012) use the dimensions of social media marketing, namely: 1) Entertainment is the function of social media to have pleasant conditions and influence consumers to be attracted to social media; 2). Interaction is the second function of social media to convey information, provide information, and as an attribute in exchanging opinions; 3). Trendiness relates to new information, and using the brand's social media is a trendy thing; 4). Customization means that social media provides various kinds of information that are customized or based on consumer demand; 5). Word of mouth describes the willingness of customers to use social media to pass on information to other customers in the form of brands, products, and services.

The leading goal of social media marketing activities is to acquire new customers, increase sales, strengthen word of mouth communication and create customer loyalty (Tsimonis & Dimitriadis, 2014). In addition, companies actively exploit this kind of content and generate customer-generated information in social media marketing actions (Fortezza & Pencarelli, 2015; Leavy & Sterling, 2010; So et al., 2017). In addition, social media influences customer trust sentiment and purchase intention beyond the ease of interaction among consumers. (Hajli, 2014). Then, social media is an efficient way to interact the present with potential customers and develop a positive brand image (Fortezza & Pencarelli, 2015). Social media is a marketing communication that affects customer attitudes (Duffett, 2017). In other words, social media is a web-based marketing communication that develops brand image (Coursaris, Van Osch, & Albin, 2018).

### B. Brand Image

The customer determines the purchase decision from brand image. Keller defines brand image as an opinion that memorizes in consumers' minds. In other words, the brand image indicates the psychological aspects of how customers perceive a brand. Sallam (2014) revealed that a company has mainly responsible for the product to create the differentiation from the competitor. The identical product will be more straightforward to stay in customers' memory (Spencer & Freeman, 2012). Therefore, the companies strive to build a positive image to reflect their products. In addition, Keller (2013) defines brand image as a brand association. He describes the category of a brand's assets and liabilities that include anything linked in memory to a brand. The mental image that consumers have about the brand of a product is formed through marketing communications carried out by the company (Gavilan & Avello, 2020). Likewise with the consumer experience and the influence of the social environment. When the consumer's brand image has been formed, it will affect consumer attitudes towards the brand and trust. This study analyzes the brand image, which adopts the concept from Kotler & Keller (2012) use indicators: 1) Strength of brand associations; The power of information about the brand in the minds of the public, and how to maintain it as part of the brand image of the advertised product; 2) Favorability of brand associations; Creating consumer confidence that the brand has relevant benefits and can meet the needs and desires to form a positive brand attitude towards them. 3) Uniqueness of brand associations; The degree of uniqueness of a brand that has competitive and continuous benefits so that it can cause the target audience to be interested in using it.

Based on the literature about social media marketing and brand image, the research framework illustrated in Fig.1;

Fig. 14 Framework Research

### C. Hypotheses

Social networks as marketing tool has a function to create the relationships between brands and consumers. Lately, many businesses have turned to social media such as Instagram to communicate product information to attract new customers and retain old customers. Bonilla, del Olmo Arriaga, & Andreu (2019) stated that marketing that uses Instagram well will produce effective marketing activities and build a positive brand image. Consumers will get to know the product faster than using media such as brochures which can lead to high advertising costs, narrower target reach, and limited advertising intensity. Social media marketing has a positive effect on brand image. Based on research by Hanaysha (2018), it shows social media marketing has an effect on brand image. If the application of social media marketing is getting better, automatically the brand image that is owned will also be good. Social media is able to influence the perspective of people on a business. Almost every time on social media someone sends posts or comments about the products or services. Consumers influence each other through posting or comments, and the message spreads. The favorable product will be positive reviews or positive recommendations that have an instant effect on how the customers interact with the business, and with the global influence of social media websites, the company can promote your brand to a worldwide audience (Alim, Ali, Ara, & Rokonzaman, 2017; Budiman, 2021; Guha, Mandal, & Kujur, 2021). Social media users exchange opinions and talk about everything. Invariably shopping is a popular topic, and it is common for users to offer opinions on products they buy or share their experiences with other users. This of course affects a brand greatly and it is not difficult to see how a few negative stories can soon spread like wildfire across sites such as Instagram, thus negatively affecting the brand and reputation. In building brand image use social media marketing the company require to determine the interesting brand, listen the feedback from the customer, and build the engagement with the customer. In building a brand image using social media marketing the company requires to determine the interesting brand, listen to the feedback from the customer, and build engagement with the customer (Guha et al., 2021).

H<sub>1</sub> : The social media marketing affect brand image

### III. RESEARCH METHODOLOGY

An objectives have been identified in this study. This paper examines the effect of social media marketing on brand image. The Fig.1 has shown the research variables, correlation between variable, and the research model proposed for testing hypotheses. Quantitative methods applied to test the correlation between the both variables and achieve the determined objectives. The descriptive method aims to create an overview of social media marketing and brand image. The data collection using questionnaires to 96 respondents as generation Z. The data is measured with a likert scale between 1 to 5. Then the simple regression used to test the hypotheses using SPSS. The operational of variables shown in Table 1:

Table 25. Operational definitions of research variables

No	Variables	Dimensions	Indicators
1	Social media marketing	1. <i>Entertainment</i>	a. Interesting content b. Pleasant
		2. <i>Interaction</i>	a. Sharing information
		3. <i>Trendiness</i>	a. Follow the trend
		4. <i>Customization</i>	a. Clear information
		5. <i>Word of Mouth</i>	a. Recommendation
2	Brand image	1. <i>Strenght of brand association</i>	a. Positive opinion on product b. Impression
		2. <i>Favorability of brand associations</i>	a. Has a characteristics
		3. <i>Uniqueness of brand associations</i>	a. Recommended product

### VII. RESULT / FINDING

This research examines the demographic characteristics of the respondents. 21 of the participants are students, 31 of the respondents are civil servants, and 44 are employee. The most frequently used Instagram in a day spend 1-3 hours 34.7% of the participants, then 65.3% of participants spend more than 3 hours per day on Instagram.

Before testing the hypothesis, this study tested the validity and reliability. The results of validity and reliability show a fair score. The descriptive analysis of respondents' responses to social media marketing variables is good. The highest indicator of hijab social media marketing, consumers participate in providing information on hijab products. The response is quite beneficial for hijab companies because it can help increase sales, and provide information to other consumers, namely new models, motifs, or colours issued by the company, hence information about products will quickly spread. Hijab Elzatta provides information on social media Instagram regarding outlet addresses for consumers who want to buy products directly, and customer service to make it easier for consumers to order products online. On social media, Elzatta's Instagram provides information on what ingredients are used in the product and the price of each Elzatta hijab product. Complete information is needed by consumers to consider and make purchasing decisions.

While the lowest value of the social media marketing indicator is that consumers exchange information about the hijab. This is supported by interviews that consumers are more interested in sharing information about other attractive products, such as lower prices with materials that are not much different from motifs. The description of the brand image indicates good criteria. It means that the brand image of Elzatta's hijab is good. A company must be able to create a good brand image in the minds of consumers. A good brand image will get a positive response from consumers because consumers already have confidence or trust in a brand. Unfortunately, there is a dimension that unfavorable criteria. It shows that consumers must buy Elzatta's hijab products in the city. The hypothesis testing uses inferential statistics, namely simple linear regression.

Table 26 The result of hypotheses testing

Model		Unstandardized Coefficients		Standardized	t	Sig.
		B	Std. Error	Coefficients Beta		
1	(Constant)	-.961	3,966		-.242	,810
	X	,689	,082	,846	8,399	,000

a. Dependent Variable: Y

The test results reveal the value is 0.000. It means the value is smaller than the alpha value of 0.05, and social media marketing indicates a significant influence on brand image. A positive regression coefficient value shows the effect of the independent variable on the dependent variable is positive. It means that when companies use social media marketing well, the company's image will be better (Bilgin, 2018). On the other hand, when the company is not good at using social media marketing, the brand image will be not good (Momen, Sultana, & Haque, 2020). The test of determination explains the magnitude of the variable proportion of the dependent variable which is explained by the independent variable. This test looks at the r-square value as shown in Table 3;

Table 27. The results of determination

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	,846a	,716	,706	2,03184

a. Predictors: (Constant), X

The value of R Square shows 0.716, meaning that the influence of social media marketing on brand image is 71.6%. While the remaining 28.4% that affect the brand image is another variable. The results showed that well-managed social media marketing can improve the brand image of a product offered to consumers. This study is in accordance with the results of previous research conducted by Halligan & Shah (2011).

#### IV. DISCUSSION

Gunelius (2011), social media marketing is a form of direct or indirect marketing to build awareness, recognition, memory, and action for brands. The descriptive result shows that social media marketing is beneficial for hijab companies because it can help increase sales, and provide information to other consumers namely new models, motifs, or colours issued by the company, hence information about products will quickly spread. In addition, Sallam (2014) revealed that a company has mainly responsible for the product to create the differentiation from the competitor. The identical product will be more straightforward to stay in customers' memory. The hypothesis testing indicates a positive influence on the brand image when the social media marketing is more intensive. This research is similar to Hanaysha (2018) showing that social media marketing has an effect on brand image.

The influence of social media on a brand image has an effect of 71.6%. The percentage proves that social media involvement can shape the brand image of an object. Promotional activities through social media are the key to the success of improving brand image. Based on the descriptive analysis, the customization dimension is an effort to adjust the product to the wishes of consumers. Customization refers to the process of offering products or services in a way that is consistent with the wants and needs of consumers. The context used is usually an interesting caption every time you post content. An object in context also provides a variety of important and interesting information periodically on various official social media, especially on Instagram.

As the company uses social media marketing properly, therefore the brand image gets positive. Social media with interesting concepts such as products promoted by the influencer will attract the attention of consumers. A celebrity or influencer will promote a product by using the product to be promoted by taking a photo in an interesting place, hence the uploaded photo looks more attractive because many encourage such as the concept of the photo or the words used are interesting enough to invite followers to use the same product (Dwivedi, Johnson, & McDonald, 2015). Then the number of followers of a brand will increase consequently, consumers will be more confident to use the same brand as their idol. Thus, the image of the product will improve in the consumers' perception.

#### V. CONCLUSION AND RECOMMENDATION

Social media is the marketing media that is effective to apply in the current 4.0 revolution era. Most of the consumers for each product are Z-generation, who are active social media users. The hypothesis test revealed a positive and significant influence of social media marketing on brand image. It explains that social media create a positive brand in the consumers' memory. It implies that social media can improve brand image. The descriptive result shows that social media marketing is beneficial for hijab companies because it encourages increased sales and provides information to other consumers about recent models, motifs, or colours. It implies that information about products will quickly spread using social media. Therefore, suggestions for companies that want to expand their marketing can use social media so that product information reaches consumers quickly, sales increase, and a better brand image.

#### ACKNOWLEDGEMENT

We thank The Dean of Telkom University for providing Sustainable Collaboration in Business, Information and Innovation (SCBTII) 2022.

## The Effect of Good Corporate Governance Characteristics on Company Financial Performance (Study on Mining Companies listed on IDX 2015-2020)

Faiz Muhammad<sup>1</sup>, Viverita<sup>2</sup>

<sup>1,2</sup>Faculty of Economics and Business, Universitas Indonesia, Jakarta, Indonesia

### Abstract

*This study aimed to determine the effect of good corporate governance (GCG) characteristics on the financial performance of all listed mining companies in Indonesia from 2015 to 2020. The sample selected was mining companies. GCG is measured using five characteristics: the size of the board of directors, the board's independence, the frequency of audit committee meetings, insider shareholders, and institutional ownership. The other three independent variables are company size, interest rates, and the Covid-19 pandemic. Meanwhile, the firm's financial performance is measured by its profitability and market value. Using the fixed effect model, it is found that all characteristics of GCG except board independent and interest rates have a significant effect on company profitability. Meanwhile, the five characteristics of GCG and interest rates have a significant effect on the company's market value. This study also shows that the size of the company and the Covid-19 pandemic haveno significant effect on the company's financial performance. In accordance with previous studies, this study found various findings from each of the independent variables tested. However, it has strengthened some existingtheoretical frameworks. It can be said that companies in Indonesia, particularly in the mining sector, can improvetheir financial market performance by implementing appropriate corporate governance mechanisms.*

*Keywords— Good Corporate Governance; Company Financial Performance; Corporate Governance; Firm Size; Interest Rate*

---

### I. INTRODUCTION

The mining industry in Indonesia is one of the sectors that drives the Indonesian economy. This industry can be said to be an industry that absorbs quite a lot of workers. However, in its operation the mining industry has a significant impact on the environment and socio-economics (Dominguez-Gomez and Gonzalez-Gomez, 2021). This sector also causes serious environmental damage (such as landscape destruction, groundwater pollution, carbon emissions and industrial waste), threatens employee health and safety (such as work-related accidents), and disrupts the local communities where the company operates (Tang et al., 2020 ). Seeing these extraordinary environmental and social issues, Corporate Social Responsibility (CSR) has become an important activity in industrial sustainability in the mining sector in maintaining the company's reputation and increasing public trust in accepting companies operating. One of the driving forces for a company's CSR is corporate governance, wherehigh CG standards are very important in ensuring financial stability and maintaining company growth (OECD, 2018).

In addition, as one of the sectors that is expected to have an effect on the national and regional economies, mining companies must be able to maintain good corporate governance which aims to ensure the survival of the company, employees, and other stakeholders. Through good corporate governance, it is expected to be able to improve the company's financial performance.

The concept of comprehensive Corporate Governance began to develop after The New York Exchange Crash in 1987 where there were many multinational companies listed on the New York Stock Exchange experiencing substantial financial losses. Subsequently a series of major financial crises, scandals, and corporate failures, especially from the 1990s onwards, such as Enron and the 2007/2009 global banking crisis led to the importanceof Good Corporate Governance (hereinafter referred to as GCG).

The Forum for Corporate Governance in Indonesia (FCGI, 2001) formulated the purpose of CG to create added value for all stakeholders. GCG is expected to reduce the occurrence of conflicts of interest. Company performance can be affected by conflicts that arise within the company, these conflicts arise due to a different interest between the agent and the principal. Jensen and Meckling (1976) stated that the conflict of interest can bereduced through a supervisory mechanism that aims to align these various interests.

The purpose of establishing a company is to achieve the maximum profit, to prosper the owners or shareholders of the company and to maximize the value of the company (Ross et al. 2019). The high value of the company attracts the attention of shareholders to invest their shares in the company. Firm value is influenced by many factors, one of which is the GCG factor (Susanti and Amanti, 2012). In addition, there is some evidence showing that investors are willing to pay a high premium for the shares of companies that are considered to have a good corporate governance structure (Clarke, 2007). This confirms why the CG mechanism can be considered related to the company's financial performance.

Previous research has been conducted to examine the CG factors that affect the company's financial performance. The CG factors studied include the size of BOD, Board Independence, Insider shareholder, audit committee, and institutional ownership. Fama & Jensen (1983) stated that the general peak of the organizational decision control system, both large and small organizations is the Board of Directors (hereinafter written BOD) where companies with large BOD sizes tend to have effective supervision that can improve company performance. Al-Najjar (2014) found that a large BOD size will increase profitability, but a small BOD size will be more efficient in its stock performance. While the research of Peng et al. (2021) resulted in a negative relationship between the size of the BOD with the company's financial performance.

Fama & Jensen (1983) stated that the general peak of the organizational decision control system, both large and small organizations is the Board of Directors (hereinafter written BOD) where companies with large BOD sizes tend to have effective supervision that can improve company performance. Al-Najjar (2014) found that a large BOD size will increase profitability, but a small BOD size will be more efficient in its stock performance. While the research of Peng et al. (2021) resulted in a negative relationship between the size of the BOD with the company's financial performance. This is also in line with Yeh's (2018) research which argues that a small BOD size has advantages in communication, collaboration, and efficient decision making.

Rosenstein and Wyatt (1990) argue that the proportion of independent directors has a positive effect on stock prices and company financial performance. The board of directors can supervise the company effectively if it is separated independently from the company's management (Fama & Jensen, 1983).

Insider Shareholder is a term used to describe a director or senior officer in a company who owns several shares of the company, usually the proportion is more than 10% (Jensen & Meckling, 1976). Jensen & Meckling (1976) also said that the number of insider shareholding or managerial ownership in the company affects the company's financial performance. This is because managers who have significant shares in their own companies, in their decision making will not invest in high-risk projects, so these managers will choose to invest in projects that are likely to generate high profits. However, Kyere & Ausloos (2020) found that insider shareholding had an insignificant effect on return on assets (hereinafter written ROA) and Tobin's Q in 252 companies listed on the London Stock Exchange.

Kent and Stewart (2008) find that the quantity of disclosures reported by companies is positively related to the frequency of board and audit committee meetings held. While Kyere & Ausloos (2020) found that there was a significant effect of the frequency of audit committee meetings on ROA, but there was no significant effect on the company's Tobin's Q value.

Lins (2003), Chaganti and Damanpour (1991), and Jafarinejad et al. (2015) concluded that there is a positive influence of institutional ownership on firm value. Grief and Zychowicz (1994) in their research show that high institutional share ownership will cause the level of supervision to be more effective.

Firm size can be measured using total assets in a company where creditors view companies with large total assets because the company will be able to pay off its debts in the future so that it can avoid financial problems/difficulties (Nora, 2016). In his research, Dogan (2013) found that total assets had a significant positive effect on company profitability. Meryani et al. (2020) also found that there was a positive relationship between firm size and firm ROA.

Macroeconomic factors are outside the company and are not under management control, including social, environmental, and political conditions; competitors, as well as government policies and regulations (Adidu and Olanye, 2006). Meanwhile, the main economic factors include gross domestic product (GDP), unemployment rate, exchange rate, inflation rate, and interest rates (World Bank Group, 2015; Broadstock et al., 2011). These factors can have a positive or negative influence on the company's performance. In this study, the macroeconomic factor used is the interest rate. According to Keynes (1936); Gupta (2011), the interest rate represents the cost of borrowing the company's capital for a certain period. Since loans are a significant source of finance for many companies, the prevailing interest rates are of concern to many companies because of the indexing of interest rates in some loan arrangements; interest rates will continue to affect the firm for the entire period (Keynes, 1936;

Gupta, 2011). According to Kithuria, (2006) an increase in interest rates increases the cost of funds where this will have an impact on businesses and investors.

Indonesia is one of several countries affected by the emergence of the Covid-19 virus. Covid-19 not only has an impact on public health, but also has an impact on the economic condition of a country. So that it also has an impact on the business activities of a company. Based on data from the Central Statistics Agency (BPS) in September 2020, it was recorded that 82.85% of companies in Indonesia were affected by the Covid-19 virus pandemic.

Based on the above background, the author is interested in conducting research on the effect of the company's GCG characteristics on the company's financial performance in Indonesian mining companies. The characteristics of GCG that will be examined are the size of BOD, board independence, frequency of audit committee meetings, insider shareholders, and institutional ownership. In addition, there are three other independent variables, company size, macroeconomic variables measured by looking at interest rates, and the covid-19 pandemic. Meanwhile, the company's financial performance will be measured by looking at the profitability and market value of the company.

## II. LITERATURE REVIEW

### A. Agency Theory

Agency relationship is a contract in which the principal orders the agent to perform a service on behalf of the principal and authorizes the agent to make the best decision for the principal. If both parties have the same goal of maximizing the value of the company, it is believed that the agent will act according to orders in the interests of the principal.

By using the GCG mechanism, conflicts of interest can be avoided, in this case GCG functions as a supervisor in aligning the objectives of the principal with the agent. GCG can reduce agency problems because with supervision, management will tend to act in the interests of the company as a whole and not only individual interests.

### B. Stewardship Theory

Donaldson and Davis (1991) define stewardship theory as a situation in which management is not motivated by individual goals but is more focused on the principal's main goals. Empirical evidence shows that the company's return on equity (ROE) increases when the chairman/director role is combined with the role of Chief Executive Officer (CEO) (Donaldson and Davis, 1991).

Fama & Jensen (1983) argue that a manager has access to more in-depth and specific information about the company than an independent director. So that managers will have deeper knowledge that will help in making the right decisions. Therefore, based on stewardship theory, a low number of independent directors is an ideal condition for companies (Donaldson and Davis, 1991).

### C. Hypotheses Development

#### *The Effect Of BOD Size On The Company's Financial Performance*

BOD plays an important role in the corporate governance structure (Fama & Jensen, 1983). In addition, Al- Najjar (2017) also argues that the size of BOD is the main key in the field of corporate governance. A large BOD size will tend to be more able to access critical resources, also have more experience, knowledge, and skills (Dalton et al., 2005). Several previous studies have investigated the relationship between BOD size and firm performance. Coles et al. (2008) found that a large BOD size has a positive and significant effect on the company's Tobin's Q value.

Based on this description, the hypotheses to be tested are:

H1: The size of BOD affects the company's financial performance.

#### *The Effect of Board Independence on the company's financial performance*

According to agency theory, directors who are independently positioned apart from management can supervise the company effectively (Beasley, 1996; Fama & Jensen, 1983). Jensen & Meckling (1976) argue that independent boards can help reduce agency problems by monitoring management's opportunistic behavior. The existence of a non-executive board can reduce the occurrence of fraud in the company's financial statements (Beasley, 1996).

Previous empirical research has been conducted in examining the relationship between board independence and the company's financial performance. Black & Kim (2012); Dahya & McConnell (2007); Atmaja, Haman & Tanewski (2011) found that board independence has a positive effect on financial performance.

Based on this description, the hypotheses to be tested are:

H2: Board Independence affects the company's financial performance.

*The Effect Of The Frequency Of Audit Committee Meetings On The Company's Financial Performance*

Audit committees must be diligent and active in carrying out their responsibilities to ensure transparency, high-quality reporting and to increase the confidence of external auditors in their role (Kalbers and Fogarty, 1993; Abbott et al., 2004). An indication of diligence that is often used is the number of audit committee meetings held annually. Kent and Stewart (2008) find that the quantity of disclosure is positively related to the frequency of board and audit committee meetings held.

Based on this description, the hypotheses to be tested are:

H3: The frequency of audit committee meetings effects on the company's financial performance.

*The Effect Of Insider Shareholders On The Company's Financial Performance*

The structure of corporate ownership and its impact on the economy and non-economics have been the subject of many recent literature breakthroughs, one of which is Jensen and Meckling's (1976) agency theory. Based on agency theory, the difference in interests between managers as agents and shareholders as principals gives rise to what is called agency conflict. One of the causes of the conflict of interest that occurs between the agent and the principal is the small ownership of the agent over the company (Said et al., 2009). Therefore, a mechanism is needed to protect the interests of shareholders (Jensen and Meckling, 1976). One way to reduce agency conflicts is by having share ownership by management (insider shareholders). Gupta and Sachdeva (2019) found that companies with a high number of insider shareholders performed better than companies with a low number of insider shareholders.

Based on this description, the hypotheses to be tested are:

H4: Insider Shareholder influences the company's financial performance.

*The Effect Of Institutional Ownership On The Company's Financial Performance*

Institutional ownership is ownership of company shares owned by agencies/institutions or institutions such as insurance companies, banks, investment companies and other institutional ownership. McConnell and Servaes (1990) found a positive relationship between institutional investors' share ownership and firm performance as measured by Tobin's Q. This is since institutional investors only buy shares of companies that perform well.

Based on this description, the hypotheses to be tested are:

H5: Institutional ownership affects the company's financial performance.

*The Effect Of Firm Size On The Company's Financial Performance*

Firm size is a major factor in determining company profitability, where companies with larger sizes can produce goods at a much lower cost than smaller companies (Indonesia stock exchange, 2019). Companies that have large total assets are considered to have good prospects in a relatively stable period and can generate profits compared to companies that have low total assets (Chen et al., 2005).

Dogan (2013) examined the effect of firm size on firm profitability, where firm size was measured using total assets, sales, and the number of workers. The results show that total assets have a significant positive effect on company profitability. Devi and Devi (2014) found that firm size has a positive effect on 50 Pakistani companies listed on the Karachi Stock Market. Meiryani et al. (2020) also found that firm size had a positive effect on the firm's ROA value.

Based on this description, the hypotheses to be tested are:

H6: Firm size affects the company's financial performance.

*The Effect Of Interest Rates On The Company's Financial Performance*

The interest rate is a measure of the cost of capital that must be incurred by the company for the use of funds from the owners of capital (Suseno, 1990). High interest rates will increase the cost of capital that must be borne by the company (Tandelilin, 2010). Interest rates affect the overall level of economic activity, the flow of goods

and services and financial assets in the economy (Saunders, 1999). According to Kithuria, (2006) an increase in interest rates will increase the cost of funds where this will have an impact on businesses and investors. In that situation it will be more attractive for investors to deposit money in banks, so companies or businesses will slow down the implementation of their business plans and investors will reduce their investment in financial markets.

Several previous studies have been conducted regarding the effect of interest rates on the company's financial performance. Aggarwal (2010) argues that the effect of interest rates on stock market performance greatly affects the price of securities which are basically determined by a company's net income, and therefore directly proportional to the company's performance. Lee (2009) argues that interest rate volatility may have mixed effects across the economic spectrum in any given country. For example, interest rates will have an impact on the cost of doing business. The effect of interest rates can ultimately be reflected in stock prices.

Based on this description, the hypotheses to be tested are:

H7: Firm size affects the company's financial performance.

#### *The Effect Of The Covid-19 Pandemic On The Company's Financial Performance*

Indonesia is one of several countries affected by the emergence of the Covid-19 virus. Covid-19 not only has an impact on public health, but also has an impact on the economic condition of a country. So that it has an impact on the business activities of a company. Based on data from the Central Statistics Agency (BPS) in September 2020, it was recorded that 82.85% of companies in Indonesia were affected by the Covid-19 virus pandemic.

The Covid-19 pandemic affects the economy and financial markets through its impact on consumption, supply, financial markets, and its spillover effect on the real economy (Brodeur et al., 2020; Coibion et al., 2020). Economic inactivity and negative impacts on supply chains and employment directly affect the operational and financial performance of companies. Greenwood et al. (2020) said that the impact of the Covid-19 pandemic on corporate earnings was comparable to that of the global financial crisis.

Based on this description, the hypotheses to be tested are:

H8: The Covid-19 pandemic affects the company's financial performance.

## I. RESEARCH METHODOLOGY

Research methodology, the research method describes the design of activities, scope or object, main materials and tools, place, data collection techniques, operational definitions of research variables, and analytical techniques. [Times New Roman, 10, normal].

### A. Population and Sample

The population in this study were all companies listed on the Indonesia Stock Exchange from 2015 to 2020. The sample selected was mining companies.

The method used for sampling is purposive sampling with the aim of obtaining a representative sample and meeting predetermined criteria, including:

- 1 Mining companies listed on the Indonesia Stock Exchange in 2015 - 2020.
- 2 Mining companies that issue annual reports.

### B. Dependent Variables

Several researchers have measured financial performance with various accounting-based measures such as sales, earnings per share (EPS), and return on equity (ROE). In this study, financial performance is measured by measuring the company's profitability and market value, profitability is measured by using ROA, while market value is measured by the value of Tobin's Q. Core et al. (2006) argues that ROA is the most appropriate measure in measuring the company's operating profit, especially in examining the relationship between corporate governance and the company's financial performance. ROA is also not affected by leverage, extraordinary items, and discretionary items. Several previous studies have also used ROA in measuring the company's financial performance (Kyere and Ausloos, 2020; Al-Najjar, 2014; Peng et al., 2021). So, the authors use the ROA measure in measuring the company's financial performance.

The second dependent variable used in this study is Tobin's Q. Tobin's Q is used to assess the company's existing assets and future growth potential (Malkiel and Fama, 1970). Tobin's Q can also show how investors'

expectations of future events include the evaluation of current business strategies (Demsetz & Villalonga, 2001).

The following is a mathematical description of the two dependent variables.

- ROA provides an indication of how well a company's assets are being used to generate profits. ROA is calculated by dividing the company's annual net income by its total assets

$$ROA = \frac{\text{Net Income}}{\text{Total Assets}} \times 100$$

- Tobin's Q is the ratio of the market value of outstanding shares and the book value of debt divided by the book value of the company's assets.

$$Q \text{ Ratio} = \frac{\text{Total Market Value} + \text{Total Book Value of Liabilities}}{\text{Total Book Value of Assets}}$$

### *C. Independent Variables*

#### *Size of BOD*

BOD size is the number of BOD members in the company. BOD size is measured by counting the number of BOD members in the company.

#### *Board Independence*

Independent board refers to an outside board of directors who is not affiliated with the top executive of the company (Fama and Jensen, 1983). Board independence is expressed as a percentage (%) which is measured by comparing the number of independent boards divided by the total number of BOD in the company.

#### *Frequency of Audit Committee Meeting*

The frequency of audit committee meetings is the number of meetings/meetings in a year held by the audit committee in a company. The frequency of audit committee meetings is calculated by calculating the number of audit committee meetings frequency in the company's annual report listed in the corporate governance report.

#### *Insider Shareholder*

Insider Shareholder is the level of management's share ownership that actively participates in decision making (Jensen & Meckling, 1976). Insider Shareholder is measured by calculating the percentage (%) of the number of shares owned by the management, namely managers, affiliated commissioners (excluding independent commissioners), and directors divided by the total number of shares getting smaller.

#### *Institutional Ownership Variables*

Institutional ownership is shares owned by institutions such as banks, insurance companies, pension funds, limited liability companies, and other financial institutions (Pirzada et al., 2015). Institutional ownership is expressed as a percentage (%) which is measured by comparing the number of shares owned by institutional investors divided by the total number of shares outstanding.

#### *Firm Size*

Firm size is usually used as an important fundamental characteristic of a company (Dang et al., 2018). Several previous studies (Dogan, 2013; Saliha and Abdessatar, 2011; Pervan and Visic, 2012) have used the natural logarithm of total assets as an indicator of firm size. So that in this study the size of the company is measured by calculating the value of the natural logarithm (Ln) of the company's total assets.

#### *Interest Rate*

The interest rate is a measure of the cost of capital that must be incurred by the company for the use of funds from the owners of capital (Suseno, 1990). The interest rate used in this study is the Bank Indonesia interest rate. The Bank Indonesia interest rate is the interest rate that reflects the monetary policy set by Bank Indonesia and announced to the public ([www.bi.go.id](http://www.bi.go.id)).

#### *Covid-19 Pandemic (Dummy)*

Dummy of the Covid-19 pandemic as a measure of conditions during and in addition to the Covid-19 pandemic in Indonesia. Where the number 0 is used as an indicator of the period of conditions other than the Covid-19 pandemic and the number 1 as an indicator of the period of conditions during the Covid-19 pandemic.

#### *Hypothesis Testing*

According to Nachrowi (2006), hypothesis testing is useful for testing the significance of the regression coefficients obtained. This means that the regression coefficient obtained statistically is not equal to zero, because if it is equal to zero, it can be said that there is not enough evidence to state that the independent variable has an influence on the dependent variable. For this purpose, all regression coefficients must be tested.

Testing the hypothesis regarding the effect of BOD size, board independence, frequency of audit committee meetings, insider shareholders, institutional ownership, company size, interest rates, and the Covid-19 pandemic on financial performance using panel data regression analysis. The regression model created is:

Model 1: Effect of GCG characteristics, firm size, interest rates, and the covid-19 pandemic on profitability

$$ROA_{it} = \alpha + \beta_1 UB_{it} + \beta_2 BI_{it} + \beta_3 FMKA_{it} + \beta_4 IS_{it} + \beta_5 KI_{it} + \beta_6 UP_{it} + \beta_7 SB_{it} + \beta_8 PC_{it} + e_{it}$$

Model 2: The effect of GCG characteristics, firm size, interest rates, and the covid-19 pandemic on market value

$$Q_{it} = \alpha + \beta_1 UB_{it} + \beta_2 BI_{it} + \beta_3 FMKA_{it} + \beta_4 IS_{it} + \beta_5 KI_{it} + \beta_6 UP_{it} + \beta_7 SB_{it} + \beta_8 PC_{it} + e_{it}$$

Information:

ROA: Return on assets

Tobin's Q Ratio

$\alpha$ : Regression equation constant

$\beta$ : Regression coefficient of each variable

UB: Size of Board of Director

BI: Board Independence

FMKA: Frequency of Audit Committee Meetings

IS: Insider Shareholder

KI: Institutional Ownership

UP: Firm Size

SB: Interest Rate

PC: Covid-19 pandemic

error

## III.RESULT / FINDING

## A. Descriptive Statistics

Descriptive statistics show the characteristics of the sample and data used in the study, namely by looking at the minimum and maximum values, the average (mean) and standard deviation which are the results of data processing of the dependent and independent variables.

Table 1. Descriptive Statistics.

Variable	Maximum	Minimum	Mean	Standard Deviation
BOD	86	2,00	12,0096	4,011
MKA	86	2,00	77,0013	9,1019
IS	86	0,00	0,9406	0,017
KI	86	0,00	0,9968	0,028
P	86	18,40	31,103,43	2,393
SB	86	4,25	7,5049	5,108
PC	86	0,00	1,0067	0,047
Q	86	0,318,17	74,53244,4	7,11061,52
ROA	86	2,00	12,0096	4,197

The table shows that the value of Tobin's Q (Q) as the dependent variable has an average value of 7,244.40, or greater than 1, which means that most companies in the mining sector have a market value greater than the value of the listed company assets. This shows that the shares in most of the mining sector companies are overvalued. Meanwhile, the second dependent variable, namely ROA, shows an average value of -0.02 which means that most companies in the mining sector cannot use their assets effectively to generate income.

## B. Hypotheses Testing

Coefficient of Determination ( $R^2$ )

The coefficient of determination essentially measures how far the model's ability to explain variations in the dependent variable is. The value of the coefficient of determination of the regression model in this study is shown in the following table:

Table 2. Coefficient of Determination.

Model	M Square	R Square	Adjusted R Square
1		0,787	0,732
2		0,982	0,978

The table above shows the  $R^2$  value of 78.7% and Adjusted  $R^2$  of 73.2% in model 1. While model 2 shows the value of  $R^2$  of 98.2% and Adjusted  $R^2$  of 97.8%. According to Ghazali (2009), the fundamental weakness of using  $R^2$  is the bias towards the number of independent variables included in the model. Every additional one independent variable, then the value of  $R^2$  must increase. Therefore, many researchers recommend using the Adjusted  $R^2$  value when evaluating the best regression model. From the results of the table above, the value of Adjusted  $R^2$  is 73.2% in model 1, which means that 73.2% of the variation in company profitability as measured by ROA can be explained by variations of eight independent variables, namely BOD size, Board Independence, meeting frequency, audit committee, Insider Shareholder, Institutional Ownership, company size, interest rate, and the Covid-19 pandemic. The remaining 26.8% is explained by other variables outside the model. While in model 2, the Adjusted  $R^2$  value is 97.8%, which means that 97.8% of the variation in firm value as measured using Tobin's Q can be explained by variations of five independent variables, namely BOD size, Board Independence,

frequency of audit committee meetings, Insider Shareholder, Institutional Ownership, company size, interest rates, and the Covid-19 pandemic. The remaining 2.2% is explained by other variables outside the model.

### F Test

The F test is used to determine the effect of the independent variables on the dependent variable together. The significance of the hypothesis model proposed in the F test is a significance ( $\alpha$ ) of 5%. The following is a table of F test results:

Table 3. F Test.

	M	F	Sig. F
odel			
1	77	14,2	0,000
2	385	214,	0,000

From the table above in model 1, the calculated F value is 14,277 with a significance of 0.000. Because the significance value of the F test in model 1 is  $0.000 < 0.05$ , it can be concluded that the eight independent variables are BOD size, Board Independence, audit committee meeting frequency, Insider Shareholder, Institutional Ownership, company size, interest rate, and the Covid pandemic. -19 jointly affect the company's ROA. While in model 2, the calculated F value is 214.385 with a significance of 0.000. Because the significance value of the F test in model 2 is  $0.000 < 0.05$ , it can be concluded that the seven independent variables are BOD size, Board Independence, audit committee meeting frequency, Insider Shareholder, Institutional Ownership, company size, interest rate, and the Covid pandemic. -19 have a joint effect on the company's Tobin's Q value.

### T Test

For testing the first hypothesis to the eighth hypothesis testing is done using the t test. The t-test basically shows how far the influence of one independent variable individually on the dependent variable. Based on the test results using multiple linear regression analysis, the following results were obtained:

Table 3. T Test.

Variable	Var Regression	Coef.	t	Sig	Results
Constanta	C	3,543			
B	U	-	-	(	Significant
I	B	1,075	1,	(	Not Significant
MKA	F	-	-	(	Significant
S	I	1,318	3,	(	Significant
I	K	0,909	2,	(	Significant
P	U	0,005	1,	(	Not Significant
B	S	-	-	(	Significant
C	P	-	-	(	Not Significant

In model 1 of the eight independent variables, namely BOD size, Board Independence, frequency of audit committee meetings, Insider Shareholder, Institutional Ownership, firm size, interest rates, and the Covid-19 pandemic, there are five independent variables that have a significant effect on company profitability as measured by using ROA.

Table 4. T Test.

Variable	Coef. Regression	t	Sig.	Results
Constanta	30304,71			
UB	-495,69	-	0,03	Significant
BI	-23823,89	-	0,00	Significant
FMKA	772,81	-	0,00	Significant

		40	00		
IS	12670,92	9	3,13	0,00	Significant
KI	-6402,45	2,085	-	0,03	Significant
UP	-68,17	1,083	-	0,07	Not Significant
SB	-2036,18	2,087	-	0,03	Significant
PC	1078,69	5	0,54	0,58	Not Significant
			88		
			20		
			34		
			87		
			65		

While in model 2 of the eight independent variables, namely BOD size, Board Independence, frequency of audit committee meetings, Insider Shareholder, Institutional Ownership, firm size, interest rates, and the Covid-19 pandemic, there are 2 independent variables that have no significant effect on the company's market value. as measured using Tobin's Q ratio. This can be seen from the significance probability for the company size of 0.0734

> 0.05 and the Covid-19 pandemic of 0.5865 > 0.05. While the other six variables have a significant effect on the company's Tobin's Q value.

#### IV. DISCUSSION

Testing the effect of the BOD measure showed a significant negative result on ROA and Tobin's Q. These results are in line with the research of Peng et al. (2021) which results in a negative relationship between the size of BOD and the company's financial performance as measured by ROA. Yeh (2018) argues that a small BOD size has the advantages of communication, collaboration, and more efficient decision making compared to companies with a large BOD size. This is also supported by the view that a large BOD measure can weaken the efficiency of supervision, control, and decision making (Lipton and Lorsch, 1992). Then the first hypothesis can be proven by models 1 and 2 or the first hypothesis is accepted.

Testing the effect of board independence shows results that are not significant to the company's ROA. This could be because the existence of independent commissioners in the company is only used as a formality in fulfilling existing regulations. So that the function of the independent commissioner in monitoring and independence of the board of directors' policies is not carried out properly (Darwis, 2009). Meanwhile, the second model of board independence shows a significant negative effect on the company's Tobin's Q value. These results are in line with the research of Klein (1998) and Peng et al. (2013) which resulted in a negative relationship between BI and the company's financial performance. This is supported by the view of stewardship theory which states that inside directors have more in-depth knowledge of the company (Donaldson, 1990). Thus, compared to inside directors, the effectiveness of independent directors' performance is limited by asymmetric information (Matusaka et al., 2010; Fama & Jensen, 1983). So, the second hypothesis cannot be proven by model 1, but can be proven by model 2 or the second hypothesis proposed is accepted.

Testing the effect of the frequency of audit committee meetings shows negative and significant results on the company's ROA value. The results in model 1 are in line with previous studies conducted by Bouaine & Hrichi (2019) and Ferial et al. (2016) which says that the audit committee has a negative effect on financial performance. Not all audit committees have expertise in accounting and finance, thus affecting the effectiveness of supervision of the company's financial statements. However, the test showed significant positive results on the company's Tobin's Q value. This result is different from the first model but supports the view of Kent and Stewart (2008) that a high frequency of audit committee meetings leads to high financial performance. This result also shows that the role of the audit committee is well implemented, namely, to assist the Board of Commissioners in carrying out its oversight function (oversight) and become one of the main pillars in the implementation of GCG principles in the Company. It can be concluded that the third hypothesis which states that the frequency of audit committee meetings influences the company's financial performance is acceptable.

Testing the influence of insider shareholder shows a significant positive result on the ROA value. This means that the increase in IS will have a positive effect on the company's ROA and Tobin's Q values. This result is in line with the research of Gupta and Sachdeva (2019) which found that companies with a high number of insider shareholders have better performance than companies with a low number of insider shareholders. Jensen and Meckling (1976) observed that an increase in insider shareholder can reduce agency costs. Managers who have a significant stake in a company will not invest in high-risk projects that are destructive or excessive. Therefore, in principle, managers will be careful in investing. Based on the results of panel data regression testing, it can be concluded that the fourth hypothesis which states that insider shareholders affect the company's financial performance can be proven by model 1 or the fourth hypothesis proposed is accepted. It is concluded that the fourth hypothesis which states that insider shareholder influences the company's financial performance can be proven or the fourth hypothesis proposed is accepted.

Testing the effect of institutional ownership using panel data regression showed a significantly positive result on ROA. Every increase in KI will have a positive effect on the company's ROA value. This result is in line with the research of McConnell and Servaes (1990) which found a positive relationship between institutional investors' share

ownership and firm performance. This is due to the fact that institutional investors only buy shares of companies that are performing well. It is different in the second model, which shows a significant negative result on the company's Tobin's Q value. This result is in line with research by Jennings (2002) which shows that institutional ownership does not succeed in increasing firm value, namely institutional ownership reduces firm value. This is because institutional investors are not the majority owners so they are not able to monitor the performance of managers properly. Institutional existence actually reduces public confidence in the company. As a result, the stock market reacted negatively in the form of a decrease in stock trading volume and stock prices, thereby reducing the value of the company. So it can be concluded that the fifth hypothesis which states that institutional ownership affects the company's financial performance is proven or the fifth hypothesis proposed is accepted.

Testing the effect of firm size shows insignificant results on ROA and Tobin's Q. These results may be due to the limited number of research samples. Based on the results of panel data regression testing, it can be concluded that the sixth hypothesis which states that company size affects the company's financial performance cannot be proven or the sixth hypothesis proposed is rejected. So it can be concluded that the sixth hypothesis which states that company size affects the company's financial performance cannot be proven or the sixth hypothesis proposed is rejected.

Testing the effect of interest rates using panel data regression showed a significant negative result on ROA and Tobin's Q. This result is supported by the argument of Kithuria (2006) which states that an increase in interest rates will increase the cost of funds where this will have an impact on business and also investors. In that situation it will be more attractive for investors to deposit money in the bank, so the company or business will slow down the implementation of their business plans and investors will reduce their investment in the financial market, as a result the value of the company will decrease. So it can be concluded that the seventh hypothesis which states that interest rates affect the company's financial performance can be proven or the seventh hypothesis proposed is accepted.

Testing the effect of the Covid-19 pandemic showed insignificant results on ROA and Tobin's Q. This result may be due to the limited number of research samples. In addition, the sample of companies studied are mining companies listed on IDX, so it can be said that they are large companies. Greenwood et al. (2020) found that small businesses most impacted by the Covid-19 pandemic were thus highly dependent on bank debt and loans from shareholders, which could trigger financial difficulties for these companies during the pandemic. In addition Shibata's (2020) research found that at the employee level the Covid-19 pandemic had more of an impact on low-income groups compared to wealthier groups. So it can be concluded that the eighth hypothesis which states that the Covid-19 pandemic affects the company's financial performance cannot be proven or the eighth hypothesis proposed is rejected.

Companies in Indonesia, especially in the mining sector, can improve their financial performance both in terms of profitability and market value by implementing the right GCG mechanism. One of the GCG factors that can be taken into consideration is the size of the BOD in a company where the two models tested show that the higher the BOD size, the lower the company's financial performance. A small BOD size has the advantage of more efficient communication, collaboration, and decision making compared to a company with a large BOD size. From these results, it can be considered for the company to streamline the number of its BOD members so that the company's performance can increase. Then another GCG factor that can be taken into consideration by the company is the insider shareholder, where the high number of insider shareholder also shows a positive influence on the company's financial performance in the two models tested. Management who has a fairly high shareholding in their own company tends to be more careful and calculating in making investment decisions.

## V. CONCLUSION AND RECOMMENDATION

Based on the results of the analysis presented in chapter 4, namely the panel data regression method on two models of the influence of the five characteristics of GCG, company size, bank interest rates, and the Covid-19 pandemic on the company's financial performance.

The estimation results of the first model show that of the five characteristics of GCG, there is only one independent variable whose hypothesis is rejected, namely the independent variable board independence. While in the second model, the results of the study show that the five characteristics of GCG have a significant influence on the company's financial performance. The two models tested show that the independent variable interest rate has a significant effect on the company's financial performance. While the independent variables of company size and the covid-19 pandemic have no significant effect on the company's financial performance.

In accordance with previous studies, this study produced various findings from each of the independent variables tested. However, it has strengthened some existing theoretical frameworks. It can be concluded that companies in Indonesia, particularly in the mining sector, can improve their financial market performance by implementing appropriate corporate governance mechanisms.

One of the GCG factors that can be taken into consideration is the size of the BOD in a company where the two models tested show that the higher the BOD size, the lower the company's financial performance. A small BOD size has the advantage of more efficient communication, collaboration, and decision making compared to a company with a large BOD size. From these results, it can be considered for the company to streamline the number of its BOD members so that the company's performance can increase. Then another GCG factor that can be taken into consideration by the company is the insider shareholder, where the high number of insider shareholder also shows a

positive influence on the company's financial performance in the two models tested. Management who has a high shareholding in their own company tends to be more careful and calculating in making investment decisions.

Other academics can develop this research further, it should be noted that this research has a limitation, namely it only uses a period of 6 years (2015 to 2020), so that the scope of the research period can still be expanded. In addition, the sample used in this study is only for companies in the mining sector, so it can be studied further in other sector companies. Further research can also consider other GCG factors such as BOD/BOC gender, BOD/BOC tenure, and others. In addition, other factors outside of GCG such as technology, economic conditions, and others can be considered for research, because they may have an impact on the company's financial performance.

#### ACKNOWLEDGEMENT

I would like to express my deepest appreciation to Ms. Viverita, Ph.D. for their valuable suggestions, constructive and useful criticism during the planning and development of this research work. I also thank the University of Indonesia for giving me the opportunity to continue my studies as a Master of Management student. Finally, I would like to thank my parents for their support and encouragement during my studies.

## Does Educating Customers Increase Loyalty Toward Digital Banks?

Jefry Hartanto Kurniawan<sup>1</sup> and Triana Hadiprawoto, PhD<sup>2</sup>  
<sup>1,2</sup> University of Indonesia, Jakarta, Indonesia

### Abstract

*Digitalization, as part of the use of technology in the financial industry, plays an important role in cost efficiency, network enhancement, and innovation. Banking is one of the industries experiencing a rapid digitalization transition with the emergence of digital banking. Indonesian people are still not very familiar with digital banking and have considerations related to information security and usage. For this reason, it is important for digital banking to educate customers about specifications, benefits, financial services, and expertise. Education will enhance the different skills of each individual, both company-specific skills and market-specific skills. When digital banking invests in education to customers, it will be smarter and more informative, whether it will lead customers to switch or even carry out E-WOM positive associations and generate customer loyalty. The purpose of this study was to test sixteen hypotheses about the effect of education on customer loyalty with a multi-cross-sectional study design. Two hundred respondents of digital banking customers in Indonesia will be surveyed in stage one (T1) on independent variables. thereafter within three months will be re-tested for the dependent variable (T2). Data analysis will be carried out using the SEM (Structure Equation Model) method to measure the level of loyalty to education that has been carried out by digital banking. The result is the significant effect of education on digital banking loyalty, so digital banking needs to make the right education strategy to increase the level of customer loyalty.*

### I. INTRODUCTION

Indonesia is a country with the fourth-largest population in the world (Hayati et al., 2011). Indonesia is also a member of the G20 consisting of developed and emerging countries in the world. The forum has discussed that one of the biggest challenge in economic development is digitalization (Zaoui & Souissi, 2020). It is predicted and expected there will be a transformation into the internet and data-based digitalization in order to support the realization of the cost efficiency, network development, and the utilisation of technology. For example, as the implication of the COVID-19 pandemic many commercial transaction has moved towards the digital sphere, where customers are no longer visiting a physical store but instead browse through an online store or online marketplace; completing transaction through bank transfer, e-wallet, or credit card, and have the products delivered directly to home (Tabrizi et al., 2019). The development of digitalization in Indonesia is still growing. Digital banking channels improve customers' access, facilitate the offerings of more services, increase customer loyalty, attract new customers, provide services offered by competitors and reduce customer attrition (Muluka et al., 2015).

Based on the data from OJK (Otoritas Jasa Keuangan). Banking as one of the indicators of the economy cannot be separated from the transformation of digital development, currently, there are many emerging Digital Banking where the bank does not have a branch office (OJK, 2020). Today's increased regulation and competitive challenges are forcing banks to have transformation in cost reduction and enter digital banking (Muluka et al., 2015). Digital banking technology is very advanced that it plays a major role in improving service standards in the financial institution sector (Fernandes & Pinto, 2019). Currently, major players in the conventional bank industry these are competing to invest in digital banks (Laycock, 2021). The digital bank was pioneered by major conventional banks in Indonesia such as Blu by BCA, TMRW by UOB, Digibank by DBS Indonesia, Jenius by BTPN, and others. Digital Bank has a low-cost structure because it does not have a branch office, which makes it easy for its customers to manage their financial portfolios (Laycock, 2021). People can open accounts without having to come to the branch office, can open deposits online, and also able to make money transfers via their mobile phones easily and quickly. However, at the present time, the Indonesian people are still quite anxious (Setiawan, 2012). People still feel worried about the security of online transaction and also suspicious with the concept of having their money in a digital bank that has no physical presence (Priyambodo, 2016). Conventional banking is still very dominant in Indonesia, seeing that most Indonesians are still comfortable with banking with branch offices. Whereas digital banks have to heavily educate the public by providing advertisements both in traditional channels such as television, prints, and outdoors, as well as online channel such as social media, and others.

Customers skepticism and their lack of knowledge encourage digital banks to continue their education effort to the public. Investment in education is hoped to be the gateway to build positive perception towards the service and loyalty in long term. Company education will produce expertise and knowledge for customers. Company and market education can produce two different customer skills, namely firm-specific expertise and market-specific expertise (Bell et al., 2017). The expertise of a customer can come from anywhere, such as the environment, family, workplace, and others customer learning and product standards in creating switching costs that can reduce the threat from competition in mature markets. (Anderson & Simester, 2013) said that three stages for customers in learning information. the awareness stage, the consideration stage, and the decision stage. (Kotler & Keller, 2016) Kotler said the initial stage in buying a product and service is to seek information. The first stage in learning is awareness. For this reason, it is important to conduct proper education when customers are looking for information and awareness.

It has been suggested that WOM can serve as one of the most credible ways for customers to obtain product-related information and make product adoption decisions (Zhang et al., 2021). WOM is also something to consider in the marketing mix (Cheng et al., 2021). Customers who are expert can easily evaluate alternatives so that they can focus more on the benefits of the product. If customers are experts and are satisfied, will they engage in spreading positive word-of-mouth (Imbayani & Gama, 2018). World of Mouth and provide references to others However, increased knowledge may lead to the exploration of other services from competing providers (Sun et al., 2021). The effect is that customer loyalty can decrease even though the company has invested in customer education. The main goal of the company in the final stage is loyal customers. Loyal customers will certainly accept all the advantages and disadvantages of the company and remain customers who make purchases and even make references to others (Keller et al., 2006). In addition, the research of Jin Zhang Et al (2019) found that one of the factors for customers to determine the satisfaction of payment platform services is the customer expertise. In their research, customers with high expertise has higher satisfaction and tend to be more loyal to the brand (Eisingerich et al., 2014).

The main problem of this research is how digital banking should educate considering the market for digital banking is still relatively new in Indonesia. The role of education is whether to bring customers to try digital banking and become loyal like in conventional banking.:

- a. What are the benefits of educating customers?
- b. What is the relationship between customer education and customer expertise?
- c. Will customer expertise relate to E-WOM positively?
- d. How is customer expertise related to perceived switching cost?
- e. How is E-WOM related to customer loyalty?
- f. How is customer expertise related to customer loyalty?
- g. What is the relationship between customer education and customer satisfaction?

At first, the researcher will determine the problem, namely how a digital banking needs to educate customers, and whether this will have a positive impact (loyalty) to the Firm or vice versa. In addition, will investing in the customer education stage make the customer switch to another Firm in the same market. The initial hypothesis sees that there is a possibility that when the Firm conducts market education it will make customers disloyal to the Firm, seeing the intense business competition. After finding the right problem, data will be collected using a survey method with Structure Equation Modeling. Furthermore, data analysis will be carried out using MOS (Moment Analysis of Structure). After the data is successfully analyzed, a hypothesis and validity test will be carried out and conclusions will be drawn for the Firm's managerial steps.

## II. LITERATURE REVIEW

### A. Customer Education

The definition of customer education is refers to activities initiated by a company/firm to provide knowledge to their customers (Sweeney et al., 2014)., The effect of customer education can be positive (on loyalty) or negative (on buying a competitor's product). Education is a process of informing, explaining, and demonstrating concepts to customers (Bell et al., 2017). It leads to the reduction of information asymmetry between the firm and its customers and provides direction to customers on how to evaluate the selection of products and services (Bergh et al., 2019).

### *Firm-Specific Education*

Firm-specific education refers to education activities initiated by firm that produces special abilities related to the products and services offered by the firm itself(Bell et al., 2017). The information provided is an attribute, specification, and others related to the firm directly. A direct example is when a firm educates customers about the benefit of low administrative costs or the free transfer fee to other bank(Eisingerich & Bell, 2006).

#### *Market-Specific Education*

Market-specific education refers to any education activities initiated by a firm that produces industry-specific skills from firm-related products and services(Bell et al., 2017). The firm provides extensive information about products and services in related industries(Bell & Eisingerich, 2007). For example, when a firm conducts education related to the digital banking about how efficient it is due to its ability to open an account anywhere or the ease of use of its mobile app.

#### *Customer Expertise*

Basic customer expertise is obtained when customers have product-related experiences(Wirtz & Mattila, 2003). Customer will form an expertise from internal (demography, family, reviews) and external factors (firm, environment) so that they will be able to see and understand the products and services in the market(Bell & Eisingerich, 2007). Customer expertise has been noted as a "valuable asset" that can be leveraged to increase cross-selling opportunities, while customer expertise a major determinant of engagement in the service co-production process (Sweeney et al., 2014). Customer expertise related to the firm is the expertise possessed by customers about aspects related directly to the firm such as brand, product value, and added value. For example, customers know that Bank BCA, for example when a customer knows how to apply for a mortgage product at BCA. What documents are required as well as the benefits of the product compared to other banks. Another thing could be when a customer has a problem with a debit card, what is the procedure and does the customer understand the firm's expertise? Expertise related to the market is the expertise possessed by customers about product and service variables and perceptions of the value and benefits of products in the product and service industry. for example, when customers know what savings are, what are the procedures, and benefits.

### *B. Perceived Switching Cost*

Customers with more education perceive less risk in switching companies as a result of being more confident in assessing competitive alternatives (Anderson & Simester, 2013).Switching costs are one-time costs, not recurring costs when customers first switch to other products and services(Eisingerich & Bell, 2006). Based on the following theory,(Burnham et al., 2003) explain that switching costs are costs that are obtained by customers when they switch to competitors from the products and services they have used. The costs that may arise are not only economic costs but can also be more indirect such as costs of seeking information, discount fees, study costs, and psychological risks.

The cost of switching customers consists of three parts, namely (Burnham et al., 2003):

#### *Information Switching Costs*

This principle makes the customer will incur costs related to the economic and time costs that have been carried out by the customer, such as evaluation costs, study costs, and setup costs.

#### *Financial Switching Costs*

Financial switching costs are more related to the resources already expended by the customer. Customers will lose these resources by switching to competitors. Examples such as financial losses due to the cost of closing an account at a bank.

#### *Switching Costs Associated With Relationships*

when a customer switches to products and services elsewhere, they will experience psychological and emotional risks due to losing their identity and relationship with the main Firm. For example, when a banking customer loses contact with customer service customers at the bank

### *C. E-WOM*

WOM is ranked as the most effective source of information in marketing products and services (Huang et al., 2011). Because service products such as financial products cannot be seen directly, experience from other customers become important information to shape perception and evaluation (Keller et al., 2006).

E-WOM is the process by which customers exchange information with each other through online channel/platform about a brand (Tantrabundit, 2018). Marketing is done through word of mouth between customers to meet the marketing objectives of a Firm (Kotler & Keller, 2016). (Hennig-Thurau et al., 2004) define eWOM as positive or negative statements made by potential, current, or former customers about products or companies that are made available to people and institutions via the Internet. Based on the virtual community created by the Internet, consumers can create social networks with people they have never met in person and exchange opinions about products and services with others (Le et al., 2018). From the communication capabilities of eWOM, (Hennig-Thurau et al., 2004) noted that the perpetuation of opinion has increased the level of information exchange compared to offline WOM. In addition, according to eWOM can be considered an extension of traditional interpersonal communication in the new era. Although studies (Eisingerich et al., 2014) found that about 90% of WOM communications are offline, many recent marketing practitioners and scholars believe that eWOM will play an important role for consumers to rely on as a source of information soon due to the increasing number of consumers (Anderson & Simester, 2013). Internet user. There are different researchers in the existing literature, who have recognized that E-WOM is positively related to customer loyalty (Zhang et al., 2021).

#### *D. Customer Satisfaction and Loyalty*

Customer satisfaction said it involves customer creation, customer maintenance, and retention (Kotler & Keller, 2016). Customer satisfaction is a very personal assessment that is strongly influenced by individual expectations (Boateng, 2019). Customer loyalty is the activity of customers who remain loyal to the product/brand/firm they have chosen. Customer loyalty is the goal of all companies. Customers who already have loyalty will continue to buy goods even though there are weaknesses in terms of price or quality. Customer loyalty is the customer's attachment to a brand, manufacturer, or service provider (Suh et al., 2015). Customer loyalty is how a customer will continue to buy products that have been sold by the Firm even though there are certain factors (Iqbal et al., 2021). Tandjung (2004) says there are four types of customer loyalty, as follows:

- a. No Loyalty: Customers who do not have loyalty and rarely go to the same place repeatedly
- b. Inertia Loyalty: These customers will buy because they feel comfortable and comfortable with the product, resulting in loyalty
- c. Latent Loyalty: This customer will buy a product or service because of the situation and conditions so that they make a purchase
- d. Premium Loyalty: Customers are very proud of the products they already have and even give references to their relatives.

For this reason, every Firm needs to make each of its customers loyal to the Firm. This will have a positive impact on the Firm because every customer will continue to buy the Firm's products (Suprajang et al., 2019).

#### *E. Digital Banking*

Digital banking is a digital transformation from conventional banking. All types of activities from account opening to banking transactions are carried out online. (Kennedy, 2016) note that digital banking technology has advanced so much that it plays a major role in raising the standard. The main market for digital banking today is Generation X, Y and Millennials (Katadata, 2022). Market characteristics that prefer convenience, speed and flexibility increase rapid market penetration in big cities. Digital banking increases customer satisfaction by providing convenience and promotions in terms of fees, rewards and others (Muluka et al., 2015). (Muluka et al., 2015) that digital banking technology has advanced so much that it plays a major role in raising the standard of service provision in the financial institution sector. OJK explained the definition related to digital banking by introducing OJK Regulation number 12/POJK.03/2021. The regulation states that digital banks are banking institutions that are including the Indonesian legal entity bank (BHI). Based on these categories, digital banks have the function to provide and carry out banking business activities through electronic channels without a physical office other than the head office or using limited physical offices. The issuance of digital bank services can be carried out by new banks or old banks that are transformed into digital banks (Jasa, 2021).

Previously, this study continued research from (Bell et al., 2017) regarding how the paradox of education to customers is, will education provide loyalty with indicators of increased sales or will keep customers away from the company because customers prefer competitors. The response from customers will be different to the education that the company does. It is very interesting if researched based on different industries will produce different customer responses as well. In addition, related to service companies, there is another hypothesis that service quality can strengthen customer expertise towards company loyalty.

Table. 1. Previous Research

No	Journal	Author	Research Objectives	Study	Findings	Result
1	Unraveling the Customer Education Paradox: When, and How, Should Firms Educate Their Customers?	Bell et al	Find different primary data (education) and secondary data (sales) and importance of educating customer increasing loyalty	Using AMOS to test primary data and secondary data	Education increase loyalty and will release different expertise both firm-specific and market-related	Company firm specific education will increase expertise to make switching cost (high) and will increase sales
2	Relationship Marketing in The Financial Services Industry. The Importance of Customer Education, Participation and Problem Management for Customer Loyalty	Eisingerich Andreas B. Bell, Simon J.	How Educating Customer (Direct) using CRM on Financial Industry and importance variabel customer education, participation and problem management for loyalty	Customer relationship management factor increasing loyalty	Customer Education through CRM have effect to customer loyalty	CRM through customer education increase loyalty
3	The Impact of Customer Education on Customer Loyalty Though Service Quality	Suh Munshik Greene, Henry Israilov, Baiastan, Rho, Taeseok	Find what is importance of customer education with excellence services on customer loyalty	Customer education and service quality	Customer Education with excellent service will give loyalty	Customer Education importance factor on repurchase intention
4	Making your online voice loud. The Critical Role of WOM Information	Huang, Minxue et al	Importance of WOM Information on purchase decision and loyalty	WOM, and customer purchase retention	Customer will trust WOM from other customer who already using the product	Purchase decision is depend on WOM and validity
5	Does educating customers create positive word of mouth?	Sun et al	How Educating customer can create positive WOM to increase firm loyalty	Find different expertise to increase positive WOM	Expertise increase WOM intention	Satisfaction and expertise increase WOM intention

Source : Journal Marketing

The table above illustrates a summary of several previous research journals related to related variables. As in the beginning (Bell & Eisingerich, 2007) conducted research related to relationship marketing in the banking world on loyalty. How customer education plays a significant role in customer loyalty.

### III. RESEARCH METHODOLOGY

Bryman (Cooper & Schindler, 2014) argues that the quantitative research process starts from theory, hypothesis, research design, selecting subjects, collecting data, processing data, analyzing data, and writing conclusions. This research was conducted to measure the dependent variable, namely customer loyalty. While the independent variables are firm-specific education and market-related education. The mediator variables are firm-specific expertise, market-related expertise customer satisfaction, perceived switching cost, and E-WOM. This research uses descriptive and analytic designs. Where in the early stages the researcher seek information on the situation that occurs based on the time the research takes place. So that the factors will be found based on the analysis carried out. According to (Cooper & Schindler, 2014) descriptive is a research conducted to determine the value of independent variables, either one or more (independent) variables without making comparisons or connecting with other variables.

Data collection will be used primarily, according to (Cooper & Schindler, 2014) Primary data is a data source that directly provides data to data collectors and is carried out online and offline. In this study, the author will focus more on the distribution of online data collection.

## 1. Population

The total amount consists of objects that have certain qualities and characteristics determined by the researcher. According to (Cooper & Schindler, 2014). Population is an area/study of research that has certain characteristics that are studied and given conclusions. In this study, the population is all digital banking customers in Indonesia. Based on the data (Katadata, 2022), digital bank customers fall in between 20-45 years old, hence this paper limits its participants into that age range.. The population in this study is 200 customers who have been or are currently digital banking customers in Indonesia. Digital banking in Indonesia is banking without branch offices and has online transaction features.

## 2. Sampling

- a. The sampling technique used is purposive sampling, which is a sampling technique with certain considerations (Cooper & Schindler, 2014).The reason for using this purposive sampling technique is because it is suitable for use for quantitative research. Meanwhile, simple random sampling is the taking of sample members from the population that is carried out randomly without regard to the strata that exist in the population(Cooper & Schindler, 2014). This was done seeing that the demographic and customer background variables were not seen in this study. The sample in this study was 200 customers who became digital banking customers in Indonesia. These customers have transacted and become customers of digital banking. The research sample criteria are:
  - a. Digital banking customers in Jabodetabek because most digital banking in Indonesia has a head office in Jakarta and the largest transaction center is in Jabodetabek.
  - b. Have been a digital bank customer for at least 3 months, the main reason for being a digital banking customer for 3 months is to be able to experience the services and education provided. In addition, seeing that digital banking in Indonesia is still relatively new and only a few banks are carrying out digital transformation.

### A. Research Study

This research uses multi-cross-sectional studies where one respondent will be measured for other variables in different periods. According to (Zick et al., 2008), a study is said to be a multi-cross-sectional study when the data variables taken are one in different periods. In contrast to longitudinal studies where data is taken twice in different periods where data is usually measured in the before and after periods so that they can be compared(Allis Nurdini, 2006). In this study, another variable will be taken in a different period, namely the Y variable (loyalty). The time interval between the variables taken between X and Y is 3 months. Variable Y, namely loyalty is taken after the variable X is taken. According to McKinsey, the education and learning process only takes 3 months with the 3x3x3 method ((Sneider & Sternfels, 2020).Based on this, we recommend that customers have learned and understood the products, services, and services of digital banking within three months. Based on this, it can be said that respondents have received more than adequate education within 3 months, and the next variable data can be taken, namely loyalty(Sneider & Sternfels, 2020). Loyalty variables will be measured for the same respondents and data analysis will be carried out at the same time.

This paper primary data collection relies on survey carried out both offline and online.. Primary data is a data source that directly provides data to data collectors and is carried out online and offline. In this study, the authors will focus more on the distribution of online data collection (Cooper & Schindler, 2014).

- a. The population are all digital bank customers in Indonesia
- b. The sample is digital bank customers who use the account for 3 months in jabodetabek\*

\* Jabodetabek because 70% of business and CASA are based on Jabodetabek also head office (Katadata, 2022).

Questionnaire is a data collection tool by provides a list of questions answered by respondents(Cooper & Schindler, 2014). Researchers used an online questionnaire. According to (Setiawan, 2012) online questionnaires provide the benefits of cost-effective, time-saving, broad reach, and effective dissemination media. Where there are more Digital Banking respondents and they often interact online compared to offline. Questionnaires are given to respondents who have been determined according to the specified criteria. The questionnaire uses a Likert scale of 1-5 based on the variable measuring factors that have been determined. The distribution of the questionnaire is based on 3 stages, namely:

*B. The First Part Is Related To The Screening Of Respondents*

In the first part, the respondent's profile will be filtered according to the research limitations, namely respondents who have been Digital Banking customers in Indonesia. Furthermore, the respondents resided in Indonesia, especially the Jabodetabek area in the past year. Initial filter questions are useful for getting the right target respondents, namely customers who have gained experience in becoming a Digital Banking customer and received education from digital banking.

*C. The second part is related to the Profile and Characteristics of Digital Banking customers*

The second part aims to obtain more in-depth information regarding the profile and characteristics of respondents from Digital Banking customers in Indonesia. Respondents will mention the digital banking companies they have and their behavior in transacting there. For example, transactions that are often made, the purpose of opening, account opening factors, and the number of accounts held. Each question aims to address certain variables, such as the number of account holdings, which means that customers have a low perceived switching cost level so they can easily have multiple accounts.

*D. Part Three Core questions related to independent and moderator variables*

In this section, the respondents have entered the core question stage. Each question will lead to the selected operational variable indicator. In the third stage, respondents will be measured for independent and moderating variables from education, expertise, perceived switching costs, and E-WOM. Based on research from Bell and Eisingerich (2007) the author uses questions related to the 'expertise' scale, mostly taken from the market-related skill variable. The last three items capture the words 'E-WOM', 'expertise', and 'knowledge' according to the predefined variables.

*E. Fourth Part Questions related to the dependent variable (loyalty) will be conducted after 3 months\* (T2) - multi-cross-sectional studies.*

\*According to Mckinsey, the education and learning process only takes 3 months with the 3x3x3 method (Sneider & Sternfels, 2020)

Furthermore, respondents will measure the dependent variable for this study, namely loyalty with operational variable indicators obtained based on journals. Respondents will be asked to answer questions related to loyalty to the digital banking they use.

*F. Part Five Questions related to demographics from respondents*

In the last section, the respondents were asked to demographic data such as gender, occupation, income, and others to see the characteristics of the existing respondents. In addition, at this stage respondents will be asked to provide email data and cellphone numbers for further research (T2) to measure after education by the Firm.

Based on previous research (Bell et al., 2017) it was found that the education of the firm produce expertise and knowledge for customers. Expertise provide customers with various information that have an impact on purchase evaluations. In subsequent research (Bell et al., 2017) found that education to customers should be divided into two variables, namely firm-specific education and market-specific education. Firm-specific education is education conducted by the firm regarding the firm's products and services, while market-specific education is more related to the firm's industry in the market. In this study, there are independent variables, namely firm-specific customer education and market-specific customer education which affect the dependent variable, namely repurchase intention. Further development, according to (Sun et al., 2021) education will be able to provide positive or negative associations to WOM (Word of Mouth). This study makes the WOM variable a endogenous variable on the impact of education on customers. Zhang et al. (2021) said that WOM will provide loyalty to customers. Iqbal et al. (2021) said the more satisfied the customer, the higher the customer will be satisfied and comfortable so that they become loyal to the firm. Meanwhile, satisfied customers can refer the firm's products to others in WOM. In this study, the author focuses on digital banking so the impact study is more focused on the WOM occurred online (Le et al., 2018).

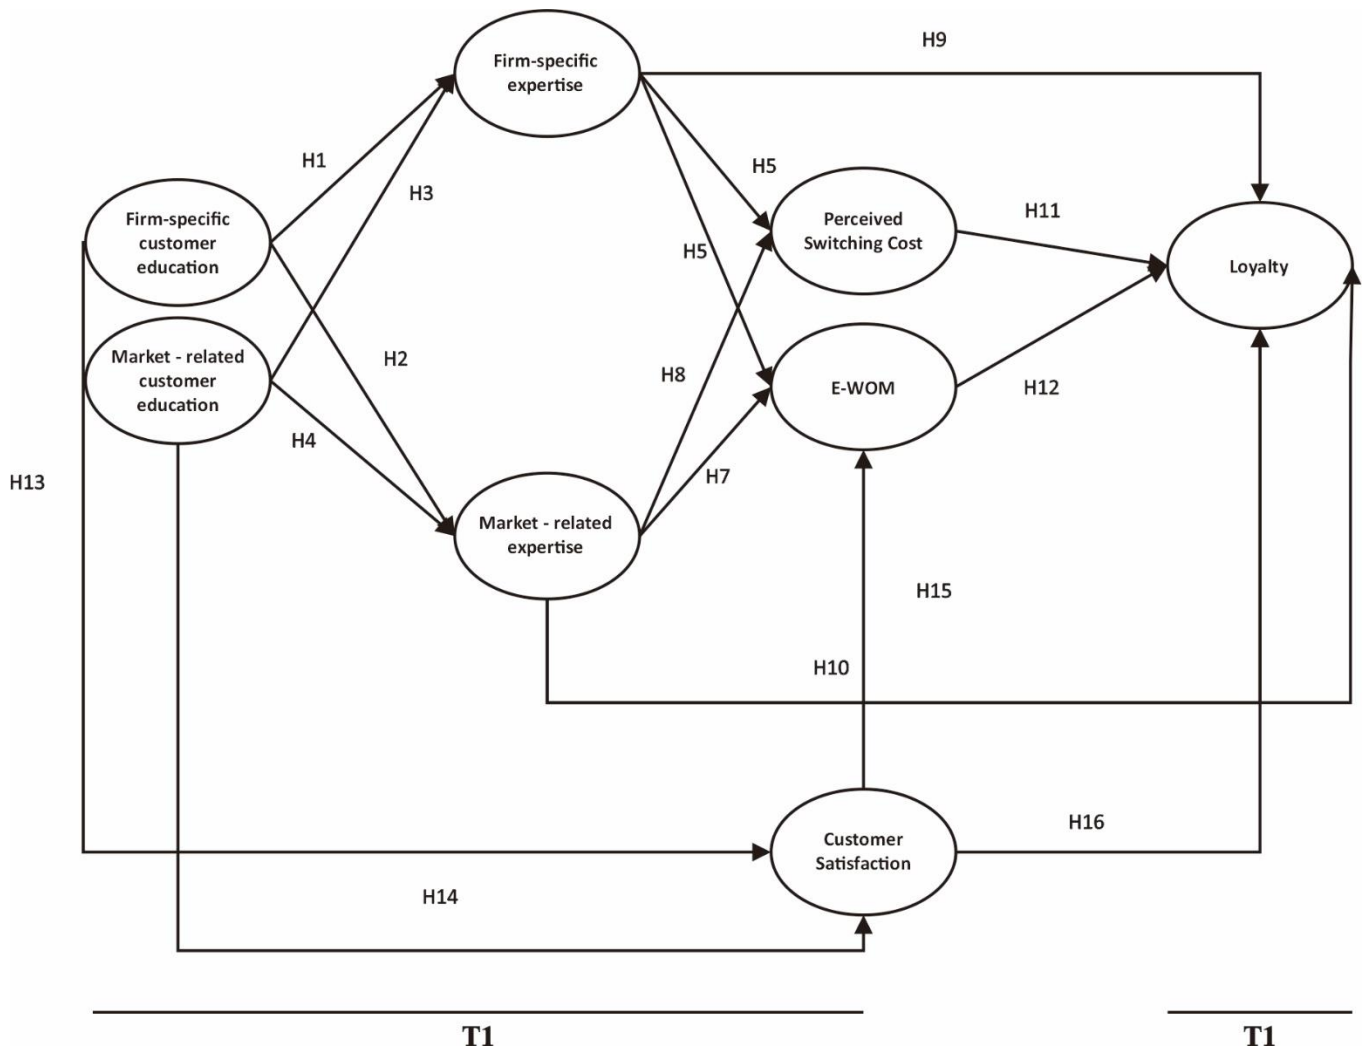

Fig 1. Research Model

**Hypothesis 1:** Firm-specific customer education will be positively related to firm-specific skills with a positive association

(Bell & Eisingerich, 2007) says that the education carried out will produce expertise for customers. (Kotler & Keller, 2016) says that in making purchasing decisions, customers will look for information. At this time, education will be carried out by the firm. Customer education can be delivered through various educational programs: professional advice, seminars, advertising, booklets, blogs, and service provider forums can educate customers (Buttle & Burton, 2002). Education steps will play a role in helping customers know which behavior to adopt and how to do it in the service delivery process (Dellande et al., 2004). Similar to customer education, Bell et al. (2017) divides the education carried out by companies into two dimensions, namely firm-specific expertise and market-specific expertise. Of course, when the firm conducts firm education, education conducted by the firm about the knowledge related directly to the firm will produce firm-specific.

**Hypothesis 2:** Firm-specific customer education will be positively related to market-specific skills

The difference between declarative knowledge / procedural knowledge is often used in assessing the type of expertise gained from education. The firm's customer education can enhance the firm's or market-specific expertise (Retana et al., 2016).

Knowledge is also often differentiated according to the specific level of expertise it can be broad-based or product-specific (Goodman, 2006). Broad knowledge skills (market) can increase knowledge related to product variants in the industry, but product knowledge skills can focus on product specifications, Firm services, and others. On the other hand, when the customer's expertise regarding the market increases, the customer will have greater confidence in evaluating competing alternatives (Burnham et al., 2003). Market-specific information provided by the firm will increase the expertise to customer not only about the market but also about the firm. For example, educating customers about the new product of mortgage will notify customers that a new type of mortgage is now available in the market, too. Hence, this research posits.

**Hypothesis 3:** Market-specific customer education will be positively related to firm-specific skills

When customers receive education about the market through the internet, advertisements, forums, social media, and others, customers will receive complete information about the industry. The information obtained can be managed by the customer and will increase the Firm's product expertise. Customers will learn how an industry does business and which products suit them. Even according to (Susskind & Curry, 2016) customers will continue to look for the services of each Firm that best suits their needs. Solutions from customers can even be made by themselves. Education that revolves around the market knowledge such as financial products available within the industry will feed customer expertise specific to the market as well. Bell et al. (2017) found that these two variables are related positively. Therefore

**Hypothesis 4:** Market-specific customer education will be positively related to market-specific skills

In line with the education carried out regarding the market, it will increase customer expertise regarding the market. When customers are looking for an identical product such as financial services, customers are looking for education to produce market services. According to (Fernandes & Pinto, 2019) customers will continue to seek information and then evaluate it until it suits their needs. This is by the impact of education on increasing market knowledge.

**Hypothesis 5:** Firm-specific customer expertise will be negatively related to perceived switching cost

According to (Hennig-Thurau 2002) customers who have Firm-specific related expertise are more loyal to the Firm. They are familiar with the products and services of the Firm they have purchased from. Customers are familiar with service quality, aftersales, product capabilities, specifications, and others. So to be able to switch to competitors requires higher costs because customers need to know more, try the product and evaluate it. The knowledge that customers have accumulated provides trust and loyalty. In other words, switching costs between firms grow (Bell et al., 2005) as customers become more comfortable with certain ways of doing things. Switching costs are perceived as "the initial investment costs that customers associate with getting to know another Firm" (Burnham et al., 2003).

**Hypothesis 6:** Firm-specific customer expertise will be positively related to E-WOM

The higher the specific expertise of the customer's Firm, the higher the information about products and services, customers who feel comfortable with the service tend to see the value of timely information provided. difficult and expensive to obtain (Kohlbacher, 2009). Previous research has found that customer expertise influences the way customers use and evaluate information and (Wirtz & Mattila, 2003); Eisingerich and Bell 2008; Hibbert, Winklhofer, and Temerak 2012; Wieseke, Geigenmu'ller, and Kraus 2012). As customer expertise increases, customers also feel more comfortable asking questions (Miyake and Norman 1979). Customers with higher levels of expertise feel greater control and are more confident in participating in the service process by making constructive suggestions;(Eisingerich & Bell, 2008; Hibbert et al., 2012); Customer expertise related to Firm specifics will increase the ability and confidence in doing E-WOM so that the association hypothesis is positive(Sun et al., 2021).

**Hypothesis 7:** Market-specific customer expertise will be positively related to E-WOM

Customers who have market expertise are more aware of the services of various companies. Customers with a high level of expertise also value services more functionally such as politeness, empathy, and personal attention.

Because experienced customers may feel more comfortable asking questions when the service context is complex (Eisingerich et al., 2014), they are more comfortable providing references and information to other customers. Customers with more market expertise use products from several companies so they will judge better. So the possibility to do E-WOM will be higher than for those who do not have market-specific expertise.

**Hypothesis 8:** Market-specific customer expertise will be positively related to perceived switching costs

Customers who have expertise and information related to the market will find it easier to switch to competitors. Customers already understand the Firm's work processes in the industry and can easily choose products that suit customer needs (Hibbert et al., 2012). Because their knowledge is more extensive and can easily move, customers will experience lower evaluation costs (costs associated with assessing competitive alternatives) and economic risk costs (costs of uncertainty about a new provider) because these customers are better suited to the market as a whole (Burnham et al., 2003).

**Hypothesis 9:** Firm-specific related customer expertise will be positively related to customer loyalty

Customers who have a high level of Firm-specific expertise will be more loyal to companies they already know. Customers with product-specific skills, for example, have been shown to show a greater calculative commitment to the firm (Hennig-Thurau 2002). When the information obtained by customers is limited and only about certain products, customers will buy products from the same Firm. They are comfortable with existing products so the authors propose a positive relationship between Firm-specific customer expertise and a positive relationship with customer loyalty. Customers who have longer expertise will be more loyal to the Firm (Burnham, Frels, and Mahajan 2003).

**Hypothesis 10:** Market-specific customer expertise will be negatively related to customer loyalty

According to (Porter, 1990) the higher the customer's expertise related to the specific market, the more confident they are in evaluating alternatives in the market. So that it is more likely that a customer will buy another product from a well-known Firm. For example, when a customer who already has market knowledge finds a cheaper product with the same value while looking for information before buying a product, it is easy for the customer to switch to another product. For this reason, the authors propose a hypothesis of the relationship between customer expertise related to specific markets with negative associations.

**Hypothesis 11:** Perceived switching cost will be negatively related to customer loyalty

Switching costs are related to purchasing decisions from customers. Before making a purchase, the customer will look for information related to the product and the Firm in question. These expectations are based on information-seeking theories (eg, Heilman, Bowman, and Wright 2000) and decision-making heuristics (eg, Park and Lessig 1981) which predict that the decision-making process and evaluation of choices will change as customer expertise changes. The lower the switching costs, the easier it is for customers to switch to other companies. According to (Punj and Staelin 1983) Loyalty will increase if the switching costs are low so the relationship between switching costs and customer loyalty is negative. If customers are easier to switch to competitors then no Loyalty levels will decrease and customer retention to buy products repeatedly will decrease. The perception of switching costs will have several advantages depending on the level of loyalty of the customer. For example, switching costs will reduce sensitivity to customer satisfaction and price (Retana et al., 2016).

**Hypothesis 12:** E-WOM will be positively related to customer loyalty

Hennig-Thurau et al., (2009) say e-WOM is, "a negative or positive statement made by a prospective or actual consumer, a consumer before a product or Firm where this information is made available to a person or institution through the medium of the internet. Of course, based on research (Zhang et al., 2021) it was found that customers who do e-WOM must have been educated and have knowledge related to the Firm or market so they are expected to give e-WOM positive associations and can become more loyal to the Firm (Retana et al., 2016). The possibility of negative e-WOM associations may occur if the Firm provides a negative message/education (Sweeney et al., 2014). Every Firm will certainly provide the best service and education so that if a customer does e-WOM, the customer is satisfied with the Firm's products and services which will have an impact on loyalty.

**Hypothesis 13:** Firm-specific related customer expertise will be positively related to customer satisfaction.

Customers who receive education from the Firm will manage information and make customers more experts (Sun et al., 2021). The results of education will make customers more skilled and more satisfied with the services provided by the Firm. Customers can further appreciate detailed information about their investment portfolios, additional insight into advisory decision-making processes, and more opportunities for co-production. An online interface may provide an ideal forum for responding to an increasing level of customer expertise (i.e. enabling the provision of targeted technical information) (Bell & Eisingerich, 2007). Customers who understand more about all the products they have purchased and are experts in the Firm's products will be more satisfied with the service because they understand what products they are buying about the weaknesses and strengths of a product.

**Hypothesis 14:** Market-specific customer expertise will be positively related to customer satisfaction

Continuous education to customers will increase customer satisfaction because customers will increasingly get information so that they can get services according to their expectations (McKinney et al., 2002). Customers who are increasingly skilled in the market will be more satisfied because they higher the ability to evaluate alternatives. (Retana et al., 2016) Customers who are not actively educated will be increasingly dissatisfied with services because they have to find information on their own (low expertise). For this reason, if the customer is increasingly skilled in the market, if the customer chooses a product, he will feel satisfied because he has compared it with competitors' products and services. Satisfied customers have received the best products in the market.

**Hypothesis 15:** Customer satisfaction will be positively related to E-WOM

The higher the customer satisfaction, the higher the possibility of customers doing E-WOM (Sun et al., 2021). Satisfied customers will be happier to tell other people so that it will bring up product references to relatives, family, or friends. Previous research in the tourism sector found that there was a positive relationship between a satisfying tourist experience and a positive intention to recommend WOM ;(Serra-Cantallops et al., 2018; Swanson & Hsu, 2011) said it had not, when customers are satisfied with service, they will provide references to others. In the restaurant industry, Yang (2017) found no support for the relationship between satisfaction and positive eWOM intentions. Meta-analysis of methodological aspects of guest surveys in the industry. travel also raised some concerns regarding the relationship between satisfaction and intention to recommend to others(Suprajang et al., 2019). For this reason, the authors examine how in the banking industry customers will have the intention to recommend. Satisfied customers should tend to give positive experiences to others resulting in positive associations.

**Hypothesis 16:** Customer satisfaction will be positively related to customer loyalty

Satisfied customers will be comfortable with products and services from products that have been used so they will make repeat purchases (Bell et al., 2017). When the customer is satisfied with a product, of course, the customer will be reluctant to switch to another product and create loyalty. If the customer wants to switch to another product, switching costs will arise and the customer needs to search for related information again.

#### IV. RESULT / FINDING

The measurement model to be carried out uses exploratory and confirmatory factor analysis in AMOS (Hair et al., 2011). The measurement model that will be carried out using exploratory factor analysis and confirmation in Smart PLS The author will use the method of structural equation modeling and SMART PLS

Where the main reasons are:

- a. Suitable for theoretical and predictive
- b. Multiple Model Constructions and Relationships
- c. Model Complexity - Small Population

Degree of Confidence = 95%

The questionnaire has been tested through a wording test and pilot test before being used for our data collection.

Measurement of models and indicators needs to be done to determine the level of validity and consistency of the data. Rhoa\_A is a correlation that shows the value and construct. CR (Composite Reliability) is a value that shows the consistency of each variable. Meanwhile, the AvE (Average Variance Extracted) value is to measure the amount of variance that appears compared to its construct related to the variance error that appears. According to (Shiau et al., 2019) indicators that can be declared valid and reliable are

- a. Valid value if Rhoa\_A > 0.7
- b. Reliable value if CR > 0.7
- c. Valid value if AvE > 0.5

Table 1. AVE, Rho.A, Cronbach Alpha, CR

	Cronbach's Alpha	rho_A	CR	(AVE)
Customer Loyalty	0.848	0.860	0.898	0.688
Customer Satisfaction_	0.943	0.945	0.956	0.815
E-WOM	0.949	0.950	0.961	0.832
Firm-spesific education	0.853	0.868	0.901	0.695
Firm-spesific expertise	0.867	0.867	0.918	0.790
Market-related education	0.919	0.922	0.943	0.804
Market-related expertise	0.909	0.910	0.943	0.845
Perceived switching cost	0.819	0.820	0.892	0.734

Based on this value limit, it can be concluded that all analyzed variables are valid because they have exceeded the following indicator value limits. Validity is defined as the degree to which a concept is measured accurately in quantitative research. (Heale & Twycross, 2015). The KMO value ranges from 0 to 1 which indicates whether the data is suitable or not for further analysis. If the KMO value is equal to or greater than 0.5 and with a significant value (sig) or probability (p) less than 0.05, it means that the data has met the requirements for further analysis in factor analysis (Napitupulu et al., 2017). For this reason, the author analyzes the KMO value of each variable against the limit value.

Table 2. KMO Result

Variable	KMO	Value	Result
Firm Spesific Education	0.799	0.5	Valid
Market Spesific Education	0.838	0.5	Valid
Firm spesific expertise	0.728	0.5	Valid
Market-related expertise	0.745	0.5	Valid
Perceived Switching Cost	0.700	0.5	Valid
E-WOM	0.877	0.5	Valid
Customer Satisfaction	0.903	0.5	Valid
Customer Loyalty	0.744	0.5	Valid

Each variable that was tested resulted in varying KMO values. The highest KMO value is in the customer satisfaction variable, which is 0.903, while the lowest KMO value is in the perceived switching cost indicator, which is 0.700. All variable values have passed the limit value of 0.5 so it can be said that all data that has been collected is valid and can be analyzed further

#### *Reliability Test*

The second measure of quality in quantitative studies is the reliability, or accuracy of the instrument. In other words, the extent to which a research instrument consistently has the same results when used in the same situation on repeated occasions (Heale & Twycross, 2015). Cronbach's alpha and composite reliability scores. (Johnson & Guilford, 1956) suggested a value of 0.7 as a benchmark for Cronbach Alpha. However (Napitupulu et al., 2017) showed that Cronbach's alpha value of 0.6 was acceptable. The author takes a higher value of 0.7 for the level of reliability so that the results obtained are more consistent at different times. The table below is the result of the reliability test

Table 3. Cronbach Alpha testing II

Variable	Cronbach Alpha	Value	Result
Firm Spesific Education	0.852	0.7	Reliable Consistent
Market Spesific Education	0.919	0.7	Reliable Consistent
Firm spesific expertise	0.867	0.7	Reliable Consistent
Market-related expertise	0.907	0.7	Reliable Consistent
Perceived Switching Cost	0.814	0.7	Reliable Consistent
E-WOM	0.949	0.7	Reliable Consistent
Customer Satisfaction	0.961	0.7	Reliable Consistent
Customer Loyalty	0.848	0.7	Reliable Consistent

Furthermore, after each variable is declared valid, a reliability test will be carried out to see the level of consistency of each variable. A reliability test can be done by calculating the Cronbach alpha value for each variable being tested. A good cronbach alpha value is 0.7 (Tavakol & Dennick, 2011). If the value is above 0.7 then the variable can be declared consistent. Values higher than 0.7 can be said to be consistently high.

#### *Discriminant Validity Test*

The indicators will be measured using the measurement of discriminant validity and convergent validity. It is used to see the suitability of the model. According to J. F. Hair et al., (2011) the minimum AVE (Average Variance Extracted) level is 0.5 while the outerloadings value is 0.70.

Table 4.

Variable	Item	AVE	Outer Loadings
<i>Firm-specific education</i>	FED1	0.688	0.810
	FED2		0.891
	FED3		0.801

	FED4		0.829
<i>Market-related education</i>	MED1	0.865	0.891
	MED2		0.898
	MED3		0.912
	MED4		0.886
<i>Firm-specific expertise</i>	FEX1	0.832	0.862
	FEX2		0.903
	FEX3		0.900
<i>Market-related expertise</i>	MEX1	0.695	0.931
	MEX2		0.921
	MEX3		0.906
<i>Perceived Switching Cost</i>	PSC1	0.790	0.857
	PSC2		0.827
	PSC3		0.886
<i>E-WOM</i>	WOM1	0.804	0.903
	WOM2		0.897
	WOM3		0.921
	WOM4		0.923
	WOM5		0.916
<i>Customer Satisfaction</i>	CS1	0.845	0.903
	CS2		0.857
	CS3		0.927
	CS4		0.928
	CS5		0.896
<i>Customer Loyalty</i>	CL1	0.734	0.898
	CL2		0.819
	CL3		0.788
	CL4		0.809

Based on the data and the AVE value, it can be seen that all variables are above equal to 0.5 while the indicator value of each variable is at 0.7. This can be indicated that the indicators and variables are valid.

Furthermore, the level of discriminant validity can be seen by using the Fornell-Lacker test. The condition that must be met in this test is that the Fornell-Lacker value itself must be above the value of the inter-construct correlation (J. Hair et al., 2014).

*Structural Model*

Structural model. It indicates the quality of the adjusted model (Ringle et al., 2014). Based on R Square Table 5. E-WOM and Customer loyalty are the highest effect on dependent variable. R Square >0.75 strong relationship, 0.50 moderate relationship and 0.25 weak relationship (Hair et al., 2011).

Table 5. R Square

Variable	R Square	R Square Adjusted
Customer Loyalty	0.682	0.673
Customer Satisfaction_	0.500	0.495
E-WOM	0.703	0.698
Firm-specific expertise	0.490	0.484
Market-related expertise	0.378	0.371
Perceived switching cost	0.518	0.513

Market-related expertise have weak relationship regarding dependent variable indicate R Square adjusted. Model fit analysis carried out to test the model alignment and validity

Table 6. Model fit test

	Saturated Model	Estimated Model	Fit Criteria
<b>SRMR</b>	0.052	0.097	<0.08
<b>d_ ULS</b>	1.358	4.715	>0.95
<b>d_ G</b>	1.044	1.243	>0.95
<b>Chi-Square</b>	1,165.167	1,237.101	<1
<b>NFI</b>	0.813	0.802	>0.9

The model is measured based on five related indicators to measure the suitability of the model. For the SRMR indicator, the model is considered less fit because it exceeds the value of 0.08. Meanwhile, the d\_ ULS and d\_ G model indicators exceed the limit values, so they are said to be good. For Chi-Square, it has a positive value of 1,249 so it can be accepted. The NFI value is 80.4% fit to the model.

## V. RESULT/FINDING

Hypothesis testing is done by looking for the value of T Statistics and also the value of P Values. According to (Cohen 1998) the T statistic value below 1.96 means that there is no relationship, whereas if the T statistic value is > 1.96 then there is a relationship between variables. If the P Values are above 0.05 then it is not significant but if the P Values are below 0.05 then the relationship between the independent and dependent variables has a significant value (AlWahaibi et al., 2020).

Table 7. Hypothesis result

Relationship Variable	T Statistic	P Values	Result
<b>Hypothesis 1</b> Firm Education → Firm Expertise +	5.441	0.000	Accepted
<b>Hypothesis 2</b> Firm Education → Market Expertise +	3.838	0.000	Accepted

<b>Hypothesis 3</b> Market Education → Firm Expertise +	2.935	0.002	Accepted
<b>Hypothesis 4</b> Market Education → Market Expertise +	2.918	0.002	Accepted
<b>Hypothesis 5</b> Firm Expertise → Perceived Switching Cost +	4.942	0.000	Accepted
<b>Hypothesis 6</b> Firm Expertise → E-WOM +	2.522	0.006	Accepted
<b>Hypothesis 7</b> Market Expertise → E-WOM +	0.765	0.222	Rejected
<b>Hypothesis 8</b> Market Expertise → Perceived Switching Cost +	3.139	0.001	Accepted
<b>Hypothesis 9</b> Firm Expertise → Customer Loyalty +	1.407	0.080	Weak
<b>Hypothesis 10</b> Market Expertise → Customer Loyalty -	0.270	0.394	Rejected
<b>Hypothesis 11</b> Perceived Switching Cost → Customer Loyalty +	3.278	0.001	Accepted
<b>Hypothesis 12</b> E-WOM → Customer Loyalty +	2.938	0.002	Accepted
<b>Hypothesis 13</b> Firm Education → Customer Satisfaction +	4.695	0.000	Accepted

<b>Hypothesis 14</b> Market Education → Customer Satisfaction +	2.693	0.004	Accepted
<b>Hypothesis 15</b> Customer Satisfaction → E-WOM +	11.844	0.000	Accepted
<b>Hypothesis 16</b> Customer Satisfaction → Customer Loyalty +	2.078	0.019	Accepted

Based on the results of hypothesis testing, it was found that there were 3 rejected hypotheses, namely hypothesis 7, namely the influence of Market-related expertise on E-WOM has no relationship and is not significant, hypothesis 9 is firm-specific expertise on customer loyalty has no relationship and is not significant and hypothesis 10 namely Market-related expertise on customer loyalty has no relationship and is not significant and hypothetical. In addition, all hypotheses are accepted and by initial assumptions, namely the T values above 1.96 and the P values below 0.05, which are significant.

## VI. DISCUSSION

Education is how a company provides information as to facilitate a learning process to customers so that they can how to conceptualize and, explain the asymmetry of products and services, and direct customers to the right information related to products and services. According to (Bell et al., (2017) the education carried out by the company will produce two expertise, namely firm-specific expertise and market-related expertise. Our research extends the findings by Bell et al. (2017) and confirms how customer education and customer expertise are both should be analysed in two separate dimensions namely market-specific and firm-specific.

Based on the results of hypothesis testing, it can be seen that there is a significant relationship between education and expertise. The theory is that education will produce information that can be learned by customers which makes them experts (Workshop, 2009). When they are experts, customers can do positive E-WOM so that it provides benefits for the company (Sun et al., 2021), but of course, when they become more skilled, it becomes easier for customers to choose products and services from competing industries (Bell et al., 2017). Therefore education is one of the most important elements and companies are obliged to analyze further before conducting education. Even if the company does not provide education, customers will still seek information before looking for products and services (Kotler & Keller, 2016), so that they can satisfy their needs.

The initial hypothesis says that customer expertise will be directly related to positive E-WOM. Customer expertise influences the way customers use and evaluate information and experiences (Alba and Hutchinson 1987; Eisingerich and Bell 2008; Hibbert, Winklhofer, and Temerak 2012; Wieseke, Geigenmüller, and Kraus 2012). Customers who have received education will understand the products and services used so that they will share their experiences with others. Highly skilled customers feel greater control and are more confident in participating in the service process by making constructive suggestions (Eisingerich et al., 2014); Eisingerich and Bell 2008; Hibbert, Winklhofer, and Temerak 2012; Wieseke, (Nyffenegger et al., 2015). Hypothesis testing saw that the initial hypothesis related to firm-specific expertise would be significantly related to positive E-WOM, but market-related expertise did not have a significant relationship with positive E-WOM. This happens because when companies provide education regarding the product and service industry as a whole, customers cannot tell their experiences and advantages of products and services but understand the information in choosing their products in the product and service industry (Bell et al., 2017). For this reason, companies need to provide more education related to companies than the industry to create positive E-WOM.

The initial hypothesis is that after the customer receives education, the expertise of the customer will increase. Based on Bell's research in 2017, the results of the education carried out can produce two types of

expertise, namely market-related expertise and firm-specific expertise. According to the results of the hypothesis test, it is known that the accepted hypothesis, namely firm-specific and market-related expertise, has a significant relationship with perceived switching costs. It is also by the theory that customers who have company-specific related expertise are more loyal to the company. They are familiar with the products and services of the company they have purchased from (Hennig-Thurau 2002). Customers who are familiar with the values, products, specifications, and how the company works will have a higher perceived switching cost compared to people who do not have related knowledge. They know the company better and understand the advantages and disadvantages of products and services. Customers will find it more difficult to move and have to do product research again, try to get to know the product, and see other people's reviews. This will increase the perceived switching cost so that it is better for customers to stay with the products they already have. It's different when the customer is not comfortable. dissatisfied with the products and services they have received, the perceived switching cost will decrease and they will easily switch to other companies (Duarte et al., 2018).

According to Kotler (2016), there are several levels of loyalty, one of which is Premium loyalty where not only do customers continue to buy goods and services from related companies, but customers act as people who make positive references/WOM. In this study, as the basis for most of the reviews and digital banking education channels through digital means, E-WOM is one of the research variables. Based on the hypothesis test by the initial hypothesis, namely positive E-WOM will be significantly related to loyalty. The higher the level of positive E-WOM customers, the higher the level of customer loyalty. Customers show loyalty by buying references and sharing their experiences with others (Imbayani & Gama, 2018). By the results of hypothesis testing, there is a significant positive relationship when E-WOM increases loyalty increases. Customers who do E-WOM have entered a higher level of loyalty by sharing their experiences with others. Loyalty is one of the good impacts that have been carried out by companies and banks (Churchill, 2000).

Expertise is the result of education conducted by the company and can make customers make repeat purchases, but customers can also consider moving to competitors after knowing more about products and services (Bell et al., 2017). Based on the hypothesis test on loyalty, the result is rejected where expertise does not have a direct significant effect on loyalty. Expertise has no direct effect on loyalty, but based on the hypothesis test, expertise has a direct effect on customer satisfaction, E-WOM, and also perceived switching costs. Every customer who has better firm-specific and market-related expertise does not directly affect loyalty but influences other variables that will later affect loyalty. Customers who have more knowledge will not necessarily be loyal but will understand more about the goods they buy and are satisfied with them.

Continuous education carried out by the company will increase customer satisfaction, because customers increasingly understand what they are buying according to the desired value (Bhattacharjee 2001, McKinney et al. 2002). In line with the results of hypothesis testing that education has a significant relationship to customer satisfaction, customers who receive an education will understand more about the goods they have purchased, and they are satisfied because they have spent resources (psychology, money, energy, etc.) understand how the process, how it works, advantages and specifications (Suh et al., 2015). Of course, customers will be satisfied because they understand that every money spent on goods and services is explained by changes, and specifications, continuously through education. Therefore the importance of education is carried out by the company to provide a higher level of satisfaction to customers so that it can have a positive impact on loyalty and positive E-WOM.

## VII. CONCLUSION AND RECOMMENDATION

The results of the study stated that education had an impact on loyalty, but education related to market specifics did not have a significant impact. According to Kotler & Keller (2016), customers in making purchases will definitely seek information. The goal of the customer is to get goods and services according to their needs and objectives. For example, customers who need higher quality will focus more on quality than price, but buyers who focus on specifications will be different from buyers who focus on reputation and price. For this reason, education is very useful for customers because customers will directly seek information and education in various distribution channels. Engel, (2014) said that currently digital channels are seen by customers such as reviews and online comments made by customers (E-WOM). In accordance with the positive association hypothesis test between education and expertise and E-WOM, it is therefore important for companies to analyze the distribution channels of marketing education carried out by customers, for example digital marketing can be done on Twitter, Instagram or YouTube. In addition, the hypothesis test shows that firm-specific expertise has a positive relationship with E-WOM and loyalty, therefore companies should focus more on providing benefit

features and product specifications compared to the industry. (Bell et al., 2017) The results of education can lead to a switch, but the higher the value of the company, the higher the switching costs so that customers will be loyal. For this reason, the company must have a competitive advantage over other companies. Based on previous research, it is said that education will produce expertise related to the market and firm (Bell et al., 2017). The results of the hypothesis test also provide an answer that there is a significant relationship between the two, but looking at the results of the hypothesis test, the overall model should focus more on developing firm-specific education compared to market-related education. This can be seen from other variables that are affected such as E-WOM, customer satisfaction and loyalty will have a positive impact on the company through loyalty. Customers who understand more information about the company will be more satisfied because they understand what they have got (Suh et al., 2015). Companies can provide more education related to product benefits, specifications, promotions compared to education related to the industry as a whole. Customers who understand the product industry more highly will tend to look for better products and evaluate (Kotler & Keller, 2016).

For this reason, considering the company's limited resources, the company should focus on doing firm-specific education rather than market-related education. Positive e-WOM is one of the company's goals, because of course customers can become promotional "agents" for the company by telling their best experiences and references to others. Even E-WOM is one of the best marketing strategies because customers will be more receptive to information than other distribution channels (Huang et al., 2011). Based on the results of hypothesis testing, it can be seen that E-WOM has a significant relationship with expertise. Of course, how can a customer do E-WOM if the customer has minimal information regarding the company's products and services. For this reason, companies need to carry out proper analysis in educating customers.

For example, if the company's target market is customers who often open LinkedIn, the company can focus on educating there, either with videos, pictures or reviews of people who have used it. One of the things that companies can do to improve their expertise is to provide promotional programs so that customers can try to use products and services and finally, if they are in accordance with the customer's value, positive E-WOM will be carried out to other customers (Sa'ait et al., 2016). After we educate and customers become more familiar with the company and get information related to market-related and firm-specific expertise, the company must work harder in increasing the value of products and services. Customers who understand the industry and products about the company will understand more about the advantages and disadvantages of each product and service so that companies need to monitor and evaluate each product and service every time. Companies must always innovate related to products and services and carry out continuous education to increase perceived switching costs so that customers are reluctant to switch to competitors. Appropriate education for banking customers can be done by means of relationship management where Education is carried out directly personally to improve good relations with customers (Boateng, 2019). WOM is an effective marketing tool and has an important role in marketing to customers (Huang et al., 2011). In accordance with the results of hypothesis testing that there is a significant relationship between E-WOM and customer loyalty. Customers will do E-WOM if they have higher firm expertise, therefore it is important that the company provides more education regarding the advantages and specifications of the company. For example, companies can create infographics related to specifications and benefits compared to other digital banking. One of them is SEABank which provides infographics regarding the differences between other banks and SEABank in terms of interest, transfer fees and others. Customers who get information and feel comfortable with banking will do positive E-WOM to their family, friends and relatives and of course because they feel comfortable with the company will become loyal customers.

E-WOM has an important role in getting customers to buy company products and services (Imbayani & Gama, 2018). Based on the hypothesis test, customers who have expertise are not directly related to loyalty. Customers who already have more expertise but are less comfortable with the company after knowing information related to products and services can easily move. For this reason, companies need to provide personal education, especially to customers who have personal needs. One of the things that can be done is to do relationship management (Boateng, 2019). Directly, expertise does not have a direct relationship with loyalty, but customer expertise will be satisfied if they understand all the details of the process, specifications and value of goods and services. For this reason, companies should focus more on providing personal education to each customer to increase loyalty through customer education (Bell et al., 2017). Customer satisfaction is the main thing in a company (Muluka et al., 2015). When customers are satisfied, they can make repeat purchases or even make referrals to other customers. Of course, indicators of customer satisfaction will differ in different demographics (Seiler et al., 2013). For this reason, in the current digital banking era, companies need to personally educate customers. Companies can focus on education focused on companies related to aftersales,

purchasing, process and value. When customers fully understand the specifications of products and services, even product guarantees and product benefits, customers will feel satisfied because they have received goods in accordance with the sacrifices they made (Iqbal et al., 2021). For this reason, comprehensive education is important for the company so that customers can be satisfied doing E-WOM and in the long term will be loyal to the company.

In consumer behavior theory, customers will search for information at an early stage, and the right time for education is at this stage. Digital banking which is still relatively new in the market must take the right time when customers are searching for information. Digital banking can focus more on the features and benefits of digital banking products such as ease of transactions, how to submit and others compared to conducting education related to the market industry. In addition, banking by conducting education has proven to have a positive impact on customer satisfaction and can provide positive E-WOM. This can be an effective marketing communication strategy to customers. These customers can become marketing agents from digital banking to other customers and create loyalty to digital banking.

## The Effect Of Financial Literacy, Financial Inclusion, And Financial Behaviour On Investment Decision Of WRAP Entrepreneurship Students

Hanna Syaghofa<sup>1</sup> and Aldilla Iradianty<sup>2</sup>  
<sup>1,2</sup> Telkom University, Bandung, Indonesia

### Abstract

*Merdeka Belajar Kampus Merdeka is implemented in various ways, one of which is WRAP Entrepreneurship by Telkom University, which organizes students who want to learn to build their own businesses. As entrepreneur, they must have good financial literacy related to managing their business finances. Besides, entrepreneurs are also required to have a good level of financial inclusion and financial behaviour because the business activities carried out depend on capital, then as an entrepreneur is required to be able to make decisions related to the investment made. Therefore, this study will examine whether there is an effect of financial literacy, financial inclusion, and financial behaviour on the investment decisions of the WRAP Entrepreneurship students. The research method used is quantitative research, with descriptive analysis using using SPSS software by distributing questionnaires to 52 respondents. The results showed that WRAP Entrepreneurship students had good levels of financial literacy, financial inclusion, financial behaviour, and investment decisions. Partially, financial literacy and financial inclusion do not affect investment decisions, but financial behaviour does affect investment decisions. Even though financial literacy, financial inclusion, financial behaviour, and investment decisions are classified as well, this still needs to be improved so that the results are very good by providing knowledge about business finance and business investment, even if possible, given a business finance simulation so that the business carried out can run smoothly, and investment decisions can be made correctly while participating in the WRAP Entrepreneurship program.*

*Keywords— financial literacy; financial inclusion; financial behavior; investment decision*

### I. INTRODUCTION

Along with economic development, people are required to be able to manage their finances well because nowadays someone is more responsible for managing their own finances than before. Currently, the available financial products are increasingly diverse, including those for consumption, savings, pension and investment needs. (Lusardi, 2019). In Indonesia, investment continues to increase every year, as evidenced by the continued increase in Single Investor Identification (SID) throughout 2018-2021 (KSEI, 2021).

Fig. 1. SID growth (KSEI,2021)

In 2018 the number of owners of capital market SID was 1,619,372. In the following year, 2019, the number of owners of the capital market SID was 2,484,354. Then in 2020, the number of capital market SID owners increased to 3,880,753, and in 2021 the number of capital market SID owners grew drastically by 93% compared to the previous year, 7,489,337. This large number of investors can certainly be an opportunity for startups to obtain funding from investors.

WRAP Entrepreneurship is one of *Merdeka Belajar Kampus Merdeka* (MBKM) conducted by Telkom University which organizes students who want to learn to build their own businesses. As startup business owners,

WRAP Entrepreneurship students should have good financial knowledge so that if their startup succeeds in obtaining income from investors, they can allocate it well too. One of them by investing. According to a survey by KSEI, as many as 28.03% of SID holders are students, so it is possible that WRAP Entrepreneurship students will also invest. Making investment decisions must be supported by financial literacy, financial inclusion, and good financial behaviour because the business activities carried out depend on capital, then as an entrepreneur is required to be able to make decisions related to the investment made because they will be faced with various investment alternatives.

Based on the results of a survey by Otoritas Jasa Keuangan (OJK) in 2019, it was found that the student financial literacy index was 31.69%. It can be seen that although students have a high interest in investing, only 31.69% of them have the adequate financial literacy to make good investment decisions. As entrepreneurs, WRAP Entrepreneurship students must have good financial literacy related to managing their business finances. Therefore, it is necessary to provide financial-related information by banks, financial institutions, and academics who will be the spearhead in an effort to improve financial literacy in the community (Finansialku, 2019).

Based on the results of a survey by the OJK in 2019, it was also known that Indonesia's financial inclusion index was 76.19%, an increase compared to 2016, with a financial inclusion index of 67.80%. This means that the use of financial products or services by the public continues to increase. However, increasing financial inclusion does not always have a positive impact if the younger generation is not equipped with a good financial understanding (OCBC, 2021). According to research conducted by OCBC NISP Bank and NielsenIQ, it shows that the average financial health of the younger generation is only 37.72%. The results of this research and statement indicate that the financial behaviour of the younger generation is still not good and still needs to be improved. According to research conducted to determine the pattern of student financial behaviour, students often have difficulty managing their finances because they do not have their own income and only depend on monthly money from their parents (Suryanto, 2017).

According to several previous studies, it is known that financial literacy has a significant effect on investment decisions (Adil et al., 2021; Baihaqqy et al., 2020; Kumari, 2020). Then the research conducted by Bongomin et al. (2015) shows that financial literacy and financial inclusion are interrelated because financial literacy will help in using financial products. Johan et al. (2021) stated that financial behaviour would affect financial decisions, as evidenced by the difference between someone who has attended financial training will produce better financial decisions than someone who has never attended financial training. Concerning factors that can influence investment decisions, the researcher wants to know whether financial literacy, financial inclusion, and financial behaviour can influence investment decisions made by WRAP Entrepreneurship students because we want to know how students make investment decisions as part managing their finances if they have earned income from their startup business.

## II. LITERATURE REVIEW

Investment is a long-term investment in assets or securities to make a profit. (OJK, 2017). Investment is an action to delay the use of funds or assets in the present in the hope of getting a profit in the future (Ekananda, 2019). Kumari (2020) found that investment decisions can be influenced by financial literacy, including those related to ability, knowledge, and financial management.

Financial literacy is the knowledge, ability, and trust to improve the quality of decision-making and financial management that aims to achieve prosperity (OJK, 2019). The Organization for Economic Co-operation and Development (OECD) defines financial literacy as a combination of awareness, knowledge, attitudes and behaviour in making financial decisions in order to achieve financial well-being goals (OECD, 2020). Financial literacy refers to the ability to use the knowledge and skills possessed to manage finances effectively. Financial literacy is very important in making investment decisions (Adil et al., 2021).

According to a survey conducted by the OJK, financial literacy and financial inclusion are interrelated in achieving prosperity. Financial inclusion is important in the growth and development of a country. Financial inclusion is the availability of access for the public to understand financial institutions, services and products according to their needs and abilities in managing finances with the aim of achieving prosperity. (OJK, 2019). Financial inclusion, according to Chandran (2014) is a process of ensuring access for the public, especially the lower classes, to obtain information about financial products and services in a fair and transparent manner. Reliable, useful, and affordable financial products and services (Nugraha et al., 2021). Financial inclusion provides access to financial services such as savings, credit, insurance, and other payment methods to the public, especially those who have not or have never used banking services. The information provided is about savings, credit, insurance, and other payment methods (Thomas, 2020).

Kumari (2020) stated that making investment decisions requires not only high financial literacy but also behavioural factors. Human behaviour related to financial decision-making and money management, such as budget control, bill payments, and saving habits, is called financial behaviour (Rai et al., 2019). Good financial planning will minimize the problem of the financial crisis, one of which is making purchases as needed with the principle of looking for the best product at the best price so that the money you have will run longer and be able to avoid debt (OECD, 2020). Fitriarianti (2018) found that the better a person's financial mentality, the better they are in making financial decisions, including investment decisions. According to Baihaqqy et al., (2020) making individual investment decisions will be driven by how they manage their finances, which will affect satisfaction in financial management. Based on the description described above, to make it easier to understand the research, the following is a framework that describes the research problem.

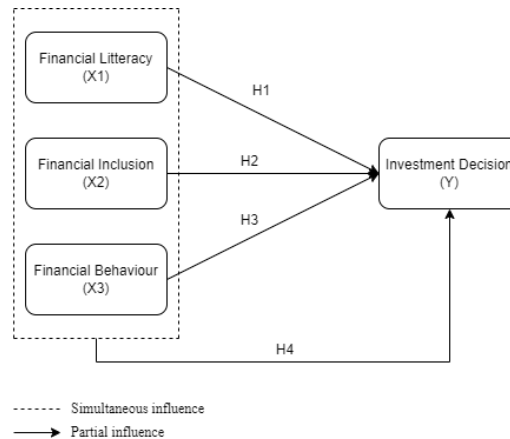

Fig. 2. Conceptual Framework (adopted from Upadana & Herawati (2020) and Nugraha et al. (2021))

Based on the framework above, it can be concluded that the hypotheses in this study are:

H1 :Financial literacy (X1) has a significant effect on the investment decisions of WRAP Entrepreneurship students (Y).

H2 :Financial inclusion (X2) has a significant effect on the investment decisions of WRAP Entrepreneurship students (Y).

H3 :Financial behaviour (X3) has a significant effect on investment decisions of WRAP Entrepreneurship students (Y).

H4 : Financial literacy (X1), financial inclusion (X2), and financial behaviour (X3) simultaneously affect the investment decisions of WRAP Entrepreneurship students (Y).

### III. RESEARCH METHODOLOGY

The research method used in this research is quantitative research, which is a type of research that uses measurement procedures to achieve new findings from several characteristics that appear in human life called variables. The variables used in this study are financial literacy, financial inclusion, financial behaviour as the independent variable and investment decisions as the dependent variable. The scale used for the variables in this study is the ordinal scale, which is a measurement scale that has levels in each category. The assessment of this variable was carried out using a Likert scale. Namely, a score of 1 for the answer 'strongly disagree', a score of 2 for 'strongly agree', a score of 3 for 'neutral', a score of 4 for 'agree', and a score of 5 for 'strongly agree'. The population in this study were all students who were members of the WRAP Entrepreneurship, as many as 60 students. Sampling was done by using the convenience sampling technique. Namely, the sample was selected based on the availability of the population to be used as a sample. The sample in this study amounted to 52 students who were determined based on the Slovin formula.

This study uses primary and secondary data. The primary data source in this study is the result of a questionnaire distributed to selected respondents, namely students who are members of the WRAP Entrepreneurship program. At the same time, secondary data relating to data related to investment, financial literacy, financial inclusion, and financial behaviour are sourced from scientific articles, printed books and e-books, online news, previous research, and other sources relevant to this research. After the data obtained answers from the respondents to the questionnaires that have been given, the researchers will then test the validity using the Pearson Product Moment and test the reliability by looking at Cronbach's Alpha to determine the level of

validity and reliability of all statements in this study. The data analysis technique in this study is descriptive analysis with Microsoft Excel, classical assumption test, multiple linear regression and hypothesis testing using SPSS 26 version.

#### IV. RESULT / FINDING

Based on the results of distributing questionnaires to 52 WRAP Entrepreneurship students, the characteristics of the respondents are as follows:

Table 1. Characteristics of Respondents

Characteristics	Amount	Percentage
Startup	Aipet	1,9%
	Arkamaya	3,8%
	A-Tani	5,7%
	Survo	5,7%
	Edu Alecta	9,4%
	Gravis Indonesia	7,5%
	GrowUp	9,4%
	Halo Law	5,7%
	Houset	9,4%
	Kiri	7,5%
	Nufish	9,4%
	ServEasy	7,5%
	Signature Store	7,5%
	Travemates	9,4%
	Gender	Male
Female		36,5%
Personal Income	<2.000.000	58,5%
	2.000.001-5.000.000	35,9%
	5.000.001-10.000.000	3,8%
	>10.000.000	1,9%
Investment Experience	Never	21,2%
	Yes	78,8%
Investment Asset	Never	9,6%
	Gold	7,7%
	Cryptocurrency	3,8%
	Property	2%
	Bond	2%
	Mutual funds	23,07%
	Mutual fund, Cryptocurrency	2%
	Stock	15,4%
	Stock, Gold	2%
	Stock, Mutual fund	19,2%
	Stock, Mutual fund, Cryptocurrency	2%
	Stock, Mutual fund, Bond	9,6%
Stock, Mutual fund, Bond, Cryptocurrency, Gold	2%	

Data processed

In reference to table 1. it can be seen that all respondents in this study were students who came from 15 WRAP Entrepreneurship startups and were in accordance with the target respondents of this research. Respondents in this study were dominated by male students, as much as 63.5%. As many as 31% of students have income below IDR 2,000,000 per month, and as many as 78.8% of students have invested with the choice of investment asset, the most chosen Mutual fund as much as 23.07%.

The results of the validity test for the variables of Financial Literacy (X1), Financial Inclusion (X2), Financial Behavior (X3), and Investment Decisions (Y) indicate that all statement items are valid because the R count is greater than R table (0.233). Meanwhile, for the reliability test, the results show that the value of Cronbach's Alpha variables for Financial Literacy (X1), Financial Inclusion (X2), Financial Behavior (X3), and Investment Decisions (Y) is above 0.60, so all statement items in this study are reliable.

Furthermore, the questionnaires that have been filled in are then collected and calculated to determine the percentage level of scores and the assessment criteria for each of the variables studied. The categories for assessing the variables are based on the table of score interpretation criteria that have been determined below.

Table 2. Score Interpretation Criteria

Index	Category
20% - 36%	Very Not Good
37% - 52%	Not Good
53% - 68%	Pretty Good
69% - 84%	Good
85% - 100%	Very Good

Arikunto (2013)

After distributing questionnaires to WRAP Entrepreneurship students to determine the scoring on each statement item that has been determined, the following is the result of calculating the index for each variable in this study.

#### A. Financial Literacy

Table 3. Financial Literacy Descriptive Statistics

Item	Statement	Strongly Disagree	Not Agree	Neutral	Agree	Strongly Agree	Index	Category
		1	2	3	4	5		
LK1	To make short-term and long-term plans, good financial management is needed.	0	0	0	10	42	96%	Very Good
LK2	Financial knowledge is important for students all the time.	0	0	1	14	37	94%	Very Good
LK3	To increase my financial knowledge, I like to read or watch news related to finance.	1	2	11	18	20	81%	Good
LK4	I understand the importance of keeping expenses within the set budget.	0	0	5	17	30	89%	Good
LK5	I compare the available credit offers when buying goods in installments	2	3	11	13	23	80%	Good
LK6	I understand the type of investment that yields the highest returns.	3	3	12	16	18	77%	Good
LK7	I understand the savings products provided by financial institutions.	2	7	13	17	13	73%	Good
LK8	Speculative risks will still arise even though I have made good financial planning.	1	1	8	19	23	84%	Good
Average total index							84%	Good

Data processed

Based on the results of the analysis in Table 3. Financial Literacy Descriptive Statistics, it can be seen that the financial literacy index of WRAP Entrepreneurship students is 84% and is in a good category. The highest index of each statement is on LK1 (To make short-term and long-term planning, good financial management is needed) of 96%, with the most answering 'Strongly Agree' as many as 42 students. While the lowest index of financial literacy is in the statement of LK7 (I understand the savings products provided by financial institutions) at 73%, with the most answering 'Agree' as many as 17 students.

## B. Financial Inclusion

Table 4. Financial Inclusion Descriptive Statistics

Item	Statement	Strongly Disagree 1	Not Agree 2	Neutral 3	Agree 4	Strongly Agree 5	Index	Category
IK1	Products and services provided by financial institutions are safe for students.	0	1	11	23	17	82%	Good
IK2	The initial cost of opening an account from a financial institution is quite affordable for students.	0	0	11	19	22	84%	Good
IK3	Financial products and services issued by financial institutions have low administrative costs.	1	4	10	24	13	77%	Good
IK4	Financial products or services provided by financial institutions have increased student access to financial facilities.	0	0	8	24	20	85%	Very Good
IK5	Financial products or services provided by financial institutions have improved student welfare.	0	1	13	23	15	80%	Good
IK6	Financial products in the form of investments provided by financial institutions according to student needs	0	1	12	26	13	80%	Good
IK7	Financial products in the form of savings provided by financial institutions according to student needs	0	0	8	24	20	85%	Very Good
IK8	Financial products in the form of loans provided by financial institutions according to student needs	0	5	14	19	14	76%	Good
Average total index							<b>81%</b>	<b>Good</b>

Data processed

Then the results of the descriptive analysis are in Table 4. Financial Inclusion Descriptive Statistics show that WRAP Entrepreneurship students have a financial inclusion level index of 81% and are included in the 'Good' category. The highest index of each statement is in IK4 (Financial products or services provided by financial institutions have increased student access to financial facilities), with 24 students answering 'Agree' and IK7 (Financial products in the form of savings provided by financial institutions according to student needs) of 85% with 24 students answering 'Agree'. While the lowest index of financial inclusion is in the statement of IK8 (financial products in the form of loans provided by financial institutions according to student needs), at 76%, with 19 students answering 'Agree'.

## C. Financial Behaviour

Table 5. Financial Behaviour Descriptive Statistics

Item	Statement	Strongly Disagree 1	Not Agree 2	Neutral 3	Agree 4	Strongly Agree 5	Index	Category
PK1	I always pay my bills on time to avoid extra fees	0	2	4	13	33	90%	Very Good
PK2	I record and control my personal expenses	2	5	5	19	21	80%	Good
PK3	I save regularly every month	0	5	9	21	17	80%	Good
PK4	I have financial reserves that can be used in the most unexpected times	0	3	6	16	27	86%	Very Good
PK5	I have an expense budget (daily, weekly, monthly, yearly, etc.) that I follow	2	5	9	19	17	77%	Good
PK6	I spend money according to my planned budget	10	11	13	6	12	60%	Pretty Good
PK7	I like to use financial products to save money	1	2	9	16	24	83%	Good
Average total index							<b>79%</b>	<b>Good</b>

Data processed

Furthermore, based on the results of the descriptive analysis in Table 5. Financial Behaviour Descriptive Statistics, it is known that WRAP Entrepreneurship students have an index of financial behaviour level of 79% and are included in the 'Good' category. The highest index of statements about financial behaviour is on PK1 (I always pay my bills on time to avoid additional fees) at 90%, with the highest frequency of answers being 'Strongly Agree' as many as 34 students. While the lowest index of financial behaviour is in the PK6 statement (I spend money according to my planned budget) of 60%, with the highest frequency of answers being 'Neutral', as many as 14 students.

D. Investment Decision

Table 6. Investment Decision Descriptive Statistics

Item	Statement	Strongly Disagree 1	Not Agree 2	Neutral 3	Agree 4	Strongly Agree 5	Index	Category
KI1	I can take into account the security and risk of investment	1	4	10	20	17	78%	Good
KI2	I can predict the factors that can be a risk in investment	1	4	9	26	12	77%	Good
KI3	I can calculate the rate of return on investment	1	5	11	21	14	76%	Good
KI4	I can calculate the duration and rate of return of the investment in order to meet expectations.	1	4	13	20	14	76%	Good
KI5	I can understand the future value of money as an aspect of the growth of the investment I make	2	3	7	28	12	77%	Good
KI6	I can understand changes in asset values over time	1	4	9	23	15	78%	Good
KI7	I can analyze the flow of funds disbursement (liquidity) from each investment instrument	1	6	14	14	17	75%	Good
KI8	I prefer to invest in multiple assets rather than just one asset	1	2	9	22	18	81%	Good
Average total index							<b>78%</b>	<b>Good</b>

Data processed

The results of the descriptive analysis are in Table 6. Investment Decision Descriptive Statistics shows that WRAP Entrepreneurship students have an investment decision level index of 78% and are included in the 'Good' category. The highest index of each statement is at KI8 (I prefer to invest in various assets rather than only one asset) at 81%, with the most answering 'Agree' as many as 22 students. While the lowest index of investment decisions is in the statement of KI7 (I can analyze the flow of funds disbursement (liquidity) from each investment instrument) of 75%, with the most answering 'Strongly Agree' as many as 17 students.

E. Classic assumption test  
Normality Test

The purpose of the normality test is to determine the distribution of the data in the variables to be used. The normality test in this study used the Kolmogorov-Smirnov normal test, with the results of the normality test using SPSS version 26 as follows:

Table 7. Normality Test Results

One-Sample Kolmogorov-Smirnov Test	
Asymp. Sig. (2-tailed)	Results
0,200	Data is normally distributed

Data processed

Based on table 7. Normality test results show that the value of sig. 0.200 > 0.05, then it can be seen that the data in the variables to be used is normally distributed.

Heteroscedasticity Test

A heteroscedasticity test was conducted to test whether there was a difference in residual variance from one observation period to another. The results of the heteroscedasticity test using SPSS version 26 are as follows:

Fig. 2. Heteroscedasticity Test Results (Data processed)

Based on Figure 2. Heteroscedasticity Test Results can be seen that there is no heteroscedasticity in this research model because :

- The data points on the scatterplot spread above and below or around the number 0.
- There are no clustered points above or below the scatterplot.
- The points on the scatterplot do not form a wavy pattern that widens, then narrows again and widens again.
- The scattered dots on the scatterplot do not form a pattern.

#### *Multicollinearity Test*

The multicollinearity test was carried out to determine the similarity between one variable and another variable so that a strong correlation could occur. According to the multicollinearity test, the criteria for a good regression model is if the VIF is between 1 to 10. The results of the multicollinearity test using SPSS version 26 are as follows:

Table 8. Multicollinearity Test Results

Variables	VIF	Results
Financial Literacy	2,225	No Multicollinearity
Financial Inclusion	1,765	No Multicollinearity
Financial Behaviour	1,845	No Multicollinearity

Data processed

Based on table 8. Multicollinearity test results, it can be seen that there is no multicollinearity because the financial literacy VIF results are 2.225, financial inclusion VIF is 1.765, and financial behaviour VIF is 1.845, which is still between 1 to 10, so it can be said that the regression model in this study This, when viewed from the multicollinearity test, is good.

#### *Multiple Linear Regression*

The results of multiple linear regression using SPSS 26 in this study are as follows:

Table 9. Multiple Linear Regression

Coefficients					
Model	Unstandardized Coefficients		Standardized Coefficients		
	B	Std. Error	Beta	t	Sig.
1 (Constant)	-8.842	4.011		-2.204	.032
Financial Literacy	.271	.167	.181	1.621	.111
Financial Inclusion	.041	.135	.031	.305	.761
Financial Behaviour	1.059	.152	.707	6.953	.000

Data processed

So that the following equation is generated:

$$Y = -8.841 + 0.272X_1 + 0.042X_2 + 1.057X_3$$

The explanation of this study's multiple linear regression equation is as follows:

- The constant value of investment decision (Y) is -8.841, which states that if the variables of financial literacy (X<sub>1</sub>), financial inclusion (X<sub>2</sub>), and financial behaviour (X<sub>3</sub>) are equal to zero, then the investment decision is -8.841. So in this condition, all variables cannot be zero.
- The coefficient of financial literacy (X<sub>1</sub>) is 0.272, meaning that assuming other variables are constant, every time there is an increase in the financial literacy variable (X<sub>1</sub>) by 1 unit, the investment decision of WRAP Entrepreneurship students increases by 0.272.
- The coefficient of financial inclusion (X<sub>2</sub>) is 0.042, meaning that assuming other variables are constant, every time there is an increase in the financial inclusion variable (X<sub>2</sub>) by 1 unit, the investment decision of WRAP Entrepreneurship students increases by 0.042.
- The coefficient of financial behaviour (X<sub>3</sub>) is 1.057, meaning that assuming other variables are constant, every time there is an increase in the financial behaviour variable (X<sub>3</sub>) by 1 unit, the investment decision of WRAP Entrepreneurship students increases by 1.057.

### F. Hypothesis Test

Hypothesis test in this study using t-test and F-test. The t-test was conducted to determine how far the influence of one independent variable individually in explaining the variation of the dependent variable was carried out, while the F-test was conducted to determine whether the dependent variable had a linear effect on the independent variables. The following are the results of hypothesis testing using the t-test. Based on table 9. The results of the t-test can be interpreted as follows:

- The financial literacy variable, when projected with investment decisions, has a significant level of 0.107 which means it is greater than 0.05 and produces a t count of 1.642, which means it is smaller than a t table of 2.00958. So it can be concluded that financial literacy has no significant effect on investment decisions (H1 is rejected).
- The financial inclusion variable, if projected with the investment decision variable, has a significance value of 0.755, which is greater than 0.05 and produces a t count of 0.314, which is smaller than t table 2.00958. This result means that if projected, financial inclusion has no significant effect on investment decisions (H2 is rejected).
- The financial behaviour variable, if projected with the investment decision variable, produces a significance value of 0.000, meaning it is 0.05 smaller. The projection of financial behaviour variables and investment decisions also results in a t count of 7.042, which is greater than the t table of 2.00958. This result means that financial behaviour significantly affects investment decisions (H3 is accepted).

After the t-test is carried out, the F test is then conducted to find out how financial literacy, financial inclusion, and financial behavior, when tested together, will affect investment decisions.

Table 10. F- test Result

ANOVA						
Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	1569.532	3	523.177	43.720	.000 <sup>b</sup>
	Residual	574.391	48	11.966		
	Total	2143.923	51			

Data processed

Based on table 10. The results of the F test can be seen that the calculated F value generated is 44,725. This result is greater than the F table 2.79. Then it can also be seen that the resulting significance value is 0.000, which is greater than 0.05. Based on these results, it can be concluded that the independent variables (financial literacy, financial inclusion, and financial behaviour) simultaneously affect the investment decisions of WRAP Entrepreneurship students (H4 is accepted).

### G. Coefficient of Determination

Table 11. Coefficient of Determination

Model Summary				
Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.856a	.732	.715	3.459

Data processed

Based on table 11. The coefficient of determination can be seen that the value of the coefficient of determination (R square) is 0.732 (73.2%). So it can be concluded that the variable ability of financial literacy, financial inclusion, and financial behavior as independent variables in explaining the investment decision variables of WRAP Entrepreneurship students as the dependent variable is 73,2% and the rest is explained by other variables not discussed in this study.

## V. DISCUSSION

### A. The Effect of Financial Literacy on Investment Decisions

Based on descriptive statistical analysis, it is known that the financial literacy index of WRAP Entrepreneurship students is 84% . Depending the classification of the categories that have been set, it is in the 'Good' category. Descriptive statistical analysis also shows that the investment decision index of WRAP Entrepreneurship students is 78% and is in the 'Good' category. However, after doing the analysis using the t-test with SPSS 26, it shows that the t-count is 1.621, smaller than the t-table 2.01063. So this result does not follow

the hypothesis set earlier because financial literacy was in the 'Good' category and investment decisions were in the 'Good' category. However, they did not significantly affect the investment decisions of WRAP Entrepreneurship students. These results can be because students have never received material related to investment and business finance in the WRAP Entrepreneurship program. The results of this study contradict several previous studies by Kumari (2020); Baihaqqy et al. (2020); Adil et al. (2021), which state that financial literacy has a positive and significant effect on investment decisions.

*B. The Effect of Financial Inclusion on Investment Decisions*

In reference to the results of financial inclusion descriptive statistical analysis, it is known that the financial inclusion index of Entrepreneurship WRAP students is 81%, and the investment decision index of WRAP Entrepreneurship students is 78%. Hence, both variables fall into the 'Good' category. However, after the t-test with SPSS 26, it is known that the t-count of 0.305 is smaller than the t-table 2.01063, so financial inclusion does not significantly affect the investment decisions of WRAP Entrepreneurship students, and this result is not following the established hypothesis. So even though the level of financial inclusion increases, this does not improve the quality of investment decisions. This result may also be because the WRAP Entrepreneurship program does not provide investment or personal finance material. Financial inclusion still needs to be improved if it gets capital from investors one day and wants to be allocated to investment instruments. The results of this study contradict the results of previous studies by Ziyao & Nuoxin (2021), which stated that financial inclusion had a positive effect on investment decisions.

*C. The Effect of Financial Behaviour on Investment Decisions*

Contingent on financial behaviour descriptive analysis, it is known that the financial behaviour index of WRAP Entrepreneurship students is 79% and is in the 'Good' category. Moreover, the investment decision index of WRAP Entrepreneurship students is 78%, so both variables fall into the 'Good' category. Furthermore, the t-test using SPSS 26 to determine the effect of financial behaviour on investment decisions shows that the t count is 6.953, greater than t table 2.01063, so it can be concluded that financial behaviour has a significant effect on investment decisions of WRAP Entrepreneurship students, the third hypothesis in this study was accepted. This study's results align with the research by Zahera & Bansal (2018), which concluded that financial behaviour influences investment decisions because the value of financial behaviour will enrich the understanding of financial markets related to an investor's investment pattern.

*D. The Effect of Financial Literacy, Financial Inclusion, and Financial Behavior on Investment Decisions Simultaneously*

Depending the results of the t-test, it is known that financial literacy and financial inclusion variables do not seem to affect investment decisions. In contrast, financial behaviour has a significant effect on investment decisions. However, after the F test, it is known that the calculated F value produced is 43,720, which means it is greater than the F table of 2.79. Then it can be seen that the resulting significance value is 0.000, which is smaller than 0.05. Therefore, based on the results of the F test, it can be concluded that if the test is carried out together, financial literacy, financial inclusion, and financial behaviour can simultaneously affect the investment decisions of WRAP Entrepreneurship students.

## VI. CONCLUSION AND RECOMMENDATION

*A. Conclusions*

Based on the results of quantitative research using questionnaires to collect answers from WRAP Entrepreneurship students in 2021/2022 as research objects, the following conclusions can be drawn :

- a. Financial literacy has no significant effect on investment decisions of WRAP Entrepreneurship students.
- b. Financial inclusion has no significant effect on investment decisions of WRAP Entrepreneurship students.
- c. Financial behaviour has a significant effect on investment decisions of WRAP Entrepreneurship students.
- d. Financial literacy, financial inclusion, and financial behaviour simultaneously affect the investment decisions WRAP Entrepreneurship students.

This result is obtained because financial behaviour is the most influential in investment decision-making. Therefore, these results show that even though they have good financial knowledge, they cannot make sound investment decisions if an exemplary implementation does not support it.

*B. Recommendations*

- a. Students can improve their financial literacy and inclusion by increasing their knowledge of financial institutions' savings, loans, and investment products. In addition, it is hoped that students will be more aware of the importance of understanding investment before deciding to invest so that they are not wrong in making investment decisions.
- b. Telkom University as the organizer of WRAP Entrepreneurship can provide knowledge through courses and even simulations, if possible, about business finance and investment so that personal finances and business finances that are managed can run smoothly and investment decisions can be made appropriately while participating in the WRAP Entrepreneurship program.
- c. The next researcher can conduct similar research on the next period of WRAP Entrepreneurship students by using the same variables and other variables such as income, geographics, gender and others.
- d. Financial institutions, OJK, and IDX are expected to hold outreach to Indonesian people from various circles, especially students, regarding the importance of financial literacy to have better financial literacy.
- e. The Indonesian Stock Exchange (IDX) is expected to disseminate information about an investment to the Indonesian people, especially students, so they not only increase investment but also avoid illegal and untrusted investments that promise high profits.
- f. Online investment platform providers are expected to provide more investment products accompanied by explanations of the benefits, risks, and flow of funds disbursement so that people are more interested in investing.

ACKNOWLEDGEMENT

The completion of this research cannot be separated from the blessings of Allah SWT and the assistance of various parties involved, either directly or indirectly. In this opportunity, I would like to express my gratitude to:

- a. Mrs Aldilla Iradianty S.E., M.M. as an Advisor who has guided me in preparing this research so that it can be completed properly.
- b. My parents, Mr Eko Pudji Kristiarso and Mrs Ani Priyantini, always love and fulfil material needs in every step of the researcher's life, which is the greatest gift in my life.
- c. WRAP Entrepreneurship students who are willing to spend their time as respondents in this research.

## The Effect of Platform Characteristics, Reward Recognition, and Customization on Customer Loyalty Intention of MSMEs Culinary Products in Food Delivery Applications

Agung Dwi Saputra<sup>1</sup>, Gita Gayatri<sup>2</sup>

<sup>1,2</sup>Faculty of Economics and Business, Universitas Indonesia, Salemba Campus, 10430, Jakarta, Indonesia

### Abstract

*This study focuses on using the Stimulus Organism Response (SOR) model to analyze the influence of platform characteristics on customer loyalty intention in food delivery applications. High expectations for food delivery application users to food merchants on the platform are not directly proportional to the digital literacy capabilities of MSMEs actors in the culinary field during the migration process from convenience stores to digital platforms. Previous studies related to the influence of platform characteristics on customer loyalty with the SOR model in the context of different platforms and studies related to food delivery applications in previous studies were dominated by the use of different theoretical frameworks. This research uses a Stimulus-Organism-Response (SOR) perspective on food delivery applications (Platform to Consumer) with the development of the organism variable using perceived value and satisfaction mediation.: The unit analysis of this research is individuals aged 14–35 years who have purchased MSMEs culinary products through the food delivery applications with 276 respondents and data processing with Structural Equation Modeling (SEM). Results show that system quality and customization affect the perceived value and customer satisfaction. Service quality, information quality, and reward recognition do not affect the perceived value and customer satisfaction. Perceived value and customer satisfaction affect customer loyalty intention MSMEs culinary merchants need to pay attention to the quality of food and customize it to the customer's wishes advertised through the food delivery applications platform.*

*Keywords— Food delivery applications; platform characteristics; reward recognition; customization; customer loyalty intention*

---

### I. INTRODUCTION

Most MSMEs are engaged in the culinary field. Based on BPS economic census in 2016, the number of MSME actors in the accommodation, food and beverage sector is 16.93%, making it the second largest business sector after wholesale and retail trade. The growth in the number of MSMEs in the culinary field is also influenced by the use of information technology, especially food delivery applications. In the last five years, internet penetration in Indonesia has increased from 82 million to 143 million. In 2017, the ratio of internet users in Indonesia touched 54.68% of the total population of Indonesia and 49.2% aged 14–35 years, which has great potential as a consumption base (Krisnawati 2018). Furthermore, according to Krisnawati (2018), the development of the culinary industry in Indonesia has been significantly affected by the existence of digital technology, including social media, websites, culinary review applications, websites, e-commerce applications, and distribution applications.

The food delivery applications are divided into two categories: firm-owned applications directly owned by restaurants such as McDonald's Delivery, Pizza Hut Delivery, KFC Delivery, and Domino's Pizza Indonesia. Then there are third-party applications belonging to certain companies that provide food delivery services, such as Gofood, Grabfood, and Shopeefood. According to Dirsehan & Cankat (2021), mobile food applications are divided into two categories: firm-owned applications (restaurant to consumer) and third-party applications (platform to consumer). Firm-owned applications, i.e., restaurants, develop their applications to provide online delivery services for the convenience of their customers. Meanwhile, third-party applications focus on ordering and delivering food, not on its preparation.

The increasing number of food delivery application consumers, especially third-party applications that based on the platform to the consumer, is an indicator for MSMEs in the culinary field to pay attention to their appearance and services. High expectations from users of food delivery applications cause food and beverage sellers to pay more attention to packaging, food quality, delivery costs, offers, ease of use, and different payment options (Elvandari et al., 2017). The existence of limited capital and knowledge for MSME actors related to digital literacy is one of the challenges for them to be able to provide an attractive appearance and quality services to consumers on digital platforms, so it is feared that it will have an impact on consumer loyalty in the future.

Although many studies on loyalty have been carried out in various industries, the results of studies in one industry are difficult to generalize to other industries due to differences in characteristics. This needs to be

investigated regarding the formation of loyalty in other new industrial sectors. According to Yeo et al. (2017), the food delivery applications service business is currently developing and promising in the future. In contrast, little literature examines the factors that drive customer loyalty to online food delivery services (Suhartanto et al., 2019). In addition, the high number of MSMEs, especially the culinary sector that migrates from convenience stores to digital platforms have not been matched with sufficient digital literacy, so it can impact store displays that are less attractive, uninformative, and services that lack quality on digital platforms. This makes the characteristics of the platform on food delivery applications, especially third-party applications which are the basis for the MSMEs in the culinary sector in Indonesia need to be investigated further to see how it affects consumer behavior and loyalty in the future.

Several studies have been carried out to see the effect of website design or platform characteristics with various models. Molinillo et al. (2020) previously investigated the effect of website design variables on behavioral loyalty by assessing intermediary perceived value as an organism factor using the SOR model on the social media platform Facebook. The research by Lin, Li, and Guo (2021) looked at the effect of platform characteristics on continuous purchase intention through perceived value as an organism factor using the Stimulus Organism Response (SOR) model on the fresh food e-commerce platform. Wang et al. (2016) looked at the effect of platform characteristics on stickiness intention with perceived value and customer satisfaction as intermediary variables using the e-commerce success model on the group buying website. However, no research uses the Stimulus Organism Response (SOR) model to see the effect of platform characteristics on food delivery applications.

The influence of platform characteristics on consumer behavior and loyalty needs to be investigated further to determine the success of culinary MSMEs on digital platforms. Information quality and service quality are the two dimensions most often used by researchers to measure the design, quality, and success of website services (Wu et al., 2015). Attractive, informative displays and qualified services on digital platforms are expected to increase perceived value and customer satisfaction, which will further foster consumer behavior loyalty in the future. This is in line with the research of Fida et al. (2020) that shows service quality and perceived value are considered antecedents of customer loyalty. Furthermore, service quality has an important influence on customer loyalty and customer satisfaction.

This research is also important because although the Stimulus Organism Response (SOR) model has been widely used in research related to online retail, it is still limited in the context of social commerce and e-commerce platforms. On the other hand, the use of research models in the context of food delivery applications in previous studies was dominated by the use of the Technology Acceptance Model (Dirsehan & Cankat, 2021), Theory of Planned Behavior (Yeo et al., 2017) and Unified Theory of Acceptance and Use of Technology (Alalwan, 2020). Based on this, it is necessary to conduct a study with a different theoretical framework from previous research through the use of the Stimulus Organism Response model on the food delivery applications platform.

This study contributes to the theory and practice of marketing by enhancing the understanding of customer perceived value and behavioral intentions in the food delivery applications context, by testing relationships and a moderating effect hitherto unassessed. Therefore, we believe that the present study's findings will be of interest to academics and MSMEs culinary merchants.

## II. LITERATURE REVIEW

### A. *Food delivery applications*

Mobile commerce is an example of e-commerce where consumers engage in digital purchases using mobile devices. Mobile commerce is a platform for shopping and product browsing and has experienced higher growth compared to e-commerce over the last decade. One example of the emergence of m-commerce is retail delivery services or food delivery services in developing countries, which are mostly based on mobile technology (Zhao & Bacao, 2020).

The presence of integrated m-commerce through the internet encourages the presence of products and services such as clothing, mass transportation, travel, and ordering food and beverages (Hidayanto, 2017). Mobile commerce is a platform that has a dominant role in society and provides benefits to all stakeholders related to comprehensive business processes, including customers and vendors involved in the process from upstream to downstream (Prastiwi and Iswari, 2019).

Since the advent of smartphones, most mobile devices have been used as a means of e-commerce. In 2016, e-commerce penetration in China reached 66% of all e-commerce activities (Evans, 2017). The decrease in the cost of producing smartphones can lead to increased use of m-commerce in the short term and make it a relevant platform for commerce and outreach activities. Based on the report of the Global Association of Cellular

Operators, it is estimated that more than 4 billion mobile internet users in 2020 expect huge growth from the current 51% penetration rate of mobile services to 60% by 2025 (GSMA, 2021).

Food delivery applications are online-to-offline services that offer two-way benefits for catering companies and customers through the provision of efficient online ordering and offline delivery services (Zhao & Bacao, 2020). The popularity of food delivery applications is related to their ability to provide convenient and fast food delivery facilities to customers (Xu, 2017). In addition, according to Xu and Huang (2019), food delivery applications also provide restaurants with more opportunities to increase revenue without increasing restaurant seating capacity.

#### *B. The stimulus-organism-response (SOR) framework*

The SOR psychological model explains human behavior through a three-phase process, namely the perception of external or environmental stimuli (stimulus), which affects the emotional and cognitive state of the individual (organism) to encourage conscious or unconscious responses (response) (Mehrabian and Russell, 1974). According to Zhang et al. (2014), an organism is a consumer's internal state, which is related to cognitive and emotional systems, including perception, experience, and evaluation. Furthermore, the result of such processing is responses, which come in various forms, ranging from conscious to subconscious and from internal to external (Jiang, Chan, Tan, & Chua, 2010). Chang and Chen (2008) modeled website quality and website brand as stimuli to examine their effect on purchase intention (R), through moderating trust and perceived risk (O).

In retail trade, environmental stimuli have an effect on internal consumers, which in turn directs their behavior towards the store. In online retail, stimuli relate to the design features of the online environment that consumers interact with (Eroğlu et al., 2003). In physical stores, arousal refers to cues that come from appearance, decoration, music, smell, and store staffing (Baker, Parasuraman, Grewal, & Voss, 2002). Although the Stimulus Organism Response (SOR) model has been widely used in research related to online retail, so far it is still limited in the context of social commerce and e-commerce platforms. On the other hand, the use of research models in the context of m-commerce platforms, especially food delivery applications, in previous studies was dominated by the use of the Technology Acceptance Model (Dirsehan & Cankat, 2021), Theory of Planned Behavior (Yeo et al., 2017) and Unified Theory of Acceptance and Use of Technology (Alalwan, 2020).

#### *C. Previous Research*

This study is a development of two previous research models by Molinillo et al. (2021) and Wang et al. (2016). The first model adaptation of Molinillo et al. (2021). This study uses a stimulus-organism-response (SOR) framework to see the effect of website design consisting of information quality, service quality, reward recognition, and customization variables on behavioral loyalty mediated by consumer perceived value in social commerce. The next model adaptation comes from Wang et al. (2016), this study uses an e-commerce success model and commitment-trust theory to see the effect of the characteristics of the group buying website platform on stickiness intention by mediating perceived value and customer satisfaction.

#### *D. Hypotheses development*

The research of Molinillo et al. (2021) shows that service quality has a considerable influence with the same intensity as the perceived value on social commerce platforms. Other studies also show that service quality has a significant impact on perceived value when shopping through a fresh food e-commerce platform (Lin, Li, and Guo, 2021). Thus, the following hypothesis is proposed:

**H1.** Service quality has a positive effect on perceived value

Service quality has an important influence on customer loyalty and satisfaction. This is based on the phenomenon that there is a significant relationship between the three variables: service quality, customer satisfaction, and customer loyalty (Fida et al., 2020). Service quality also has a positive direct influence on customer satisfaction in the context of group buying websites (Wang et al., 2016). Thus, the following hypothesis is proposed:

**H2.** Service quality has a positive effect on customer satisfaction

Information quality influences the perceived value on social commerce platforms (Molinillo et al., 2021). Lin, Li, and Guo (2021) state that information quality has a significant influence on the perceived value of fresh food e-commerce platforms. Information quality also has a positive direct influence on perceived value in the context of users of group buying websites (Wang et al., 2016). Thus, the following hypothesis is proposed:

**H3.** Information quality has a positive effect on perceived value

According to Fu et al. (2020), information quality is potential technical support that can be provided by an e-commerce platform to ensure customer satisfaction in the form of smoothness, ease of use, and user convenience in accessing the platform and is a technical characteristic of the platform. Information quality is the dimension most often used by researchers to measure the design, quality, and success of service websites (Wu et al., 2015). Thus, the following hypothesis is proposed:

**H4.** Information quality has a positive effect on customer satisfaction

System quality plays an important role in influencing consumers' perceived value of online shopping websites (Gao and Li, 2018). According to Hsu et al. (2017), system quality as part of the characteristics of the platform positively affects consumers' perceived value related to e-commerce platforms. System quality is manifested in the overall website system performance and can be measured through the level of customer perception of user-friendliness when shopping at online retailers. Thus, the following hypothesis is proposed:

**H5.** System quality has a positive effect on perceived value

System quality has a positive influence on customer satisfaction in the use of group buying websites (Wang et al., 2016). The stability, smoothness, and innovation of the platform system have improved significantly, and the quality of the system has gradually become a key factor for evaluating the shopping platform and continuing to buy as a form of customer satisfaction (Li et al., 2017). Thus, the following hypothesis is proposed:

**H6.** System quality has a positive effect on customer satisfaction

In general, customers positively appreciate the reward recognition they receive through social media, which in turn makes them feel like doing something in return and makes them increase their participation and engagement (Van Doorn et al., 2010). Consumers who see themselves as having an idiosyncratic fit with reward programs have a higher perceived value (Kivetz & Simonson, 2002). Molinillo et al. (2021) also researched to see the effect of reward recognition on customer perceived value on social commerce platforms. Thus, the following hypothesis is proposed:

**H7.** Reward recognition has a positive effect on perceived value

Satisfied and dissatisfied customers perceive reward program loyalty in different ways, and further studies are needed to verify this relationship (Dowling & Uncles, 1997). Direct rewards should be more easily and integrated to form service evaluation, studies show that customer satisfaction is greater when resources from the same category are exchanged than when resources from different categories are exchanged maintaining a constant value (Foa et al., 1993). Financial incentives such as price discounts, quantity discounts, points, and rewards such as vouchers and loyalty programs should be implemented for customers who actively use food ordering applications (Shareef et al., 2014). Thus, the following hypothesis is proposed:

**H8.** Reward recognition has a positive effect on customer satisfaction

Customization in the context of e-commerce relates to activities carried out by retailers to adapt their sites to meet actual customer needs and can add value and strengthen the relationship between customers and retailers (Srinivasan et al., 2002). Lee J. et al. (2012) argue that customers value well-tailored programs for the value they derive from the final product or service because they enjoy the experience of the customization process. Thus, the following hypothesis is proposed:

**H9.** Customization has a positive effect on perceived value

Research by Kasiri et al. (2017) in the hospitality industry found that customization is applied to ensure maximum customer satisfaction. Therefore, further research needs to be done to see the direct effect of customization on customer satisfaction on the m-commerce platform. Thus, the following hypothesis is proposed:

**H10.** Customization has a positive effect on customer satisfaction

According to Wu et al. (2014), perceived value is the fundamental basis for all exchange activities and can drive purchase choices. The perceived value of a product or service has become a concern because of its critical effect on consumers' buying behavior in the future (Ha & Jang, 2010). Previous studies have shown that in the context of e-commerce, perceived value positively influences repurchase intentions (Fang et al., 2016). Thus, the following hypothesis is proposed:

**H11.** Perceived value has a positive effect on continuous purchase intention

Perceived value significantly affects consumers' willingness to rebuy, increases word of mouth towards products, and reduces the chance for consumers to seek other alternatives (Ulaga et al., 2002). When consumers feel that the supplier has given them value that can develop an emotional commitment to the company, then this will make them like it, which is reflected by positive WOM (McKee et al., 2006). Previous research in the context of e-commerce has shown empirically that perceived value has a positive effect on eWOM (Shaikh et al., 2018). Thus, the following hypothesis is proposed:

**H12.** Perceived value has a positive effect on positive eWOM intention

According to McDougall and Levesque (2000), perceived value is a key element in explaining consumer behavior and future intentions towards certain companies and brands. If the consumer's value needs for the product are not met, the consumer will be dissatisfied with the platform and will no longer want to buy products on the platform (Xuequn et al., 2021). Thus, the following hypothesis is proposed:

**H13.** Perceived value has a positive effect on customer engagement behavior intention

Several studies have shown a positive relationship between satisfaction and measures of repurchase intention (Anderson et al., 1994). There is a direct relationship between service, sales, satisfaction, and profit (Gerson, 1993). Continuous Purchase Intention is the subjective frequency of consumers' intentions to continue buying products from the same seller, which represents consumer recognition, satisfaction, and loyalty to the product or platform (Chiu et al., 2014). Thus, the following hypothesis is proposed:

**H14.** Customer satisfaction has a positive effect on continuous purchase intention

Customer satisfaction is identified as a determinant of consumer eWOM communication (Chen et al., 2021). Individuals with high levels of satisfaction can have a large impact on positive eWOM. If consumers have a very good psychological experience with a particular product or service, they may feel satisfied and tend to adopt that product or service shortly (Teng & Wu, 2019). Thus, the following hypothesis is proposed:

**H15.** Customer satisfaction has a positive effect on positive eWOM intention

According to Lee and Charles (2021), consumers will have a deeper understanding of the platform or product and leave a deep impression after the first purchase so that they feel the high value brought by the product or platform, which will also encourage them to have higher satisfaction and loyalty. Thus, the following hypothesis is proposed:

**H16.** Customer satisfaction has a positive effect on customer engagement behavior intention

Previous studies have shown that gender influences user behavior in their intention to shop online (Shaouf et al., 2016). Huang and Benyoucef (2017) show that gender affects the social perception of commerce website design and the importance of this function on website usability. Thus, the following hypothesis is proposed:

**H17.** Gender moderates the effect of platform characteristics, reward recognition, and customization on perceived value and customer satisfaction, as well as their impact on customer loyalty intention.

Frequency of use is a significant moderator of customer behavior in contexts such as social networking services, internet banking, and electronic commerce. Wang (2010) showed that the frequency with which customers browse a particular online store positively affects their loyalty to that store. Frequency of use is a behavioral variable that may be a consequence of the characteristics of the social trading website or the value of profits. Frequency of use can also be considered to be a moderator of the customer-retailer relationship (Molinillo et al., 2021). Thus, the following hypothesis is proposed:

**H18.** The frequency of using food delivery applications moderates the effect of platform characteristics, reward recognition, and customization on perceived value and customer satisfaction, as well as their impact on customer loyalty intention.

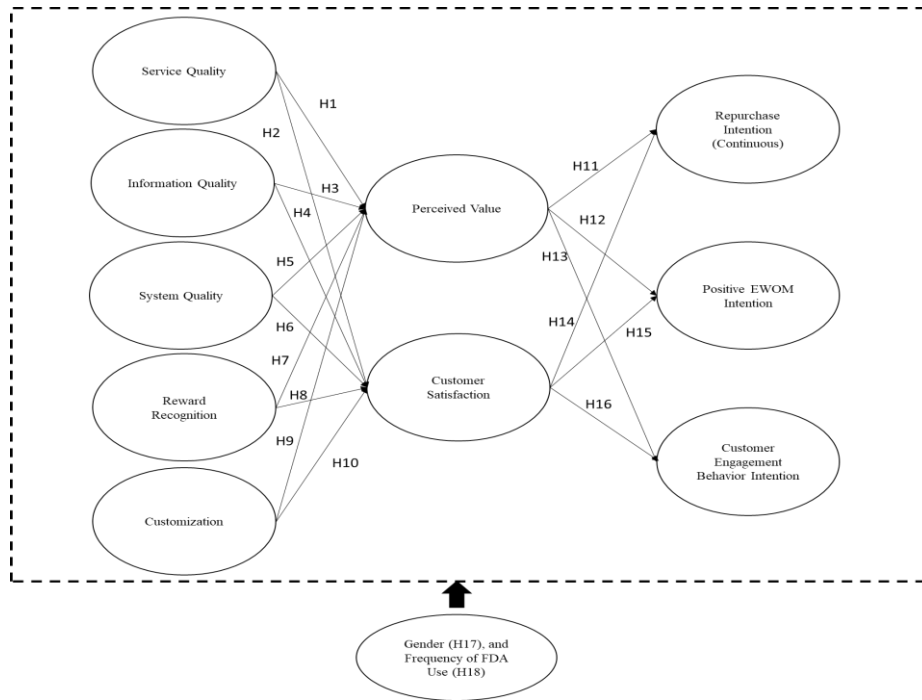

Fig. 1. Research model (Source: Molinillo et al. (2021); Wang et al. (2016))

### III. RESEARCH METHODOLOGY

This model is expected to be able to represent the needs of researchers because of the desire to prove the influence of platform characteristics, reward recognition, and customization that reflects the readiness of MSMEs to enter digital platforms, which includes store appearance, quality of information and services provided, perceived value, and customer satisfaction, and their impact on consumer behavior and loyalty in the future. In all cases, 6-point Likert-type scales were used (1 strongly disagree; 6 strongly agree).

In addition, before the data collection, five experts reviewed the questionnaire and introduced minor modifications to improve the understanding of the questions while maintaining the meanings of the original scales. Subsequently, a pre-test was conducted with a convenience sample of 30 respondents with experience in food delivery applications. The Cronbach's alpha results were greater than 0.60 (Hair et al., 2010). This research was conducted in a cross-sectional manner with a purposive sampling method and judgment sampling type. The questionnaire uses 18 hypotheses with 51 indicators, so the minimum number of respondents required is 255–510 respondents. The questionnaire consists of four parts, namely opening, screening questions, core questions, and respondent profiles.

The questionnaire is addressed to individuals aged 14–35 years who have purchased culinary products from MSMEs through food delivery applications based on platforms (Gofood and Grabfood) in the last 3 months since the questionnaire was received. In April 2022, data were gathered through an online survey with a structured questionnaire in Indonesia. Following a convenience sampling method and to reduce possible bias, the link to the questionnaire was posted on various WhatsApp groups and distributed through social media (e.g., Facebook, Instagram). Before they completed the questionnaire, the participants viewed an invitation to take part in the study and a piece about the objectives of the study, which included a tick box where they provided their consent to participate. Participation was voluntary. If they agreed to take part, they could access the questionnaire using the link. A screening question was posed to exclude people who did not belong to the target group.

Structural equation modeling was applied to evaluate the quality of the measurement instrument and the hypotheses of the proposed model. Structural Equation Modeling (SEM) is a class of statistical models looking for relationships in multiple variables (Hair et al., 2010). Structural Equation Modeling (SEM) is a multivariate statistical technique that combines aspects of multiple regression and allows researchers to simultaneously test a group of interrelated dependent relationships in the tested variables and latent constructs or between several latent constructs.

## IV. RESULT / FINDING

From the results of the study, a total of 276 valid questionnaires were obtained. Of the respondents, 63% were female, and 35% used food delivery applications every few weeks (see Table 1).

Table 1. Sample characteristics.

Characteristic	Count	%
State Civil Apparatus (ASN)	16	5.80%
Teacher	8	2.90%
Housewife	3	1.09%
BUMN employee	18	6.52%
Private employee	42	15.22%
Student	165	59.78%
Unemployed	4	1.45%
TNI/ POLRI	6	2.17%
Self-employed	14	5.07%
S1/ Bachelor	96	34.78%
S2/ Master	11	3.99%
S3/ Doktor	1	0.36%
Primary school studies	90	32.61%
High school	27	9.78%
Secondary school studies	51	18.48%
Jabodetabek	60	21.74%
Non Jabodetabek	216	78.26%
Male	102	36.96%
Female	174	63.04%
Income < Rp 1.000.000	136	49.28%
Income Rp 1.000.000 – Rp 2.500.000	39	14.13%
Income Rp 2.500.000 – Rp 5.000.000	39	14.13%
Income Rp 5.000.000 – Rp 10.000.000	24	8.70%
Income > Rp 10.000.000	38	13.77%
Outcome < Rp 1.000.000	152	55.07%
Outcome Rp 1.000.000 – Rp 2.500.000	55	19.93%
Outcome Rp 2.500.000 – Rp 5.000.000	35	12.68%
Outcome Rp 5.000.000 – Rp 10.000.000	23	8.33%
Outcome > Rp 10.000.000	11	3.99%
Several times a day	9	3.26%
Several times a week	96	34.78%
less than once a month	61	22.10%

Gofood	213	77.17%
Grabfood	63	22.83%

Source: SPSS Statistics 26.0

Table 2 shows the results of the construct reliability and convergent validity assessments. All factor loads are greater than 0.50, except CE1. Cronbach's alpha (CA) and composite reliability (CR) in all cases exceeded the minimum value of 0.6 (Hair et al., 2010). The average variance extracted (AVE) exceeded the minimum recommended level of 0.5 (Fornell and Lacker, 1981).

The assessments demonstrated the reliability and validity of the measures; thus, the structural model is appropriate for the analysis. If an unreliable construct cannot be valid, it is necessary to measure reliability using

composite reliability (CR). The value of CR 0.70 is declared to have good reliability. Values between 0.6 and 0.7 are declared acceptable if the validity value is good (Malhotra, 2010).

Table 2. Variable descriptive statistics, reliability and convergent validity

Construct Variable	Variable	M	SD	Loading	CA	CR	AVE

The square root value of AVE for each latent variable is greater than the correlation value between latent variables so that all variables meet the criteria of discriminant validity (see Table 3).

This study uses a 95% confidence level, so the t-critical value is 1.96. If the t-value is greater than 1.96, it indicates a significant effect between the two variables being tested. Structural coefficient estimation is the coefficient of the result of linear regression in hypotheses testing.

Table 4. Results of hypotheses testing

The coefficient of determination ( $R^2$ ) shows the strength of the relationship between two variables, which explains the large proportion of the total variation of the dependent variable that is explained by the variation of the independent variable (Malhotra, 2010). The higher the  $R^2$  value, the higher the prediction accuracy level as well (Hair et al., 2010).

Two multi-group analyses were performed using the SEM-MGA technique to test the hypotheses associated with the two proposed moderating variables (hypotheses 17 and 18). Each moderator variable was categorized into two values, which were then used as criteria to divide the sample into groups. As to gender, the sample was divided into male and female. The groups were formed using the median values of their distributions. Thus, the sample was divided into two groups based on the frequency of food delivery applications use, with the low-

frequency group using it once a day or less, and the high-frequency group using it several times a day. In the multi-group analyses, the path coefficients of the two structural models resulting from the division of the sample were compared based on the two categories of the moderating variables. The Student t-test for independent samples was used to evaluate whether there were significant differences.

Table 6. Results of the SEM multigroup analysis (MGA)

Source: Output Lisrel 8.72

Table 6 shows significant differences in the two structural model relationships based on gender. On the one hand, men have a more significant moderating influence on the relationship between research variables. On the other hand, women only show a significant moderating effect on the relationship between reward recognition variables on perceived value and customer satisfaction. The frequency of using the platform has a significant moderating effect on the relationship between several research variables. The use of food delivery applications with low frequency has a more significant moderating effect on the relationship between research variables. On the contrary, the use of high-frequency platforms only shows a significant moderating effect on the relationship between perceived value variables and continuous purchase intention. Consequently, the results do not allow us to reject hypotheses 17 and 18, because the gender and frequency of use variables significantly moderated several of both models' relationships.

## V. DISCUSSION

The present study makes several contributions to mobile commerce research. First, the results allow us to better understand the role that customer perceived value and satisfaction play in the success of food delivery applications. The present study is the first to propose and empirically evaluate a behavioral model including features of food delivery applications as antecedents of perceived value, customer satisfaction, and response

variables, such as continuous purchase intention, positive e-WOM intention, and customer engagement behavior intention. This is a contribution to the growth in the scientific knowledge of and literature on consumer behavior.

Second, service quality does not have a significant positive effect on the perceived value and customer satisfaction of food delivery application users when shopping for culinary products at MSMEs. The results of this study are contradictory to previous studies, although in the context of a different platform. Suhartanto et al. (2019) mention that service quality is very important in determining food quality, perceived value, and satisfaction. The main purpose of using food delivery applications is the food, not the food service. When compared to other restaurant elements such as service quality and restaurant environment, food quality is the dominant factor in influencing customer interest in restaurants (Ha and Jang, 2010). The results of the study indicate that food delivery application service providers should emphasize both factors rather than focusing only on service quality or the quality of the food itself.

Third, the results show that information quality does not have a significant positive effect on the perceived value and customer satisfaction of food delivery application users when shopping for culinary products at MSMEs. The results of this study are contradictory to previous studies, although in the context of a different platform. According to Strauss and Frost (2012), in addition to social and cultural trends, individuals vary in their online behavior, which is partly based on individual differences, such as age, income, education, ethnicity, gender, positive attitudes towards technology, online abilities and experiences that playing an important role in the exchange process, making consumers more adept at finding information and products quickly. Further, Burke (2002) states that the person with higher education will prefer shopping through non-store channels such as the internet and catalogs to find more products, seek product information, and buy these products. Most of the respondents in this study were students with the last education level in primary school, secondary school, and high school. Burke (2002) states that consumers with low education are significantly more receptive to most forms of communication. In addition, the presence of other mediating variables that are not included in this study, such as rating or customer reviews can also give different results (Liu & Park, 2015).

Fourth, the results of this study indicate that there is a positive influence between system quality from Food delivery applications on customer perceived value and satisfaction. The results of this study are following previous studies on perceived value (Hsu et al., 2014; Lin, Li, and Guo, 2021) and customer satisfaction (Wang et al., 2016; Li et al., 2017).

Fifth, the results of the study show that reward recognition does not have a significant positive effect on the perceived value and customer satisfaction of food delivery application users when shopping for culinary products at MSMEs. Although there has been no previous research that looks at the effect of reward recognition on customer perceived value and customer satisfaction in the context of food delivery applications, the results of this study can contribute to the consumer behavior literature. Other studies in different contexts also show that reward recognition does not have a significant positive effect on customer perceived value in social commerce (Molinillo et al., 2021). Dowling and Uncles (1997) stated that satisfied and dissatisfied customers perceive reward program loyalty in different ways, and further studies are needed to verify this relationship. In this study 174 respondents or 63.04% were female. Burke (2002) stated that most women stated that they needed more personalized discounts according to the type of product and the intensity of shopping. Currently, the rewards given by the food delivery applications platform to customers are in the form of promos or discounts that apply equally to all customers so the award does not create satisfaction for the customer.

Sixth, the results of the study show that customization has a significant positive effect on the perceived value and customer satisfaction of food delivery application users when shopping for culinary products at MSMEs. Although there has been no previous research that looks at the effect of customization on customer perceived value and customer satisfaction in the context of food delivery applications, the results of this study can contribute to the consumer behavior literature. The results of this study are following previous studies. Although in different contexts, research proves that customization has a significant positive effect on customer perceived value (Lee J. et al., 2012; Srinivasan et al., 2002) and customer satisfaction (Huffman & Kahn, 1998; Kasiri et al., 2017).

Seventh, the results of the study show that perceived value has a significant positive effect on customer loyalty intention. The results of this study are following previous studies. When customers perceive a product or service to be valuable, they are more likely to purchase it (Khan and Mohsin, 2017). Consumers feel that the supplier has provided them with value that can develop an emotional commitment to the company, then will make them like it, which is reflected by positive WOM. Their motivational engagement with cellular technology can shape the influence of their attitudes on their overall value, ongoing engagement, and intention to continue engaging with their cellular activities (Kim et al., 2013).

Eighth, the results of the study show that customer satisfaction has a significant positive effect on customer loyalty intention. The results of this study are following previous studies. Research by Kim C. et al. (2012) also showed that customer satisfaction had a significant effect on repurchase intention on internet shopping sites. Satisfaction is the main aspect driving loyalty. If the customer is satisfied, then there are more possibilities for the client to have a positive perception of the organization, show loyalty to the company, and represent the company positively through WOM (García-Fernández et al., 2018). On the other hand, customer satisfaction does not have a significant positive effect on customer engagement behavior intention for food delivery applications. The demographics of the respondents in this study were mostly dominated by young students, namely 60%, or 165 respondents. Homburg and Giering (2001) also found a significant moderating effect of customer characteristics such as age, variety-seeking behavior, and income. Young customers tend to be less loyal, with behavior that likes to seek variety, so it is very related.

Ninth, the result shows the moderating effect of gender. Men have a more significant moderating influence on the relationship between research variables. On the other hand, women only show a significant moderating effect on the relationship between reward recognition variables on perceived value and customer satisfaction. This is in line with previous research which states that women are more motivated by emotional and social interactions while men prioritize comfort over social interaction (Hasan, 2010). Yang and Chen (2010) also mention that women prefer a variety of available information as a basis for making decisions. On the other hand, men do not like the use of comprehensive information for decision-making. Lee (2011) stated that female consumers are directly influenced by intangible attributes for post-adoption decisions. Female customers are motivated to form loyalty because of product delivery and price. In online and in-store shopping environments, women are consistently more focused on prices, promotions, and coupons than men (Burke, 2002).

Tenth, the frequency of using the platform has a significant moderating effect on the relationship between several research variables. The use of food delivery applications with low frequency has a more significant moderating effect on the relationship between research variables. On the contrary, the use of high-frequency platforms only shows a significant moderating effect on the relationship between perceived value variables and continuous purchase intention. The results of this study are following previous studies (Ajzen, 1991; Wang, 2010; Molinillo et al., 2021).

## VI. CONCLUSION AND RECOMMENDATION

This research also has important implications for practitioners. First, ratings or customer reviews are very important in determining the quality of information on the food delivery application platform. If it is not accompanied by a rating or customer review, new customers in particular cannot physically inspect the product, so the buyer can only rely on the possibility of inaccurate or inadequate information provided by the seller.

Second, in the context of the food delivery application platform, service quality cannot stand alone in influencing customer satisfaction. Service quality must also be supported by food quality because the main purpose of customers using the food delivery application platform is to find qualified food. Third, companies can create attractive marketing programs to increase customer engagement, especially for young customers. This is because customer satisfaction has no significant effect on customer engagement behavior intention in young customers, according to the demographics of the respondents in this study.

Fourth, the food delivery application platform can provide a menu suggestion feature to customers according to their preferred purchase history so that customers have a customized experience that can increase perceived value and customer satisfaction. Fifth, rewards to customers can be given in the form of accumulated coupons to form the effect of reward recognition on the customer's perceived value rather than in the form of promos or shipping discounts because they are not proportional to the price difference that customers have to pay more for additional costs and taxes.

Sixth, MSME merchants need to pay attention to the quality of food advertised through the food delivery applications platform because it is the main factor that determines customer satisfaction apart from the quality of the service itself. Seventh, merchants need to provide a menu that can be customized according to the customer's wishes because the food delivery application platform greatly influences the perceived value and customer satisfaction. Eighth, merchants can give rewards in the form of regular promos to increase the value felt by customers through the food delivery application platform with low frequency, because this customer segment uses applications only when there are attractive promo programs that meet the customer's wishes.

ACKNOWLEDGEMENT

I am very grateful to God for the opportunity to complete this study and learn so many things from my lecturers and friends. The completion of this paper would not have been possible without the support of my wife and family, who always give so much advice and lessons while I am making this thesis.

<sup>1,2,3,4</sup>Faculty of Economy, Management Department, Universitas Garut, Samarang Street, Garut, Indonesia

### Abstract

*This study investigates the differences in purchase decisions before and after the decoy effect marketing strategy is implemented. The decoy effect is a behavior of consumers who tend to change their choices when an unbalanced third option is available. The population in this study is the people of Garut Regency. The sampling technique used in this study is a non-probability sampling technique. The findings in this study are Target products are the part of the product that is most in demand or will be chosen by consumers, which is then followed by Competitor products and the last is the Decoy product. The purchase decision is influenced by the consumers' behaviors and unexpected situations. The decoy effect marketing strategy greatly affected consumers' purchase decisions in Indonesia (Siswanto, 2019). The process was not successfully implemented to improve the target product as it only affected millennial consumers. The consumer would purchase based on their interests (characters and satisfaction). The novelty of this study is discovering an appropriate decoy effect strategy for the Indonesian context. The study used questionnaires to obtain the data. Then, the data was tested by Wilcoxon Test to find the significance of the purchase decision before and after the decoy effect strategy was implemented. The study is in line with the previous studies that the decoy effect strategy significantly influenced purchase decisions. Although it only applied to some products, the decoy effect strategy changed the consumer's perception to determine the purchase decisions. It was suggested that Indonesian companies thoroughly comprehend the decoy affects marketing strategy.*

*Keyword— Marketing Strategy, The Decoy Effect, Purchase Decisions, and PT Telkomsel.*

---

### I. INTRODUCTION

Trading is an economic activity carried out between producers and consumers as a distribution activity that guarantees the circulation, distribution and supply of goods through a market mechanism. In this case, producers and consumers are the subjects who play essential roles in trading activities. Thus, the interests of both parties will always need to be considered to benefit the two parties. From the consumer's point of view, profit means buying an item at the lowest price with the possibly highest quality. Meanwhile, from the producer's point of view, profit means selling as many products as possible to get the highest profit. As a result, producers that sell similar products compete with each other to maintain and develop their existence by relying on the marketing department to realize their business plans by implementing marketing strategies.

According to (Sadeli, Utami, & Djuwendah, 2017), a marketing strategy is a mix consisting of a combination of factors that can maximize the success of a company's marketing activities, including products that have particular benefits, locations or other names of distribution that make a product easily accessible to consumers, promotion to provide information to consumers about the products they have, and price as the essential marketing strategy variable which influenced consumers to make decisions of purchasing goods or services. Companies need to determine their products' prices to get the maximum profit. Companies might apply a price psychology trick called the decoy effect to achieve this goal.

The decoy effect is a phenomenon in which consumers tend to change a particular preference between two options when a third option is also presented (Decoy), which is dominated asymmetrically (Huber, Payne, and Puto, 1982). In other words, the decoy effect is a behavior in which a consumer tends to change his choice when an unbalanced third option is given. According to Monk (2016), there are three divisions of product categories. The first is Competitor Products which are products that have standard prices. The second one is the target product which is the most economical and profitable from the consumer's point of view, and the last is the decoy product

(bait) that has the least effective price which serves as a comparison product. Through this strategy, companies provide bait or “lure” for consumers to change their purchase decisions towards products that are more profitable for the company. The examples of the case before and after the application of the decoy effect can be seen in Figure 1.1.

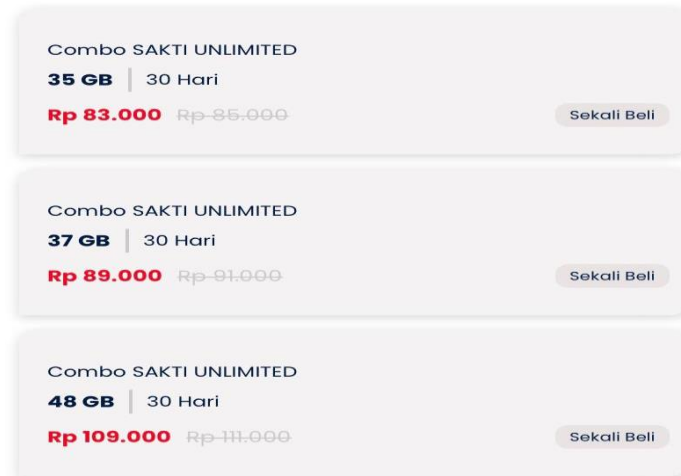

Fig 1. An Example Of The Case Before The Decoy Effect Strategy Implementation Kasus

Figure 1.1 shows an example of the application of the decoy effect available in My Telkomsel application which displays three options or alternative quota packages for the same or similar products. The first and second prices usually have a price increase that goes hand in hand with the corresponding number of products. However, the third price package, which basically just baits or decoy, tends to be slightly more expensive than the increase in the first and second price packages. Accordingly, it influences the purchase decisions made by consumers based on the consumer's own responses. This is supported by Djati (2020) in deciding to buy some products; consumers often have more than two choices involved in the buying process. Each producer carries out various ways or strategies so that consumers decide to buy their products. In addition, the study by Siswanto (2019) stated that the decoy effect strategy had an effect on consumers' purchase decisions, but the decoy effect strategy was not fully implemented to increase the target product because it only influenced the consumers of the X generation. Basically, every consumer who makes a purchase will first consider what is good in accordance with his interests before deciding what he wants to buy. Consumers will also choose according to the character and inner satisfaction that will be obtained later.

From the case above, it can be seen that the purchase decision is influenced by two factors that will determine consumer response. According to Kotler & Keller (2012), the purchase decision is the stage of the decision process in which consumers actually purchase a product with two factors that arise between purchasing tendencies and purchasing decisions, namely the attitude of other people and unexpected situation factors. This is supported by the result of research proposed by (Siswanto, 2019), who researched the decoy effect strategy and purchasing decisions in several segments based on demographics. The result stated that the decoy effect strategy affected consumers' purchase decisions in Indonesia. However, in this study, the decoy effect strategy was not fully implemented to increase the target product because only consumers with generation X were affected. Since every consumer who makes a purchase will first choose what is good in accordance with his interests before deciding what to buy, consumers will also choose according to the character and inner satisfaction that will be obtained later. Besides, this is also caused by the factor of pricing that is still poorly managed to increase consumer sensitivity to the decoy effect.

Based on the results of the observations made by the researchers through questionnaires via a google form, 57 people responded to these observations. This observation aimed to check the knowledge of people in Garut regarding the decoy effect strategy. 4 out of 57 people did not know and had never experienced the decoy effect. In contrast, the remaining 53 had experienced it but were not aware of the implementations of marketing strategies

or what is commonly called the decoy effect. Then the respondents were required to choose three types of products in maximum, in which the decoy effect strategy was implemented, from the five types of products available, as shown in Figure 1.2 below:

Fig 2. the result of preliminary research towards decoy effects products in Garut Source: the researchers observation in 2020)

According to the figure 2, from 57 respondents, drinks were in the first place, namely 39 respondents or equivalent to 72.2%, food was in the second place, namely 35 respondents or equivalent to 64.8%, then quota was in the third place with the acquisition of 30 respondents or equivalent to 55.6%, and in the fourth position at 27.8% or equivalent to 15 respondents chose premium packages/subscription to applications such as viu, Netflix and youtube. Lastly, the fifth position, gadgets, was occupied by 24.1% or equivalent to 12 respondents. From the observations above, the researcher concluded that people in Garut had experienced the decoy effect but were not aware that it was a marketing strategy.

## II. LITERATURE REVIEW

### A. Marketing Strategies

Marketing strategy is crucial for a company because a good marketing strategy can help the company to achieve its goals. According to Kotler (2011), marketing is a social process by which individuals or groups obtain their needs and wants by creating, offering, and exchanging valuable products and services and others freely. In a company, marketing provides customer satisfaction and welfare long-term to earn a profit. It pays attention to the dynamic interrelationships between the company's products and services, the customer wants and needs and the activities of competitors.

According to Tjiptono (2015), a marketing strategy is a fundamental tool to achieve the company goals by developing sustainable competitive advantages through the target market. It is a statement either implicitly or explicitly about how a brand or product line achieves its goals.

A marketing strategy provides direction related to market segmentation, target market identification, positioning, marketing mix elements, and marketing mix costs. According to Kotler & Keller (2012), all marketing strategies are constructed based on segmentation (market segmentation), targeting (setting targets), and positioning (positioning) or commonly abbreviated as STP.

In marketing, there is a marketing strategy called the marketing mix, which has an important role in influencing consumers to buy the products or services offered by the company. The marketing mix elements consist of all the variables the company can control to satisfy consumers. For the purpose of the company's establishment, the company needs to be able to grow and develop.

Companies blend a set of product, price, place, and promotional marketing tools to generate the desired responses in a defined target market. The concept of the marketing mix (Marketing Mix) consists of 4p, namely: product, price, place and promotion. Each element is interrelated and dependent on each other and becomes an optimal one according to the characteristics of the segment. (Kotler & Keller, Marketing Management, 15th Edition, 2016) reveals that the marketing mix includes the following 4p's:

- a. Product  
Products mean managing product elements including planning and developing the right product or service to be marketed. By changing an existing product or service, a company may add and take other actions that will affect the assortment of products or services.
- b. Price  
Price is a company management system that will determine the appropriate base price for a product or service and the strategy regarding price discounts, payment of transportation costs and various related variables.
- c. Place  
Place means how the company chooses the trade channel to distribute the products or services to the target market, and allows the company to develop a distribution system so that the delivery and commerce of physical products runs smoothly.
- d. Promotion  
Promotion is an element to inform and persuade the market about new products or services to the consumers through advertising, personal selling, sales promotions, and publications.

*B. Decoy Effect*

The decoy effect is a condition in which consumers have other preferences for existing products because of the emergence of bait products and provides new perceptions of the desired product. Another opinion suggests that the decoy effect strategy can introduce a relationship between higher prices for the same product or even lower quality products (Wu & Cosguner, 2020). The dimensions and indicators of the decoy effect, according to Wu & Cosguner (2020), explain that the decoy effect has three sub-systems that change consumer preferences, namely:

- a. Target  
The target is the product set by the company to be purchased by the consumers as it is the most expensive one.
- b. Competitors  
Competitors are the products with the lowest prices compared to the target product. If there are only competitor products and the target product, it will be dominated by the competitor one or the product with the lowest price.
- c. Decoy  
Decoy products are the least effective product because they are in the middle between the competitor products and the target product. To make the target product dominates the sale, the company makes the decoy product look very ineffective because it tends to compete with the price of the target product so that consumer preferences will judge that the target product is the most effective product than the competitor products and the decoy products.

*C. Purchase Decisions*

Alma (2012) argued that purchase decisions as a decision made by a consumer are influenced by the financial economy, technology, politics, culture, products, prices, locations, promotions, physical evidence, people and processes, thus, they form an attitude on consumers to process all information and the decision making on what products they will buy. The purchase decision is a process in which consumers go through five stages, namely problem recognition, information search, alternative evaluation, purchasing decisions, and post-purchase behavior, which begins long before the actual purchase is made and has an impact long after that.

- a. The choice of the product is something that the company must pay attention to by focusing on consumer's interests and the advantages of products that emphasize the expected quality, the benefits of the product regarding the level of usability to meet consumer needs, and the selection of products according to the expected quality and benefits that consumers will get.
- b. The choice of the brand should determine what brand to buy, so the company needs to know how consumers choose a brand, namely the interest in the brand that pays attention to the brand image stored in consumers' minds, brand habits are caused by the habit of buying the same product repeatedly, price suitability is considered by consumers to get a price that matches the quality and benefits of the product.
- c. The number of purchases is determined by the consumer by taking into account the number of products that suit the wishes of different consumers.
- d. The time of purchase adjusts to the needs when consumers feel the need to make a purchase, the benefits they feel after buying the product and have a reason to meet their needs.

The decoy effect is considered as something that is capable of changing consumer views in making purchase decisions. A good decoy is a bait that can change consumers' views and emerge a desire to buy a product. To create a good decoy, the company needs to carry out various strategies to create new opportunities among the consumers by generating a decoy accepted by consumers and producing something positive in the consumers' minds in order to create a belief that the purchased product is at the lower price with a bigger size. If the decoy has a positive value in the consumers' minds, it will lead to high purchase decisions for the products desired by consumers.

### III. RESEARCH METHODOLOGY

The research method used is quantitative research to test the predetermined hypothesis. In this study, the Wilcoxon Test was used to test the differences before and after the implementation of the Decoy Effect in the Purchase Decisions. The decoy effect on a marketing strategy is very appropriate if this phenomenon is studied in Indonesia, especially in Garut, considering the vast area and fairly rapid business development in various products. Researchers distributed questionnaires to the people in Garut to obtain the data. In this study, the Decoy Effect is the independent variable, and the Purchase Decision is the dependent variable. The operationalization of this research variable is explained in the following table:

Table 1. Variables

Research Variables	Dimensions	Indicators
<b>Decoy Effect (X)</b> (Wu & Cosguner, 2020)	1. Target	1. Gender
		2. Age
		3. Incomes
	2. Competitors	1. Product choice
		2. Positioning
		3. Brand choice
		4. Place
	3. Decoy (bait)	1. Price
		2. Benefits
3. Quantity		
<b>The purchase decisions (Y)</b> (Kotler & Keller, 2012)	1. Product choices	1. The excellence of the product
		2. The advances of the product
		3. The choice of the product
	2. Brand choices	1. The interest towards the brand
		2. The habit towards the brand
		3. The suitability of the price
	3. Number of sale	1. The number of purchase decisions
		2. The purchase decision for stockpiles

4. Time	1. Based on the needs
	2. Benefits gained
	3. The rational of the purchase

#### IV. RESULT/FINDINGS

Validity test is a measure that shows the level of validity of an instrument or measuring instrument. The results of the validity test can be seen by comparing the  $r_{count} > r_{table}$ , while to obtain the  $r_{table}$ , it can be seen from the  $r_{table}$  and obtained a value of 0.195. In this study, the calculation is assisted by using SPSS 20. The following are the results of the validity test:

Table 2. Validity test of *Pre-Test*

No Item	Corrected Item Total Correlation ( $r_{count}$ )	$r_{table}$ 5% (100)	Note
Item_1	0,716	0,195	Valid
Item_2	0,717	0,196	Valid
Item_3	0,639	0,197	Valid

The table above, it can be seen that the results of statistical testing show that  $r_{count} > r_{table}$ , then all question items for pre-test answers are declared valid.

Table 3. Validity test of *Post-Test*

No Item	Corrected Item Total Correlation ( $r_{count}$ )	$r_{table}$ 5% (100)	Note
Item_4	0,723	0,195	Valid
Item_5	0,744	0,196	Valid
Item_6	0,466	0,197	Valid

The table above shows the validity of the post-test and revealed that  $r_{count} > r_{table}$ . This means that all question items for the Post-test answers are declared valid. Reliability test is used to determine whether the items to be tested are reliable in providing measurements before and after. The significance test was carried out at the level of  $\alpha = 0.05$ .

Table 4. Reliability test of Pre-Test

Cronbach's Alpha	Number of Items
0.451	3

From the table above, Cronbach Alpha is  $0,451 > 0,195$  ( $r_{table}$ ). Thus, the table is considered reliable. It showed by the result of the rest in which Cronbach Alpha  $> r_{table}$ , and considered the pre-test reliable.

Table 5. Reliability test of Post-Test

Cronbach's Alpha	N of Items
0.331	3

From the table above, Cronbach's Alpha is  $0.331 > 0.195$  ( $r_{table}$ ). Thus the measuring instrument is considered reliable. This is based on the results of the reliability test which shows Cronbach Alpha  $> r_{table}$ , so that the post-test results are declared reliable. The normality test was used to test whether or not the data was normally distributed. Based on the histogram display in the attachment, it can be seen that the curve does not form a bell. The basis for decision making is based on probability. If the probability  $> 0.05$ , then the research data is normally distributed. Using the SPSS 20 Software Kolmogrov-Smirnov method, the following are the results of the calculation:

Table 6 Normal distribution test

	N	Unstandardized Residual
Normal Parameters <sup>a,b</sup>	Mean	.0000000
	Std. Deviation	.74196028
Most Extreme Differences	Absolute	.314
	Positive	.217

	Negative	-.314
	<b>Kolmogorov-Smirnov Z</b>	3.143
	<b>Asymp. Sig. (2-tailed)</b>	0.000

a. Test distribution is Normal.  
b. Calculated from data.

Based on the table, it shows that the value of Asymp.Sig. (2-tailed) of 0.000 < 0.05 (alpha), then the data is not normally distributed.

Based on the previous test above, it can be said that one of the conditions for using parametric testing (Sample Paired T-Test) is not met, so that hypothesis testing utilized non-parametric testing, namely Wilcoxon test.

## V. DISCUSSION

Wilcoxon test is a tool to test two pairs of populations. Wilcoxon test results can be seen by comparing Asymp. Sig > significance level ( $\alpha$ ). In this study, the calculations used SPSS 20 software. The following is the output of the Wilcoxon test.

Table 7 Wilcoxon test  
Ranks

		N	Mean Rank	Sum of Ranks
<b>Post Internet quota - Pre a Internet quota</b>	Negative Ranks	32 <sup>a</sup>	38.00	1216.00
	Positive Ranks	50 <sup>b</sup>	43.74	2187.00
	Ties	18 <sup>c</sup>		
	Total	100		

a. Post < Pre

b. Post > Pre

c. Post = Pre

The negative ranks or differences (negative) between Telkomsel products for pre-test and post-test are 32 for N value, 38.00 for Mean rank and 1216,00 for sum of rank. This value of 32 indicates a decrease (reduction) from the value of the pre-test to the post-test. The positive ranks or difference (positive) between Telkomsel products for pre-test and post-test are 50 positive data (N), which means that 50 respondents experienced an increase in their purchasing decisions from the pre-test to the post-test. The mean rank or average increase is 43.74, while the number of positive ranks or sum of rank is 2187.00. Ties is the similarity of pre-test and post-test scores. The ties value is 18, so it can be said that there is the same value between pre-test and post-test, which is 18.

Table 8 Wilcoxon test  
Test Statistica

	<b>Post Internet quota - Pre Internet quota</b>
<b>Z</b>	-2.491 <sup>b</sup>
<b>Asymp. Sig. (2-tailed)</b>	0.013

a. Wilcoxon Signed Ranks Test

b. Based on negative ranks.

Asymp significance results. Sig. (2-tailed) is 0.013 < 0.05, so H<sub>0</sub> is rejected. Thus, the conclusion is that there is a significant difference between before and after the implementation of the decoy effect on the consumer's purchasing decisions for Telkomsel products in Garut.

From the results above, the value of each product has a significant effect on the purchase decisions between before and after the strategy implementation. The results of this study are consistent with the results of research conducted by Claudia Marchella Siswanto (2019) which stated that the decoy effect had a significant effect on the consumer purchase decisions. These results explain that consumers of the X generation were affected by the price and the size of the product when deciding to purchase a product that encouraged the purchase decisions. The same thing happened to the results of the research conducted by Wu & Cosguner (2020) stated that there was a significant increase, especially in the sale of engagement rings, when consumers were given different prices.

The target product was determined from a product that was considered to have a high value at the most reasonable price; the competitor's product was the product that had an appropriate value and product price (on average); the decoy product was the product that had low values with inappropriate prices. So it can be concluded

that the target product was the most demanded product or would highly be chosen by the consumers, which was then followed by the competitor product and the last is the decoy product.

## VI. CONCLUSION AND RECOMMENDATION

Based on the results of the research, the Decoy Effect influences the consumer's purchase decisions. However, not all products had a significant difference between before and after the implementation of the Decoy Effect. Nevertheless, the Decoy Effect was still able to change the consumer's point of view in determining the Purchase Decision. It is suggested that Telkomsel in Garut fully understand the Decoy Effect strategy. Practically, the strategy could be started by setting the price that influences consumer psychology more (according to the theory) so that the Decoy Effect strategy is successful and emerges with a positive impact, namely an increase in the company's higher income level.

From the results of 100 respondents regarding the implementation of the decoy effect strategy on Telkomsel products, in this illustration/case it can be seen between options 1 and 2 which apparently have prices that are not too much different. Then most people think they will definitely choose option 3 because there are many advantages there even though the price is more expensive. Therefore, choice 2 is called Decoy. Judging from the average choice before and after where there are 18 values which indicate that the value after is superior to the value before which means  $H_0$  is rejected. At the time of the pre-test respondents chose the 1st choice as many as 81 people and the 2nd choice as many as 19 people. Meanwhile, during the post-test, 18 people were given a third choice (decoy) to change their choice to a larger package size for reasons of a more affordable price and the many benefits offered. Thus, it can be concluded that based on testing of 100 respondents, it is proven by Ties of 18 and seen from the mean results so that the hypothesis decision  $H_0$  is rejected, which means that there is a significant difference between before and after the Decoy Effect is applied to purchasing decisions on Telkomsel products.

The failure of the Decoy Effect strategy might be caused by too many factors that influence a consumer (respondent) to make decisions, whether it's a factor of need, a number of family members, lifestyle, and much more. Thus, the Decoy Effect strategy is not successful in influencing the consumer's purchase decisions as the company wishes. For further research, it is expected to add other variables to be tested.

The researchers only conducted significance tests on the results of before and after the Decoy Effect. As the researchers used designed prices, further research may use different tests with prices that already exist in the products. In this study, it is not certain that the objects used are the products of the companies that set the Decoy Effect strategy's, so that the future research may add products from companies that have implemented the Decoy Effect strategy to ensure the Decoy Effect strategy success in Indonesia. In addition, the object of research may use products that are considered to have more emotional value for consumers.

## Impact Analysis of Government Debt Issuance on Corporate Debt in Emerging Countries from 2010 to 2019

Christian Jonathan Hadipraja, S.E.<sup>1</sup> and Arief Wibisono Lubis, Ph..D.<sup>2</sup>

<sup>1,2</sup>Faculty of Economics and Business, Universitas Indonesia, Jakarta, Indonesia

### Abstract

*Global financial crisis that started in the U.S. causes many economies suffered and experiencing a recession. Many governments around the world try to manage the crisis through expansionary fiscal policy. A report by the World Bank says that since the global financial crisis in 2008, there is an increase in debt and budget deficit among the emerging and developing countries. the objectives of this study is to analyze the impact of government debt to corporate debt, analyze if there is a different impact of government debt on the short-term and long-term debt of corporations, and to know what capital structure theory is followed by the firms. This study uses data from 117 firm in China, Colombia, Indonesia, Malaysia, and Mexico from 2009 to 2010. by using feasible generalize least square (FGLS) and Panel-Corrected Standard Error (PCSE), it is found that government debt has positive and significant effect on the corporate debt and leverage level. Moreover, there is a different impact of government debt on the firms' short-term and long-term debt. For the short-term debt, the firms follow the static trade-off theory, Meanwhile for the long-term and total debt, the firms follow the pecking order theory. The results of analysis done in this study show that government debt can significantly impact the corporate debt. There is also different impact of government debt between the firms' short-term debt and long-term debt.*

*Keywords—Capital structure; corporate debt; cost of capital; crowding-out; government bonds*

---

## I. INTRODUCTION

A report by the World Bank says that since the global financial crisis in 2008, there is an increase in debt and budget deficit among the emerging and developing countries. This increase in debt and budget deficit can give negative impact to the economy by affecting a rise in borrowing costs (World Bank, 2017). If the government is too aggressive in issuing bonds, there will be a crowding-out effect on the financial market. This can happen because funds from the public are used too much by the government, so it will be more difficult for the private sector to get financing from the capital market. Furthermore, data show that the government debt has increased to 47 percent of GDP in 2016 from previously 35 percent of GDP in 2007 among the developing countries. Meanwhile, budget deficit also increased from around 1 percent of GDP to around 5 percent of GDP in the same period from 2007 to 2016.

Several studies in the developed countries shows that government borrowing affect firms financing and capital structure. Elmendorf and Mankiw (1999) argue that an increase in government debt can increase the financing costs of companies. Friedman (1978) also found that government spending and financing through debt can cause crowding-out phenomena in corporate debt financing due to competition to get financing from investors. A similar statement was made by Graham et al. (2014), research confirmed that optimizing and adjusting investor portfolios is responsible for the crowd-out effect of government debt financing on corporate financing. But study around this issue is still rare on emerging and developing countries that is why this research try to capture the phenomenon. This research can be useful for public and fiscal policy makers in determining their decision to fund government spending. By knowing the impact of the issuance of government debt, policy makers can calculate the advantages and disadvantages of each decision to be taken. For investors, this research can be useful as a reference for choosing financial instruments and their choices in investing. And for financial managers in companies and companies in developing countries, this research can be a source of new knowledge in managing the company and determining the company's financial decisions and plans in the future.

## II. LITERATURE REVIEW

### A. Fiscal Policy

Government and policymakers can influence the economy by using monetary policy and fiscal policy. Central banks regulate this monetary policy through interest rates, money supply, and others open market operation. In the other hand, government control the economy through fiscal policy. The goal of fiscal policy is to achieve

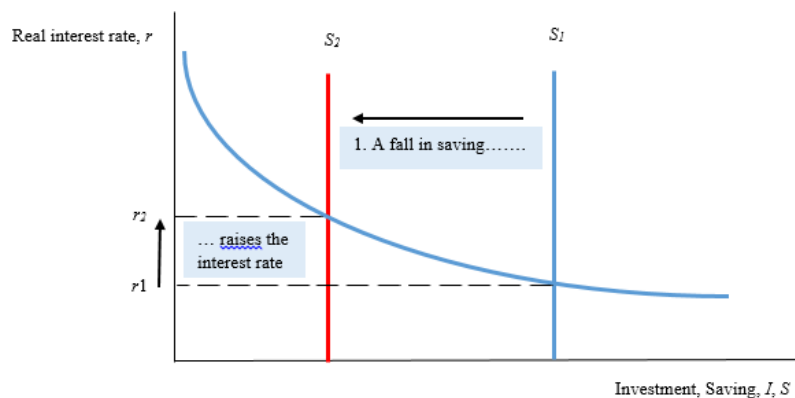

economic growth, stability, reducing inequality, and pushing down poverty. Because of the market failure and arguments against the laissez-faire, government is pushed to take role in economic activity (Mankiw, 2016). Fiscal policy is divided into two categories, namely expansionary fiscal policy and contractionary fiscal policy.

### B. Budget Deficit

The role of the government as a public policy maker is to encourage growth and create economic stability, one of them through contracyclical fiscal policy is one way that the government can do. In the classical economic theory proposed by Keynes, it is stated that economic growth is influenced by the role of the government. Governments can influence and manage how resources are used in the economy, both directly and indirectly (Horton and El-Ganainy, 2020). Looking at the GDP equation through expenditure that is  $GDP = C + I + G + (\text{Export} - \text{Import})$ , the government influence on the economy can be seen. This equation prove that governments can affect economic activity directly, that is GDP, by managing the G component from the equation. By doing so, the government can influence the C, I, and Net Export indirectly. Governments can manage the G component by changing the taxes, transfers, and spending.

### C. Crowding-Out on Financial Market

Issuance of government bonds to finance the budget deficit can lead to the phenomenon of crowding-out effect on private investment. Because the issuance of government bonds leads to increase in demand for investment and capital, while the supply of money or capital in the market is limited. Therefore, the supply for private investment also decreases, as public and private sector compete to get source of financing. A phenomenon often referred to as crowd out of private sector borrowing (Friedman, 1978). In classical economic theory proposed by Keynes, a budget deficit and an increase in bonds issued by the government will increase interest rates and the cost of borrowing from the private sector.

### A Reduction in Saving

A reduction in saving, possibly the result of a change in fiscal policy, shifts the saving schedule to the left. The new equilibrium is the point at which the new saving schedule crosses the investment schedule. A reduction in saving lowers the amount of investment and raises the interest rate. Fiscal-policy actions that reduce saving are said to crowd out investment.

Fig. 1. Budget Deficit Effect (Mankiw, 2017)

### D. Capital Structure

Capital structure is one of many core topics in corporate finance. According to the literature, there are two methods that can be use by company to finance its activities. The pie model explained that company can get their financing through debt and equity. The goal of managing this capital structure is to maximize the value of the company. When discussing about capital structure we also need to discuss the concept of the firm's weighted average cost of capital (WACC). The concept of WACC tells us about the firm's overall cost of capital is a weighted average of the costs of the various components of the firm's capital structure.

The function of the capital structure is to regulate and manage the capital owned by the company. The company uses several methods and various sources to obtain the capital or funding needed for its operational activities. The elements in the capital structure can be divided into equity shares, preference shares, short and long term loans, debt securities, retained earnings, and other sources of funding. The elements of this capital are arranged based on the proportion of the overall capital and combined in accordance with the company's strategy and objectives.

### E. Trade-Off Theory

This theory argues that the decision to choose the form of financing is by comparing the benefits and costs of issuing debt. Through calculation of the benefits and costs of debt, then the firms choose the optimal amount of

debt and leverage needed. By issuing debt the firms can get benefit from tax deductibility or tax shield from the interest paid to bondholders and maintaining the free cash flow of the firms. While the costs of debt rise from the bankruptcy costs and agency problem that may happen between bondholders and stockholders (Frank and Goyal, 2009).

#### F. Pecking Order Theory

The pecking order theory first introduced and developed by Myers (1984). This theory argues that firms will look internally for its main source of funds. Firms will use their retained earnings to finance their investments to avoid the costs of issuing new securities. Problems arising from asymmetric information make issuing new equity becomes risky decision. Moreover because of this asymmetric information there is a serious adverse selection problem with equity. While debt has less adverse selection problem compared to equity. To avoid those problems and minimize the costs of financing, firms will use its retained earnings first to finance new investments. Debt financing will be used when retained earnings are insufficient. Financing through equity will be used as a last resort. According to the pecking order, there is no optimal level of leverage. Firms' decisions of its leverage are not influenced by the benefits and costs of debt and equity. The decisions is mainly influenced by the firm's net cash flows (Frank and Goyal, 2009).

#### G. Previous Empirical Studies

Studies and research on the effect of government debt on corporate debt and finance have been carried out in various countries and conditions. Especially in developed countries such as Europe and the United States. Based on this research, it was found that there was an influence from the issuance of government debt due to the budget deficit on the financial market and corporate finance, especially on corporate debt. Friedman (1986) states that changes in government debt will cause changes in the rate of return on investment assets (return on assets) of the investor's portfolio. In recent studies that focus more on developed countries, such as those conducted by Graham et al. (2014) in the United States. Through his study, Graham found that government debt has a significant influence on corporate financing, investment and prices of various assets in financial markets. The same thing also happened in European countries, Ayturk (2017) stated that there is significant statistical evidence that there is a relationship between government debt and financing decisions in corporations in 15 European countries. The findings of this study emphasize the negative relationship of government debt on corporate debt and corporate financial leverage. Meanwhile, in developing countries, Nasir et al. (2020) found a negative relationship between government debt and debt financing for companies listed on the Vietnamese financial market. In particular, the study states that government debt has a stronger influence on the company's short-term debt than its long-term debt. Recently Zhang, Brookins, and Huang (2022) also found that government debt, both local and central, affect the corporate debt negatively. In broader market Demirci, Huang, and Sialm (2019) investigate the same phenomenon, that crowding-out effect also happened and affect corporate debt in 40 countries from 1990 to 2014.

#### H. Research Framework and Hypothesis

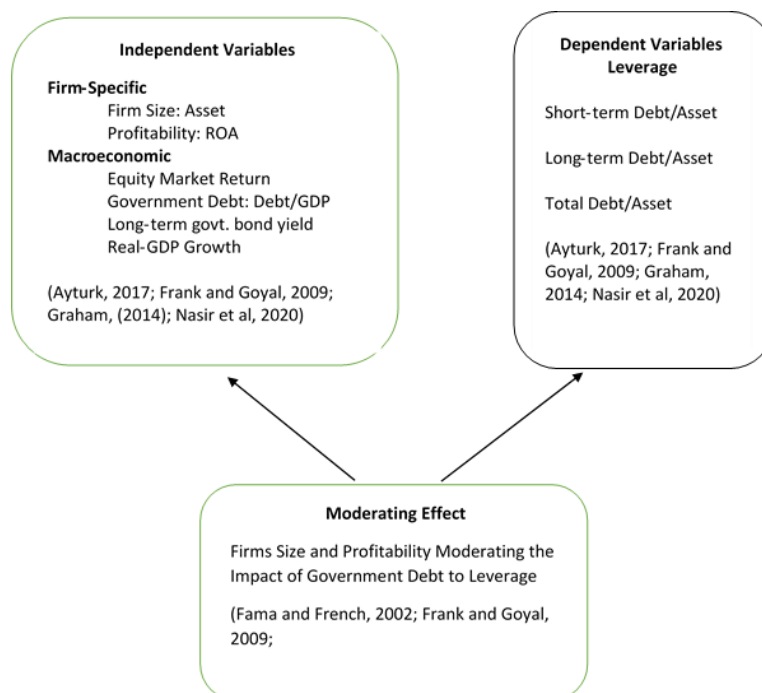

Fig 2. Research Framework (Processed by Author, 2022)

The purpose of this research is to investigate if there is crowding-out effect in the emerging countries. Data shows that since the global financial crisis 2008, the proportion of government debt to GDP is increasing. The hypothesis for this research is still the same with other previous studies. The government debt significantly affects the corporate debt. Since there is different nature in debt, this research will also investigate the different impact of government debt on the short-term and long-term corporate debt. Using firm-specific factors, this research also tries to investigate the influence of firms conditions to the choice of financing. The empirical result can show if the firm-specific factors can weaken or strengthen the impact of government debt to the capital structure. With firms' profitability and size moderated by the government debt, it can be analyzed if there is different effect of government to bigger and profitable firms. Looking at the research done by Frank and Goyal (2009) among publicly traded American firms, that becomes one of the foundations for capital structure analysis, profitability and firms' size have significant impact on leverage. Frank and Goyal (2009) conclude that firms with high profit tend to have less leverage and larger firms tend to have high leverage. The hypotheses on this research are:

H1: There is significant impact of government debt to corporate debt.

H2: There is different impact between the short-term debt and the long-term debt.

H3: The firms follow the pecking order theory

#### *I. Controlling Variables*

Many factors inside and outside of the firms can influence the choice for the capital structure. Research suggests that there are also macroeconomic conditions that have significant impact to capital structure. This macroeconomic factor becomes important because it can tell the aggregate demand, the level of price, and others condition in the market that for sure will affect the firms performance. It is important to include this variable into the model to avoid omitted variable bias. For the purpose of this research GDP growth, equity market return, and the long-term government bond yield are included as control variables.

### III. RESEARCH METHODOLOGY

In this study, quantitative methods will be used in analyzing and drawing conclusions from the problems that have been described previously. This quantitative analysis method includes the process of mathematical modeling, statistical processing, and econometrics. This research method includes data collection, organization, tabulation, and finally the results and analysis of data processing.

#### *A. Model Specification*

The research is based on the framework and theoretical basis generated through research conducted by Frank and Goyal (2009); Graham et al. (2014). In the study, the model that was used try to capture the phenomenon of the company's finances, through financial leverage within the company. Included in the model as the suggested control variables ( $X_t$ ) are macroeconomic factor in the form of long-term government bonds, equity market return, and real GDP growth rate. Based on the specifications, three analytical models can be formed to find out how the impact of government bonds on corporate debt which consists of short-term debt and long-term debt, as well as the total debt as a whole. Below are the three models that are constructed:

**Model 1:** The dependent variable in this model is the short-term financial leverage of the company, which is the ratio of company's short-term debt to its assets (Short-term Leverage) at book value in year  $t$ . The independent variable consists of the ratio of government debt to its assets (DTGDP) in year  $t$ , the company's asset (Assets) at book value in year  $t$ , the ratio of EBIT to total assets of the company's (ROA) in year  $t$ , and the moderating variables of company's assets and profitability to government debt. In addition, this model adds control variables or vectors of several variables depicted in  $X_t$ . This model is used to study the different impacts of government debt on short-term debt and long-term debt. The moderating variable is also helpful in analyzing what capital structure theory is followed by the firms.

$$\begin{aligned}
& \text{Short – term Leverage}_{it} \\
& = \alpha + \beta_1 DTGDP_{it-1} + \beta_2 Assets_{it-1} + \beta_3 ROA_{it-1} + \beta_4 (DTGDP_{it-1})(Assets_{it-1}) \\
& \quad + \beta_5 (DTGDP_{it-1})(ROA_{it-1}) + \beta_6 x_{it-1} + \varepsilon_t
\end{aligned} \tag{1}$$

**Model 2:** The dependent variable in this model is the long-term financial leverage of the company, which is the ratio of company's long-term debt to its assets (Long-term Leverage) at book value in year t. The independent variable consists of the ratio of government debt to its assets (DTGDP) in year t, the company's asset (Assets) at book value in year t, the ratio of EBIT to total assets of the company's (ROA) in year t, and the moderating variables of company's assets and profitability to government debt. In addition, this model adds control variables or vectors of several variables depicted in  $X_t$ . This model is used to study the different impacts of government debt on short-term debt and long-term debt. The moderating variable is also helpful in analyzing what capital structure theory is followed by the firms.

$$\begin{aligned}
& \text{Long – term Leverage}_{it} \\
& = \alpha + \beta_1 DTGDP_{it-1} + \beta_2 Assets_{it-1} + \beta_3 ROA_{it-1} + \beta_4 (DTGDP_{it-1})(Assets_{it-1}) \\
& \quad + \beta_5 (DTGDP_{it-1})(ROA_{it-1}) + \beta_6 x_{it-1} + \varepsilon_t
\end{aligned} \tag{2}$$

**Model 3:** The dependent variable in this model is the total financial leverage of the company, which is the ratio of company's total debt to its assets (Total Leverage) at book value in year t. The independent variable consists of the ratio of government debt to its assets (DTGDP) in year t-1, the company's asset (Assets) at book value in year t-1, the ratio of EBIT to total assets of the company's (ROA) in year t-1, and the moderating variables of company's assets and profitability to government debt. In addition, this model adds control variables or vectors of several variables depicted in  $X_{t-1}$ . This model is used to study government debt's impact on firm debt and capital structure. The moderating variable is also helpful in analyzing what capital structure theory is followed by the firms.

$$\begin{aligned}
\text{Total Leverage}_{it} = & \alpha + \beta_1 DTGDP_{it-1} + \beta_2 Assets_{it-1} + \beta_3 ROA_{it-1} + \beta_4 (DTGDP_{it-1})(Assets_{it-1}) \\
& + \beta_5 (DTGDP_{it-1})(ROA_{it-1}) + \beta_6 x_{it-1} + \varepsilon_{it}
\end{aligned} \tag{3}$$

## B. Data

The data to be used in this study comes from public companies listed on each country's stock exchange and the analysis is applied using the company's financial statements. However, the data taken does not include companies operating in the financial sector and companies with negative book value on its equity. Other supporting data will be taken from World Bank. Regression analysis with panel data will be used in the study. Top companies from each country's stock market index will be used as the subject of research. Therefore, the market price and liquidity of the company's stock become the important aspect of choosing the sample. The time-series period is from 2009 to 2019. The reason for the selection of the research periods is because there is evidence that since global financial crisis in 2008, many countries running budget deficit in order to recover from the crisis.

The selection of the countries that will be used in the research is based on the report published in 2018 and 2020 by International Monetary Fund. The data that will be used is from the emerging market and middle-income economies. Since this research is trying to find out the impact of the issuance of government debt, countries that show significant increase in debt will be taken as the subject of the research. Purposive sampling will be used in this research. According to IMF working paper, the optimal debt to GDP ratio on economic growth for developing countries is between 30 – 60 percent (Chudik, et al, 2015). Using this evidence, the countries that are chosen for this research are countries that have debt to GDP ratio between 30 – 60 percent in 2019. Moreover to get countries with similar government debt condition, countries that are chosen are the ones with 1 – 10 percent average growth on its debt to GDP ratio from 2009 to 2019. Only top companies in each country are included in this research. Looking from the top stock index from each country's stock exchange. This index is measured by the biggest market capitalization and most liquid company in the stock exchange. Due to limited data, both at company's financial statement and macroeconomic data, five countries are chosen to be analyzed. For China, 28 non financial firms are selected from the SSE 50 Index. For Colombia, 11 non financial firms are selected from the COLCAP Index For Indonesia, 36 non financial firms are selected from the LQ45 Index. This index measures the price performance of 45 stocks in Indonesia Stock Exchange that have high liquidity, large market capitalization, and are supported by good company fundamentals. For Malaysia, 20 non financial firm are selected from the FTSE

Bursa Malaysia KLCI Index. At last for Mexico, 22 non financial firms are selected from the Mexican IPC Index. In total there are 117 firms for the observation coming from China, Colombia, Indonesia, Malaysia, and Mexico.

### *C. Moderated Regression*

To know if there is a different effect of government debt across companies with different characteristics, this research adds interaction effects in the model. Moderation occurs when the effect of an independent variable on a dependent variable varies according to the level of a third variable, termed a moderator variable, which interacts with the independent variable (Edwards and Lambert, 2007). It is to be said that when there is interaction effect the effect of independent variable can be vary across levels of a moderating variables. The purpose of adding moderating variables is to analyze interaction effects of government debt across firms' size and profitability.

### *D. Panel Data Analysis*

This research using panel data analysis for the estimation method. Combining time series and cross sectional data. For the cross sectional this research using data from firms financial statement. The data collected from the balance sheet and income statement firms in countries. For the time series this research using firms financial statement data from 2009 to 2019. Panel data analysis is chosen because this research try to analyze the impact of government debt not only in firm-level but for all the firms. To get the most appropriate estimation method, three methods are used for the study. They are Fixed-Effect, Panel-Corrected, Standard Error, and Feasible Generalized Least Squares.

### *E. Fixed-Effect Model*

Fixed-effects models are a class of statistical models in which the levels (i.e., values) of independent variables are assumed to be fixed (i.e., constant), and only the dependent variable changes in response to the levels of independent variables. Fixed-Effect estimation is useful when there are variation across subjects of the research but constant overtime. The purpose of the method is to focus with subject-specific fixed-effects. In this case, firm-specific variables and country-specific variables become the control for omitted variables that vary across firms and countries but not overtime. The inclusion of this control variables, fixed-effect variables, will allows the regression model to have a firm-specific intercepts. The intercept represents the unique fixed-effect for each firm.

### *F. Feasible Generalized Least Squares*

The Feasible Generalized Least Square (FGLS) method is one of the developments of the least square method which is used to estimate the regression coefficient. The FGLS method can handle OLS problems when there is a violation of classical assumptions such as heteroskedasticity and autocorrelation (Dougherty, 2013). Using the estimated residual, the objective of the model is to transform the equation into a generalized differential equation. When heteroskedasticity problem occurred, the FGLS method can correct the panel data analysis by using weights on the observations according to the square root of the variances and making the model robust to heteroskedasticity problem. Hence, the FGLS method can predicts the regression coefficient if the variance of the error is unknown in the regression model, and is able to produce an estimator that is BLUE.

### *G. Panel-Corrected Standard Error with Panel-Level Heteroskedasticity*

Generalized Least Square (GLS) proposed by Park is designed to manage problems in panel data. The temporal and spatial properties of panel data can be problematic when using OLS estimation. Serial correlation and heteroskedastic problem in the model errors often happen in panel data analysis. Beck and Katz (1995) argue that the improvement in power using FGLS with such data is small and that the standard error estimates from FGLS are unacceptably optimistic (anticonservative). Beck and Katz (1995) propose another method by retaining the OLS estimates but then replace the original standard errors with the panel-corrected standar errors (PCSE). Furthermore, study using Monte Carlo analysis shows that the new proposed estimations can be very accurate even in the presence of complicated panel error structures. Because OLS estimation in panel data is not the best method when autocorrelation occurred. The PCSE model introduced Prais-Winsten specification to be included in the estimation. The Prais-Winsten estimator takes into account AR(1) serial correlation of the errors in a linear regression (Judge et al. 1985). To manage the heteroskedasticity problem, the estimation can be diverge a little bit from the usual PCSEs to estimate standard errors that are panel-corrected. This estimation method is used only for panel-level heteroskedasticity.

## IV.RESULT/FINDING

## A. Descriptive Analysis

Table 1. Data Summary from 2009 to 2019

Variable	Obs	Mean	Std. Dev.	Min	Max
Short-Term Leverage	1287	0.074	0.077	0	0.406
Long-Term Leverage	1287	0.168	0.147	0	0.796
Total Leverage	1287	0.242	0.159	0	0.811
Debt to GDP Ratio	1287	0.405	0.115	0.23	0.572
ROA	1287	0.118	0.1	-0.528	0.66
Assets_Log	1287	15.207	1.457	11.603	19.788
Equity Return	1287	0.034	0.111	-0.161	0.558
Govt. Bonds 10 Yield	1287	0.058	0.019	0.035	0.1
GDP Growth	1287	0.05	0.026	-0.053	0.106
ROA-Debt to GDP	1287	0.046	0.039	-0.122	0.344
Moderation					
Assets-Debt to GDP	1287	14.259	1.561	10.463	19.179
Moderation					

IMF, Thomson Reuters, and World Bank

To begin the analysis, this part of the chapter shows the descriptive analysis of the data before diving to the empirical results. This descriptive analysis act as a preliminary condition check and to see the trend on the data. As mentioned before in chapter 3, the data that will be use in this research is the corporate debt and leverage, debt to GDP ratio, the size of the firms, firms' return on assets, stock market return, government long term debt yield (10 Year), and GDP growth. Here below shows the summary from all variables use in the research. The number of observations used in this research is 1.170 observations. The sample for observations is 117 blue chip companies in China, Colombia, Indonesia, Malaysia, and Mexico. The periods of observation is from 2009 to 2019.

*Government Debt to GDP Ratio*

Fig 3. Debt to GDP Trend (IMF, Fiscal Monitor)

Since the global financial crisis, government all around the world try to stabilize and boost economic growth. Data shows that government debt increases in emerging and middle income countries to counter the economic recession and downturn. From the data summary above, the average debt to GDP ratio in this 5 countries are 40,5 percent with standard deviation 11,5 percent. The minimum value is 22,9 percent and the maximum value is 57,2 percent. The lowest value is from Indonesia in 2012 and the highest is coming from Malaysia in 2019.

Looking from the data at 2019, Malaysia has the highest debt to GDP ratio and China as the second largest followed by Mexico, Colombia, and Indonesia as the country with the lowest debt to GDP ratio. Despite there is difference value of this ratio, one condition remain the same that is the upward tren of government debt. Below are the graphical trend of debt to GDP ratio from each country start from 2009 to 2019. In 2009 China has 34,3 percent debt ratio and by 2019 the debt ratio increases to 54,5 percent. Colombia has 35,4 percent debt ratio in 2009 and by 2019 the debt ratio increases to 52,9 percent. Indonesia has 26,5 percent debt ratio in 2009 and by 2019 the debt ratio increases to 30,4 percent. Malaysia has 51,1 percent debt ratio in 2009 and by 2019 the debt

ratio increases to 57,2 percent. Mexico has 43,7 percent debt ratio in 2009 and by 2019 the debt ratio increases to 53,4 percent. Below can be seen the graphical trend of debt to GDP ratio in each country. Data shows that there is an upward trend of government debt.

*Corporate Capital Structure*

Fig 4. Level of leverage in China (Thomson Reuters)

Fig 6. Level of leverage in Indonesia (Thomson Reuters)

Fig 7. Level of leverage in Malaysia (Thomson Reuters)

For the firms capital structure the range of leverage level, on average, is around 22 percent up to 34 percent in 2019. With firms in Colombia and Mexico being the highest ones. The average of total leverage in Colombia is 33,7 percent and in Mexico is 33,8 percent. In the second place is Malaysia, followed by Indonesia and China. The respective level of total average on these countries are 28 percent, 26 percent, and 22 percent in that order. As for the capital structure of short-term debt and long-term debt, the proportion of long-term debt or leverage is higher than the short-term debt in all countries except for China. In China, the short-term rate proportion is higher but not by much. Meanwhile in all others country, the difference proportion of short-term leverage and long-term leverage is quite high. Especially for Mexico, in 2019 itself the short-term leverage is only 3,8 percent and the long-term leverage is around 30 percent.

There is an upward trend of using debt on all the countries is, the graphs shows that the level of total leverage increase from 2009 to 2019 except for China. It can be said that the level of leverage in China is quite stable. Meanwhile for all the other country, the level of total leverage is increasing. Increase in long-term leverage give contribution for the increase of firms' leverage. Because the level of short-term leverage remains stable for all the country.

### B. Regression Analysis

The methods for analysis used in the research and for all model are Fixed-Effect, Feasible Generalized Least Square, and Panel-Corrected Standard Error for Panel-Level Heteroskedasticity. The Hausman test shows that Fixed-Effect method needs to be taken for the analysis. To get the best and unbiased results, specification tests are conducted in the model. The results shows that autocorrelation and heteroskedasticity problems appeared in the estimation. This misspecification problems can invalidate the usual standard error created in the Fixed-Effect model. Therefore, robust standard error is introduced in the model. The purpose of this method is to get unbiased and robust standard errors of the model coefficients.

Added to the research model is another two estimation methods that are used to address the problems. According to literature, the FGLS model can give correction for the autocorrelation and heteroskedasticity problem. The model is more efficient and less biased than the previous model. Furthermore, the FGLS model can gives more power to the estimation compared to the Fixed-Effect model (Brewer, et al, 2013). The PCSE model introduced by Beck and Katz (1995) can solve this problem and more appropriate to be used in short panel data with small T and large N (Hoechle, 2007).

#### *Short-term Debt and Government Debt*

Result shows that there is negative relationship between debt to GDP ratio and the short-term debt on the Panel-Corrected Standard Error model (PCSE) and the FGLS model although it is statistically insignificant. The impact of increase in government debt will reduce the amount of short-term debt in the form of reduction in firms' short-term leverage. Other variables for control, which is firm-specific and macroeconomic condition, also significant for influencing the short-term leverage except stock market return and firms' return on assets (ROA). Especially for GDP growth that is statistically significant in both the FGLS and PCSE models.

#### *Long-term Debt and Government Debt*

Result shows that debt to GDP ratio is significantly affects the long-term debt on the Fixed-Effect model with robust standard error, the FGLS model, and the Panel-Corrected Standard Error model (PCSE). But the coefficient of government debt on long-term debt is positive. It can be said that the impact of increase in government debt will also increase the amount of long-term debt in the form of a raise in firms' long-term leverage. Other variables for control, which is firm-specific and macroeconomic condition, also significant for influencing the long-term leverage except stock market return and firms' return on assets (ROA).

#### Total Debt and Government Debt

The result shows that debt to GDP ratio is significantly affect the total debt on the Fixed-Effect model with robust standard error, the FGLS model, and the Panel-Corrected Standard Error model (PCSE). Same as the long-term debt, the coefficient for the total debt is also positive. Therefore there is crowding in effect as opposed to crowding-out effect of the government debt. The argument of the logical reasons behind this effect is relatively the same with the long-term debt and leverage. Other variables for control, which is firm-specific and macroeconomic condition, also significant for influencing the total leverage except stock market return, firms' return on assets (ROA), and the GDP growth. This gives slightly different results than the long-term debt, where the growth of GDP affect the long-term leverage level. But when combined with the short-term leverage it shows that GDP is not a significant factor to choice the form of financing.

## V. DISCUSSION

### A. Short-term Debt and Government Debt

Based on the results, it can be concluded that the government debt significantly impact the choice of capital structure. Moreover, it shows that the size of the firms in term of assets have negative effect on the short-term leverage. This indicate that the firms' behaviour follow the trade-of theory and not the pecking order theory for its short-term debt. It can be said that firms is sensitive to the demand and supply of funds, a slight change of cost of funds will deviate firms to use internal source with slightly less cost. Therefore, firms will rely on its investor(s) or owner(s) money and the long-term debt to acquire assets. This can be true remembering the nature of an asset is as a long-term investment. Using short-term debt for long-term investment can creates maturity mismatch and

affects the firms in a negative way. The macroeconomic factors also influenced the choice for capital structure. The coefficient of the GDP growth indicates that the economic growth will give incentive for firms to take on more debt. While increase in government 10 year bonds yield will reduce the firms' short-term leverage.

The interaction effect, through moderating variables, also significant for the assets and its relations with government debt to GDP ratio. The coefficient of the moderating variable of assets is positive, this means that the effect of government debt to firms short-term leverage increases as the firms' assets grow bigger or for firms with bigger assets compared to firms with less assets on their hand. In this case the crowding-out effect is stronger in larger firms. The possible logical reason behind this, bigger firms tend to have better credit rating and cheaper borrowing costs. Frank and Goyal (2009) stated that large and more diversified firms face lower default risk. Older firms with good reputations in the financial market will face a lower debt-related agency costs. The trade-off theory predicts larger firms to have relatively more debt. The impact of government issuance and the possibility of increasing interest rate will be less severe for the smaller firms because they use relatively smaller leverage compared to the bigger firms.

#### *B. Long-term Debt and Government Debt*

There is no crowding-out phenomenon happening for the long-term debt. There is different result from previous studies, where the government debt will reduce the amount of debt financing by the firms. Further research regarding the positive impact of the government debt and government expenditure on the economy, such as crowding in and multiplier effect, needed to be done. Past studies show that government spending and private sector spending can affect private sector investments. A study done based on the real business-cycle theory found that government expenditure can enhance private sector investment expenditures but at the same time reducing the consumption expenditures (Lawrence and Eichenbaum, 1992). Furthermore, recent study by Bal (2014) confirmed that there is crowding in effect as proposed in Keynesian perspective. Using data from 1998-2012 in India, Bal (2014) found out that public debt has significant effect on interest rate, output, and gross fixed capital formation. The empirical evidence from the study concludes that government debt has a positive impact on gross fixed capital formation and output.

The coefficient of the GDP growth indicates that positive economic growth will encourage firms to take less debt. This can mean that the firms are confident with the economic condition ahead and have positive projection going forward. According to Frank and Goyal (2009), during expansions leverage should decline if the pecking order theory holds with assumption all else equal. While increase in government 10 year bonds yield will increase the firms' long-term leverage. Research shows that monetary contractions will increase net debt issues for large firms but for smaller firms will remain stable (Gertler and Gilchrist, 1993). For the firm-specific variables, the size of the firms in terms of assets have positive effect on the long-term leverage. This indicates that the firms' will use external funds to acquire new assets. This can be true because acquiring new assets can be said as a long-term investment and will not give cash inflow immediately. To manage its cash flow firms' will use the mix of internal and external funds. This behaviour follows the pecking order theory and not the trade-off theory for its long-term debt.

The interaction effect, through moderating variables, also significant for the assets and its relations with government debt to GDP ratio. The coefficient of the moderating variable of assets is negative, this means that the effect of government debt to firms long-term leverage decreases as the firms' assets grow bigger or for firms with bigger assets compared to firms with less assets on their hand. In this case the crowding in effect is weaker in bigger firms. The possible logical reason behind this, bigger firms tend to have more cash compared to smaller and less established firms. Firms that have cash generating capability through its assets will reduce the use of the long-term debt as the form of financing. The pecking order theory predicts that there is an inverse relation between leverage and firm size and age. Larger firms with relatively bigger assets have more ability to generate profits because its assets can generate more sales and revenues. Moreover, as firms get older they have more opportunity to retain its earnings.

#### *C. Total Debt and Government Debt*

As stated in the previous section the result for the total debt is similar with the long-term debt, with only a slight different result. There is also different result for the moderating effect in total debt compared to the short-term and long-term leverage. For the total leverage the ability of the firms to generate profits efficiently will moderate the effect of government debt, besides the level of assets. The coefficient for the moderating variables are negative, this means that the effect of government debt to firms total leverage decreases as the firms' assets grow bigger or for firms with bigger assets compared to firms with less assets on their hand and for firms with

higher profit margin. The regressions show that the moderate effect of return on assets (ROA) on government debt to total leverage is significant in the Fixed-Effect and the FGLS model. The coefficient of regressions show that the crowding in effect is smaller on firms with higher ROA. The regressions shows that the moderate effect of assets on government debt to total leverage is significant in the FGLS and the PCSE model. The coefficient of regressions show that the crowding in effect is smaller on firms that have more assets.

Looking from the interaction effect it can be concluded that the pattern of financing taken by the blue chip companies in China, Colombia, Indonesia, Malaysia, and Mexico is following the pecking order theory. The companies will use its internal funds first and they use external funding strategically to manage their cash flows or when there is no sufficient internal funds.

## VI. CONCLUSION AND RECOMMENDATION

The results of analysis done in this study show that government debt can significantly impact the corporate debt. It can be said that there is crowding in effect happened for top firms in China, Colombia, Indonesia, Malaysia, and, Mexico. As the government increase the debt, the leverage level of the firms also increases. The supporting theory behind this effect is the macroeconomic theory introduced by Keynes. The theory stated that expansionary fiscal policies can raise the level of output and positively can impact investments (Motlaleng et al., 2011; Traum and Yang, 2010; Bahmani-Oskooee, 1999).

Another finding from this study is that there is different impact of government debt between the firms' short-term debt and long-term debt. This means that for there is different effect of fiscal policy in the short-run and the long-run. Despite there is negative shock in the short-run, but the impact of the policy will be good for the economy in the long-run. And also the pattern for financing can differ from time to time. Firms and financial managers will analyze the best and efficient option to support the firms' objectives. Therefore, there is no one best option and one fit for all solution to achieve good performance.

There are some implications and suggestions for business owners, investors, managers, and public policy maker. For people conducting a business and managing company, the results show that expansionary fiscal policy can be an opportunity for firms and businesses to grow. To capture gain from the situation, businesses need to monitor the changes in macroeconomy conditions. For public policy maker, it is necessary to evaluate the impact of their policies. Government can learn every actions made and gain knowledge from it to make better policies in the future. For investors it can be opportunity to invest on financial asset that can give higher return.

## Optimalization of Digital Marketing Channels and Online Sales Channels To Increase MSME's Brand Exposure

Taufiq Rachman Hidayat<sup>1</sup> and Yeshika Alversia<sup>2</sup>

<sup>1,2</sup> Faculty of Economics and Business Universitas Indonesia, Jakarta Pusat 10430, Indonesia

### Abstract

*COVID-19 pandemic that had hit Indonesia since March 2020 has caused an economic crisis as indicated by the Indonesian economy declining by 2.07%. As with previous economic crises that Indonesia had experienced, Micro, Small, and Medium Enterprises (MSME) play an important role in saving Indonesia from an economic recession. A study conducted qualitative research on Indonesian food and beverage MSMEs, with the descriptive analysis used primary data collected through interviews the owners, observations the conditions, survey to existing customers, and literature studies to map MSME's conditions and problems. Afterward, the problems found were that the sales method was still conventional and did not optimize their resources such as digital marketing channels and online sales channels so that sales cannot grow, and the brand's exposure was low. It happened because the owners did not know the optimal strategy for their digital marketing using social media. So, this study aims to assist the owner to make optimal strategy for digital marketing on social media by providing suggestions digital marketing strategy which will be focused on optimizing their existing digital marketing and online sales channels. As known that if digital marketing through social media and online sales through e-commerce optimally deployed can be disruptive tools for MSME to build brand awareness and compete with larger competitors.*

### I. INTRODUCTION

Indonesia is one of the countries with the largest economy on the Asian continent. Reported by Official News of Statistics published by the Indonesian Central Bureau of Statistics in February 2020, Indonesian economy showed continued to grow by 5.03% in 2016, 5.07% in 2017, 5.17% in 2018, and 5.02% in 2019. But in 2020, the Indonesian economy fell by 2.07%. This is measured by Gross Domestic Product (GDP) at current prices reaching Rp. 15,434.2 trillion and GDP per capita reaching Rp. 56.9 million or US\$ 3,911.7 (Herlando & Kurniawan, 2021).

The decline in the Indonesian economy that occurred due to Covid-19 became the third economic crisis experienced by Indonesia. Where the first economic crisis occurred in 1998. Then the next economic crisis occurred in 2008. Based on the experiences of the two previous economic crises, there is a big role for MSMEs (Micro, Small and Medium Enterprises) which have become government instruments in saving Indonesia from economic recession due to the economic crisis. Bahlil Lahadalia, Head of the Investment Coordinating Board (BKPM) said that during the (Indonesian) economic crisis, it was MSMEs that saved our economy, not conglomerates or large corporations. This was because MSMEs can be established with not too large a capital (*Ingat Krisis 1998, UMKM Penyelamat Ekonomi RI Bukan Konglomerat : Okezone Economy*, 2020). In addition, because it is flexible, this business can also be used as an alternative to have a side income, even in difficult situations.

Without large capital, MSMEs can become an important wheel of the country's economy with a crucial role and function for the country's economy, MSMEs can be established with not large a capital. In addition, because it is flexible, this business can also be used as an alternative to have a side income, even in difficult situations. Reported by Official News of Statistics published by the Indonesian Central Bureau of Statistics on March 2022, there were more than 1.52 million MSMEs businesses in the food and beverage sector in 2020, which this sector was the highest number (Sukamto et al., 2022).

Starv.inc group is an MSME in the food and beverage sector which was founded since 2018 with the vision of "One-stop tummy solution". This business is based on the owner's hobby in exploring and tasting Indonesian and foreign cuisines, both food and drinks. Starv.inc has 2 subsidiaries, Coffeebreak0930 whose products are bottled milk and coffee-based drinks and Ricers Club which serves food products packaged in the form of rice bowls. Starv.inc group is selling the products through online and offline. Where offline sales are carried out only in the owner's office area, while online sales are carried out by Grab Food and GoFood. Online sales through Grab Food and GoFood have only been done in the last 6 months. To increase online and offline sales outside the owner's office area, a strategy needs to be carried out by referring to existing consumers in the existing market,

owner's office. Based on that data, the marketing strategy can be made so it will be able develop sales outside the owner's office.

Based on the interviews the owners, observations the conditions, and survey to existing customers, can be concluded that Starv.inc have not used online sales channels and online marketing channels resources optimally. This can be seen from the menu that posted in the online sales channel is less informative and less attractive. Then the online marketing channel, the posts, feeds, and story, in the Starv.inc Instagram account is irregular and unplanned. Also, the caption used in the feeds is considered less informative and less interesting. This can make Starv.inc difficult to gain brand awareness from potential customers. It happened because the owner did not know the optimize strategy for their digital marketing on social media.

In the Customer Decision Journey theory, awareness is the initial stage for consumers before deciding to buy or use a product (Court et al., 2009). Based on this theory, it is important for Starv.inc to create a marketing strategy with the aim of increasing awareness for its products. Marketing strategies must also be adapted to the conditions of MSMEs and their environment to produce optimal results.

## II. LITERATURE REVIEW

### A. *Brand Exposure and Brand Awareness*

During building a brand process, after found the target market / customer, the brand should start to expose itself using some strategies, this process is called Brand Exposure (Shojaee & bin Azman, 2013). Brand exposure is closely related to brand awareness, which those are describing consumer recognition of products with their brand names. This recognition level refers to the consumer's familiarity with certain products or services (*Brand Awareness Definition*, 2022). Brand exposure can be measured by assessing the ability of consumers to identify brands under different conditions.

Brand Exposure and brand awareness can be built with brand recognition and brand recall. Brand recognition is the ability of consumers to confirm previous brand knowledge by providing keywords related to the brand as a signal. This can show whether consumers know the brand as a brand they already know. Meanwhile, brand recall is the ability of consumers to recall the brand when given a product category, a need that is satisfied by the category, or a purchase or use situation as a signal (Keller & Swaminathan, 2019).

There are several cases told success in building brand exposure and brand awareness through social media, one of them is the sales of Ford Fiesta in 2010. One-half years before Ford launched a sub-compact car called Ford Fiesta, Ford began a broad promotion using a buzz strategy called with Fiesta Movement. This buzz involved 100 more social media influencers by giving them the Ford Fiesta, they were asked to complete different missions every month using that car. With the direction of Ford and using their own imagination, the influencers became agents of Ford that had various missions to complete, such as delivering food, sending a package, and even going on wild adventures. All these stories were documented and posted to social media. As the result, the videos related to the Ford Fiesta campaign generated 6.5 million views on YouTube and Ford got 50,000 requests about the car which were mostly from non-Ford drivers. Then when the car was launched, Ford Fiesta sold 10,000 units within the first six days of launching (*How Ford Got Social Marketing Right*, 2010; Saravanakumar & Suganthalakshmi, 2012).

### B. *Integrated Marketing Communication (IMC) in MSME*

Integrated Marketing Communication (IMC) is a marketing strategy with an integrated approach to communication elements. Where each promotional element affects other elements, with the aim of communicating the resulting product or service to consumers. The elements used in IMC are called promotion mix decisions. An integrated marketing communication uses elements called promotion mix decisions consisting of advertising, sales promotion, public relations, personal selling, and direct and interactive marketing (Marshall & Johnston, 2019).

MSME as a small business organization, in the initial step of existence may have less managerial experience talent to build and deploy dynamic capabilities. Moreover, the cost to transform the capabilities does become disadvantage for new MSMEs that have to focus on the short-term, to address the liabilities of newness and smallness (Butkouskaya et al., 2020). This may prevent the effectiveness of IMC implementation as dynamic capabilities in the MSME. On the other side, some study suggested for MSME to apply cross-functional coordination and have certain level of flexibility to success implementing the IMC (Butkouskaya et al., 2021;

Luxton et al., 2017). The other study showed that MSMEs with flexible and simpler structure organization are having better cross-functional coordination and sharing information inside it. Simpler coordination and less formal structure organization in MSME will result in faster response to adapt in the dynamic market environment. (Bouchard & Basso, 2011; Carrier, 1994). Furthermore, study suggest that MSMEs may also be successful in integration due to the simplicity of their communications. Thus, the MSMEs could grow and compete with the larger competitor in IMC effectiveness (Darcy et al., 2013).

### C. Social Media Marketing

On the last decade, social media marketing has become an important tool for marketing of brands and businesses, with opportunities to build relationships, engage with customers, and increase sales. The previous study proved that social media has more influential than the traditional marketing communication strategies (Lepkowska-White et al., 2019; Macarthy, 2017). This happens because people are using social media to get information and reviews of product. Also, some social media provides customized marketing program for marketers to promote and offers their brands and products not only to consumers but also to other businesses which these results in brand building. The fact, more than 90% of businesses and marketers are using social media platforms, like Instagram and others to build awareness and exposure so it can attract new customers (Yurdakul & Bozdağ, 2018).

Instagram, one of many social media platforms, was founded in 2010. Instagram was founded initially for users to share their photos, search other people information, document their life moments, and show their coolness and creativity (Xin Teo et al., 2019). The number of Instagram's users has grown drastically, in 2019 there were almost 815 million registered users who accessed photo-sharing platform Instagram monthly around the world. Reported in Quarter 4 of 2021, Instagram was the most downloaded phone apps world-wide, and it expected to grow to reach nearly 1.2 billion users in 2023 (*Instagram Statistics You Need to Know for 2022 | Sprout Social, 2022; Instagram Users Worldwide 2023 | Statista, 2022*). As the growth of Instagram, it attracted the attention of businesses and organizations to use it as their commercial and marketing campaigns. According to Instagram's internal data in 2016, 50% of Instagram users follow at least one business account, then 60% claim that they learn about product or service from it, and 75% visit the product's website to get more product's information or tell their friends about the the product after looking an Instagram advertising post (*Hitting 500,000 Advertisers | Instagram Business Blog | Instagram for Business, 2016*).

## III. RESEARCH METHODOLOGY

This study was using qualitative research method which supported using primary data and secondary resources. Primary data was a data source that can directly provide data during the data collection process.

The data collection method for primary data and secondary resources were carried out in different steps. For primary data, it was obtained through a direct observation process to the Starv.inc operations centre so that discussions and interviews with the owners and employees of Starv.inc could be conducted. In addition, surveys were also conducted on current consumers and markets. Meanwhile, secondary resource for this business coaching was conducted through literature studies from existing research journals, articles, related books, and documents owned by Starv.inc and its subsidiaries.

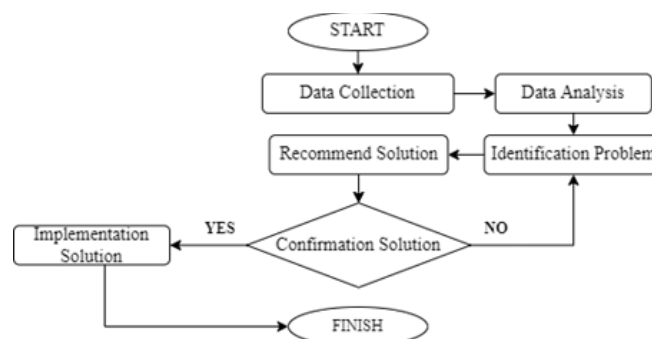

Fig. 1. Business coaching flow chart.

The retrieved data will be analyzed to understand the current conditions and problems of the MSME using several analytical methods and tools. The methods and tools used were business model canvas (BMC) analysis, external analysis with analytic tools Politics, Economics, Socials, Technology, Environment, and Legal (PESTEL) and the Five-Forces Model of Competition, then internal analysis using analytic tools Segmenting, Targeting, and Positioning (STP), and Product Marketing Mix, as well as SWOT and TOWS analysis. Furthermore, the results of each analysis will be summarized and evaluated together with a gap analysis (GAP analysis). These analyses result will be used to identify the MSME's problem.

After data analysis conducted and MSME's problem found, then MSME's owner would be proposed the solution by researcher as business coach. Then, if the proposed solution approved and verified by the owner, the business coach will assist the owner to implement the solution.

#### IV. RESULT / FINDING

Result section presents the results of the study. Research results can be supplemented with tables, graphs (pictures), and / or charts.

##### A. BMC analysis, internal analysis, and external analysis

Based on the data collected that had been evaluated using BMC analysis, external analysis, and internal analysis, it can be summarized as follows:

Table 1. Matrix brand knowledge.

ANALYSIS METHOD	IDEAL CONDITION	ACTUAL CONDITION	GAP	CODE
<i>Business process</i>	Carry out promotional activities on Instagram social media by regularly uploading updated product information and promotional programs to increase product and brand awareness.	Starv.inc owners often forget to upload updated information on Instagram social media.	Update information related to products and promotional programs can be an influence and attract people's attention so that they become consumers.	<i>Marketing communication</i>  <i>Digital Marketing</i>  <i>Channel Distribution</i>
BMC	Using social media Instagram to market products and find new consumers.	Social media is not used routinely to upload updated information	Instagram is not regularly updated regarding product information and promotional programs	<i>Marketing communication</i> <i>Digital Marketing</i>
	Develop sales channels to increase product sales.	Not adding resellers to develop sales channels.	Programs / packages for resellers are not generally informed.	<i>Marketing communication</i> <i>Digital Marketing</i>
	Using Go-Food and Grab-Food marketplace partners to make sales.	Starv.inc group has registered and has Go-Food and Grab-Food merchant accounts, but sales are still not that many.	Sales information through Go-Food and Grab-Food is lacking, this information is not listed on Instagram social media accounts.	<i>Marketing communication</i>
<i>Porter's Five Force</i>	Have a good marketing strategy to increase product and brand awareness.	There is no marketing strategy and marketing activities are still lacking.	Tend to be passive in marketing activities so it is difficult to compete with other businesses.	<i>Marketing communication</i>
STP	Take advantage of every opportunity that exists to get new target consumers.	Do not take advantage of existing opportunities.	Starv.inc group consumers tend to be people around the owner.	<i>Marketing communication</i>
<i>Product Marketing Mix</i>	Promoting through Instagram social media, so that the public knows information related to products and promotional programs.	Not maximally promoting on Instagram social media.	Lack of promotion through social media Instagram	<i>Marketing communication</i>

Based on the summary analysis described above, there are differences between ideal conditions and actual conditions as well as problems that occurred. To determine the priority of the problems that must be solved, it is necessary to calculate using the weights and values for each problem. Then the problem with the largest distribution will be the main priority to be solved using pareto analysis. Here the calculation of weight and values of.

Table 2. Pareto analysis.

NO	GAP	VALUES	WEIGHT	CONTRIBUTION	DISTRIBUTION
1.	Marketing communication	9	10	90	48,4%
2.	Digital Marketing	9	8	72	38,7%
3.	Channel Distribution	4	6	24	12,9%
TOTAL				186	100%

Based on the Pareto analysis above, there are two things that will be prioritized in this business coaching are marketing communication and digital marketing. These analysis results are also strengthened by the results of a survey conducted, which the survey result will be explained below.

### B. Survey analysis

The survey was conducted to current existing consumers and market of Starv.inc. It was conducted to find out the comparison between consumers and those who have never bought, the reasons for buying, the experience of buying and enjoying MSME products, as well as knowing the competitors in the area. The distributed questionnaire has the following flow:

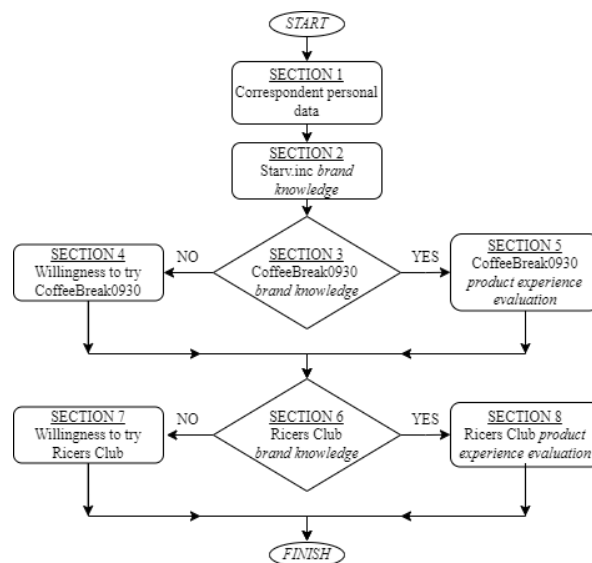

Fig. 2. Survey questionnaires flow chart.

Based on the questionnaires survey answers, it can be concluded several things as follows:

- a. Based on section 1 of the correspondent's personal data, it is known that the correspondents consist of 79 (70.5%) men and 33 (29.5%) women with most of the age range from 28 to 33 years (60 people: 53.6%). In addition, it is also known that most correspondents have an income of Rp. 6,000,001 to Rp. 9,000,000 in a month and the majority of correspondents budget from Rp. 30,001 to Rp. 50,000 to buy food and drinks or snacks in one day.

Fig. 3. Correspondent data.

- b. Based on sections 2, 3, and 6 regarding brand knowledge, it is known that 62 people (55.4%) know Starv.inc and 50 people (44.6%) do not know Starv.inc. Then for CoffeeBreak0930 brand knowledge 81 people (55.4%) know CoffeeBreak0930 and 31 people (27.7%) don't know CoffeeBreak 0930. And for Ricer Club, 78 people (69.6%) know Ricers Club and 34 people (30 ,4%) do not know the Ricers Club. If the brand knowledge of Starv.inc, CoffeeBreak0930, and Ricers Club is combined and analyzed into a matrix in Table 4.3, it is known that 50 people (44.6%) know Starv.inc, CoffeeBreak0930, and Ricers Club. Then 22 people (19.6%) did not know about Starv.inc, CoffeeBreak0930, and Ricers Club. And 19 people (17.0%) did not know Starv.inc but knew CoffeeBreak0930 and Ricers Club. So, it can be concluded that the brand knowledge of Starv.inc as the parent brand is smaller than CoffeeBreak0930 and Ricers Club.

Table 3. Matrix brand knowledge.

CONDITION	BRAND KNOWLEDGE			SCORE	PERCENTAGE
	STARV.INC	CB0930	RC		
CONDITION 1	Yes	Yes	Yes	50	44,6%
CONDITION 2	Yes	Yes	No	7	6,3%
CONDITION 3	Yes	No	Yes	5	4,5%
CONDITION 4	Yes	No	No	0	0,0%
CONDITION 5	No	Yes	Yes	19	17,0%
CONDITION 6	No	Yes	No	5	4,5%

CONDITION 7	No	No	Yes	4	3,6%
CONDITION 8	No	No	No	22	19,6%

- c. Based on section 4, it is known that from 31 people who do not know CoffeeBreak0930, 27 people (87.1%) of them want to try CoffeeBreak0930 products with the majority choosing the Golden Caramel menu as the menu they want to try.

Fig. 4. CoffeeBreak0930 menu graphic that correspondent want to try.

- d. Based on section 5, it is known that out of 81 people who know about CoffeeBreak0930, 80 people (98.8%) of them have bought CoffeeBreak0930 products. And in the last 1 week of this questionnaire distributed 73 people (90.1%) bought 1 to 2 times. Meanwhile, the most correspondents who bought CoffeeBreak0930 in the last 1 week, 5 to 6 times, were 3 people (3.7%). And the CoffeeBreak0930 menu which is the correspondent's favorite is Uppercut Aren with 35 people (38.0%) for the type of drink with coffee, while for the type of drink without coffee the favorite is Cereal Mylk which is shown by 16 people (17.4%) choosing the menu.
- e. From this section, it can also be seen that the reasons for buying most correspondents are to have good taste, have a preferred flavor variant, and get to know the owner of Starv.inc. As for product experience, CoffeeBreak0930 products can be categorized as providing a good experience for consumers, this is proven by the average value or product experience rating of this questionnaire of 3.5 out of 4.0.

Table 4. CoffeeBreak0930 product experience.

CRITERIA	SCORE
Price information for CoffeeBreak0930 products can be found by me	3,7
CoffeeBreak0930 product price information is understandable and clear to me	3,7
CoffeeBreak0930 price is affordable for me	3,4
CoffeeBreak0930 products are useful for me	3,3
CoffeeBreak0930 products are guaranteed quality	3,5
CoffeeBreak0930 has innovative product variants	3,5
CoffeeBreak0930 has a variety of products that I like	3,6
The CoffeeBreak0930 brand provides good quality	3,6
The CoffeeBreak0930 brand has a selection of products that match my expectations	3,5
<b>AVERAGE SCORE</b>	<b>3,5</b>

Then from this section, it can also be seen that the competitors are CoffeeBreak0930, where the biggest competitor is the coffee vending machine. And based on the answers to this questionnaire, most

correspondents chose CoffeeBreak0930 over other competitors because of the easy-to-reach and known sales location, and good taste.

- f. Based on section 7, it is known that of 34 people who do not know Ricers Club, 30 people (88.2%) of them want to try Ricers Club products with the majority choosing the Chicken Salted Egg menu as the menu they want to try.

Fig. 5. CoffeeBreak0930 menu graphic that correspondent want to try.

- g. Based on section 8, it is known that out of 78 people who know about Ricers Club, 69 people (88.5%) of them have bought Ricers Club products. And in the last 1 week of this questionnaire distributed 71 people (91.0%) bought 1 to 2 times. While the correspondents who bought the most Ricers Club in the last 1 week, 5 to 6 times, were 1 person (1.3%). And the Ricers Club menu which is the correspondent's favorite is Chicken Salted Egg with 31 people (34.4%) for the type of chicken side dish, while the favorite type of beef side dish is Beef Cheese Creamy Mushroom and Beef Cheese Black Pepper Sauce which are both indicated by 7 people (7.8%) chose each of the menus.

Table 5. Ricers Club product experience.

CRITERIA	SCORE
Price information for Ricers Club products can be found by me	3,6
Ricers Club product price information is understandable and clear to me	3,7
Ricers Club price is affordable for me	3,3
Ricers Club products are useful for me	3,5
Ricers Club products are guaranteed quality	3,6
Ricers Club has innovative product variants	3,6
Ricers Club has a variety of products that I like	3,6
The Ricers Club brand provides good quality	3,5
The Ricers Club brand has a selection of products that match my expectations	3,5
<b>AVERAGE SCORE</b>	<b>3,6</b>

From this section, it can also be seen that the reasons for buying most correspondents are to have good taste, have a preferred flavor variant, and get to know the owner of Starv.inc. As for product experience, Ricers Club products can be categorized as providing a good experience for consumers, this is proven by the average value or product experience rating of this questionnaire of 3.6 out of 4.0.

Then from this section it can also be seen the competitors of the Ricers Club, where the biggest competitor is the canteen available at the owner's office. And based on the answers to this questionnaire, most correspondents chose to buy food at the office canteen rather than the Ricers Club for reasons of a centralized location with a wide variety of choices of side dishes and prices.

## V. DISCUSSION

Based on the analysis, found that the problem occurred were marketing communication, digital marketing, and channel distribution selling. To solve that problems coach proposed 2 solutions, optimize the digital marketing channels on the Instagram and optimize online sales channels on GoFood and Grab Food. Since the solutions of business coaching will focus on digital marketing channels and online sales channels, it is necessary to make a digital marketing guidance which will be explained with the digital marketing canvas.

The digital marketing canvas is a tool that can be used to describe the digital marketing strategy planning that will be carried out. This will be explained by showing the value proposition, channel, target audience, customer journey, objectives, key performance indicators, tactics, and metrics (Khalkhali, 2017). The digital marketing canvas for the implementation of business coaching can be seen in Table 6.

a. Value proposition

Value proposition is the value possessed by MSMEs that consumers and potential customers want to convey and feel. The value proposition from Starv.inc includes hit foods and drinks that are made with selected ingredients and processed properly to produce good taste and are sold at affordable prices.

b. Channel

Channel is where this digital marketing strategy will be carried out. For business coaching, we will use Instagram, GoFood, and Grab Food as digital marketing channels.

c. Target audience

The target audience is the object of the digital marketing strategy that will be carried out. For this business coaching, the target audience is divided into 2, namely men and women who want to eat food that is packaged practically for the Jakarta and Bekasi areas, as well as men and women who like sweet and refreshing drinks with milk and coffee base located in Jakarta, Bogor, Depok, Tangerang, and Bekasi.

d. Customer Journey

The customer journey is the stage where the target audience is. For business coaching, those who become customer journalists are divided into 2, namely existing customers and new customers. The customer journey for existing customers focuses on the action and post-action stages. Where the strategy will be to invite existing customers to continue to buy and share the experience of enjoying their products to the people around them through social media. As for new customers, it focuses on the awareness and interest stages. Where the strategy will show Starv.inc's value proposition to potential customers.

e. Objective

Objective is the purpose of this digital marketing strategy. For business coaching, the goal is to increase brand awareness on social media, Instagram and increase sales through online sales channels, GoFood and Grab Food.

f. Key performance indicators

Key performance indicators are a measure of the success of the digital marketing strategy carried out. For business coaching, the benchmark is increasing brand awareness through social media Instagram and increasing sales on online sales channels, GoFood and Grab Food.

g. Tactics

Tactics are steps that will be taken to achieve the goals (objectives) that have been determined. For this business coaching, the steps taken are optimizing the digital marketing channel, Instagram and optimizing the digital sales channel, GoFood and Grab Food.

## h. Metrics

Metrics is a measure that becomes a reference in describing the key performance indicators of the digital marketing strategy carried out. For business coaching, the metrics are the number of account followers as well as likes and comments on uploads as well as views, reacts, and programs from Instagram stories uploaded on Instagram. As well as the number of products sold on digital sales channels, GoFood and Grab Food.

Table 6. Digital Marketing Canvas (DMV).

<b>TACTICS</b>	<ul style="list-style-type: none"> <li>Optimizing digital marketing channels on the Instagram platform.</li> <li>Optimizing digital sales channels on the GoFood and Grab Food platforms.</li> </ul>		
<b>VALUE PROPOSITIONS</b>	<b>CHANNEL</b>	<b>TARGET AUDIENCE</b>	<b>CUSTOMER JOURNEY</b>
<ul style="list-style-type: none"> <li>Drinks &amp; food produced through the development of recipes from well-known shop menu mainstays in the market so as to produce a delicious taste.</li> <li>Beverages &amp; food are produced using selected ingredients from the basic ingredients to the packaging.</li> <li>Selling drinks &amp; food at affordable prices</li> </ul>	<ul style="list-style-type: none"> <li>Grab Food &amp; GoFood</li> <li>Instagram</li> </ul>	<ul style="list-style-type: none"> <li>For Coffeebreak0930 : Men &amp; women who like sweet &amp; refreshing drinks with milk &amp; coffee base located in Jakarta, Bogor, Depok, Tangerang, &amp; Bekasi</li> <li>For Ricers Club: Men &amp; women who are hungry &amp; want practical packaged food located in Jakarta and Bekasi</li> </ul>	<ul style="list-style-type: none"> <li>The customer journey for existing customers focuses on the action and post-action stages</li> <li>The customer journey for new customers focuses on the awareness and interest stages</li> </ul>
<b>OBJECTIVES</b>	<ul style="list-style-type: none"> <li>Increase brand awareness on social media, Instagram</li> <li>Increase sales through online sales channels, GoFood and Grab Food</li> </ul>		
<b>KEY PERFORMANCE INDICATOR (KPI)</b>	<ul style="list-style-type: none"> <li>Brand awareness increases through social media Instagram</li> <li>Sales increased on online sales channels, GoFood and Grab Food</li> </ul>		
<b>METRICS</b>	<ul style="list-style-type: none"> <li>Increased brand awareness through social media is proportional to the increase in engagement. Where engagement increases will be shown by the number of likes and comments on uploads as well as views, reacts, and regrams from uploaded Instagram stories.</li> <li>Increased sales on online sales channels will be indicated by the number of products sold.</li> </ul>		

Based on the digital marketing canvas above and the condition of existing Instagram account and online sales channels, the solutions proposed is optimizing Instagram as digital marketing channel and optimizing GoFood and Grab Food as online sales channels. The optimization will be referred to the book written by Macarthy (2017).

The optimization in digital marketing channels using the Instagram platform, there are several things that need to be improved, @coffeebreak0930 and @ricersclub as follows:

- a. Merging two Instagram accounts @coffeebreak0930 and @ricersclub into one @starvinc account. This is done because there are not many content materials owned and Instagram is directly owned by the owner who has limited time so it is better to combine them so that the exposure obtained from the two accounts can focus on one @starv\_inc account.
- b. Optimizing the Instagram bio which is on the top side under the profile photo on the account page. There is a limit of 150 characters for the Instagram bio so it must be optimized, such as by mentioning the vision to explain the uniqueness of the product and include a purchase link.

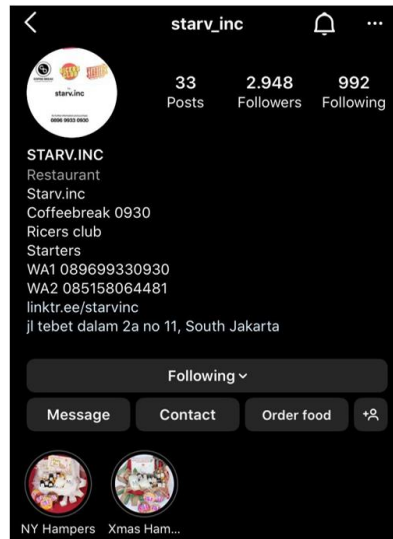

Fig. 6. New look Starv.inc's Instagram bio.

- c. Upload photos with sharp resolutions and use the rule of thirds for product photos. And for the photo editing process, it is recommended to always use the same filter and brightness level consistently.

Fig. 7. Ricers Club photo product for content.

- d. For content feeds, captions must be used, this aims to strengthen the image content and to reflect brand identity. Captions can contain product descriptions which can then be added something that can provoke discussion in the comment's column. And in the caption, it is necessary to include a hashtag because this hashtag will be a link between the uploaded photo and the photos uploaded by other accounts. In addition, it can also appear when someone searches for things related to the hashtag.
- e. Upload feeds and posts at the best time of Monday, Wednesday, and Friday at 11.00. This is in accordance with the results of research by Elizabeth Arens (2021).
- f. Using the geotagging feature found on Instagram, so that users who see the upload can find out the location of the store.
- g. Re-upload (repost / regram) other account story uploads that mention the brand in their story.

And for optimization in online sales channels on the GoFood and Grab Food platforms, there are several things that need to be improved from the existing online sales channels, GoFood and Grab Food, with reference to secondary resources, as follows:

- a. Using new product photos for photos posted on the GoFood and Grab Food menus. This product photo is done by adjusting the focus value (aperture), the speed of the lens opening (shutter speed), and the level of light sensitivity (ISO) and focusing on the product presentation so that the photos will be sharp and focus on the products offered. This is because a higher and sharper image quality with a larger image size results in a higher level of perceived quality and purchase intention (Xin Teo et al., 2019).
- b. Improve the product description content on the GoFood and Grab Food menus. This product description is structured to describe the product in detail and attractively so that it can provide clear information to prospective buyers and then potential buyers can imagine the taste of the drinks and food to be ordered.

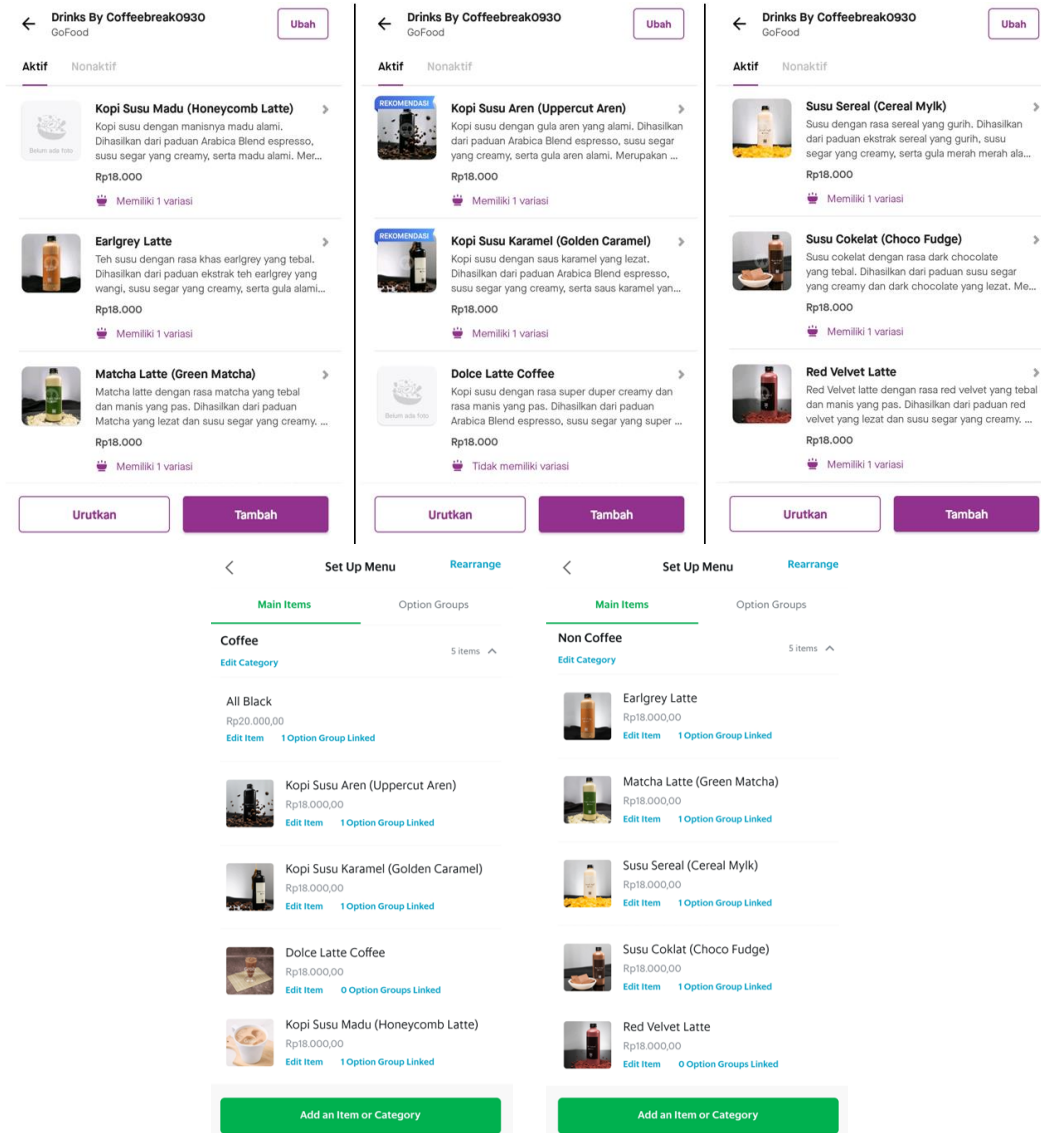

Fig. 8. Starv.inc's menu on GoFood and Grab Food.

- c. Develop promotional strategies and bundling packages as attractive sales promotions. With this, it is hoped that it will attract potential buyers to buy and maintain consumer loyalty. As it is known that sales promotion is a short-term incentive carried out to encourage people to try to buy goods or use service products by targeting traders and end consumers (Keller & Swaminathan, 2019).

## VI. CONCLUSION AND RECOMMENDATION

Based on the results of the analysis that has been carried out through business coaching activities, it can be concluded that the main problem that is being helped to improve is the optimization of digital marketing channels on Instagram and online sales channels on GoFood and Grab Food. Where several considerations are made in accordance with the conditions of the Starv.inc SMEs.

Based on the implementation of business coaching that has been carried out by the author, there are implementations that have been carried out and those that have not. The implementations that have been carried out on social media digital marketing channels include merging 2 Instagram accounts into @starv\_inc, optimizing Instagram Bio by adding contacts in the form of phone numbers and addresses, linktree, and activating the action button. Then the implementation that has been done on the online sales channel is to improve the product description content on the GoFood and GrabFood menus. While the implementations that have not been carried out include updating product photos for catalogs on the GoFood and Grab Food menus as well as Instagram content, planning content schedules on Instagram, and planning promotional strategies in the form of price discounts and bundling packages.

The implementation of business coaching that has not been implemented has caused the objectives of business coaching, to increase brand awareness on social media and increase sales in E-commerce, cannot be achieved.

## The Effect of Family Ownership On Tax Aggressiveness With Political Connections As A Moderation

Siti Rahma Siregar<sup>1</sup> and Dahlia Sari<sup>2</sup>.

<sup>1</sup>Master Student, Postgraduate Study Program in Accounting, Faculty of Economics and Business, University of Indonesia, Depok, Indonesia

<sup>2</sup>Lecturers, Postgraduate Study Program in Accounting, Faculty of Economics and Business, University of Indonesia, Depok, Indonesia

### Abstract

*The study aims to prove how family ownership effects the corporate tax aggressiveness and political connection as a moderating variable. Tax amnesty on 2017 reached 40% of Indonesia's GDP, that proves many Indonesian companies taking advantage of existing tax regulatory loopholes. 50% of Indonesian companies have a family ownership structure. That should be minimized tax aggressiveness because family companies more conservative and see long-term effects. This research contributed by developing proxy of Chen et al. (2017). Their focuses on looking at the magnitude of political connection that each level of government. So it will be known at which level of government this political connection variable has a greater effect. This research contains all non-financial listed companies on Indonesia Stock Exchange from 2017 to 2019 by using purposive sampling method and regression for data analysis. Tax aggressiveness is measured through Current Effective Tax Rate (CETR). The results show that family ownership negatively affects corporate tax aggressiveness and moderation of political connections will weaken the negative effects of family ownership. Due to the presence of unique features of the family as in Puji et al. (2014) which most Indonesian companies have family ownership in their capital structure and company owners have political connection, so they use their power to manage tax planning activities. The result of this study proven that Directory of General Tax (DGT) should more attention to political members who have influence in the company.*

*Keywords— Family Ownership ; Tax Aggressiveness ; Political Connection*

---

### I. INTRODUCTION

Taxes obtained and collected from tax objects in accordance with the amount of the specified amount are the largest source of income for the Indonesian state. This large tax role is still not in accordance with its achievement and realization because there is still a tendency for taxpayers to carry out *tax avoidance* practices to reduce the tax burden paid. The Minister of Finance emphasized that tax revenues have never reached the target and are getting worse in 2020 due to the Covid-19 pandemic (kemenkeu.go.id, 2020). Revenue through 2017 *tax amnesty* which reached 40% of Indonesia's GDP (CNN Indonesia, 2021) proves that many Indonesian companies are tax avoidance by taking advantage of existing tax regulatory loopholes. With more than 50% of family ownership companies, Indonesia is one of the developing countries that has a fairly concentrated family ownership structure (Ying et al., 2017). A family-owned company will significantly reduce its agency costs compared to a company not owned by a family (Kovermann & Wendt, 2019). Family-owned companies will be more conservative and look more at long-term effects, so companies will tend to avoid bad behaviors such as doing tax avoidance. Overly aggressive tax avoidance will create managerial incentives resulting in a large amount of information asymmetry that can harm governments and companies (Moore, 2012). This behavior indicates a lack of financial transparency between companies and the government (Ying et al., 2017) as a result of weak supervision (Desai & Dharmapala, 2009). Previous research suggests that family-owned companies will be willing to pay higher taxes than to accept the risk of a bad reputation due to tax avoidance (Ying et al., 2017). However, the results of research by Suchayo et al., (2020) explained that family-owned companies have the option of engaging in greater tax avoidance if the company has political connections with the government compared to family-owned companies that do not have political connections.

Political connections are important that can facilitate companies to connect with the government so as to get more information on economic resources from the government (Shen et al, 2019). The company considers political connections as a valuable resource and can influence corporate decision-making, one of which is getting protection against the rule of law (Ferdiawan & Firmansyah, 2017) and reducing market pressure for public transparency

(Kim & Zhang, 2016). Political connections will look more favorable for countries with high levels of corruption (Faccio, 2006). Indonesia's increasing CPI index can be ascertained that corrupt practices in the field of politics and licensing continue to develop and are perceived as ordinary by the government (Ferdiawan & Firmansyah, 2017). This research develops the research of Ying et al., (2017) on the impact of ownership structures on tax aggressiveness in China and similar research by Hidayati & Diyanti (2018). This research develops another driving factor, namely political connections that match the level of developing countries such as Indonesia. This is supported by Faccio's (2006) research that political connections can change the allocation of investment costs for companies that lack a competitive desire. Other literature also supports that political connections will encourage companies to pay lower taxes than companies that do not have political connections (Wahab et al., 2017). The existence of potential political connections that companies have can affect family ownership and corporate tax aggressiveness. Based on previous similar research, political connections were measured by dummy variables (Harymawan et al., 2020; Rahmasari et al., 2020; Wahab et al., 2017).

This research contributed by developing proxies in the research of Chen et al., (2017). It aims to capture important information that is how strong each level of political connection is. The level or hierarchy of political connections in question is the level of connection of the board of directors and the board of commissioners at the central, provincial, or municipal level. Research by Chen et al., (2017) focuses on looking at the magnitude of political connections that each level of government has. Where this is in accordance with the tiered structure of the Indonesian government. So that in addition to knowing the impact of political connections owned by companies on tax aggressiveness, it will also be known at which level of government this political connection variable has a greater effect. The higher the power of political connections that the company has, the greater the special treatment of obtained by the company from the government (Faccio, 2006) then this can weaken (strengthen) the family ownership company in carrying out tax avoidance. This factor is not illustrated if measured by a dummy variable.

## II. LITERATURE REVIEW

The dominant family ownership of companies in Indonesia has an impact on tax avoidance practices by companies. The results of research by Rahmasari et al (2020), Suchayo et al (2020) and Nuritomo et al (2020) show that companies with family ownership tend to engage in greater tax avoidance than companies that are not owned by the family. Although family-owned companies exhibited responsible behavior to the public, management's desire to save the costs incurred by the company on tax expenditures encouraged the company to carry out tax avoidance. But the research of Chen et al., (2010); Shen et al., (2019) and Zhang et al., (2012) assert that gaps do occur in family ownership and non-family ownership companies. A company with a larger family ownership than a non-family CEO shareholding will limit the plans of CEOs who want to carry out company renewal (Mitchell et al., 2009). This is because the founders of family ownership companies will always prioritize the *socio-emotional* wealth they have so that they will avoid business decisions that can threaten the company's continuity in the long term. The family company will maintain non-financial wealth such as maintaining the identity or good name of the family in running the business so that the continuity of the family dynasty can continue (Gomez-Mejia et al., 2003). Hidayati and Diyanti (2018) found that investments in family ownership companies are not diversified with a long time horizon and avoid long-term risk activities. This is because family members consider investment as a wealth inheritance for the next generation, so that all company activities will avoid the risk of subduing company prices (Casson, 1999). In line with previous research, it can be concluded that companies with family ownership will avoid risky behaviors such as tax avoidance for the company's long-term goals. Then the hypothesis in the study is:

H1: Family ownership negatively affects the aggressiveness of taxation.

A public company is a company that has a tendency to have political connections in its ownership structure. Managers in family-owned companies can reduce the burden associated with government rules and supervision by the competent authorities through their political connections, be protected against the risks of future litigation and have direct access to special information (Ajili & Khelif, 2020). As a result of the privileges obtained, companies that have political connections will get more attention by the government and the public. They expect companies to have higher moral standards than companies that have no political connections (Zhang, 2017), so that companies will comply as much as possible and avoid aggressive taxation behavior. The existence of political connections causes companies to be more likely to take higher risks. This finding is supported by the research of Ferdiawan & Firmansyah (2017) and Wahab et al., (2017) where political relations have an impact on tax

avoidance, this is characterized by the average company using its political connections to obtain lower tax payments through branch companies, subsidiaries or foreign activities attached to companies with *profit shifting* schemes and *profit holding*. A company with political connections will take advantage of the convenience gained from the political connections it has to carry out aggressive tax actions. This is done to increase the value of the company in the form of large assets or low debt (Thiele & Wendt, 2017), so that this family company tends to have a good reputation. A good company reputation will have an impact on the image of politicians who play a role in the company. The benefits of political connections are also used by companies to avoid the possibility of being entangled in punishment due to expropriation and poor management (Hidayati &diyanti, 2018). The vice nature of this political connection affects the true nature of family ownership (wanting to protect the family's reputation) so that it will have an effect in making tax avoidance decisions. In accordance with this explanation, the hypotheses in this study are:

H2: Political connections weaken the negative influence of family ownership on the aggressiveness of taxation.

### III. RESEARCH METHODOLOGY

#### A. Population and Research Samples

This study will use quantitative methods with a sample of all companies on the Indonesia Stock Exchange for the period January 1, 2017 – December 31, 2019 except financial sector and real estate sector companies. The final sample from this study are 542 companies. The data used are secondary data derived from financial statements and annual reports accessed through IDX, the company's official website and eikon's Thomson Reuters database as well as other publications related to the study.

#### B. Operationalization of Variables

In accordance with the purpose of this study, which is to look at the influence of family ownership on the aggressiveness of corporate taxation in Indonesia and how the influence of political connections owned by each company moderates the relationship of family ownership to tax aggressiveness, the model that can describe the relationship is:

$$TAg = \beta_0 + \beta_1FO_{it} + \beta_2PC_{it} + \beta_3FO*PC + \beta_4ROA_{it} + \beta_5LEV_{it} + \beta_6PPE_{it} + \epsilon_i$$

Where:

TAg = Tax aggressiveness measured by CETR.

FO = Family ownership will use *dummy variable*

PC = Political connections using measurements developed by Chen et al (2017).

FO\*PC = interaction between family ownership and political connections

ROA = The company's profitability ratio as measured by *return on assets*.

LEV = Debt level ratio measured by *debt to asset*.

PPE = Gross Value of *Property, Plant and Equipment*

The aggressiveness of taxation in this study used CETR. This calculation will reflect the tax deposited by the company to the Directorate General of Taxes, where the figure is obtained through the Notes to the company's Financial Statements. CETR is used because it can reflect the cash taxes that companies pay (Hanlon, Hoopes, & Shroff, 2014).

CETR = Current tax burden

---

Profit before tax

Previous research on family ownership has been very much found (Ying et al., 2017) and is most often measured by the percentage of voting rights owned by shareholders. The threshold value of voting rights used by previous studies varies, but in this study will use the threshold of 5% shareholding. Family ownership will use a *dummy variable*, bern value 1 if the shareholder has at least a 5% stake owned by the same family, 0 if the shareholder is not owned by the same family (Berrone et al., 2010; Hidayati &diyanti, 2018; López-González, Martínez-Ferrero, & García-Meca, 2019). The same family in the context of this study refers to blood relationships and marriage (Xu et al., 2019). The name of the shareholder in a company in Indonesia is known to have the same last name. After

searching, it turned out that the shareholders with the same last name had family ties. As in PT. MNC Investama Tbk. The shareholders of this company are owned by the Hary Tanoesoedibjo family. After being traced, the political connections that this family has are also very prominent. Where Hary Tanoesoedibjo as the chief commissioner together with Wiranto formed the Hanura political party and was the presidential and vice presidential candidate in the 2014 election. Even though he failed to serve as vice president, Hary Tanoesoedibjo is still actively supporting the government program carried out by the current president, Joko Widodo. In line with her husband, Liliana Tanoesoedibjo is also active in politics with her involvement as the general chairperson of the Perindo Party Kartini and attending charity activities sponsored by Perindo. The involvement of the Tanoesoedibjo family in politics was also passed down to his son, Valencia Tanoesoedibjo, who was known to have run for the legislature in Central Java. Based on the description of the political connections owned by each president commissioner and commissioner of PT. MNC Investama Tbk can be scored on political connections as follows:

Table 1 Examples of Political Connection Calculations

Official Name	Position and shareholding	Political Connection			
		Center	Province	City	Does not have
Hary Tanoesoedibjo	President Commissioner (3.23%)	3	-	-	-
Liliana Tanoesoedibjo	Commissioners (2.05%)	3	-	-	-
Valencia Tanoesoedibjo	Commissioners (1.4%)	-	2	-	-
Total political connection score		6	2	-	-

Based on the calculation table above, it is known that PT. MNC Investama Tbk has the strongest political connections in the center. It is evident from the suspension of political connections at the central level which is greater than the provincial level. The existence of large political connections in the center will make it easier for companies to find out the loopholes of government regulations so as to provide benefits for companies, such as carrying out tax aggressiveness (Ajili & Khelif, 2020). After calculating the total scoring of each connection, linear regression will be carried out by calculating the natural logarithm of the total scoring. So that index of pt. MNC Investama Tbk is  $LN(1+8) = 2,197$ . Furthermore, the political connection index for each level will also be calculated. So that the central level political connection index is  $LN(1+6) = 1,945$ , the provincial level political connection index is  $LN(1+2) = 1,098$ , and the city-level political connection index is  $LN(1+0) = 0$ .

This study will control the characteristics of companies related to the measurement of tax aggressiveness, so that the results will not be driven by the fundamental differences between family-owned companies and *non-family-owned* companies. The first variable control that captures the company's profitability is ROA. ROA will be measured by dividing net profit after tax by total assets. ROA will describe the company's ability to make a profit through its assets. Companies that have greater profits will have many incentives in carrying out tax aggressiveness (Gaaya et al., 2017). Therefore, ROA has a positive effect on tax aggressiveness (Kim & Zhang, 2016; Mafrolla & D'Amico, 2016). Furthermore, variable leverage is used for the company's ability to finance its operational activities. This risk will be measured by comparing the company's total expenses with total assets. Through variable *leverage*, it will be seen that the higher the *leverage* ratio of a company, the higher the amount of funding from third-party debt used by the company and the higher the interest costs arising from the debt (Jian, Li, & Zhang, 2012; Kovermann & Wendt, 2019; Muttakin, Monem, Khan, & Subramaniam, 2015). The next variable control is PPE which will capture the difference between the book value and the actually reported tax, which can affect the calculation of tax aggressiveness. Chen et al. (2010) explained that companies that make capital investments will have an impact on the treatment of their depreciation costs. Where the cost of depreciation will be of different value for taxation purposes and for financial reporting purposes. This will have a positive effect on tax aggressiveness (Brune et al., 2019; Kim & Zhang, 2016).

#### IV. RESULT / FINDING

##### A. Descriptive Statistics

The descriptive statistical results of each of these research variables are shown in Table 2. It can be seen that based on the results of standard deviations CETR and ETR reflects figures of 12% and 15% with an average of 24% and 21%. If the standard deviation and average results are compared with the applicable tax rate, it is concluded that the company is still below the rate set by the Directorate General of Taxes. It is likely that sample companies are subject to aggressive tax activities by reducing the taxes they pay to the Directorate General of

Taxes.. Furthermore, it is known that most of the sample companies are family-owned companies, which account for 65.26% of the total research sample. Of the 542 companies sampled, 354 of them have family ownership structures and 32.77% or 116 companies in them have political connections spread across the central, provincial and municipalities.

**Table 2 Descriptive Statistics**

Variabel	N	Mean	Min	Max	Std. Deviasi
CETR	1.626	0,24	-16,23	0,9090	0,12
FO	1.626	0,46	0	1	0,44
ROA	1.626	0,03	-33,11	1,12	0,89
Lev	1.626	0,72	-9,76	2,72	2,35
PPE	1.626	3,21	0	0,744	1,67
ETR	1.626	0,21	-113,75	0,7442	0,15

**Dummy Variables**

Variable	Nilai 1	Nilai 0	Total
FO	65,26%	34,74%	100%
	354 Companies	188 Companies	542 companies

CETR= current effective tax rate as measured by the ratio between the company's total current tax expense and the company's profit; FO= Dummy variable that is 1 if the shareholder has at least 5% of the shares owned by the same family, 0 if the shareholders are not owned by the same family (Berrone et al., 2010; Hidayati &diyanti, 2018; López-González, Martínez-Ferrero, & García-Meca, 2019); ROA = Level of profitability (profit before tax divided by the total assets of the previous year ); LEV = Leverage level (measured by the ratio of the company's total expenses to total assets. ); PPE= The size of the company as measured by the ratio of property, plants, & equipment to the company's last year's assets;

Source: Processed Author Data (2022)

Based on the statistical description in table 3, information was obtained that a family-owned company with political connections in it would have a tendency to have a low CETR value tendency. This shows that the company is quite aggressive in carrying out tax management. Similarly, when tested with ETR, family-owned companies that have political connections tend to carry out tax aggressiveness. A higher ETR value than CETR indicates that companies are more utilizing permanent tax differences to carry out tax aggressiveness (Hidayati & Diyanti, 2018)

**Table 3 Descriptive Statistics of the Influence of Moderation of Political Connections**

Description	Average Values	
	CETR	ETR
Firm with FO	20.8 0%	2 3.19%
Non-FO firms	20,33%	22,77%
Firm with FO and PC	20,00%	2 2.27%
Firm with FO without PC	20,30%	22,72%

Firm with FO denotes a company with family ownership, while a non-FO firm is the opposite. Firm with FO and PC indicates a family-owned company with a political connection, while a firm with FO without PC indicates a family-owned company with no political connection.

Source : Processed Author Data (2022)

**B. Analysis of Model Test Results**

The data in this study were obtained with *stata* 16.0 software. before the regression test was carried out, the data first went through a classical assumption test so that the data used was BLUE. The autocorrelation test was

performed with *the Wooldridge command*, heteroskedasticity was tested with *the wald test*, and multicollinearity through the VIF test. So that all data in this study is BLUE and these three problems have been overcome.

Table 4 shows that family ownership companies tend to be less aggressive in carrying out their tax management. The negative direction on the variable of family ownership (FO) towards tax aggressiveness in accordance with the initial hypothesis of the study. Brune et al., (2019) found that the family played a role in considering the activities of tax aggressiveness. They are reluctant to lose social emotional wealth and company founders can influence the level of tax aggressiveness even if they have no direct influence (serving as CEO). This has caused the family ownership company to be very sensitive to reputation issues and to strongly maintain the good name of the family that will be their legacy to the next generation (Casson, 1999). The results of this study are in line with previous research, namely Hidayati & Diyanti (2018); Chen et al., (2010); Shen et al., (2019); Zhang et al., (2012); Gomez-Mejia et al., (2003). So it can be concluded that the first hypothesis is accepted.

**Table 4 Regression Test Results**

<b>Hypothesis 1 : Family ownership negatively affects the aggressiveness of taxation</b>		
<b>Research Model :</b>		
$TAg = \beta_0 + \beta_1FO_{it} + \beta_2PC_{it} + \beta_3FO*PC + \beta_4ROA_{it} + \beta_5LEV_{it} + \beta_6PPE_{it} + \varepsilon_i$		
<b>Variable</b>	<b>Koef</b>	<b>Prob</b>
Constant	0,0021	
FO	-0,015	0,000***
PC	0,003	0,066**
ROA	0,066	0,074*
Leverage	0,031	0,273
PPE	0,048	0,076*

Table Description:  
FO= Dummy variable that is 1 if the shareholder has at least 5% of the shares owned by the same family, 0 if the shareholders are not owned by the same family (Berrone et al., 2010; Hidayati & diyanti, 2018; López-González, Martínez-Ferrero, & García-Meca, 2019); PC= variable dummy political connections; ROA = Level of profitability (profit before tax divided by the total assets of the previous year ); LEV = Leverage level (measured by the ratio of the company's total expenses to total assets. ); PPE= The size of the company as measured by the ratio of property, plants, & equipment to the company's last year's assets;

Furthermore, testing of the effect of moderation of corporate political connections on family ownership and tax aggressiveness was carried out. Table 5 explains that the variable of political connections negatively affects (weakens) family ownership companies to carry out tax aggressiveness. Table 4 also supports the results of this moderation test, where the CETR and ETR values of family-owned companies with political connections will be lower than family-owned companies without political connections. So it can be known that family-owned companies with political connections have a tendency to carry out tax aggressiveness rather than family-owned enterprises without political connections. This is in line with the research of Ajili & Khlif (2020) which explains that manager in family ownership companies can reduce the burden related to government regulations and supervision by the competent authority through political connections owned, protected against the risks of litigation in the future and have direct access to special information. This is done to increase the value of the company in the form of large assets or low debt (Thiele & Wendt, 2017). An identical family company with a good reputation will have an impact on the reputation of the politicians involved in it. So this benefit is used by politicians to carry out tax aggressiveness to increase the value of the company. the results of this regression prove that the second hypothesis is accepted.

**Table 5 Regression Results With Moderation**

<b>Hypothesis 2 : Political connections weaken the negative influence of family ownership on the aggressiveness of taxation</b>		
<b>Research Model :</b>		
$TAg = \beta_0 + \beta_1FO_{it} + \beta_2PC_{it} + \beta_3FO*PC + \beta_4ROA_{it} + \beta_5LEV_{it} + \beta_6PPE_{it} + \varepsilon_i$

---

Table 6 illustrates the distribution of political connections owned by the companies that sampled this study. It can be seen that the most political connections are at the central level, meaning that 73 people in the riots who are sampled in this study are directly or indirectly involved with political activities in Indonesia such as serving as Ministers, serving as members of the DPR through political parties or serving as general chairmen of political parties at the center. The political connections owned by these family-owned companies turned out to have a different impact on the aggressiveness of taxation. It can be seen in the probability value of each level, that political connections at the central level exert a stronger influence than political connections at the provincial level as well as at the city level. This has an impact on family-owned companies with political connections centered on easier to find out tax loopholes (Ajili & Khelif, 2020) as well as information about government policies and economic direction (Harymawan et al., 2020).

Table 6 Results of Regression of Political Connections Between Levels

Variable	Number of political connections	% political connections	Koef	Prob
PC Center	73 people	62,93%	0,061327	0,000***
Provincial PC	38 people	32,75%	0,019952	0,008***
CITY PC	5 people	4,31%	0,0441616	0.041**
Total	116 people

## V. DISCUSSION

Previous research discussing the influence of family ownership on tax aggressiveness with moderation of political connections has often been carried out. But this study provides a new picture of the power of influence of these political connections at every level. The findings of this study support that family-owned companies will tend to avoid tax management actions that are too aggressive to keep the company's image valuable if it is passed on to later generations (Casson, 1999). Based on the regression results, the CETR value of each company that is sampled is lower than the ETR value. This shows that the company is quite aggressive in carrying out tax management. A higher ETR value compared to CETR indicates that companies are more utilizing permanent tax differences to carry out tax aggressiveness (Hidayati & Diyanti, 2018). However, this family-owned company does not necessarily always obey tax rules. It's just that the level of aggressiveness of each company in carrying out tax management is different, as well as companies without family ownership.

Factors that can influence company decisions in carrying out tax aggressiveness, one of which is political connections. Political connections within a company are defined if a company has one or more *boards of directors* who are members of parliament (House of Representatives), ministers, and or former officials and are former members of the military (retired police and TNI). Based on the regression test that has been carried out, it is known that the moderation variable of political connections affects the relationship of family ownership companies in carrying out tax aggressiveness. In accordance with the purpose of this study, in addition to looking at the influence of political connections, it will also be known the amount of influence that political connections have at various levels. As a result, family-owned companies that have political connections at the center have the greatest influence on the decisions of family ownership companies in carrying out aggressive tax management. Political connections empower firms to pursue aggressive tax management at the cost of public welfare funded by taxation (Ying et al., 2017).

This study also added testing of variable control. The variables controlled in this study are company profitability (ROA), company debt level (*leverage*), and company investment decisions (PPE). The result is that the ROA variable of family ownership companies has not effect on tax aggressiveness when measured by CETR.

This result is supported by Harymawan et al (2020). Furthermore, this study controls the level of corporate debt as measured by *leverage*. The result is that *leverage* is not correlated with CETR. These results are in line with the research of Kim & Zhang (2016). The next variable control used in this study is PPE. Through the PPE variable, you will see the capital investment made by the sample company. The results of PPE were no correlation with CETR. These results are in line with the research of Nuritomo & Hermawan (2020) .

## VI. CONCLUSION AND RECOMMENDATION

This study aims to see the influence of family ownership on tax aggressiveness, as well as how the influence of moderation of political connections on family ownership and tax aggressiveness. this research replicates the research of Hidayati & Diyanti (2018), but updates the measurement of political connections with the measurement developed by Chen et al., (2017). This is done to capture more information than just using *dummy variables*. Through the measurements of Chen et al., (2017) will be known information on the strength of political connections that family ownership companies have. It is useful for tax authorities to pay more attention to family-owned companies with political connections, because the political connections owned by family ownership companies erode the socio-emotional values that family ownership companies usually have. This study tested all non-financial and non-real estate companies listed on the Indonesia Stock Exchange in 2017 – 2019 with a total sample of 542 companies. The study used CETR to measure tax aggressiveness, but added ETR as a sensitivity test.

The regression model test used in this study aims to see the effect of family ownership on the aggressiveness of corporate taxation in Indonesia. The initial hypothesis of the study suspected that family-owned companies would tend to avoid or reduce commendable activities such as overly aggressive tax management. This is because the founders of family ownership companies will always put forward the *socio-emotional* wealth they have so that they will avoid business decisions that can threaten the company's continuity in the long term. The family company will maintain non-financial wealth such as maintaining the identity or good name of the family in running the business so that the continuity of the family dynasty can continue (Gomez-Mejia et al., 2003). Hidayati and Diyanti (2018) found that investments in family ownership companies are not diversified with a longtime horizon and avoid long-term risk activities. This is because family members consider investment as a wealth inheritance for the next generation, so that all company activities will avoid the risk of subduing company prices (Casson, 1999). The results of this study support previous research, where family-owned companies were less aggressive in their tax management than non-family-owned companies.

Furthermore, a variable test of the moderation of political connections to the aggressiveness of taxation of family ownership companies was carried out. The initial hypothesis of this study suspected that political connection will be caused family ownership companies to tend to take higher risks. This finding is supported by the research of Ferdiawan & Firmansyah (2017) and Wahab et al., (2017) where political relations have an impact on tax avoidance, this is characterized by the average company using its political connections to obtain lower tax payments through branch companies, subsidiaries or foreign activities attached to companies with profit shifting schemes and profit holding. A company with political connections will take advantage of the convenience gained from the political connections it has to carry out aggressive tax actions. The results of this study are in line with previous research and it can be seen that political connections at the central level have a greater impact than political connections at the provincial and municipal levels. Political connections at the central level make it easier for family-owned companies to more easily find out tax loopholes (Ajili & Khelif, 2020) as well as find out information about government policies and economic direction (Harymawan et al., 2020).

This research has many limitations that can be refined by subsequent studies. Where further research can use measurements other than CETR and ETR to detect tax aggressiveness. in addition, family ownership in this study was limited to only 5%. Further research can be developed using the composition of the number of holdings in addition to using only *dummy variables*. Further research can develop political connections by looking at political parties that are in power and not in power as supporting indicators so that the measurement of political connections becomes better.

## ACKNOWLEDGEMENT

The authors would like to thank the reviewers for their supportive comments and suggestions. This research is part of thesis and the authors received no direct funding for this research.

## The Effect of Korean Celebrity Endorsers and Online Marketplace Brand Congruence on Indonesian Consumers' Purchase Intention

Stefan Adrian Sitepu<sup>1</sup> and Gita Gayatri<sup>2</sup>

<sup>1,2</sup> Faculty of Economics & Business, Universitas Indonesia, Jakarta, Indonesia

### Abstract

*The Korean Wave phenomenon has now become global, and Indonesia is one of the countries that is greatly affected by this phenomenon. The use of Korean celebrities as endorsers is increasing among local companies especially on online marketplaces to generate purchase intention. Celebrity – Brand Congruence is one of the factors when choosing the right celebrity as an endorser, the image of the Celebrity and the Brand should match. Previous studies show an incongruent relationship between Celebrity and the Brand but still managed to maintain the congruency image as the celebrity is accepted and acknowledged by consumers. The congruency between Korean Celebrity and Online Marketplace has not been tested, as previous studies show that Indonesia has not fully viewed Korean Wave as an adopted phenomenon. An online survey was used and was filled out by 332 respondents aging between 18 – 41 and who have already seen an online marketplace advertisement that uses Korean celebrities as their endorsers. Structural Equation Model was used to test the hypothesis. The results show that Celebrity – Brand Congruence has no direct effect on Purchase Intention for online marketplaces and Brand Credibility has the most significant effect on Purchase Intention. This study offers managerial implications to online marketplaces in using celebrity endorsers more effectively, as marketing communication tools to increase revenue.*

*Keywords— Celebrity – Brand Congruence; Celebrity Endorsers; Consumers' Purchase Intention; Korean Wave; Online Marketplace.*

---

### I. INTRODUCTION

The Korean Wave phenomenon has now become global and Indonesia is one of the main countries that are greatly affected by this phenomenon. According to data released by Twitter in 2020, it was noted that Indonesia was in the third position as the country with the highest volume of tweets related to K-Pop from all countries. In addition, according to data from statista.com, Indonesia occupies the second position regarding K-Pop viewing on YouTube globally with a magnitude of 9.9% in 2019 after South Korea. Korean Wave is recognized as a phenomenon that is not temporary but a sustainable business (Parc & Hwy-Chang, 2013), so it is necessary to do a study from a marketing point of view. Korean celebrities are liked by many people from all over the world, because of their attractive appearance (Jung & Hwang, 2016)

From the Korean Wave phenomenon in Indonesia, there is a gap between this phenomenon and the theory of celebrity endorser selection. To get the right celebrity endorser, usually, the celebrity must have a positive influence, and the image of the celebrity must match or match the product (Choi & Rifon, 2012). However, currently, several studies show that celebrity endorsers who do not have a background with the product brand they endorse show a positive relationship with purchase intention. (Nguyen, 2021) the use of Son Tung a Vietnamese singer for OPPO a mobile device brand and (Rai et al., 2021), the use of Virat Kohli an athlete for American Tourist.

From the two previous studies above, even though there is an incongruent relationship between a celebrity and an endorsed brand, it shows that if a celebrity is recognized and approved by consumers, the celebrity will be considered congruent with any brand (Fleck et al., 2012). This shows that there is a gap between the two studies above and the Korean Wave phenomenon that is currently happening in Indonesia. The congruency between Korean Celebrity Endorsers and e-commerce brands in Indonesia has not been proven yet, as a study by (S. M. Kim & Park, 2020) shows that Korean Wave has not fully been accepted as an adopted phenomenon in Indonesia.

## II. LITERATURE REVIEW

### A. *Celebrity Endorser*

A celebrity endorser is an individual who enjoys public recognition and uses that recognition on behalf of the consumer good by appearing in advertisements (McCracken, 1989). The depiction of a celebrity is a professional athlete, film star, artist, singer, comedian, or figure known to the public from his achievements (Osei-Frimpong et al., 2019). The number of campaigns with celebrities has increased, with one in five marketing communications conducted in the UK using celebrities (Erdogan et al., 2001). The reason for using celebrity endorsement is that the high profile of celebrities helps to advertise to stand out, thereby increasing communication skills. Many companies are now using celebrities in their brand advertisements (Pornpitakpan, 2004)

### B. *Celebrity – Brand Congruence*

Congruence is a combination or match between the characteristics of a celebrity with the essence of an endorsed brand (Till & Busler, 2000). The selection of celebrity endorsers is very important, and successful advertising is usually believed that the celebrity must have a positive influence and the image of the celebrity must match the endorsed product (Choi & Rifon, 2012). For example, sports celebrities will be the right choice to advertise sports brands because consumers see a match between the product and the celebrity (Liang & Lin, 2018).

### C. *Attitudes Towards the Celebrity*

Attitudes Towards the Celebrity is a behavior that is formed on consumers by looking at several aspects that are measurements made by (Kamins & Gupta, 1994), namely related to attractiveness, trustworthiness, and expertise of celebrities to measure consumer behavior. The following is an explanation of the source of credibility from the endorser.

#### C.1 *Attractiveness*

Attractiveness can be seen in weight, height, good looks, or facial beauty which is the first expression seen by others. This concept is not only physical but also from mental abilities, traits, lifestyle, and talents (Erdogan, 1999).

#### C.2 *Trustworthiness*

Trustworthiness is the level of trust and honesty that is owned by the endorser and is seen by consumers (Erdogan, 1999), which depends on the perception of the target audience. When consumers believe that a source or celebrity can be trusted, they will also assume that the message communicated can also be trusted. So marketers try to promote trustworthiness by having endorsers who are seen as honest and trustworthy.

#### C.3 *Expertise*

The expertise or expertise of an endorser is a source of qualification that directly affects the level of confidence so that consumers become interested in buying products. Celebrities who are considered more skilled are more persuasive and able to generate more interest in making purchases (Ohanian, 1990). Celebrity expert produces more recall effect on product information than non-expert celebrity. So celebrities with a high level of expertise are assumed to be more persuasive than celebrities with a lower level of expertise.

### D. *Attitudes Towards the Brand*

Attitudes Towards the Brand is a point of view about what consumers believe about a particular product or service, as demonstrated by brand awareness. The better the brand builds on the brand image, the better the value that can be given to consumers to differentiate the brand from other brands, and the product is increasingly recognized by consumers.

### E. *Brand Credibility*

Brand credibility is defined as the level of trustworthiness of the information conveyed by a brand that has a major impact on the branding process. Previous research has shown that brand credibility not only affects brand selection but also moderates consumers' sensitivity to price.

### F. *Purchase Intention*

Purchase intention is the tendency to buy a brand and see based on the suitability of the purchase motive with the attributes or characteristics of the brand that will be considered for purchase. Purchase intention has an important role, especially for companies because it can be used to predict consumer behavior in making purchases and is one of the factors that determine consumer purchase decisions.

### *G. Hypothesis Development*

#### 1. Celebrity – Brand Congruence on Attitudes Towards Celebrity

Research conducted by (Min et al., 2019) shows that there is a significant relationship between Celebrity - Brand Congruence with attitudes toward celebrities where if consumers feel there is a match between celebrity and brand then consumer attitudes towards celebrities become positive. In addition, according to (Mishra et al., 2015), this is supported by attribution theory, which states that consumers seek an explanation of people's actions, in this case, the reason celebrities endorse a brand. The match that occurs between celebrity and brand will result in internal attribution. This result occurs because consumers feel that celebrities do endorsements because they feel there is a match between their personality and the brand, not solely because celebrities do endorsements to obtain financial income. This will increase consumer confidence and behavior towards celebrities. Therefore, the hypothesis proposed is as follows

**H1: Celebrity – Brand Congruence has a positive effect on attitudes towards celebrity**

#### 2. Celebrity – Brand Congruence on Attitudes Towards Brand

Research conducted by (Min et al., 2019) shows that there is a significant relationship between Celebrity – Brand Congruence with attitudes toward brands where if consumers feel there is a match between celebrity and brand then consumer attitudes towards the brand become positive. According to (Choi & Rifon, 2012), said that the congruence between celebrities and endorsed products greatly determines consumer perceptions. The results of several studies show that Celebrity – Brand Congruence has a significant effect on brand evaluation. When the perceived suitability of consumers is higher, the evaluation from consumers is better. So the hypothesis proposed is as follows

**H2: Celebrity – Brand Congruence has a positive effect on attitudes towards brand**

#### 3. Attitudes Towards Celebrity on Brand Credibility

Research conducted by (Wang et al., 2017) shows that attitudes towards celebrity have a positive relationship with brand credibility. The results show that according to consumers, if the endorsed brand is trustworthy, and liked, the consumer's perception of the celebrity brand is more positive, so the brand has a more trusted perception. In addition, research conducted by (Chin et al., 2020), that there is a positive relationship between attitudes towards celebrity and brand credibility caused by consumer perceptions of the source model from celebrity. Research conducted (Rai et al., 2021), also shows that consumer perceptions of celebrities will result in brand credibility and a positive brand image. Therefore, the hypothesis proposed is as follows

**H3: Attitudes towards Celebrity has a positive effect on Brand Credibility**

#### 4. Attitudes Towards Celebrity on Purchase Intention

Research conducted by (Min et al., 2019) shows that there is a positive relationship between Attitudes Towards Celebrity and purchase intention even though when compared to attitude toward a brand it has a greater impact on purchase intention. Several studies conducted by (Nguyen, 2021) and (Wang et al., 2017) also looked at the relationship of attitudes toward celebrities towards purchase intention but had mediating variables such as brand perception and brand credibility. Both studies show a positive relationship between the two variables. Therefore, the hypothesis proposed is as follows

**H4: Attitudes towards Celebrity has a positive effect on Purchase Intention**

#### 5. Attitudes Towards Celebrity on Attitudes Towards Brand

Research conducted by (Wang et al., 2017) shows that there is a relationship between Attitudes Towards Celebrity and attitudes toward brands. The influence of celebrity endorsement is able to create an impact on the product and the brand itself, and this study shows that there is a positive relationship with brand attitude. Research conducted by (Chin et al., 2020), that there is a positive relationship between attitudes towards celebrity and attitudes towards brands caused by consumer perceptions of the source model from celebrity. In addition, research conducted by (Nguyen, 2021) also shows a positive relationship from the celebrity endorser dimension as measured by consumer perceptions of consumers' perceptions of the brand. Therefore the hypothesis proposed is as follows

**H5: Attitudes towards Celebrity has a positive effect on Attitudes Towards Brand**

## 6. Attitudes toward Brand terhadap Purchase Intention

Research conducted by (Wang et al., 2017) shows that there is a relationship between Brand attitude and Purchase Intention, this variable has a significantly positive relationship with purchase intention. Attitudes toward a brand usually appear in the minds of consumers based on the advertisements they see. In addition, endorsers also help consumers to help shape attitudes toward the brand. Attitude toward the brand has a huge impact on Purchase Intention when there is an increase in consumer motivation (Mackenzie and Spreng, 1992). (Chin et al., 2020) and (Pradhan, 2016), proves that there is a positive relationship between attitudes towards brand and purchase intention. In the context of advertising effectiveness, it also proves that attitude towards the brand is an antecedent that affects purchase intention. Therefore, the hypothesis proposed is as follows

### **H6: Attitudes towards Brand has a positive effect on Purchase Intention**

## 7. Brand Credibility on Purchase Intention

Research conducted by (Wang et al., 2017) shows that there is a relationship between Brand Credibility and Purchase Intention, and this variable has a significantly positive relationship with purchase intention. Research conducted by (Rai et al., 2021) also shows the same results where there is a positive influence from the brand on purchase intention. (Chin et al., 2020), proves that there is a positive relationship between brand credibility and purchase intention. This is because consumers who have a positive perception of celebrity endorsers will produce a positive image of the endorsed brand and help advertisements to build credibility in the minds of consumers so that it will affect their purchase intention. Therefore, the hypothesis proposed is as follows

### **H7: Brand Credibility has a positive effect on Purchase Intention**

## 8. Celebrity – Brand Congruence on Purchase Intention

Research conducted by (Min et al., 2019) shows that there is a significant relationship between Celebrity – Brand Congruence and purchase intention where if consumers feel there is a match between celebrity and brand, it will increase consumer buying intention. The match between the product and the endorser will positively strengthen consumer confidence in a brand, so that it will affect the brand attitude and purchase intention (Fleck et al., 2012). So the hypothesis proposed is as follows

### **H8: Celebrity – Brand Congruence has a positive effect on Purchase Intention**

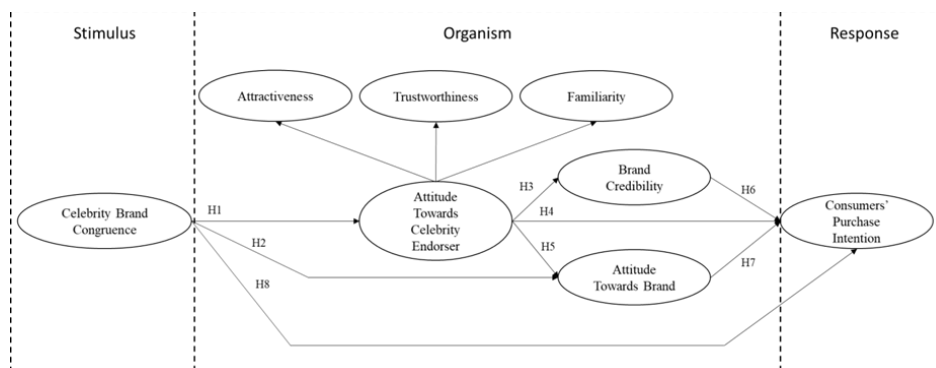

Fig.1 Research Model

## III. RESEARCH METHODOLOGY

### A. Methods

The use of celebrity endorsers who have different cultures can have a positive or negative impact on the brand. Research conducted by (S. M. Kim & Park, 2020), shows that there are six segments Korean Wave in ASEAN countries, each of which has different characteristics for products originating from Korea. This shows that the use of Korean celebrity endorsers in Indonesia for online marketplace brands has not been proven, because Indonesian consumers have not fully adopted the Korean Wave phenomenon. To answer the problem formulation and objectives in this study, the model that will be used refers to (Min et al., 2019) and (Wang et al., 2017), but adjustments are made according to other research models so that the influence of Celebrity – Brand Congruence on consumer purchase intention can be found.

### B. Data Collection and Processing

The type of data used in this study is primary data. The type of primary data used is obtained directly from the object of research to test the hypothesis to be studied. Primary data will be collected through the distribution of online questionnaires, to facilitate data collection. The questionnaire that will be sent is several questions related to the use of Korean celebrity endorsers on brand perception and consumers' purchase intention. The population that will be studied is Indonesians aged between 18 - 41 years old who have seen advertisements on online marketplace sites in Indonesia that use Korean celebrity endorsers. The responses of the survey participants to each of the items were measured on a seven-point Likert scale, ranging from 1 ("strongly disagree") to 7 ("strongly agree").

The Wording Test will be conducted to test the feasibility of the measurement items that had been obtained from a collection of journals. Translation into Indonesian is required and needs to be tested on several respondents to reduce the possibility of errors occurring when the main questionnaire is distributed. Therefore, improvements to the questionnaire can be made first. The pre-test on the questionnaire will also be carried out with the aim of ensuring that the questionnaire carried out was easy to understand before the actual questionnaire was carried out. The number of samples that will be used in the Pre-Test is 30 respondents. The expected output of this Pre-Test is the response of the respondents and the analysis of the validity and reliability tests. Structural Equation Model (SEM) will be used to test the hypothesis because this model is more suitable for testing theories and measuring the feasibility of the model and confirming it according to the empirical data.

## IV. RESULT

### A. Wording Test & Pre-Test Results

The wording test has been carried out by 4 respondents, and there are several question indicators that need to be changed and clarified to make it easier for respondents to understand. There are 8 indicators that have changed and 3 indicators that need to be clarified and have been changed according to the recommendations of the respondents. Then, a pre-test was conducted to 30 respondents using SPSS 25 and the results show that the questionnaire was valid and reliable because it met the requirements KMO between 0.1 and 0.5 and Cronbach's Alpha > 0,60

### B. Respondents Profile

The number of respondents from the main survey was 344 which were distributed through social media for 1 week (28 March 2022 – 5 April 2022), such as WhatsApp Groups, Facebook Groups, Telegram Groups and Instagram. However, of the 344 respondents who filled out the questionnaire, as many as 332 respondents met the survey criteria.

Table 1. Respondents Profile

Respondents Profile		Total	%
Gender	Male	105	31,6%
	Female	227	68,4%
Age	18 - 25 Years old	174	52,4%
	26 - 41 Years old	158	47,6%
Domicile	Jabodetabek	245	73,8%
	Outside of Jabodetabek	87	26,2%
Education	SMP	4	1,2%
	SMA/SMK	94	28,3%

	Ibu Rumah Tangga	16	4,8%
	Seniman	2	0,6%
	Freelance	5	1,5%
	Konten Kreator	1	0,3%
	F&B Crew	1	0,3%
	Guru/Pengajar	3	0,9%

### C. Data Analysis

For descriptive analysis, the average of each indicator of the variable is higher than 3,5. Therefore, it can be concluded that Indonesian consumers "agree" and there is the potential to make purchases of online marketplace advertising brands that use Korean Celebrity Endorser. In conducting the test, this study uses SEM measurements where before testing the hypothesis it is necessary to measure the model by testing the validity and reliability of each indicator first. Testing on the model uses LISREL 8.8, and each measurement item will be tested for validity and reliability. Table 2 below shows the result of the descriptive analysis, validity, and reliability test. The requirement for validity is  $SLF \geq 0.5$  and the  $t$ -value  $\geq 1.96$ , and for reliability measurement is  $CR \geq 0.70$  and  $AVE \geq 0.5$

Table 2. Descriptive Analysis, Validity & Reliability Test

Variable	Item Measurement	Mean	SD	T-Value	SLF	CR	AVE
Celebrity – Brand Congruence	CBC1	5,25	0,82	15,49	0,76	0,84	0,64
	CBC2	4,76	1,09	17,27	0,82		
	CBC3	4,96	1,06	17,39	0,82		
Attitudes Towards Celebrity (Familiarity)	FA1	5,41	1,09	7,68	0,42*	0,61*	0,65
	FA2	4,77	1,42	14,67	0,71		
	FA3	5,23	1,16	12,24	0,62		
Attitudes Towards Celebrity (Attractiveness)	AT1	5,19	1,04	16,58	0,78	0,89	0,63
	AT2	5,07	1,20	16,49	0,78		
	AT3	5,15	1,04	17,35	0,80		
	AT4	4,31	1,49	16,16	0,77		
	AT5	4,80	1,28	18,02	0,82		
Attitudes Towards Celebrity (Trustworthiness)	TW1	5,07	1,06	16,83	0,79	0,90	0,65
	TW2	4,54	1,19	17,61	0,81		
	TW3	4,73	1,12	18,28	0,83		
	TW4	4,58	1,21	18,32	0,83		
	TW5	5,06	1,01	16,02	0,76		
Attitudes Towards Brand	ATB1	3,42	1,82	18,88	0,86	0,87	0,70
	ATB2	3,05	1,79	15,87	0,77		
	ATB3	4,13	1,79	19	0,87		
Brand Credibility	BC1	4,48	1,29	14,61	0,71	0,93	0,67
	BC2	4,85	1,06	19,38	0,86		
	BC3	4,82	1,03	20,5	0,89		
	BC4	4,93	1,03	19,98	0,88		
	BC5	4,92	1,05	19,14	0,85		

Variable	Item Measurement	Mean	SD	T-Value	SLF	CR	AVE
	BC6	5,19	0,89	15,48	0,74		
	BC7	4,99	0,99	16,08	0,76		
Purchase Intention	PI1	4,78	1,13	18,39	0,88	0,89	0,68
	PI2	4,98	1,06	20,82	0,90		
	PI3	4,13	1,62	12,06	0,62		
	PI4	4,86	1,17	20,68	0,90		

From the validity test results, the item measurement FA1 did not meet the SLF requirement. Although theoretically, this variable should be omitted, referring to (Garson, 2010), stated that  $SLF < 0.40$  is considered weak and  $SLF > 0.60$  is considered strong, therefore, SLF between 0.40 and 0.60 can still be used in this research. As for the reliability test, the "Familiarity" variable has CR value below 0.7 where in theory this variable should be rejected. However, referring to previous research conducted by (Liang et al, 2018) a variable that is below the required CR can still be accepted by considering the average value of the descriptive analysis that has a high influence on the purchase. intention. Therefore, by considering the research and referring to the descriptive analysis on "Familiarity" that has an average value above a score of 5, the variable is still accepted.

#### D. Goodness of Fit

Based on the results of the goodness of fit of the model, in Absolute Fit Measures, all indicators have "Poor Fit". It can be concluded that this model is still not a "Good Fit" so modification indices are needed to get a fitter model to meet the parameters that have been set. From the results of these modifications, the following is the modified goodness of fit analysis that is recommended by LISREL 8.8

Table 3. Goodness of Fit

Parameter GOF	Tingkat Fitness	Output	Status
Absolute Fit Measures			
Chi-Square / degree of Freedom ( $\chi^2/df$ )	$\chi^2/df \leq 5$	2,94	Good Fit
Goodness of Fit Index (GFI)	$GFI \geq 0.90$	0,82	Marginal Fit
Standardized RMR	$SRMR \leq 0.08$	0,088	Marginal Fit
Root Mean Square Error of Approximation (RMSEA)	$RMSEA \leq 0.08$	0,077	Good Fit
Incremental Fit Measures			
Normed Fit Index (NFI)	$NFI \geq 0.90$	0,97	Good Fit
Non-Normed Fit Index (NNFI)	$NNFI \geq 0.90$	0,98	Good Fit
Comperative Fit Index (CFI)	$CFI \geq 0.90$	0,98	Good Fit

#### E. Hypothesis Testing

This study uses SEM measurements where before testing the hypothesis it is necessary to measure the model by testing the validity and reliability of each indicator first. Testing on the model uses LISREL 8.8, and each measurement item will be tested for validity and reliability. According to the result, this framework has met the requirements for the model to be reliable and valid, as it met the Loading Factor  $> 0.5$  and T value  $> 1,96$ . Therefore the hypothesis can now be tested, and the result is as follow

Table 4. Hypothesis Test

Hypothesis	Variable	Estimates	T-Value	Hypothesis Test
H1	Celebrity Brand Congruence -> Attitudes Towards Celebrity	0,75	7,08	Accepted

Hypothesis	Variable	Estimates	T-Value	Hypothesis Test
H2	Celebrity Brand Congruence -> Attitudes Towards Brand	0,35	5,08	Accepted
H3	Attitudes Towards Celebrity -> Brand Credibility	0,56	6,19	Accepted
H4	Attitudes Towards Celebrity -> Consumers' Purchase Intention	0,23	2,33	Accepted
H5	Attitudes Towards Celebrity -> Attitudes Towards Brand	0,59	5,98	Accepted
H6	Brand Credibility -> Consumers' Purchase Intention	0,75	11,33	Accepted
H7	Attitudes Towards Brand -> Consumers' Purchase Intention	-0,14	-1,30	Not Accepted
H8	Celebrity Brand Congruence -> Consumers' Purchase Intention	0,05	0,70	Not Accepted

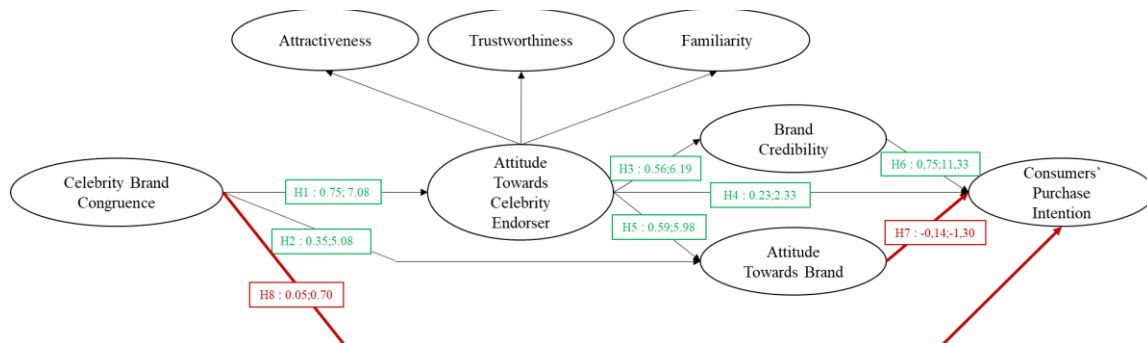

Fig 2. Hypothesis Result

## V. DISCUSSION

The relationship between the Celebrity Brand Congruence and Attitudes Towards Celebrity (H1) has a hypothesis that is accepted because it has a t-value exceeding 1.64. So based on the research and theory that has been described above, the compatibility of Celebrity and Brand, will have a positive influence on attitudes towards celebrity, which indicates that the combination of Korean celebrity endorsers with Brand Marketplaces gives consumers the perception that Korean Celebrity Endorsers do endorsements not solely to earn financial income, however, because the Celebrity feels a match with his personality, especially from the way the ad is packaged. The results of this hypothesis are supported by previous research by (Min et al., 2019) showing that there is a significant relationship between Celebrity – Brand Congruence with attitudes toward celebrities.

The relationship between the Celebrity Brand Congruence variable and Attitudes Towards Celebrity (H2) has a hypothesis that is accepted because it has a t-value exceeding 1.64. This indicates that the combination of Korean celebrity endorsers with Brand Marketplace gives consumers a positive perception of the brand. The results of this hypothesis are supported by research conducted by (Min et al., 2019) and according to the theory (Choi & Rifon, 2012) showing that there is a significant relationship between Celebrity – Brand Congruence with attitudes toward brands. The relationship between the Attitudes Towards Celebrity variable and Brand Credibility (H3) has the accepted hypothesis because it has a t-value exceeding 1.64. This study shows that Indonesian consumers' perceptions of brands endorsed by Korean celebrities can be trusted and have a more trusted image. The results of this hypothesis are supported by research conducted by (Wang et al., 2017) which shows that attitudes towards celebrity have a positive relationship with brand credibility.

The relationship between the Attitudes towards Celebrity variable and Consumers' Purchase Intention (H4) has an accepted hypothesis because it has a t-value above 1.64. So this study shows that the handsome face and attractive appearance of Korean celebrity endorsers on online shopping site advertisements can increase the

buying interest of Indonesian consumers. These results support the hypothesis obtained from research by (Min et al., 2019) showing that there is a positive relationship between Attitudes Towards Celebrity and purchase intention. The relationship between the Attitudes Towards Celebrity variable and Brand Credibility (H5) has the accepted hypothesis because it has a t-value exceeding 1.64. This study shows that consumer behavior towards Korean celebrity endorsers has a significant impact on the brand of the online shopping sites they advertise. These results also support research conducted by (Wang et al., 2017) which shows that attitudes towards celebrity have a positive relationship with Attitudes Towards Brand.

The relationship between the Brand Credibility variable and Consumers' Purchase Intention (H6) has an accepted hypothesis because it has a t-value exceeding 1.64. This shows that the credibility of the online shopping site brand which is seen by Indonesian consumers has a significant impact on their buying interest. These results are supported by research conducted by (Wang et al., 2017) and (Rai et al., 2021) which show that there is a relationship between Brand Credibility and Purchase Intention, and these variables have a significantly positive relationship with purchase intention. The relationship between the Attitudes towards Celebrity variable and Consumers' Purchase Intention (H7) has a hypothesis that is not accepted because it has a t-value below 1.64. This indicates that Indonesian consumers' perceptions of brands from online shopping sites do not have an impact on buying interest. This is not in accordance with research conducted by (Wang et al., 2017) which shows that there is a relationship between Brand attitude and Purchase Intention in the aviation sector using endorsers. Likewise with research conducted by (Min et al., 2019) who conducted research on the compatibility of brands with celebrities, where there was a significant relationship between Brand Attitude and Purchase Intention. The difference between this study and previous research is that there are different contexts, where the brand discussed in this study is an online shopping sites brand, so based on (Kuswanto et al., 2019) attitudes toward online marketplace brands are seen more from the attractiveness and the user interface of the online marketplace site platform, as previous research discusses product such as shoes.

The relationship between the Celebrity Brand Congruence variable on Consumers' Purchase Intention (H8) has a hypothesis that is not accepted because it has a t-value of less than 1.64. These results indicate that the compatibility between Korean celebrity endorsers and online shopping site brands that are deemed suitable by consumers does not have a significant impact on buying interest. This is not in accordance with the theory from the initial hypothesis derived by (Min et al., 2019) which shows that there is a significant relationship between Celebrity – Brand Congruence and purchase intention. However, research conducted by (Rai et al., 2021) also shows that the compatibility between celebrity and brand does not have an impact on consumer buying interest, this is due to financial conditions in India which have a low average income, so the main factor in determining purchases is brand credibility.

From the indirect path analysis, Celebrity Brand Congruence has a positive influence on Consumers' Purchase Intention from Attitudes Towards Celebrity and Brand Credibility. The use of Celebrity Korean endorsers for online shopping sites can improve the consumers' behavior towards Korean celebrity endorsers because they have given perceptions that Korean Celebrity Endorser endorses the site because the sense of compatibility, they feel with the online shopping site brand. The use of Korean celebrity endorsers can increase the brand credibility of the online shopping site, because of the perception given to the consumer that the online marketplace can work with endorser from Korea. The established Brand Credibility and increase Consumer's Purchase Intention.

## VI. CONCLUSION AND RECOMMENDATION

The results of this study indicate that the Korean Wave phenomenon greatly affects consumer behavior in making purchases. With the S-O-R method, Celebrity – Brand Congruence from Korean Endorser with Online Shopping Site Brands has a direct positive influence on Attitude Towards Celebrity and Brand. Attitudes Towards Celebrity has a positive influence on Brand Credibility, Attitudes Towards Brand, and Consumers' Purchase Intention. However, Attitudes Towards Brand has no effect on consumers' purchase intention. This is because consumer interest in making purchases on online shopping sites is seen in the appearance of the website, the user interface on the platform, and the services provided. In addition, Celebrity – Brand Congruence does not have a direct influence on consumers' purchase intentions. Based on previous research, celebrity – Brand congruence is not the main factor in making purchases intention, this is due to the country's economic conditions which show that income is still low, so the main factor for consumers to make purchases is brand credibility. From the results obtained Brand Credibility has a positive influence on consumers' purchase intention and the t value obtained is 11.33 which is the highest value. Brand credibility that occurs in the context of the online marketplace is caused by consumers who have positive perceptions of Korean celebrity endorsers which have produced a positive image of endorsed brands and helped advertisements to build credibility in the minds of consumers, thus influencing their purchase intention. The credibility that has been built by the brand will create security for consumers with the hope that the services provided will be in accordance with consumer expectations. Therefore, this supports the

statement from previous research that brand credibility is a very influential factor in consumers' purchase intention.

As a recommendation for managerial implication, this study shows that the use of any celebrity endorser will be very effective in increasing purchase intention if it is known and favored by consumers and has an image that is acceptable to consumers. This study also recommends that the online marketplace conduct "Harbolnas" specifically for Beauty Care products, considering the high interest in buying these products through the Online Marketplace, and according to the survey the main target segment would be women aged between 18 – 25 years. Collaborating with Korean Celebrity Endorsers is recommended to help promote and strengthen marketing communication for the "Harbolnas" event. According to previous studies, the Korean Wave is a sustainable phenomenon, therefore, conducting market studies related to the trending Korean Wave is recommended. This needs to be done because the Korean Wave will always develop as well as Korean artists. Over time, these Korean artists will experience an increase in age, so their target market will also change. So, the company must always be updated with the development of the Korean Wave.

#### ACKNOWLEDGEMENT

I would like to express my very great appreciation to Ms. Gita Gayatri, Ph.D. for her valuable, constructive suggestions and useful critics during the planning and development of this research work. Her willingness to give her time so generously despite having a time difference has been very much appreciated. I would also like to extend my thanks to Universitas Indonesia for giving me a chance to continue my study as a Magister Management student. Finally, I wish to thank my parents and my sisters for their support and encouragement throughout my study.

## The Effect of User Generated Content and Fear of Missing Out Towards Indonesian Mobile Gacha Gamers' Purchase Intention

Dimitri Ismandana Utama Putera<sup>1</sup>, Daniel Tumpal Hamonangan Aruan<sup>2</sup>

<sup>1,2</sup>Fakultas Ekonomi dan Bisnis, Universitas Indonesia, Jakarta, Indonesia

### Abstract

*This paper aims to empirically analyze the effect of perceived credibility, perceived usefulness, and information quality of user generated content (UGC), as well as fear of missing out (FoMO) towards the construct of theory of planned behavior (TPB) and purchase intention for gacha games in Indonesia. Mobile games has always been the biggest market amongst the gaming platform, with several gacha game like Genshin Impact made it to top 10 grossing worldwide in 2021. Indonesia has shown a lot of potential as the largest gaming market in South East Asia. However, there is little known research regarding gacha games and the effect of user generated content towards players' attitude regarding in-game purchase. Studies which shows the effect of FoMO towards the construct of TPB and purchase intention in gaming is also minimal. This research were assessed using PLS-SEM and 234 respondents data were collected from online survey. Finding shows that perceived credibility and perceived usefulness has a positive effect towards attitude, but information quality no significant effect towards attitude. FoMO has a positive effect towards purchase intention and subjective norms, but has no significant effect towards attitude and perceived behavioral control. Attitude, subjective norms, and perceived behavioral control has shown to have positive effect towards purchase intention. The study suggests that marketers should try to develop FoMO inducing strategy and encourage the creation of user generated content as it may lead to purchase intention.*

*Keywords— Fear of Missing Out; Gacha Games; Purchase Intention; Theory of Planned Behavior; User Generated Content.*

---

### I. INTRODUCTION

The video game industry is one of the largest entertainment industries in the world. According to data from Newzoo (2021), the market value for video games globally in 2021 is 175.8 billion USD and is expected to continue to grow to 218.7 billion USD in 2024. The same data also shows that video games have total players of 3 billion people worldwide in the year 2021 and 1.5 billion players are in the Asia Pacific region. Of the various types of video games platforms, the most popular is mobile games. According to data from Newzoo (2021), mobile games has the highest market in 2021, which was USD 79 billion, compared to other platforms such as consoles, PCs, and tablets. One of the reason why mobile games are more popular compared to other platforms is because mobile game has factors such as convenience, portability, and lower price (Bose & Yang, 2011). Indonesia itself covers 43% of the total game players in Southeast Asia and a constantly increasing smartphone penetration, with an estimated 89.2% of Indonesians are anticipated to own a smartphone by 2025 (Cekindo, 2021).

The mobile game business model can generally be divided into six categories; free, freemium, in-app purchase, in-app advertising, and combination model. Among these business model, the freemium or free-to-play (F2P) model is the most widely used and most successful (Baghbaniyazdi & Ferdosara, 2017). An analysis was conducted on the Apple App Store and showed that the majority of the apps on the App Store uses the freemium model (Brockmann, Stieglitz, & Cvetkovic, 2015). One system that adopts the freemium or F2P model are gacha games, which are games originating from Japan that have a loot box system as their monetization system and has been widely implemented by game developers worldwide. In the gacha system, players cannot directly purchase items through in-app payments, but they must participate in a raffle (gacha) to gain access or a chance to win the item (Yamakami, 2012). Gacha systems are very popular and widely implemented in mobile games in Asia with games such as Genshin Impact, Uma Musume, Fate Grand Order, and many more.

Fear of missing out or FoMO is a phenomenon where a person feels an emotional response in the form of missing out an experience. FoMO is the fear an individual feels from missing out on an experience that can enhance or maintain her/his self-concept (Zhang et al., 2020). An example of this phenomenon is that a consumer who self-identifies as a fan of a band will feel FoMO when there is a limited edition of a new recording by the band or the opportunity to see them perform in person (Zhang et al., 2020). Likewise in the context of mobile gaming, a FoMO situation is when there is a newly released in-game products like characters, skins, weapons, or other items that they play but haven't own yet. If the player thinks that the item will enhance their self-concept, they will feel FoMO.

On social media platforms such as Youtube, Twitter, Facebook, Discord or other social media, there are many user generated content (UGC) created by users who discuss games. UGC is defined as any form of content such as blogs, wikis, discussion forums, posts, chats, tweets, podcasting, pins, digital images, videos, audio files, and other forms of media created by users of an online system or service, often available through social media sites (Moens et al., 2014). These user-generated content contained information such as gameplay, in-game storylines, other discussions related to the game, as well as reviews or guides on how to use the characters, weapons, or other related in-game items. Perceived credibility, perceived benefit/usefulness, brand engagement, and information quality in UGC has shown to affect a person's attitude, which in turn has a significant effect on purchase intention (Mathur et al., 2021).

The Theory of Planned Behavior (TPB) is a theory that are widely used by academics to explain and predict behavior in a multitude of behavioral domains. According to TPB, behavioral intention are determined by attitude towards the behavior, perceived behavioral control, and subjective norms concerning the behavior (Ajzen, 2020). Using the theory of planned behavior framework, this research aims to analyze the effect of perceived credibility, perceived usefulness, and information quality of UGC towards attitude regarding in-game purchase. The study will also analyze the effect of fear of missing out towards the TPB constructs and purchase intention of in-game products. TPB framework has been used to analyze consumer behaviors in context of green products (Maichum et al., 2016; Choi & Johnson, 2019), luxury goods (Jain, 2020; Zhang et al., 2020) , and online shopping (Su & Huang, 2011; Ketabi et al., 2014), to name a few, although there is still a gap in context of in-game purchase. Previous FoMO studies address its effect towards purchase intention in context of masstige brand apparel purchase (Saavedra & Bautista, 2020) and the effect of FoMO towards purchase likelihood (Good & Hyman, 2020), however there are still a lot of gaps that can be addressed in different context. The objective of this research is to analyze the effect of perceived credibility, perceived usefulness, and information quality of UGC towards attitude and analyze the effect of FoMO towards the constructs of TPB and purchase intention.

## II. LITERATURE REVIEW

### A. *Gacha Games*

Gacha games are games originating from Japan that have a loot box system as monetization. In this game, players cannot directly purchase items via in-app payments but must participate in sweepstakes to gain access to a chance to win one of them (Yamakami, 2012). Like the free to play model in general, gacha games can be played for free, however, rare and/or valuable game items can also be obtained through monetary purchases of online gacha products (Shibuya & Teramoto, 2015). Some examples of gacha games includes Genshin Impact, Fate Grand Order, Arknights, Fire Emblem Heroes, Azur Lane, and many others. The system they use is that players can buy in-game currency using their money, where with that currency they can get the opportunity to get characters, weapons, or other virtual items.

### B. *Theory of Planned Behavior*

The theory of planned behavior (TPB) is a development of the theory of reasoned action (TRA) developed by Ajzen (1991). This theory is one of the popular theories that has been used in many fields of research to see why a behavior is carried out or why a technological innovation is adopted. In TRA, subjective attitudes and norms are the factors that determine a person's intention to perform a behavior. However, this TRA has limitations in dealing with individual voluntary behavior or voluntary behavior. With that, TPB was developed to increase the effectiveness of the model by adding a perceived behavioral control construct, the purpose of which is to see the individual's perception of his own beliefs and abilities to participate in the behavior carried out. So with that, TPB has 3 independent variables. The first is attitude, where a person judges a behavior as positive or negative. Then the second is subjective norms, which are the influence of the individual's environment on a behavior. And the third is perceived behavioral control, as previously explained. When an individual has a positive attitude, subjective norms, perceived behavioral control, behavioral intentions, the individual is more likely to perform that behavior (Ajzen, 1991).

### C. *User Generated Content*

User Generated Content or UGC includes all content in the form of images, text, audio, or video created by users (users) about a product, service, or experience they get uploaded on social media. According to Moens et al. (2014), UGC denotes all forms of content such as blogs, wikis, discussion forums, posts, chats, tweets, podcasting, pins, digital images, videos, audio files, and other forms of media created by users of an online system or service, often times available via social media sites. Wunsch-Vincent & Vickery (2007) states that UGC is content that is publicly available on the internet, content that reflects a creative endeavor, and conflicts that arise outside of professional routines and practices. According to Stoeckl et al. (2007), there are several requirements for online information to be categorized as UGC, namely information about products/services must be submitted by the user,

the person's motivation to write a review is not based on financial motivation, and the information provided must be publicly available.

#### *D. Perceived Credibility, Perceived Usefulness, and Information quality of UGC*

Perceived credibility is defined as the level of consumer confidence about the credibility of information for their purchases (Yuksel, 2016). Perceived credibility is a dimension of trust that influences message adoption either positively or negatively and can change consumer attitudes (Bouhleb et al., 2010). Credibility is an important factor in someone making a decision. Consumers believe that the feedback given by a user about a product or service is more reliable than the content provided by the seller (Jonas, 2010). Mir & Zaheer (2012), Yuksel (2016), Demba (2016), and Mathur et al. (2021) on their research shows that perceived credibility has an effect towards *attitude* in the context of UGC.

According to Davis (1989), perceived usefulness is defined as a consumer's belief that the use of a system will improve their performance. In the context of UGC, perceived usefulness is defined as consumers' perception that watching YouTube videos will improve their purchasing performance (Yuksel, 2016). In the context of information, perceived usefulness by definition is the perceived usefulness of information from a website as a belief that the information will increase efficiency in obtaining product information (Pavlou & Fygenson, 2006). Bouhleb et al. (2010) who conducted research related to blogs said that perceived usefulness is related to advantages in using blogs, and this advantage can prevent wasting time and access additional information and different perspectives about the product. Previous studies has shown that perceived usefulness in context of UGC positively affect attitude (Mir & Rehman, 2013; Yuksel, 2016; Mathur et al., 2021).

Information quality is defined as how much information available about the attributes of a product, brand or company is useful to customers, and what helps them evaluate the object (Gao et al., 2012). Muda & Khan (2020) defines information quality as a consumer's evaluation of a product or service from information available online such as accuracy, format, and completeness. Previous studies has shown that information quality positively affect attitude (Demba, 2016; Muda & Khan, 2020; Mathur et al., 2021).

#### *E. Fear of Missing Out*

Fear of Missing Out or FoMO is defined as a condition where a person experiences a fear of losing or missing an experience that can help the individual maintain or improve his personal or social self. FoMO results in a feeling where missing out on something will make a person feel left behind, personally and socially (Zhang et al., 2020). FoMO is often used commercially to stimulate demand for products targeted at young people and adults such as beer, clothing, feminine hygiene products, and real estate for young people (Hodkinson, 2016).

FoMO can lead to lower life satisfaction, increased detachment from friends or family, increased feelings of loneliness, increased unfair judgment of others, paranoia, jealousy, and decreased concentration (Hogan, 2015). FoMO can be associated with feeling absent from desired experiences, or having a desire to stay connected to what others are doing. This shows that people who feel FoMO feel the negative impact on their psyche. FoMO arises when a person chooses between an existing option and an uncertain potential option. The belief that an experience will be beneficial and relevant is one of the conditions for the emergence of FoMO (Good & Hyman, 2020).

Zhang et al. (2020) divide FoMO into two dimensions; personal FoMO and social FoMO. Personal FoMO relates to the private self, which by definition refers to a person's evaluation of one's own thoughts, feelings, behavior, or appearance (Fenigstein, Scheier, & Buss, 1975). Meanwhile, social FoMO relates to the public self, namely how someone believes how others perceive themselves (Fenigstein et al., 1975). FoMO is a feeling of fear of potential negative consequences when not taking advantage of the opportunities that exist (Zhang et al., 2020). Previous studies has shown that FoMO affect purchase intent (Saavedra & Bautista, 2020) and purchase likelihood (Good & Hyman, 2020).

#### *F. Research Hypothesis*

The main framework of this research is based on the Theory of Planned Behavior (TPB) model from Ajzen (1991). In this model, the construct of subjective norms, attitude, and perceived behavioral control are antecedents of intention. In the context of purchasing, several examples of previous studies using TPB includes internet purchasing (George, 2004; Sentosa & Mat, 2012), food purchases (Irianto, 2015), online shopping (Ming-Shen et al., 2007; Wu & Song, 2021). Therefore, based on the literature review, this research made the following hypothesis:

**H1** : Perceived credibility of UGC information has a positive effect on attitude towards purchase

**H2** : Perceived usefulness of UGC information has a positive effect on attitude towards purchase

**H3** : Information quality of UGC has a positive effect on attitude towards purchase

**H4** : Subjective norms have a positive effect on purchase intention

**H5** : Attitude towards purchase has a positive effect on purchase intention

**H6** : Perceived behavioral control has a positive effect on purchase intention

**H7** : Fear of Missing Out has a positive effect on subjective norms

**H8** : Fear of Missing Out has a positive effect on attitude towards purchase

**H9** : Fear of Missing Out has a positive effect on perceived behavioral control

**H10**: Fear of Missing Out has a positive effect on purchase intention

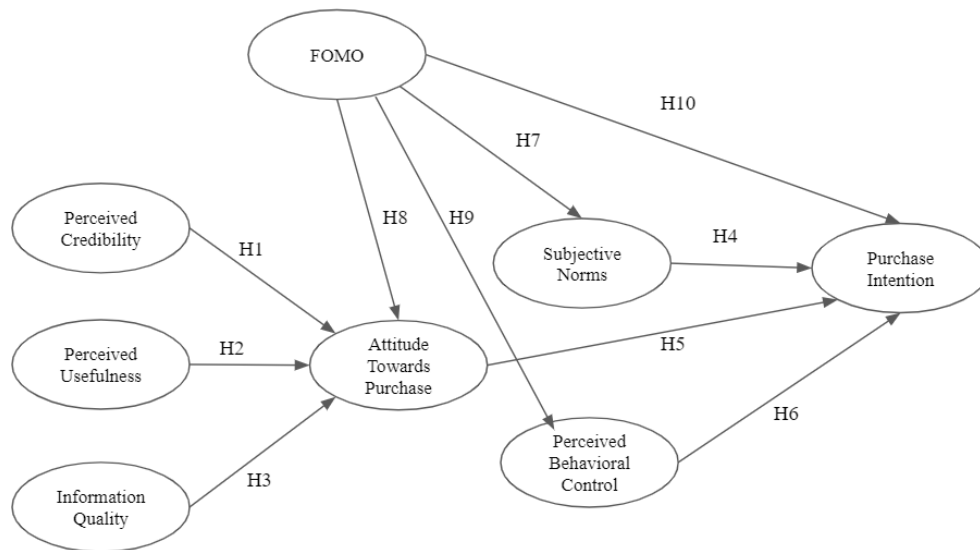

Fig. 1. Research Model

### III. RESEARCH METHODOLOGY

This research was conducted using quantitative methods by analyzing questionnaires distributed to gacha game players in Indonesia who consume UGC on social media or the internet. The measurement items that will be used for this research is a questionnaire whose research subjects will be changed according to the research objectives. Perceived credibility of UGC information will use instruments from Mathur et al (2021) & Freeman & Spyridakis (2004). Perceived usefulness of UGC information variable will use instruments from Bouhlej et al. (2010), Davis (1989), Mir & Rehman (2013), and Venkatesh & David (2000). Information quality of UGC uses instruments from Yang et al. (2005) from Kim & Johnson (2016). FoMO using instruments from Zhang et al. (2020). Attitude towards purchase using instruments from Saavedra & Bautista (2020). Subjective norms using instruments from George (2004) and Maichum et al. (2016). Perceived behavioral control using instruments from George (2004). Purchase intention using instruments from Hsu & Tsou (2011) and Saxena (2011).

This study will use a Likert scale from 1 to 6 in the questionnaire. Scale 1 indicates that the respondent strongly disagrees and a scale of 6 indicates that the respondent strongly agrees with the questions given. The even scale is used to avoid the error of central tendency (Cooper & Schindler, 2014). The question is divided into 3 parts, the first is to fill out the questions regarding their behavior in context of gaming and UGC. They will also be given a visual explanation regarding UGC related to gacha games. The function of the visual is to explain to the respondents some examples of UGC found on the internet. The second part is the main research questions and the third part is the respondents' demography. This research is designed to be conducted on the target population of mobile gacha game players in Indonesia.

The sample used in this study is a sample obtained from people who play gacha games. According to Jöreskog & Sörbom (1993), the number of respondents required is five to ten respondents for each indicator used in the measurement. This study has 37 indicators so that the number of respondents for this study is 185 to 370 respondents. The sample selection method for this research is done through non-probability sampling, by means of purposive sampling. Purposive sampling is one of the non-probability sampling methods where the subjects selected for research are in accordance with the criteria that the researcher wants to study (Cooper & Schindler, 2014). The type of survey used is a self-administered survey where respondents will fill out survey questionnaires independently which will be distributed online via google form. If there are respondents who have incomplete answers or do not fully answer the questions, then the data will not be used for further analysis. Financial incentives will be given to some lucky respondents in order to increase their interest in answering the survey.

The data obtained will be analyzed using the partial least-squared method - structural equation modeling (PLS-SEM) using SmartPLS software. The PLS-SEM method was chosen because it can be used in the analysis of complex models such as many constructs and indicators (Hair et al., 2017). With the presence of higher order construct, PLS-SEM can be used when there is a formative construct (Hair et al., 2017). The first step in PLS-SEM is to evaluate measurement model. To test the reliability of the research instrument, composite reliability and Cronbach's alpha will be used while for validity testing, average variance extracted (AVE) and discriminant validity will be used. After getting the measurement model result, the structural model are evaluated by measuring the significance and relevance of the relationship between variables, measuring the level of R<sup>2</sup>, and measuring the predictive relevance of Q<sup>2</sup> (Hair et al., 2017).

The FoMO variable (Zhang et al., 2020) is considered a higher order construct (HOC), where there are two dimensions, namely Personal FoMO and Social FoMO as the lower order construct (LOC). This construct is included in the reflective-formative category. According to Sarstedt et al. (2019), when there is a HOC, researchers can use a two-stage approach when analyzing the data. There are two types of two-stage approach, namely the embedded two-stage approach and the disjoint two-stage approach, but the differences in the results of these two types of analysis are very similar so that no one is superior (Sarstedt et al., 2019). In this study, a disjoint two-stage approach will be used. In the process, the first disjoint two-stage approach is to get the latent variable score from LOC; in this study, namely Personal FoMO and Social FoMO. After that, the latent variable is used to measure HOC; in this study, namely FoMO.

#### IV. RESULT / FINDING

##### A. Participants' Data

There are a total of 234 respondents who participated in this research. 172 participants (73.5%) are men compared to only 62 (26.5%) women. 118 participants (50.4%) fall into the age range of 26-33 years old, the majority reside in Jabodetabek with 164 participants (70.1%), for education level Bachelor's Degree is the most with 109 participants (46.6%) followed by High School with 98 participants (41.9%), and for monthly income the most are in IDR 1,000,001 – IDR 5,000,000 range with 86 participants (36.8%). The detailed participants' data can be seen in Table 2 below.

Table 2. Participants Demography

Characteristics (n=234)	Number	%
<b>Gender</b>		
Man	172	73.5%
Woman	62	26.5%
<b>Age</b>		
<18	58	24.8%
18-25	118	50.4%
26-35	54	23.1%
36>	4	1.7%
<b>Residence</b>		
Jabodetabek	164	70.1%
Outside Jabodetabek	70	29.9%
<b>Education</b>

S2	3	1.3%
<b>Monthly Income</b>		
<IDR 500.000	57	24.4%
IDR 500.000 – IDR 1.000.000	56	23.9%
IDR 1.000.001 – IDR 5.000.000	86	36.8%
IDR 5.000.001 – IDR 10.000.000	30	12.8%
>IDR 10.000.000	5	2.1%

From the behavior data, 87 participants (37.2%) play gacha games around 1-2 hours daily and only 13 participants (5.6%) play less than 30 minutes daily. The majority of the participants have done an in-game purchase with 217 participants (92.7%) and only 17 participants (7.3%) have never purchased in game products. 110 participants (47%) consume UGC about gacha games less than 2 times per week and only 21 participants (9%) see UGC about gacha games every day. The most played gacha games are Genshin Impact where 142 respondents claimed to play and the most commonly used platform for UGC is YouTube with 184 respondents claim to use it. The behavior data can be seen in Table 3 below.

Table 3. Participants' Behavior

Behaviour	Number	%
<b>Play duration per day</b>		
< 30 minutes	13	5.6%
30 minutes - 1 hour	74	31.6%
1 hour - 2 hours	87	37.2%
> 2 hours	60	25.6%

### B. Measurement Test

After getting the main test data, the first step is to see the measurement data. From the table of validity and reliability shown at Table 4, it can be seen that all of instruments have a Cronbach's alpha and composite reliability value above 0.7 which means that the instrument is reliable. For validity, in the average variance extracted value, all the instruments have values above 0.5 which means that the instrument is valid. All outer loading value shows above 0.7, except PU.1 with 0.677, however since the Cronbach's alpha, composite reliability, and AVE shows good numbers means that overall there is no problem with the indicators.

Table 4. Measurement Test Result

Construct	L	Cronbach's	Cron	CR	E	AV
Perceived Credibility (Mathur et al, 2021; Freeman & Spyridakis, 2004)						
I think that the product information given in UGC is credible	.837	(

I am capable of purchasing in-game products	.858	(			
Purchasing in-game products is entirely within my control	.830	( 2	0.79	4	0.87
I have the resource, knowledge, and capability to purchase in-game products	.819	(		8	0.69
Purchase Intention (Hsu & Tsou, 2011; Saxena, 2011)					
I would consider purchasing in-game products in the future	.879	(			
It is likely that I shall actually purchase in-game products in the near future.	.879	( 2	0.90	2	0.93
I intend to purchase in-game products.	.880	(		3	0.77

Construct	L	Cronbach's	CR	E	AV
I intend to consider in-game products in my future purchases.	.879				

For the discriminant validity of the research instrument, it can be seen using the fornell-larcker criterion. In this analysis, the correlation of numbers in other variables cannot be higher than the numbers in the same variable. From the results of data processing, it can be seen the discriminant validity in Table 5 below.

Table 5. Fornell-larcker criterion

	ATT	IQ	PBC	PC	PFOMO	PI	PU	SFOMO	SN
ATT	0.827								
IQ	0.166	0.887							
PBC	0.054	0.548	0.935						
PC	0.283	0.148	0.176	0.855					
PFOMO	0.189	0.001	0.114	0.234	0.836

SFOMO	0.351	-0.030	0.086	0.593	0.220	0.564	0.262	0.794	
SN	0.077	0.118	0.154	0.04	0.199	0.101	0.269	0.033	0.832

From the fornell-larcker criterion table above, it can be seen and concluded that all variables are valid, where all variables have the highest correlation value when tested with their own variables. This shows that these variables are not related to each other or are not found to be correlated with each other.

After getting the validity and reliability of the research instrument, the validity of the higher order construct (HOC) in this study will be analyzed, namely the FoMO variable. In Zhang et al's (2020) research, FoMO is divided into two lower order construct (LOC) dimensions, namely Personal FoMO and Social FoMO. To see the HOC validity number, some things to pay attention to are outer weights, outer loadings, and VIF. From the results of the analysis, it was found that the outer loadings were greater than 0.5 and the VIF results showed a number below 5. Thus, the validity of the higher order construct FoMO is established.

Table 6. Higher Order Construct Validity

HOC	LOC	Outer Weights	Outer Loadings	VIF
FoMO	PFoMO	0.485	0.843	1.441
	SFoMO	0.646	0.915	1.441

### C. Structural Test

After the measurement test is done, the structural model is assessed. The result of the hypothesis testing can be seen in Table 7 below.

Table 7. Hypothesis Test

Hypothesis	Path Coeff	P Values	Result
H1 Perceived Credibility -> Attitude	0.438	0.000	Accepted
H2 Perceived Usefulness -> Attitude	0.154	0.023	Accepted

H3	Information quality -> Attitude	0.088	0.119	Rejected
H4	Subjective Norms -> Purchase Intention	0.175	0.001	Accepted
H5	Attitude -> Purchase Intention	0.373	0.000	Accepted
H6	Perceived Behavioral Control -> Purchase Intention	0.118	0.013	Accepted
H7	FOMO -> Subjective Norms	0.156	0.022	Accepted
H8	FOMO -> Attitude	0.046	0.272	Rejected
H9	FOMO -> Perceived Behavioral Control	0.073	0.204	Rejected
H10	FOMO -> Purchase Intention	0.271	0.000	Accepted

From the result of hypothesis testing, it is shown that 7 hypothesis were accepted and 3 hypothesis were rejected. There were significant effects for perceived credibility and perceived usefulness of UGC information on attitude as predicted, however there is no significant effect for information quality on attitude. Subjective norms, perceived behavioral control, and attitude were shown to have a significant effect towards purchase intention. FoMO is shown to have a significant effect towards subjective norms and purchase intention, but it has no significant effect towards attitude and perceived behavioral control. The illustration can be seen in Figure 2 below.

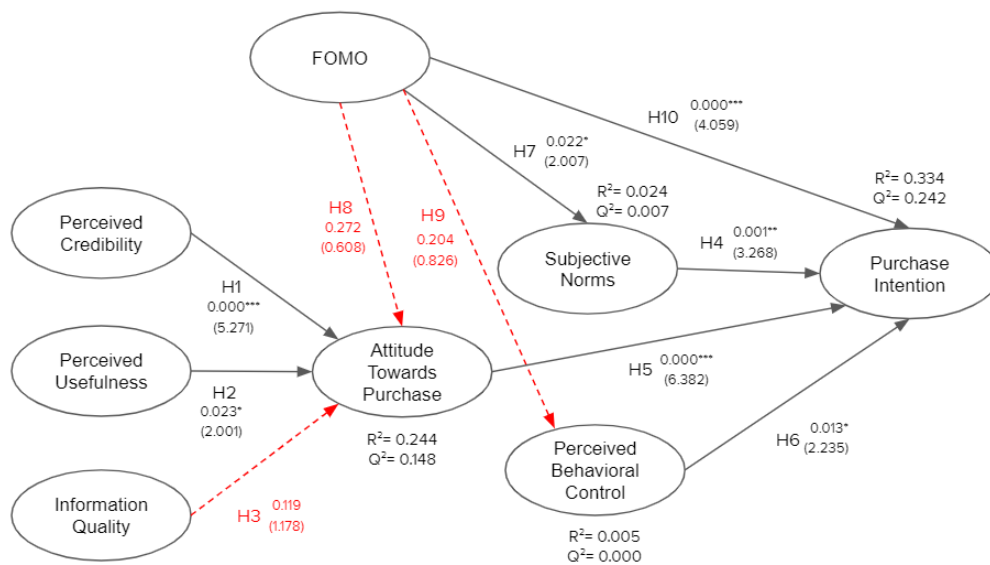

Fig. 2. Summary of the Structural Test Result

R<sup>2</sup> data is used to see the coefficient determinant of the model. In consumer behavior studies, the R<sup>2</sup> value of 0.2 is considered high (Hair et al., 2017). Result shows that attitude and purchase intention has a high predictive relevance with R<sup>2</sup> value of 0.244 and 0.334 respectively. However, perceived behavioral control and subjective norms has a value of lower than 0.2. This is reasonable because FoMO is the only exogenous variable and it is not enough to describe the variants of the two endogenous variable. Blindfolding procedure is done to see the predictive relevance of the model. A Q<sup>2</sup> value above 0 indicates that the model has predictive relevance (Hair et al., 2017). The result of the test shows that attitude, subjective Norms, and purchase intention has a Q<sup>2</sup> of above 0, which indicates there is a predictive relevance. However, perceived behavioral control has a Q<sup>2</sup> value of 0, which means that the variable has no predicative relevance. The result of both R<sup>2</sup> and Q<sup>2</sup> can be seen on Table 7 below.

Table 7. R<sup>2</sup> and Q<sup>2</sup> Result

	R <sup>2</sup>	Q <sup>2</sup>
Attitude	0.244	0.148
Perceived Behavioral Control	0.005	0.000
Subjective Norms	0.024	0.007

## V. DISCUSSION

This study aims to see the effect of perceived credibility, perceived usefulness, and information quality of information contained in user generated content as well as the effect of fear of missing out towards purchase intention. The first result shows that perceived credibility of information in UGC positively affect attitude towards purchase. This is in line with previous studies by Mathur et al. (2021), Demba (2016), and Yuksel (2016) where in their studies shown that perceived credibility has a significant effect on attitude. This conclude that perceived credibility of information in UGC in context of gacha game players can affect their attitude towards purchasing.

Perceived usefulness is shown to positively affect attitude. This is in line with previous studies by Mathur et al. (2021) and Yuksel (2016) where perceived usefulness positively affect attitude. This conclude that perceived usefulness of information in UGC can affect gacha game players' attitude towards purchasing. Based on the data, information quality is shown to have no significant effect towards attitude. This is in contrast from previous studies where information quality is shown to have significant effect towards attitude (Mathur et al., 2021; Muda & Khan, 2020). This result shows that relevant, up-to date, and valuable information contained in UGC does not affect the attitude of gacha game players towards purchasing. Fanoberova & Kuczkowska (2016) found that in the context of electronic word of mouth, information quality does not affect attitude. This is due to consumers form their attitude based on the assessment of credibility rather than the information quality. When a consumer think that the source is credible, it is assumed that the credible source provides information of sufficient quality (Fanoberova & Kuczkowska, 2016).

The theory of planned behavior constructs is shown to positively affect purchase intention for mobile gacha game players. Attitude, subjective norms, and perceived behavioral control is found to positively affect purchase intention. For attitude, the result is in line with Mathur et al. (2020) where attitude affects online purchase intention. The effect of information contained in user generated content by other users makes consumers think positively about the purchase. Inspired by the responses obtained from user generated content, consumers are ready to try new products (Mathur et al., 2020). In a study by Bautista & Saavedra (2020), it was also found that attitude has an influence on purchase intention in masstige brand apparel. For subjective norms, it is also in line with previous studies. Gunawan & Huarng (2015) in their study found that subjective norms can affect purchase intention on social media. Jain (2020), conducted a study on luxury goods in India and showed that subjective norms have a significant impact on luxury purchase intention. When the people around gacha gamers are making in-game purchases, it will form a perception of making that purchase is a normal behavior. Perceived behavioral control has a significant effect towards purchase intention. This is due to the easiness of buying items in the game, which led to higher intention to buy for the players. The result is consistent with previous studies regarding the significant effect of perceived behavioral control on purchase intention (Saavedra & Bautista, 2020; Tan et al., 2017; Cho & Sagynov, 2015).

In context of assessing the effect of fear of missing out towards the construct of theory of planned behavior and purchase intention, results shows that FoMO positively affect subjective norms and purchase intention, but it doesn't have any significant effect towards attitude and perceived behavioral control. This is in line with previous study by Saavedra & Bautista (2020) where FoMO significantly affect subjective norms and intention, and does not have any significant effect towards perceived behavioral control. It is also in line with Good & Hyman (2020), where FoMO affect purchase likelihood.

Based on data, FoMO does not have a significant effect towards attitude which is in contrast with the previous result where FoMO does significantly affect attitude (Saavedra & Bautista, 2020; Bright & Logan, 2018; Neumann et al., 2021). An explanation for the reason of why FoMO does not significantly affect attitude is that in this research, the attitude studied is towards purchasing in-game product. In the context of gaming, the experience that players want is the experience of using in-game products such as characters, weapons, or cosmetics; not a purchasing experience. The purchasing process is just a way that players can use to get the experience they want in the game. As for the reason of why FoMO does not significantly affect perceived behavioral control is that purchasing in-game product is an easy task. Based on the participants' data also shown that 93% has purchased an in-game product. In theory, perceived behavioral control is an individual's perception of the ease or difficulty of performing a behavior (Ajzen, 1991). The in-game purchasing process can be very quickly done via a debit card, credit card, or even bank transfer. Coupled with the abundant of in-game currency purchasing services from third parties on the internet such as Codashop, Unipin, Digicodes, or other people who

provide these services on social media; it will be very easy for players to buy in-game products. Hence this is why FoMO does not have any effect towards perceived behavioral control.

## VI. CONCLUSION AND RECOMMENDATION

Based on this research, it is shown that perceived credibility and perceived usefulness of information in user generated content may lead positively to the attitude of gacha game players towards purchasing, however, the information quality within the UGC does not. This research also shows that the construct of theory of planned behavior positively affect purchase intention in gacha games. FoMO felt by the players will affect purchase intention subjective norms, however it does not affect attitude or perceived behavioral control.

From this result, mobile game or game companies in general are expected to support or encourage their community of players to participate in the creation of UGC. Consumers tend to trust user-generated content more than producer-generated content (Cheong & Morrisson, 2008; MacKinnon 2012). This is because the evaluation in UGC tends to be based on the experiences of other users about the positive and negative aspects of a product (Park et al., 2007). Therefore, it is very important for game companies to support their players who makes UGC about games and also encourage other users to make UGC about their games. Some of the things that can be done are to offer in-game gifts or rewards to people who participate in creating UGC, these rewards may encourage players to create their own UGC regarding the game. The company can also promote UGC created by their players in the brand's social media to ensure that the UGC creators feels involved and get the sense of contribution to the game.

The influence of FoMO on purchase intention shows that marketers in mobile games companies can use or apply marketing strategies that can lead to FoMO for their players. According to Good & Hyman (2020), the belief that an experience will be beneficial and relevant is one of the necessary conditions for FoMO to occur. This suggests that in order for a player to experience FoMO, the in-game product being sold must be attractive or beneficial to the player so that they want to get it. The definition of beneficial in this context can vary, from the nature of the usefulness of the item to the player's gameplay, or from the player's interest based on other personal factors towards the item in the game. In nature, the gacha system that exist in the game is already FoMO inducing, however it may be boosted with a good marketing campaign.

This study has several limitation, the first is that it is only done with Indonesian population. Different demographics may give different result. This study is also only done in one specific point in time, a longitudinal approach may show a more realistic view about the players intentions and behavior. This study combines all genres of mobile games that have a gacha system. The existence of a monetization system and gameplay system that varies in each game can affect the attitude of players in purchasing goods in the game. Future research should focus on a specific gacha games, because each games has a different system (monetization pricing, gacha rates) and style of play, which may attracts different demography of players. The comparison between users who use UGC and those who does not in regards to making purchase decision will also be an interesting topic of research.

## Causality Analysis between Economic Growth and Labor Absorption in Bali Province 2002-2021

Siswo Baskoro<sup>1</sup> and Didit Purnomo<sup>2</sup>

<sup>1,2</sup>Universitas Muhammadiyah Surakarta, Indonesia

### Abstract

*The purpose of this study was to determine the relationship between economic growth and employment. This study uses secondary data to be tested. The analytical method used in this research is Granger causality analysis with an estimator model. The results of causality analysis between economic growth and employment in the province of Bali for the period 2002-2021, using the lag 1 constraint, show that the effect of economic growth on employment is not significant, then  $\beta_j = 0$ , and vice versa employment does not affect growth. economic or not significant, then  $\beta_j = 0$ . So it can be concluded that economic growth does not affect labor and labor also does not affect economic growth so that the relationship between the two does not affect each other.*

*Keywords—Economic Growth (GDP); Employment; Granger Causality Test*

### I. INTRODUCTION

Economic growth is one of the important indicators used to measure the success of a country's development. Therefore, each country will strive to achieve optimal economic growth. According to BPS, economic growth is defined as the development of the production of services and goods in the economic area in a year at the value of the previous year by calculating referring to Gross Domestic Growth on Gross Regional Domestic Growth on the basis of Constant Prices. The purpose of economic development is to improve the welfare of the general public. In these several periods, Indonesia experienced a multidimensional phenomenon, namely a condition where limited employment opportunities led to uncontrolled unemployment problems (Seran, 2017). According to (Ishak, 2018) the increasing number of residents causes the number of the workforce, namely job seekers and workers. This can happen because both the government and the private sector have limitations in providing job opportunities. Economic growth will usually accompanied by a decrease in the unemployment rate. If economic growth is higher in an area, the unemployment rate will be lower and the higher the employment rate. (The pulpit and Yusuf, 2016). Bali is one of the regions that has an economic dependence on the tourism sector, so that during the period of restriction (PSBB) it has caused economic vulnerability in the province of Bali (Pujaningsih and Sucitawathi, 2020).

From the table presented above, can be conclude the development of economic growth in Bali Province during the last twenty years, namely 2002-2021, experienced fluctuations. In 2002 economic growth was 3.04% then in 2009 economic growth rose 9.87%. however, in 2020 and 2021 the economic growth of the Bali Province declined very rapidly, namely 9.33% and 2.47%, respectively. This is influenced by the policy of restricting mobility in line with the increasing number of Covid-19 cases in Bali Province, coupled with the emergence of a new variant of Omicron which hampers economic activity. Through the data above, it can be seen that the average economic growth of Bali Province during the years 2001-2021 was 4.64%.

Furthermore, the development of the workforce in Bali Province during the last twenty years is the same as economic growth which also experienced fluctuations. In 2002 the province of Bali absorbed a workforce of 1,777,909 people. But then in 2015 the absorption of labor experienced a very rapid decline, namely 1,055,844 people. The following year, the labor absorption rate still fluctuated until 2021, the absorption of labor reached 2,580,523. absorption of the workforce reduces unemployment.

Table 1. Data on Economic Growth and Labor Absorption in Bali Province 2002-2021

Year	Economic Growth (unit %)	Employment (in million people)
2002	3,04	1777909
2003	3,57	1910054
2004	4,62	1924805
2005	5,57	2002171
2006	5,28	1990476
2007	5,29	2059711
2008	9,57	2099278
2009	5,33	2123588
2010	5,83	2246149
2011	6,66	2224874
2012	6,69	2300705
2013	6,69	2283896
2014	6,73	2316758
2015	6,03	1055844
2016	6,33	2463039
2017	5,56	2434450
2018	6,31	2561518
2019	5,60	2508294
2020	-9,33	2567919
2021	-2,47	2580523
Average	4,60	2192318

---

Absorption of labor has a very important role in the field of national and regional development. According to Altigen in (Santi, 2018). That the large population will have an impact on increasing the workforce. This means that there are also two possibilities in this situation, namely an increase in workers or an increase in unemployment. In order for the situation to be stable, the workforce must work according to their fields and competencies. This statement has an indirect consequence, namely the demand for the economy to be able to provide jobs for the new workforce.

Through the description above, the formulation of the research problem is how is the relationship between employment and economic growth of Bali Province in 2002-2021. The research objective was to set the direction of the relationship between employment and economic growth in Bali Province, 2002-2021.

## II. LITERATURE REVIEW

### A. *Economic Growth*

Economic growth is an activity that causes goods and services produced by the community to increase and increase community welfare. Economic growth can be seen by comparing past economic growth with the achievement of economic growth in other regions. An area can be said to experience rapid economic growth if from year to year it increases periodically, while the slowdown in the economic growth of a region if the economic growth from year to year fluctuates. Economic growth can be known by comparing GDP in a certain year with the previous year, with the following equation:

$$\text{Economic Growth} = \frac{\text{GDP}_t - \text{GDP}_{t-1}}{\text{GDP}_t} \times 100$$

The theory of economic growth is a theory that explains what factors affect the increase in output per capita in the long term as well as an explanation of how the factors of economic growth interact with each other so that economic growth occurs.

One of the supporting factors in human development that can be carried out continuously is economic growth. Each region is opened up by the government with the aim of generating economic income from each source of each region. The correlation between employment and economic growth is described by the Cob Douglas production function (Ghina et al., 2020). Increasing economic growth is marked by a declining unemployment rate, it means that the level of employment is also getting higher.

### B. *Employment*

Based on Law Number 13 of 2003 Article 1 concerning Manpower, it is stated that the workforce is anyone who can complete his work properly and is carried out inside and also outside of the working relationship which aims to obtain services and goods so that the needs of the community are met. It is stated in Law Number 25 of 2007 concerning Manpower that in Indonesia the age limit is fixed for a person to work if he is 15 years old. The workforce is a combination of residents of the labor force and residents of the non-labor force, this means that labor is a combination of residents who are already working and residents who are still looking for work (Ima, 2018). Labor is part of the total population that can potentially produce goods and or services (Nindya and Iwayan, 2014). The workforce is divided into three groups, namely productive workers, less productive workers, and unemployed workers.

### C. *Demand for Labor*

Demand for labor means demand by employers by employing workers with the aim of helping in a business to produce products in the form of goods and services which will then be sold and increase profits. The demand for labor is called derived demand, i.e. the increase in demand for labor will be adjusted to consumer demand in the demand for goods and services to be produced (Sri et al., 2021). According to Sholeh (2007) labor demand is a demand in the economic field which is defined as the maximum amount of goods and or services that have been in demand by consumers which will then be purchased at a certain price and period of time. The demand for labor and the demand for goods and or services are interrelated with each other, changes in the demand for labor are highly dependent on the demand for the number of goods and or services to be purchased by consumers. If the demand for goods and or services increases to be produced, the demand for labor will also increase for more production activities.

### D. *Labor Supply*

The labor supply stage is a situation where a person has to make a decision to take the offer to work or not. Labor supply means an offer that makes someone consider the opportunity cost between the time that will be used to work and the wages that will be received will be comparable or not (Ima, 2018). According to Sumarsono (2003) the the supply of labor is the correlation of the wage level with the number of units of workers that have been approved by the company which will then be offered in the labor market.

### E. *Absorption of Labor*

Absorption of labor can be interpreted as a collection of the number of workers that can be needed by a company (Feriyanto, 2014). The workers who will be absorbed are workers who have the ability and expertise who will later be employed by the company to produce products in the form of service and/or goods in large quantities. The absorption of labor in the economic field will affect productivity and national income (Ridwan, 2018). Published in the Central Bureau of Statistics (BPS). Labor absorption is the number of people working in all sectors of the economy, which is a condition of labor provided employment opportunities. Each sector has a different growth rate, this growth rate will affect the ability of each sector to absorb labor. This growth rate also

causes differences in labor productivity in each sector as well as changes in the absorption of the number of workers.

#### F. Conceptual Framework

Fig 1. Conceptual Framework

#### Hypothesis

H1 : Economic growth does not have a significant effect on employment of Bali Province in 2002-2021.

H2 : Employment does not have a significant effect on Economic Growth of Bali Province in 2002-2021.

#### G. Correlation of Economic Growth and Labor Absorption

In essence, economic growth is a mutually sustainable process between economic sectors, so that with the creation of economic growth, jobs will also be created and income distribution will eventually improve the standard of living of people. In every process of economic development that includes economic activity, one of which is to seek to optimize the use of economic factors, one of which is labor.

Economic growth is economic productivity in producing products in the form of goods and services for profit. Absorption of labor is the absorption of a number of workers needed by a company in producing goods and services in large quantities. According to research conducted by (Nurvira and Ichsan, 2021) employment does not have a significant effect on economic growth, and vice versa, also economic growth does not have a significant effect on employment in Indonesia. This is further strengthened by proprietary research (Iskandar, 2018) which states that there is no significant effect between economic growth, especially GRDP and employment in North Sumatra Province in 1986-2015.

#### H. Previous Research

Research conducted by Sri Maryati, Hefrizal Handra, and Irwan Muslim (2021), this method of this study uses multiple linear regression analysis. The results indicate that economic growth, especially GRDP and the Human Development Index (IPM) have an effect on employment in West Sumatra.

Furthermore, research conducted by Muhammad Sokian, Amri Amir, and Zamzami (2020), This research method uses path analysis. The results note that economic growth has no significant effect on employment. Economic growth also has a negative and significant effect on poverty.

Furthermore, the research conducted by Muhammad Hidayat and Nurlela (2018), This study uses the simultaneous equation regression method. The results indicate that simultaneously equation I, namely employment, shows that wages have a positive and significant effect on employment, education has a negative and significant effect on employment, economic growth has a negative and insignificant effect on employment. While the simultaneous equation II, namely economic growth, shows that wages have a negative and also insignificant correlation to economic growth, unemployment and investment have a positive and insignificant correlation to economic growth, labor has a positive and significant correlation to economic growth.

### III. RESEARCH METHODOLOGY

The object in this research is the Economic Growth and Labor Absorption, while the research location chosen is the Province of Bali. The type of data used in this study is secondary data taken through the Central Statistics Agency (BPS) in 2002-2021. The variables used in this study are Economic Growth and Employment Absorption which are sourced from the Central Statistics Agency. The analysis used in this research is the Granger Causality Test with an estimator model with the following equation:

$$\Delta GDP_t = \sum_{i=1}^m a_i \Delta GDP_{t-i} + \sum_{j=1}^m B_j \Delta EMP_{t-j} + \varepsilon_{1t}$$

$$\Delta EMP_t = \sum_{i=1}^m \lambda_i EMP_{t-i} + \sum_{j=1}^m \delta_j GDP_{t-j} + \varepsilon_{2t}$$

Which:

GDP = Economic Growth

EMP = Employment

m = Number of Lag

$\varepsilon_t$  = Error term

The Causality Test step includes the following stages:

- a. Performing a stationary test, if both variables are stationary, the Granger causality test is immediately carried out, if one is not stationary then it must be stationary, then the Granger causality test is then carried out. If the two variables are not stationary, a cointegration test must be performed.
- b. If the two variables are cointegrated, a Granger causality test can be performed, otherwise both variables must be transformed. With the transformed variable, return to step a.

#### A. Population and Sample

##### Population

The population of this study is all data on economic growth and labor in the province of Bali in 2002-2021.

##### Sample

The sample of this research is the annual data of economic and labor growth in Bali Province in 2002-2021 so that the total is 20 years.

#### B. Operational Variable Definition

##### Economic Growth

The data used in the economic growth on the growth rate of GDP at constant prices in the Province of Bali from 2002-2021 taken from the Central Statistics Agency (BPS) in the form of percent.

##### Employment

The labor data used in this study uses data on the number of people working in the Province of Bali with criteria aged 15 years and over according to their main employment status.

### IV. RESULT / FINDING

#### A. Level Stationarity Test

The stationarity test was carried out to find out that the regression data did not cause spurious data (spurious regression). False data is a regression that shows the influence between variables looks statistically significant but in reality it is not significant. The method used to perform the stationarity test in this reserach is the Augmented Dickey Fuller (ADF) test. In the ADF test, if the t-ADF value is less than the McKinnon Critical Value, it can be said that the data is stationary. Stationarity testing was carried out at the level and first difference levels.

Table 2. Level Stationarity Test Results

Variable	Prob.	Description
----------	-------	-------------

GDP	0.8304	Not Stationary
Employment	0.025	Stationary

From the results of the analysis summarized in the table above, it can be seen that only the labor variable is based on the Augmented Dickey-Fuller test with a probability below 0.05 so that it can be declared stationary at the level level.

Table 3. First Difference Level Stationarity Test

Variable	Prob.	Description
GDP	0.009	Stationary
Employment	0.000	Stationary

From the results of the analysis summarized in the table above, it can be seen that all variables are based on the Augmented Dickey-Fuller test with a probability below 0.05 so that it can be declared stationary at the first difference level.

### B. Optimum Lag Test

The test for the next stage is to determine the Optimum Lag. Determination of the optimal lag length utilizes some information using the optimum Akaike Information Criteria (AIC), Schwarz Information Criteria (SIC) and Human Quin Cirteris (HQ). The following is an image of the Optimum Lag determination table:

Table 4. Optimum Lag Test Results

Lag	LR	FPE	AIC	SC	HQ
0	NA	3,74E+26	66,86148	66,96086	66,87830
1	40,02612	4,69E+25	64,78090	65,07914	64,83137

The table above shows the determination of lag using various criteria. From the results in the table above, that the smallest Akaike Information Criteria AIC value is 64,780 at lag 1. Thus the optimum lag produced is 1 lag.

### C. Cointegration Test

Cointegration testing is carried out to determine the long-term effect between variables, namely economic growth and employment where both variables have met the requirements of the integration process.

The cointegration test in the table above uses the Johansen test method, where the trace statistic value 0 (none) is  $21.17 >$  critical value at 5%, which is 15.49. Thus, it can be stated that there are 2 cointegrations used in this study.

Table 5. Cointegration Test Result

Trace Statistic	Critical Value	Probability
21,17221	15,494791	0,0062
6,798481	3,841466	0,0091

#### D. Granger Causality Test

The causality test in this study was carried out by comparing the probability value with the real rate of 5%. If the probability value is less than 5%, it can be said that there is a causal relationship between variables. If the probability value is greater than the real level, then on the contrary, there is no causal relationship between variables. The results and causality testing can be seen in the image below:

Table 6. Granger Causality Test Result

Variable	Probability	Causality
GDP - Employment	0,9957	No correlation
Employment - GDP	0,8615	No correlation

The results of the Granger causality test show that the probability value of the variable economic growth and employment is greater than 0.05 so that economic growth does not affect the workforce. Labor also does not affect economic growth. The conclusion obtained from the Granger causality test is that the correlation between the two does not affect each other.

## V. DISCUSSION

### A. Bali Province Economic Growth

Bali is one of the Indonesia provinces with a land area of about 5,780.06 km<sup>2</sup>. Administratively, Bali Province is divided into eight districts and one municipality which includes; Buleleng, Tabanan, Jembrana, Karangasem, Bandung Regency, Bangli, Gianyar, Klungkung and Denpasar. The province of Bali consists of 80 sub-districts and 636 villages or sub-districts. The population of Bali Province based on the 2020 population census is 4,317,404 people.

Fig 2. Graph of Bali Province Economic Growth Rate in 2002-2021 (in percent)

The total economy of the Province of Bali as measured by Gross Regional Domestic Income on the basis of Constant Prices in 2010 was recorded at Rp. 143.87 Trillion, with this figure the economic growth in 2021 was recorded to have increased by 4.52 percent. However, if the accumulation of economic growth in Bali from quarter 1-2021 to quarter IV-2021, the Balinese economy recorded negative growth or contracted as deep as 2.47 percent. This is because the economic structure of Bali in 2021 is dominated by the category of providing accommodation and providing food and drink which contributes 16.66 percent.

**B. Bali Province Employment Absorption**

The workforce is people who are of working age. The workforce is grouped into two, namely the labor force and the non-labor force. The workforce is someone who has a job or is currently working, while the non-labor force are workers who are not working or are not looking for work, namely people who are in the school category (students), housekeepers, retired people, and dependent disabled people.

Fig 3. Graph of Labor Absorption of Bali Province in 2002-2021 (in million people)

Based on the picture above, it is known that from 2002-2021 the absorption of workers in the Province of Bali has increased every year. The increase in the workforce is accompanied by an increase in the population in the province of Bali. From the Central Statistics Agency, the population of Bali province in 2000 was 3,146,999 people, in 2020 reaching 4,317,404 people that the population growth of Bali Province is very fast.

Bali Province succeeded in reducing the unemployment rate in August 2021, which was 138.67 people compared to 139.14 thousand people in 2020, the activities of several businesses have been reopened, especially in the tourism sector which is the largest employment field in Bali Province. Labor absorption in the manufacturing sector increased to 88.95 people, labor absorption in agriculture increased to 25.23 people, and labor absorption in the trade sector also experienced an increase of 13.84 thousand people in productivity. Business fields in the agricultural sector have dominated the absorption of labor in the Province of Bali because the agricultural sector is an informal employment based on the field and level of education that is not too problematic. The agricultural sector absorbs the most labor from the total population of the workforce, which is 21.90%, followed by the trade and manufacturing sectors at 20.86% and 26.14%, then the akmamin sector with a share of 6.29% supported by tourism activities in Bali Province.

Granger causality test results show that the relationship between economic growth variables and employment shows a probability value of 0.9957 which means that this value is greater than the 0.05 level of significance, so it can be said that there is no correlations between economic growth (GRDP) also employment. work. Furthermore, the probability value of employment to economic growth is 0.8615, this value is greater than the 0.05 level of significance, so it can be said that there is no causal relationship between labor absorption and economic growth. Thus, it concluded that the two variables, namely economic growth and employment, do not have a causal relationship or the relationship between the two does not affect each other.

The results showed that there was no causal relationship between employment and economic growth. This is because labor is one of the supports in improving economic growth, where labor is influenced by productivity factors. Economic growth has no effect on the workforce in Bali Province due to the Covid-19 condition with periodic activity restrictions (PPKM) which causes human productivity activities to not run smoothly so that economic growth is hampered.

The results of this research support previous study from Nurvira and Ichsan (2021) which in their research states that employment does not have a significant effect on economic growth in Indonesia, and vice versa, and also economic growth does not have a significant effect on labor in Indonesia. This is because the workforce is influenced by several factors, namely age, education and a person's productivity so that if the workforce does not run productively, economic growth will not experience growth.

## VI. CONCLUSION AND RECOMMENDATION

### A. *Conclusion*

Based on research that has been done regarding the analysis of the causal relationship between economic growth and labor absorption in the Province of Bali in 2002-2021, which is from the Granger causality test, there is no two-way correlations between Economic Growth (GRDP) and Labor Absorption with a higher probability value of Labor ie  $(0.9957 > 0.05)$ , while the probability value of Economic Growth (GRDP) is greater  $(0.8615 > 0.05)$ .

This research was conducted in the period 2002-2021 in which in early 2019 there was a Covid-19 pandemic which caused many economic activities to be hampered. Economic growth fluctuated over a period of 2 years accompanied by fluctuations in the workforce.

### B. *Recommendation*

From the result and the conclusions, there are several suggestions, namely:

- a. The absorption of labor in the Province of Bali can be increased by increasing the number of business units and labor intensive in their respective fields so that the workforce will find employment, thereby increasing economic growth.
- b. For the Bali Provincial Government, it is necessary to provide capital and financing to increase the number of productivity activities in the Bali Province so that both business units and labor intensive units are able to increase employment.

## Implementation of Digital Marketing Strategies in Vertex Studio

Jordi Anggada Putra<sup>1</sup>

<sup>1</sup>Program Studi Manajemen, Fakultas Ekonomi dan Bisnis Universitas Indonesia, Jakarta, Indonesia

### Abstract

*Many companies have used digital marketing to gain competitive advantage in their respective industries. But not every company has used digital marketing strategies effectively. This problem has been observed to mainly occur in small and medium enterprises (SMEs), especially in the construction industry. The purpose of this study is to analyze, plan, and implement effective digital marketing strategies on an Indonesian architecture firm called Vertex Studio. The method used for this study is business coaching. The primary data used in this research was gathered qualitatively from the business owner, the company's staff members, and the customers through interviews. The end goal of this study is to create brand awareness on Vertex Studio's architecture design services and to potentially increase revenues coming from said services. The solutions proposed fulfilled the objective and the business landed on new design projects after a period of one month after implementation. This research shows how using digital marketing strategies effectively can be beneficial for construction and design businesses.*

*Keywords—digital marketing; architecture; construction; Indonesia*

---

### 11. 1. INTRODUCTION

As defined by Dave Chaffey, digital marketing is “achieving marketing objectives through applying media, data, and technology” (Chaffey & Ellis-Chadwick, 2019). Many big companies have used digital marketing as a tool to gain competitive advantage in their respective industries. But not only big companies, small and medium enterprises (SMEs) can also benefit from digital marketing. Regardless of their size, digital marketing has been proven to be an effective method to market a company's product or services (Jain, 2015).

SMEs from many industries have adopted and implemented digital marketing strategies. Even traditional industries like construction have used digital marketing to market their services. Small construction companies used digital means like social media and email blasting services to create brand awareness and get more projects for their businesses. But many construction SMEs are not using digital marketing effectively. This is usually due to the lack of environmental analysis and also insufficient funding and expertise to maintain and update their marketing objectives and strategies (Malesev & Cherry, 2021) (Danzen, 2022).

The aim of this study is to plan and implement an effective digital marketing strategy for a construction related SME called Vertex Studio. The method of the study will be in the form of business coaching. Current conditions of the company will be analyzed to formulate a solution that will be effective and also sustainable for the company to maintain. The proposed end result of this study is to create brand awareness on Vertex Studio's design services and increase the number of their design projects.

### 2. LITERATURE REVIEW

#### A. Stages of Service Consumption: The Prepurchase Stage

The prepurchase stage starts with the customer being aware of a need. This is called the need awareness point and it is triggered by need arousal. After the need has been identified, the customer will search for information regarding

the solutions for that need. Several service providers come into mind here which will be narrowed down into a consideration set of a few firms. After the consideration set has been made, the customer will evaluate the alternatives. This is the point where the customer will take into consideration the risks involved with choosing each alternative. Finally, the customer will make the decision to purchase from a specific service provider based on their previous evaluation. The customer will also have formed expectations on the quality of service that they will receive from the chosen provider (Wirtz J., 2022).

#### *B. Brand Awareness and Brand Association*

Good brand awareness and positive brand association plays an important role in the decision-making process in the prepurchase stage. Brand awareness is the foundation of all brand relationships. By definition, brand awareness is how aware are the customers about the firm's brand. Without brand awareness, the service providing firm will not be in one of the evoked set of brands in the customer's mind. This means that the brand will not be included into the consideration set and will not have the opportunity to get chosen by the customer. Brand association is when the customer has developed emotional, psychological, or performance associations with the brand. In other words, brand association is the brand's reputation to the customer. Having positive brand association to the customer will smoothen their decision-making process by reducing the perceived risk of choosing said brand. By choosing the brand that the customer has good association to, they will be more confident in getting the quality service that meets their expectations (Marshall, 2015).

#### *C. Communication Process Model: Message and Channel*

Communication is important in digital marketing to ensure that the customers receive the marketing information effectively. The message contains information that the sender is trying to convey. The content of the message must be structured and designed to fit the channel and the customers they are targeting. Choosing the right channels is also important to make sure that the receivers receive the sender's message. Channel is the path where information travels from the source to the receiver, and it can be personal and nonpersonal. Together with message, these two elements in the communication process can have a positive impact on the sender's brand awareness and association (Belch, 2018).

#### *D. Digital Marketing Implementation: Social Media Marketing*

Using social media as a marketing tool is an effective way to increase brand awareness (Bilgin, 2018). To effectively implement our digital marketing strategy using social media, it is important to be interactive to the customers. The brand must engage with the customers in social media and participate in conversations. The conversations can be related to many things including the brand's services, promotions, or providing the customers with support (Chaffey & Ellis-Chadwick, 2019). Bilgin's research shows that the most significant marketing activity that is valued by the customers in social media is content with customization and entertainment. Trendiness and interaction come with lesser significance to the customers. This means that in order to achieve better communication, the content that the company share to the customers must be interesting and entertaining, rather than being just trendy and promotion heavy (Bilgin, 2018).

### III. RESEARCH METHODOLOGY

This study used business coaching as its research method with primary qualitative data gathered from the business owner. The data were then analyzed using analysis tools including business model canvas, internal and external analysis, and SWOT and TOWS analysis. The methods used for internal analysis were STP analysis (segmenting, targeting, positioning), VRIO analysis (valuable, rare, inimitable, organized), and marketing mix analysis. The methods used for external analysis were PESTEL analysis (political, economic, social, technological, environmental, law) and Porter's Five Forces analysis. Results from these analysis methods will be summarized into the gap analysis format and Pareto analysis to identify the source of the problem of the SME. A solution will then be derived in the form of a new business model canvas.

IV. RESULT/FINDING

A. Business Model Canvas

<b>Business Model Canvas</b>		Designed for:	Designed by:	Date:	Version:
		Jonathan	Jordi	21/01/2022	1
Key Partners	Key Activities	Value Propositions	Customer Relationships	Customer Segments	
<ul style="list-style-type: none"> <li>- Homeowners</li> <li>- Hospitals</li> <li>- Subcontractors</li> <li>- Suppliers</li> </ul>	<ul style="list-style-type: none"> <li>- Acquire projects</li> <li>- Make quotes</li> <li>- Designing</li> <li>- Furniture construction</li> <li>- Structure construction</li> </ul>	<ul style="list-style-type: none"> <li>- Modern designs</li> <li>- Design and build</li> <li>- Experience in construction industry</li> <li>- Affordable price</li> <li>- Flexible design</li> </ul>	<ul style="list-style-type: none"> <li>- Personal selling</li> <li>- Direct contact (WA, telepon, email)</li> <li>- Entertainment</li> </ul>	<ul style="list-style-type: none"> <li>- Adults who wants to build houses</li> <li>- Hospitals that wants to build healthcare facilities</li> </ul>	
	Key Resources		Channels		
	<ul style="list-style-type: none"> <li>- Experienced labor</li> <li>- Vendor connections</li> <li>- Assets</li> </ul>		<ul style="list-style-type: none"> <li>- Word of mouth</li> </ul>		
Cost Structure		Revenue Streams			
<ul style="list-style-type: none"> <li>- Monthly wages</li> <li>- Utilities</li> <li>- Project costs</li> <li>- Customer entertainment costs</li> </ul>		<ul style="list-style-type: none"> <li>- Payment from ongoing and completed projects.</li> </ul>			

Fig 1. Business Model Canvas (Source: Author’s Analysis, 2022)

Vertex Studio’s business model canvas shows two issues that needs to be addressed. The first issue is in their customer relationships section where they have no used their company profile effectively to help with their personal selling. Vertex Studio’s company profile only contains their portfolio of finished designs. The company profile does not include relevant information about the company that gives them any credibility. It also lacks and vision and mission statement and the results of their constructions projects. Together with the fact that they are a relatively new company, these lack of information impacts the perceived risks of the consumers negatively.

The second issue is that Vertex Studio does not have an online channel like a website to market their services. Vertex Studio has potential to get more projects if they have other channels rather than relying solely on word of mouth to promote their services. Vertex Studio already have an Instagram page, but their content is lacking and unstructured. They also are not actively using Instagram for promotional purposes.

B. PESTEL Analysis

PESTEL	Point	Impact
Political	Covid-19 national budget for healthcare facilities	Positive
Economic	Low interest rates during Covid-19 for loans	Positive
Social	Social media used to search product and services	Positive
Technological	3D designs being well received by the consumers	Positive
Environmental	Stricter permit requirement for projects	Negative
Legal	Construction is an essential sector during PPKM period	Positive

Fig 2. PESTEL Analysis (Source: Author's Analysis, 2022)

The results of the PESTEL analysis show that Vertex Studio has a gap in their social section. The social trends shows that consumers are using social media as means to find information regarding companies that offer the services they need. Construction and architectural companies in Indonesia have used social media platforms like Instagram to market their services and portfolio. Vertex Studio's Instagram page can be developed better to be an effective marketing tool. Their inactive Instagram page contributes to the lack of brand awareness that the consumers have about Vertex Studio's design services.

### C. Porter's Five Forces Analysis

No.	Porter's Five Forces	Analysis Results
1	Threats of New Entrants	Low
2	Threats of Substitutes	Low
3	Bargaining Power of Suppliers	Low
4	Bargaining Power of Buyers	High
5	Competitive Rivalry	Medium

Fig 3. Porter's Five Forces Analysis (Source: Author's Analysis, 2022)

Results from the Porter's Five Forces analysis show that Vertex Studio is in a moderate to high profitability industry. The high bargaining power of buyers causes Vertex Studio to keep prices low to get projects. But the winner of the project's bidding process is not always the cheapest company. This is because the buyers perceived value of that company's services is higher than the price they offered. That value can be in the form of the company's reputation, experience, and brand equity. To build Vertex Studio's brand, an effective marketing strategy is necessary especially in online channels that have a lot of users like Instagram.

### D. STP Analysis

Geographic	Demographic	Behavioral
Consumers located in JABODETABEK area	<ul style="list-style-type: none"> <li>Adults aged 21 and above</li> <li>Consumers with middle to high income</li> </ul>	<ul style="list-style-type: none"> <li>Consumers that wants to build a house.</li> <li>Consumers that needs a design for their house.</li> <li>Consumers that needs a design for their house's interior.</li> </ul>

Fig 4. STP Analysis (Source: Author's Analysis, 2022)

Their STP analysis shows that Vertex Studio can still developed their segmenting, targeting, and positioning strategies further. The market segment that they target can be expanded to include companies and individuals outside of the JABODETABEK area. Vertex Studio can use medias like Instagram and company profiles to increase the credibility of their design services and introduce new customers outside of the JABODETABEK area about their design services.

E. *Marketing Mix Analysis*

Marketing Mix	Impact
Product	Positive
Place	Positive
Promotion	Negative
Price	Positive

Fig 5. Marketing Mix Analysis (Source: Author's Analysis, 2022)

The marketing mix analysis shows a gap in their promotion section. Vertex Studio's lack of website causes new customers to not be able to use search engines like Google to get information about the company. Vertex Studio also do not have their relevant contact information like email, WhatsApp, or office phone number in their Instagram profiles. These factors cause Vertex Studio to have difficulties getting projects from new customers. Their promotion strategies can be reworked so that new customers can easily reach Vertex Studios for inquiries.

F. *VRIO Analysis*

	Valuable?	Rare?	Costly to Imitate?	Exploited by Organization?	Competitive Advantage
Reputation	Yes	Yes	Yes	No	Unused
Suppliers	Yes	Yes	No	No	Temporary
Design services	Yes	Yes	No	No	Temporary
Construction services	Yes	Yes	Yes	No	Unused

Fig 6. VRIO Analysis (Source: Author's Analysis, 2022)

The results from VRIO analysis shows that Vertex Studio has unused competitive advantage in their reputation and construction services section. Vertex Studio can use their company profile better to promote their design services. They can utilize the good reputation they have and the results of their construction services to add credibility to their design services. Other than in the company profile, Vertex Studio also has a gap where their designs are easy to imitate. Vertex Studio can solve this issue by training their workers to increase their skill so that they can create unique designs with traits that other companies cannot imitate.

#### G. SWOT and TOWS Matrix

Strength	Weakness
<ol style="list-style-type: none"> <li>1. Experienced labor</li> <li>2. Skills in modern design</li> <li>3. Flexible designs</li> <li>4. Affordable designs</li> </ol>	<ol style="list-style-type: none"> <li>1. No website</li> <li>2. Instagram inactive</li> <li>3. Incomplete company profile</li> <li>4. No online ads</li> </ol>
Opportunity	Threat
<ol style="list-style-type: none"> <li>1. Market outside JABODETABEK area</li> <li>2. Construction is an essential sector</li> <li>3. More consumers using online channels to search</li> </ol>	<ol style="list-style-type: none"> <li>1. Competitors using Instagram for marketing</li> <li>2. Competitors having functional websites</li> <li>3. Competitors with more design portfolio</li> </ol>

Figure 7. SWOT Analysis (Source: Author's Analysis, 2022)

The SWOT table above is derived from the results from previous analyses. To summarize, the strength of Vertex Studio comes from their experienced workforce and affordable designs. Vertex Studio's main weakness is their lack of marketing. Vertex Studio has an opportunity to expand to areas outside JABODETABEK. Finally, their threat comes from competitors with more portfolio and effective marketing strategies. From the SWOT table, the TOWS matrix is made to formulate solutions that can be implemented in Vertex Studio. Here is Vertex Studio's TOWS matrix:

SO Strategies	WO Strategies
<ol style="list-style-type: none"> <li>Promote the company's skills and experience online using digital marketing strategies to get projects outside JABODETABEK area (S1, S2, S3, S4, O1, O3)</li> </ol>	<ol style="list-style-type: none"> <li>Set up website with relevant company information (W1, O3)</li> <li>Use Instagram with ads to expand target market to outside JABODETABEK area (W2, W4, O1, O3)</li> <li>Fix company profile to be more tidy and include more company information (W3, O3)</li> </ol>
ST Strategies	WT Strategies
<ol style="list-style-type: none"> <li>Use Instagram more actively to promote designs and other services (S1, S2, S3, S4, T1, T3)</li> <li>Set up website to display the company's portfolio (S1, S2, S3, S4, T2)</li> </ol>	<ol style="list-style-type: none"> <li>Actively use Instagram for promotion (W2, T1)</li> <li>Set up functional website (W1, T2)</li> <li>Set up online ads for both website and Instagram (W4, T1, T2)</li> <li>Regularly update portfolio for all channels (W1, W2, W3, T3)</li> </ol>

Fig 8. TOWS Matrix (Source: Author's Analysis, 2022)

H. GAP Analysis

After the SWOT and TOWS matrix, a GAP analysis table is made to summarize the results of each analysis methods and the possible solutions for each of the issues found. Here is the GAP analysis for Vertex Studio:

Method	Current Condition	Ideal Condition	Gap	Solution
BMC	No website containing relevant company information	Tidy website for customers to search information	Website needed	Create website
	No active social media	Social media used actively for promotion	Need active social media	Promotions in Instagram
	Company profile lacks credibility information	Company profile has complete information	More information needs to be added into the company profile	Company profile revision
PESTEL	Brand is unknown	Brand is known by the customers	Need to build brand	Promotion in Instagram
Porter's Five Forces	Competitors using social media to compete	Social media can be used to compete	Active social media page can attract customers	Promotion in Instagram
STP	No projects outside JABODETABEK area	Projects outside JABODETABEK area	Need to attract customers outside JABODETABEK	Promotion in Instagram
Marketing Mix	No promotional ads	Using online channels for advertisement	Need online ads	Create online ads
	Difficulty finding information about the company	Company information can be easily searched with Google	Need website with good SEO	Create website
VRIO	Imitable design	Have designs unique to the company	Labor training to increase skills	Labor training

	Good reputation and construction services not used to promote their design services	Reputation and construction services used	Reputation and construction services needed in company profile	Company profile revision
SWOT	Company profile lacks work experience	Company profile can be used to show portfolio	Need to revise company profile	Company profile revision
	No website	Have functional website	Website creation	Create website
	Inactive Instagram	Instagram used for promotion	Promotion in Instagram	Promotion in Instagram
	No online ads	Set up online ads for online channels	Create online ads	Create online ads

Table 1. GAP Analysis (Source: Author’s Analysis, 2022)

I. Pareto Analysis

Problem	Weight (0-10)	Score (0-10)	Contribution	Distribution (%)
Inactive social media	8	9	72	26,5
Incomplete company profile	8	8	64	23,5
No online ads	8	8	64	23,5
No website	7	6	42	15,4
Designs not unique	5	6	30	11,0
<b>Totals</b>			<b>272</b>	<b>100</b>

Fig 9. Pareto Analysis (Source: Author’s Analysis, 2022)

From the issues found above, a pareto analysis is done to determine the priority for each problem. The weight of the problem is the level of difficulty and the score is the level of urgency to solve that issue. The weight is on a scale of 1 being the easiest to 10 being the hardest problem to solve. The score is on a scale of 1 being the least urgent to 10 being the most urgent problem that needs to be solved.

J. Proposed Business Model Canvas

<b>Business Model Canvas</b>				
Designed for: Jonathan		Designed by: Jordi		Date: 14/04/2022
Version: 1				
<b>Key Partners</b>	<b>Key Activities</b>	<b>Value Propositions</b>	<b>Customer Relationships</b>	<b>Customer Segments</b>
- Homeowners - Hospitals - Subcontractors - Suppliers	- Acquire projects - Make quotes - Designing - Furniture construction - Structure construction	- Modern designs - Design and build - Experience in construction industry - Affordable price - Flexible design	- Personal selling - Direct contact (WA, telepon, email) - Entertainment - <b>Company Profile</b>	- Adults who wants to build houses - Hospitals that wants to build healthcare facilities
	<b>Key Resources</b>		<b>Channels</b>	
	- Experienced labor - Vendor connections - Assets		- Word of mouth - <b>Instagram</b> - <b>Website</b>	
<b>Cost Structure</b>		<b>Revenue Streams</b>		
- Monthly wages - Utilities - Project costs - Customer entertainment costs		- Payment from ongoing and completed projects.		

Fig 10. Proposed Business Model Canvas (Source: Author's Analysis, 2022)

The solutions for the problems in Vertex Studio are proposed in the form of a new business model canvas. For the customer relationships, company profile is added to introduce new customers to their design services. For their channels, Vertex Studio will use Instagram for promotion and also create a website so that they can be found in Google when the customers are searching.

V. RESULT/FINDING

A. Stages Of Business Coaching

After the problems inside Vertex Studio has been identified and proposed solutions have been approved by the business owner, next comes implementing those solutions into the company. Here is the timeline of the stages of business coaching implementation:

Activity	Jan 22	Feb 22	Mar 22	Apr 22	May 22	Jun 22	Jul 22
Introduction to the company and business owner							
Data gathering through interviews and observations							
Problem identification and discussion							

Solutions proposal and discussion							
<b>Implementation: Company Profile Revision</b>							
Evaluation on current company profile							
Company profile revision							
Revised company profile distribution							
<b>Implementation: Website Creation</b>							
Discussion on website elements							
Making new website (offline)							
Publishing new website (online)							
Setting up Google Ads							
<b>Implementation: Instagram Revamping</b>							
Discussion on current Instagram page							
New account creation and content posting							
Setting up Google Ads							
<b>Evaluation and Maintenance</b>							
Training to post marketing contents in Instagram							
Training to edit new website							
Training to use web analytic tools							

Table 2. Stages of Business Coaching Implementation Timeline (Source: Author's Analysis, 2022)

*B. Company Profile Revision Implementation*

Fig 11. Vertex Studio Old Company Profile (Source: Author's Documentation, 2022)

After evaluating Vertex Studio's old company profile, the business owner agreed that there are a few points that needs to be fixed. The first point is the inclusion of credibility information about the company. This information includes the company's history, the experience of the company leaders, and the certifications that the company has. Most notably, the new company profile must include the experience of Pak Oktavianus and his company Cipta Dimensi. This is done to create brand association of Vertex Studio to the decades of excellence that Cipta Dimensi

has under the management of Pak Oktavianus, who is now the commissioner of Vertex Studio. The second point is to include their vision and mission statement. This is done to strengthen the introduction of the company to new customer and build strong brand image right from the start. The third point is to include Vertex Studio's construction projects in the company profile. This is done to associate their design services to their already well-known construction services. Here is the result of the company profile revision:

Fig 12. New Company Profile

Discussions with the business owner led to a decision being made to change the name of Vertex Studio to DJO Kreasi. This new name is thought to be more fitting to the company as it is the same official name of the company registered in the company registration documents which is PT. DJO Kreasi Mandiri. Moving forward, DJO Kreasi will be used for company operational purposes including marketing purposes. Thus, the revised company profile will also use DJO Kreasi instead of Vertex Studio for the company name. The color scheme is also changed to increase the aesthetic levels of the company profile.

C. Website Creation Implementation

DJO Kreasi’s new website will be made using Wix as the primary editing platform. The business owner decided that the purpose of the website is to be more as a company introduction and contact information source rather than a portfolio gallery. A desktop version and a mobile version of the website will be made to give more accessibility to the customers. Here is the finished website in the mobile version:

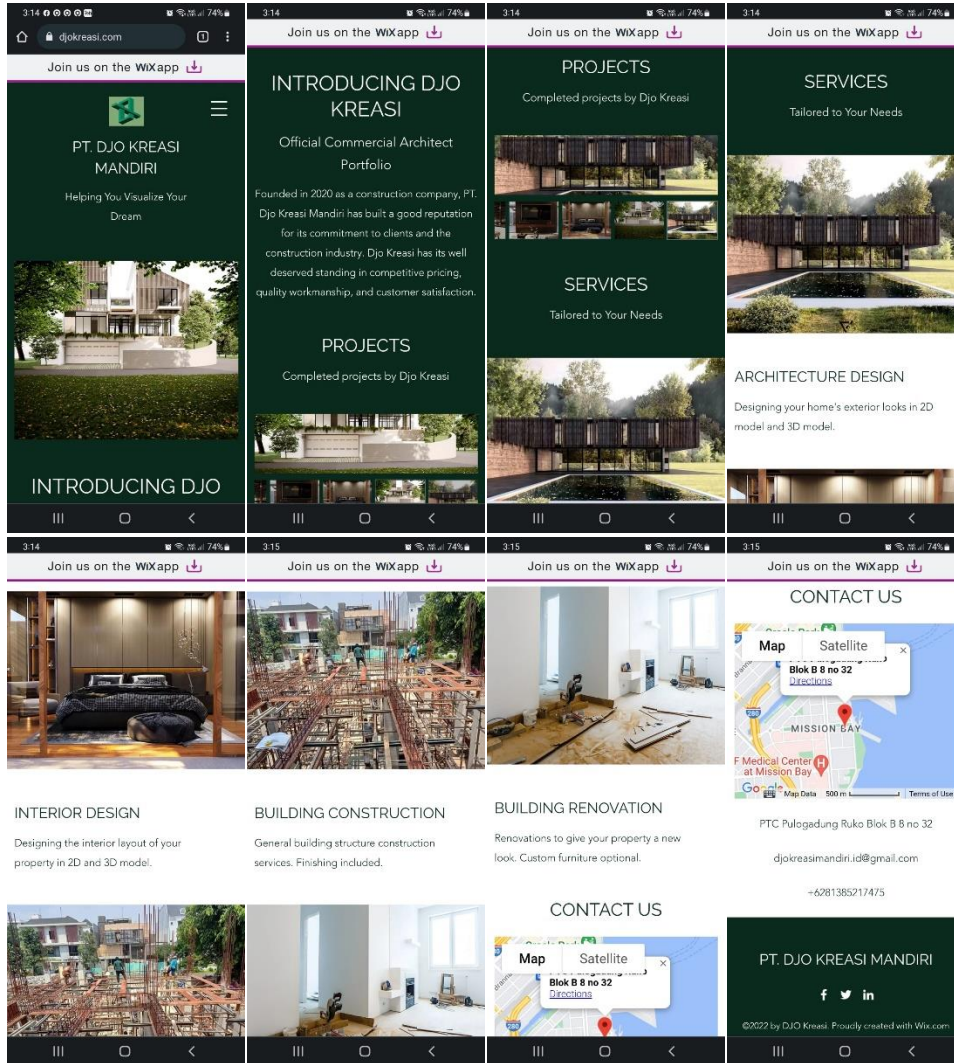

Fig 13. DJO Kreasi’s Website (Mobile Version) (Source: Author’s Documentation, 2022)

The website contains 4 sections: the introduction, small portfolio gallery, the services offered, and most importantly, the contact information of DJO Kreasi. The domain for the website is registered using Wix Domains and the address is djokreasi.com. The SEO for DJO Kreasi’s website is optimized using the help of Wix’s SEO Optimization tools so that the website can be shown in Google search results.

*D. Instagram Revamping Implementation*

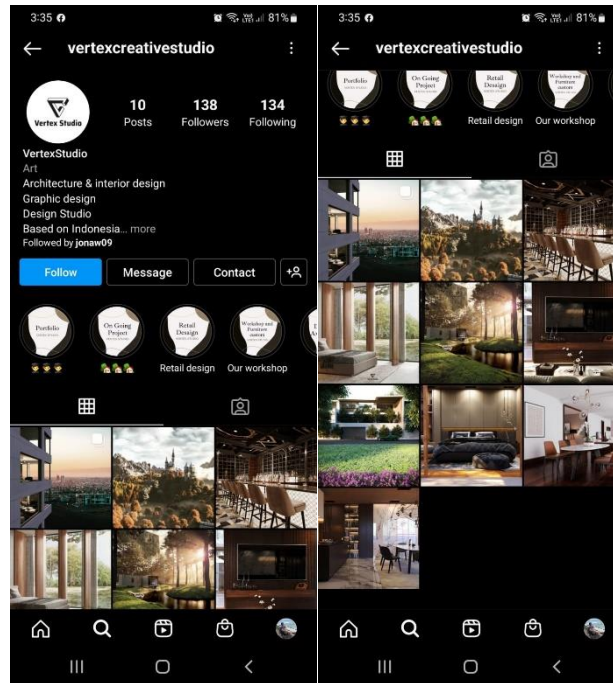

Fig 14. @vertexcreativestudio Instagram Page (Source: Author's Documentation, 2022)

When the company name Vertex Studio is changed to DJO Kreasi, the business owner also decided to abandon their old Instagram page @vertexcreativestudio to make their new Instagram page with the new company name. The old Instagram page has relatively small number of followers and only 10 pictures worth of portfolio uploaded.

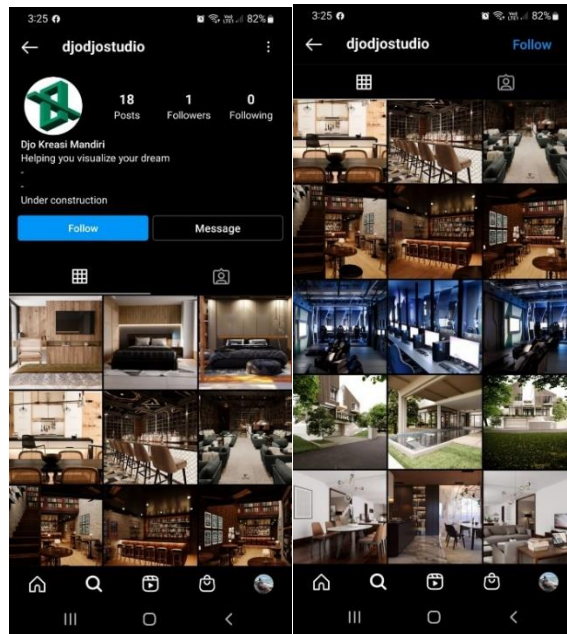

Fig 15. @djodjostudio Instagram Page (Source: Author's Documentation, 2022)

DJO Kreasi's new Instagram page is @djodjostudio. The new Instagram page sorts the pictures according to the color pallet for each row. The purpose of this method of ordering the pictures is to make the page look nicer and give the customers a message about the company's tidiness. The company will also regularly post fun facts about the construction and design industry as promotional material to attract customers.

#### *E. Evaluation and Maintenance*

After the solutions have been implemented, a staff member of DJO Kreasi's team is assigned as an administrator to handle the website and Instagram pages. The person chosen for this job is Bu Isabella. Bu Isabella is then trained to edit the website using Wix Control Panel, and also print out the web analytics results using Wix Analytic Tools. She is also trained to access @djodjostudio's account and to create promotional materials to be posted into the account's page. Instagram also has an analytics tool called Instagram Insight to evaluate the page's performance over time. These trainings are done to make sure that the online marketing channels of DJO Kreasi still run even after the business coaching process has ended.

## VI. CONCLUSION, LIMITATION, AND RECOMMENDATION

### *A. Conclusion*

After the condition of the SME has been analyzed and problems have been identified, solutions are implemented in the company to solve those problems. The first solution implemented in the SME is the revision of their current company profile. The new company profile incorporated more of the company's credibility elements and attempts to associate the company to an already established construction company called Cipta Dimensi. The SME also decided to change their brand name from Vertex Studio to DJO Kreasi during this stage. The second solution implemented is the creation of their website. Their new website address is djokreasi.com and their SEO is optimized to make the page appear in Google search results. The third solution is the revamping of their Instagram page. The new Instagram page

is @djodjostudio and the pictures are ordered in such a way to increase the tidiness of the page. An administrator staff is also trained and assigned to handle the website and post promotional material in the Instagram page.

### B. Limitation

There are a few limitations to the solutions implemented into the SME. The first limitation is the lack of hardcopy company profiles to be distributed to the customers. The business owner decided not to print the company profile in hardcopy because of the relatively high number of pages. Due to time constraints, another version of the company profile that is more suitable to be printed has not been made. The second limitation is in the website implementation where Google Ads have not been set up for the page. The business owner is not ready to use Google Ads to promote the new website because of the costs involved. The owner wants to improve the website further and post more content first before subscribing to Google Ads. The final limitation is in the Instagram implementation where the promotional material has not been uploaded yet and Instagram Ads have not been set up for the page. The reason for this is due to time and budget constraints where the administrator has not finished the new posting by the time this research is written. Instagram Ads have not been set up because there is no promotional material yet for the page.

### C. Recommendation

From the limitations above, a few recommendations can be made for the SME to improve their online marketing channels. The first one is to make another version of the company profile to be printed for the customers. This new company profile must be concise and contain lesser number of pages. The second recommendation is to upgrade their website's Wix plan so that they can remove the Wix Ads at the top of the page to make the website look more professional. The SME should also set up Google Ads so that more customers can find the page and engage the company. The final recommendation is for the administrator Bu Isabella to routinely post promotional material like fun facts to the Instagram page. The SME can also set up Instagram Ads for the page to attract more customers into visiting the page.

## **Implementation Of Admin Recruitment, Admin Sops, And Optimizing The Use Of Instagram As One Of The Customer Acquisition Efforts At Nurma Catering Smes After The Pandemic**

Tessa Viennie Setiawan<sup>1</sup>

<sup>1</sup>Marketing Management, FEB Universitas Indonesia, Jakarta, Indonesia.

### **Abstract**

*This study discusses improving the quality of services for SMEs Nurma Catering through the application of SOP Admin, Recruitment of Admin, and Optimization of Digital Marketing Strategy. The research was conducted during the Covid-19 pandemic that was hitting Indonesia. The main obstacle is the change in dynamics from offline to online, which causes unpreparedness for these conditions, resulting in overlapping tasks and not working well in product marketing. With the method of word of mouth which is a way to market products, it must be changed to an online marketing method. Furthermore, some employees perform other tasks besides their main duties such as the General Manager who doubles as Whatsapp admin, order taker, and financial manager. So that an admin is needed and the application of online marketing forms. The method used in this research is qualitative by conducting a Business Coaching process. The types of data used are primary data (interviews & observations) and secondary (literature studies) and process the business model canvas. In this process, external analysis (PESTEL & Five-Forces Model) and internal analysis (STP & Marketing Mix) is carried out so that problems that occur inside and outside the company can be known. The Business Coaching process is carried out by implementing SOPs and admin functions to simplify the ordering process and clarify roles in the field of work. In addition, a digital marketing strategy is also implemented that serves to expand marketing channels and can reach consumers online. Thus, it can be found that Nurma Catering's business activities have limitations in the use of social media and training for admins as well as maximizing the use of media as a form of implementing digital marketing.*

*Keywords— Service Quality; SOP; Digital Marketing; Business Coaching*

### **I. INTRODUCTION**

Indonesia is one of the developing countries that has the third largest economic power in Southeast Asia after China and India. In the last 5 years, Indonesia experienced the highest rate of increase in economic growth in the first quarter of 2019 which was 5.07 percent (Ministry of PPN RI, 2019). However, the increase in economic growth did not last long. After 2020, Indonesia's economic growth experienced a surprising decline.

The surprise was caused by the outbreak of the Covid-19 virus in the world, including in Indonesia. As the virus keep spreading, it caused a policy to restrict mobility when this virus emerged in 2020. The government initial action was to changed the way people carried out their daily activities, especially for groups of people who were or lived in cities that were productive with various kind of activities.

During the covid-19 pandemic, there have been many losses, one of which has occurred in the field of providing accommodation and eating and drinking. This sector experienced a contraction in economic growth of 7.26%. This happened because of restrictions on mobility and the closure of many business places such as restaurants and hotels nationwide. Contractions that occur during a national pandemic are one of the problems that the government must face and the government's restrictions on mobility are a problem for places of business, one of which is SMESs.

(UU RI, 2008) Micro, Small, and Medium Enterprises are productive businesses owned by individuals or individual business entities that are not subsidiaries or branches of companies that are controlled, owned, or become a part, either directly or indirectly, of large businesses. A business can be categorized as a Micro Business if it has assets of Rp. 50,000,000 and a maximum turnover of Rp. 300,000,000 per year; while Small Business has assets of at least Rp. 50,000,000 – Rp. 500,000,000 with a turnover of more than Rp. 300,000,000 – Rp. 2,500,000,000; and Medium-sized businesses have assets of more than Rp. 500,000,000 – Rp. 10,000,000,000 and a turnover of more than Rp. 2,500,000,000 – Rp. 50,000,000,000.

SMES Nurma Catering is located at Jalan Gedung Hijau Raya Number 1A Pondok Indah, Pondok Pinang, Kebayoran Lama, RT.3/RW.6, Pd. Pinang, Kec. Kby. Lama, South Jakarta City, Jakarta Special Capital Region 12310. SMES Nurma Catering has been established since 1993. Nurma Catering serves orders from various events such as school events, recitations, proposals, weddings, and office events to corporate events. The loyal customers of Nurma Catering from the government are City Hall, Jakarta Education Office, General Election Agency, and Jakarta Maritime Service while loyal customers from the Company are Blue Bird Group, PT. Erlangga Publishers and PT. Sido Muncul Tbk. The menu variants and the prices offered for each menu package are also very varied and no less competitive with other competitors. No wonder Nurma Catering can get an extraordinary turnover every year.

Since the COVID-19 pandemic, events that were originally running normally have been switched to online or even canceled, so that Nurma Catering, which previously could produce 2000 packages of orders per day, has decreased by 80%, in one day it can only get 400-500 orders. A Decrease in business turnover affects the workforce that is employed. Of the 30 employees, Nurma Catering only be able to maintain 15 of its employees.

Based on observations from the results of interviews conducted, several things need to evaluate by Nurma Catering to survive and run business activities smoothly during this pandemic, such as position of Mrs. Widya as social media admin (WhatsApp) and financial manager that might affect business performance. Nurma Catering also does not have a specific marketing campaign or strategy, their business marketing relies on word of mouth from its customers. Before the pandemic maybe this could run smoothly but during a pandemic it gonna takes special online marketing via Instagram.

Quoting Aaker (2010) Brand awareness is the first step for consumers before deciding to buy a product. According to Ercis (2011), to build awareness, SMEs can implement an Integrated Marketing Communication strategy by choosing the right media to communicate with customers. So it is necessary to adjust the business model while increasing marketing activities. For this reason, this thesis was prepared to help implement Integrated Marketing Communication and Marketing Optimization through Instagram SMES Nurma Catering.

## II. LITERATURE REVIEW

### A. *Integrated Marketing Communication*

The role of marketing communications is vital in planning strategies to disseminate business forms, products, and activities. With appropriate strategy that applied to the marketing process, it can provide a positive perspective from outsiders towards a business. This happen when communication becomes important to be able to bring a picture of business values in a positive direction (S. Hassan, 2019).

Marketing communication it's an instrument to communicate companies with targets and interests to be distributed for products or the company as a whole (Finne & Gronroos, 2015). According to Belch (2018), IMC (Integrated Marketing Communication) is an integrated marketing communication planning concept that aims to evaluate the strategic role of the marketing (marketing mix, product, price, place, and promotion) with various communication models, such as general advertising, personal selling, direct marketing, public relations, and combining these programs to increase sales turnover.

### B. *Digital Marketing*

Digital Marketing is a marketing activity or promotion of a brand or product using digital media or the internet. The purpose of digital marketing is to attract consumers and potential customers quickly. According to Kannan (2017), Digital Marketing is a marketing activity including branding that uses various media. Furthermore, according to Hasan Said (2019), digital marketing can help a company in promoting and marketing its products and services. Digital marketing includes direct marketing, which considers customers as individuals and defines them not only by individual characteristics but also by their behavior, and interactive marketing, which can address individuals and the ability to gather and remember responses that individuals receive (Daniel Laksana and Diah Dharmayanti). , (2018). The benefit for consumers with digital marketing is that it can be easier to get products or services (Kusumaastuti and Purnama, 2015)

This is supported by the necessary social media platforms such as Instagram. Instagram is a photo-sharing application that allows users to take photos, apply digital filters and share them to various social networking services, including Instagram owners themselves (Mahendra, 2014). According to (Diamond, 2015), Instagram has supporting elements such as profiles, followers, hashtags, push notifications, connected to other social networks, location tags, and others. Previous study (Jayanti, 2014) explains that Instagram is used by business actors to promote their business by sharing information through photos equipped with captions as explanations. The comment tool on Instagram is also used by business actors to interact with their consumers in order to build consumers' trust.

#### C. *Brand Awareness*

According to Shimp (2003:11) Brand Awareness is the ability of a brand to be remembered in the minds of consumers when they are thinking about a particular product or service category and how easily the name is raised on the basis of considerations of safety, comfort, quality and so on. It can be concluded that Brand Awareness is a general purpose of marketing communication, the higher the Brand Awareness of a product or service, the higher the potential for consumers to directly buy or use the brand when looking for a reference both offline and online.

#### D. *Company Profile*

A Company profile is a means of marketing communication in the form of printed media in the form of a book that used to inform potential consumers about the company's products or services or other messages to be conveyed (Kotler & Keller, 2016). A company profile usually includes company history, company philosophy and culture, company owner remarks, vision and mission, company address, human resources, company achievements, and a description of the products and services offered. (Kriyantono, 2008).

#### E. *Standar Operasional Prosedur*

Standard Operating Procedures are a series of instructions that describe the documentation of activities carried out repeatedly in an organization. SOP serves to maintain the quality and quality assurance of the activities carried out by an organization to maintain consistency. If the organization does not have SOPs, then the organization does not function properly because it does not have a clear flow of guidelines. (United States Environmental Protection Agency, 2007). SOPs provide information to do the job or task correctly and facilitate consistency in the quality and integrity of the end work (Rachmi dalam Herdiyanti, Puspitaningrum, Astuti, & Yuhana, 2018).

### III. RESEARCH METHODOLOGY

#### A. *Data Collection*

Data collection conducted using a qualitative approach with the business coaching method. The research design implemented using qualitative methods through case studies (Moloeng, 2010). Case studies are empirical research that investigates contemporary phenomena in depth in the context of the real world (Yin, 2014). Data collection in this method requires two types of data, primary (interviews & observations) and secondary (literature studies).

#### B. *Data Analysis*

Sugiyono (2009) suggests that data analysis is systemic process of searching and compiling data obtained from interviews, field notes, and documentation, by organizing data into categories, describing them into units, synthesizing, and compiling them into patterns, choosing which ones to use to be studied, and make conclusions so that they are easily understood by themselves and others. With the stages of data analysis, such as data reduction, data presentation, and drawing conclusions.

The data reduction is done by interviewing and observing in the field of SMEs Nurma Catering. From the results of data reduction, data exposure is carried out using tools that support data display, including segmenting, targeting, positioning (STP) analysis, PESTEL analysis, Porter's Five Forces analysis, Business Model Canvas (BMC) analysis, marketing mix analysis (7P) ) to SWOT and TOWS analysis. After all these analyzes are fulfilled, the data will be narrowed to gap analysis to see the condition of the Nurma Catering SMEs.

### C. *Business Model Canvas*

#### a. *Consumer Segment*

Based on Behavior, Nurma Catering has a target, namely people who are looking for catering or catering services for various kinds of events in large and large portions. Based on Psychography, Nurma Catering's customers are people who have events but don't have time to cook and want to present quality, delicious and nutritious dishes as well as office workers who don't want to bother leaving the office. Based on Demographics, Nurma Catering's customers are young adults to the elderly, namely 18-65 years. Based on geographical location, Nurma Catering can serve catering services in the Jakarta Bogor Depok Tangerang Bekasi area.

#### b. *Value Proposition*

The value of Nurma Catering is that there are more than 100 types of rice and side dishes, 25 drink menus, 25 types of market snacks, and 25 types of pastries. The menu offered is Archipelago dishes, Chinese Food, Western, and Middle Eastern. It can be served in the form of Buffet, Buffet, Rice Box, and Basket Rice. Nurma Catering has economical to premium prices so it can reach almost all circles.

#### c. *Channels*

Nurma Catering reaches consumers by providing Pricelist Company and Profile on blogspot but its not been updated for a long time.

#### d. *Consumer Relationship*

Nurma Catering provides information for customers via Direct Whatsapp and blogspot. Maintaining relationships with customers is an important aspect. So far, Word of Mouth has had a big influence on product sales.

#### e. *Revenue Streams*

SMEs Nurma Catering earns income from selling catering services in large quantities and already has several regular customers.

#### f. *Key Resources*

SMEs Nurma Catering has a strategic place of business located in Pondok Pinang, Kebayoran Lama. They also have complete production equipment, facilities, and excellent presentation.

#### g. *Key Activities*

SMEs Nurma Catering carries out its main key activities by producing catering orders from customers with high quality materials.

#### h. *Key Partnership*

SMEs Nurma Catering has a supplier of chicken and meat. For vegetable and fruit ingredients, the chef himself shopping manually to the main market so that they can remain consistent in choosing quality of raw ingredients.

#### i. *Cost Structure*

SMES Nurma Catering has divided the expenditure costs. Fixed Costs that are issued every month are Employee Salaries and Taxes. The variable costs that are issued every month are electricity, internet, gasoline, car delivery orders, and the cost of purchasing raw ingredients.

### D. *Eksternal Analysis*

a. *PESTEL*

PESTEL analysis is one type of analysis model used to understand the overall picture of the external environment, namely the analysis of Politics, Economics, Socials, Technology, Environment, and Legal (Thompson, Peteraf, Gamble & Strickland., 2016). This analysis can help see various things that have an impact on business continuity. This analysis uses a literature study method and searches for phenomena or news that currently happening in Indonesian society.

b. *Five-Forces Model of Competition*

According to Gamble (2015) Analysis of the Five-Forces Model of Competition is a tool developed by Michael Porter to identify and analyze the competitive conditions of the business environment of a business unit.

c. *Internal Analysis*

1. *STP*

STP analysis is an analytical method that can be used by a business actor to determine “who” is the product sales target. The elements contained in the STP analysis are Segmenting, Targeting, and Positioning.

2. *Marketing Mix*

SMES Nurma Catering is an SMES engaged in catering services, they used service marketing mix as their marketing mix.

#### IV. RESULT/FINDING

The implementation of business coaching for UMKM Nurma Catering has been formally started in November 2021 and lasted until March 2022. The implementation of business coaching includes initial introduction activities, collection of required data, solution planning, solution implementation, solution evaluation, and handover implementation result. To ensure business coaching can be carried out properly and structured, it is necessary to create timeline for business coaching implementation.

*Table 1 Business Coaching Implementation Plan*

No	Activities	Nov-21	Dec-21	Jan-22	Feb-22	Mar-22	Apr-22	Mar-222
1	Initial introduction and delivery of BC objectives							
2	SMES Data Collection							
3	Problem Identification							
4	Confirmation regarding proposed solution							
5	Implementation of Logo and Company Profile Creation Solutions							
6	Implementation of social media creation							
7	Detailed social media development							
8	Product innovation discussion							

9	Confirm product innovation to the SMES owner							
10	Monitoring the results of SMES development							
11	Results evaluation of the entire implementation							
12	Result handover							

Table 28 Proses Business Coaching PT. Nurma Catering

1. 1<sup>st</sup> Visit, Introduction and Data Collection (Interview)

The first meeting was entirely focused on the outline of the profile of Nurma Catering. Like the early history of Nurma Catering, the motivation to establish SMESs, the types of businesses and products offered, the achievements that have been achieved, business capital, turnover, and unachieved targets, and what they want to do in the future. The owner also told about the situation of SMESs during the pandemic.

2. 2<sup>nd</sup> Visit, Data Collection (Interview and Observation)

Nurma Catering has several loyal customers who come from the office located at Jalan Gedung Hijau Raya Number 1A Pondok Indah, Pondok Pinang, Kebayoran Lama, RT.3/RW.6, Pd. Pinang, Kec. Kby. Lama, South Jakarta City, Special Capital Region of Jakarta 12310. Some of Nurma Catering's loyal customers from corporate are PT Erlangga, BCA and Bluebird. The owner of SMESs said that there was no firm SOP regarding client

No	Date	Activities	Result
1	21 July '21	1th Meeting and Introduction	Introduction to SMES owners, explanation of Business Coaching activities and an overview of SMESs
2	9 August '21	First Interview and Observation	Exploratory interview on Five's Porter Analysis, PESTEL, STP, Marketing Mix, and SWOT
3	6 Dec '21	Second Interview and Observation	Interviews related to detail business processes and SMES BMC as well as direct observation of SMES activities
4	28 Feb '22	Third Interview and Observation	An in-depth exploratory interview about the problems at Nurma Catering
5	29 Mar '22	Confirm Problem Identification and Solution Plan	Data confirmation and analysis results of problem identification and discussion of proposed solutions to be implemented.
6	1 April '22	Implementation	Discussion on making SOPs, Recruiting Admins, and taking photos and materials for menu renewal content, Company profiles and Instagram content.
7	9 April '22	Implementation	Discussion of Digital Marketing Strategy and Making Whatsapp Business.
8	23 April '22	Implementation	Discussing Company Profile results and implementing Digital Marketing strategies.
9	7 May '22	Implementation	Socializing SOPs to new Admin and discussing Company Profile results.
10	28 May '22	Results and Handover	Final evaluation of SOPs and submission of Business Coaching Results

payments, such as no DP for old customers, so there was a case where customers who had ordered in large quantities canceled their orders on the H-1 event, causing losses for Nurma Catering. Owners find it difficult to make SOPs regarding payments and target potential new customers.

Table 29 Proses Business Coaching PT. Nurma Catering

3. 3<sup>rd</sup> Visit, Data Collection (2<sup>nd</sup> Interview and Observation)

The interview is still exploring more deeply related to the Business Model Canvas (BMC), Segmenting targeting positioning (STP), marketing mix, VRIO, PESTEL, and Porter's five forces. Further observations and discussions were also conducted on the problems and obstacles in running the Nurma Catering business. The owner revealed that he wanted to upgrade the service and quality as well as promotion but don't know where to start. Mba Widya stated that the Nurma Catering menu needs to be updated in terms of its photos, design, and price, due to an increasing price of raw materials.

4. 4<sup>th</sup> Visit, Data Collection (3<sup>rd</sup> Interview and Observation)
 

The interview talk about the problem of recording financial statements and inventory, the records are not neat and there are still many missing because there is no specific finance admin, the financial record is handled by Mas Ivan who also helps make the orders, and receives guests when someone comes to order directly to the office. The problem of recording arises when employees suddenly have to shop for ingredients, for example: when cooking less than 1 kilogram of vegetables, employees often forget to ask for a receipt or the seller didn't provide any receipt. Because usually, the supplier cannot shop in small quantities or specific commodity out of stock. Furthermore, regarding marketing issues, in Nurma Catering there is no special manpower. In terms of branding, Nurma Catering has a permanent logo, website, Instagram, and is easy to find on Google but yet to be optimal. There is no specific strategy for marketing, because so far Nurma Catering only relies on word of mouth.
5. 5<sup>th</sup> Visit, Problem Identification and Solution Implementation Plan
 

It was found that there were several main problems from SMESs, such as not having employee SOPs which included: SOPs for purchasing raw materials and SOPs for Grooming guests who came to the office and payments method. Second, Nurma Catering does not have a marketing strategy that includes attractive product photos, social media that has not been fully utilized and there is no menu display update that is part of the Marketing Communication.
6. 6<sup>th</sup> Visit, Implementation
 

On the sixth meeting, the owner and author made an appointment for product photos and discussed making SOPs, recruiting admins, re-evaluating, and looking at competitors' social media, menus and company profiles as benchmarks for improvisation in a better direction. The author brought a team of photographers to take some photos of the prepared Nurma Catering menu.
7. 7<sup>th</sup> Visit, Implementation (Creating Whatsapp Business)
 

Whatsapp Business was created so that Nurma Catering can be more optimal and efficient in serving customers, the first time they chat. As for some of the setups made on Whatsapp Business, these are:

  - a. Adding "greeting message" for customers initial conversation
  - b. Memasang Nama jelas dan logo Nurma Catering
  - c. Adding "Catering" as bussines categoric
  - d. Adding operational work, 08.00 – 17.00 WIB
  - e. Adding profile summary of Nurma Catering
  - f. Adding a google map geolocation so the customers can easily find out the location of Nurma Catering
  - g. Adding Email Address
  - h. Adding Call to Action directly to Nurma Catering's Instagram as an added value
  - i. Adding some Shortcuts to reply to chats quickly. The menu creation process is currently in progress.
  - j. Add "leave message" when admin off duty.
8. 8<sup>th</sup> Visit, Implementation (*Company Profile*)
 

The author helps SMES owners create a Company Profile which will later serve as a promotional tool to B2B customers. Company Profile Consists of an introduction to Nurma Catering, the services offered, registered letters, permits, and menu.
9. 9<sup>th</sup> Visit, Implementation (SOP socialization)

At the ninth meeting, socialization of the SOP was given to the newly recruited admin who had been recruited by Mba Widya based on author recommendation. Admin is in charge of recording finances and the format of financial reports has been made. Admin must go to the Nurma Catering office at least three times a week and receive Nurma Catering's Whatsapp messages, coordinate with the Kitchen and Mas Ivan regarding Inventory, and Recording of shopping receipts, especially sudden shopping.

## V. DISCUSSION

### A. *Implementation of SOP Preparation and Admin Recruitment*

SOPs need to be developed and used as they are an integral part of a successful quality system. SOPs provide information to do the job or task correctly and facilitate consistency in the quality and integrity of the final work result (Rachmi in Herdiyanti, Puspitaningrum, Astuti, & Yuhana, 2018). At the initial stage, discussions with the owner were held to discuss the Standard Operating Procedures which would later be implemented and disseminated to the new admin. Then to compile the SOP, theoretical references are used and adjusted to the work process that will be carried out by the Nurma Catering Admin. The SOP made consists of several parts as follows:

- a. The introduction section consists of the company's vision and mission, the purpose of the SOP, and the scope of the SOP. It is written to explain the purpose of the SOP being prepared and what things are included in the SOP that is prepared.
- b. Flowchart or diagram that describes admin activities.
- c. Detailed explanation of each activity in tabular form. This table describes the objectives, responsibilities, scope, and documents required at each stage.
- d. Examples of formats of supporting documents for Admin activities. The documents included in the Nurma Catering Admin SOP are consumer data documents, chat reply formats, Nurma Catering Menu List, order formats, Down Payment formats, and financial report formats.

Compiled SOP for admin activities are socialized for each content and stage to the new Admin. This is important to do so that the SOP can be applied as a guide for admin activities so that the quality of Nurma Catering services and financial records can be consistent.

### B. *Company Profile Implementation*

The function of the company profile is as the identity of the company, a means of communication, as well as information media. The company profile usually includes the history of the company, company philosophy and culture, welcome from the company owner, vision and mission, company address, human resources, company achievements, and descriptions of the products offered (Kriyantono, 2008). With such a Company Profile function, it is important for CV Nurma Catering to create an adequate Company Profile.

Discussions were held with the owner to find the needs of the Company Profile. From the results of the interview with Mba Widya as the Owner, it found that Nurma Catering is one of the tender candidates from catering vendors, for example at SCTV TV station, because lack of Company Profile, makes the client sometimes finds it difficult to apply for Nurma Catering as a permanent tender. Therefore, the owner wants information about Nurma Catering, Permits Exposure, Types of Services and Menus offered, and equipped with several photos of Nurma Catering's office.

### C. *Digital Marketing Strategy Implementation*

Based on the interview with Mas Ivan as Nurma Catering Manager, there are problems during the Pandemic, such as old customers do not order catering in large quantities. Meanwhile, compared to the other catering, which was still busy during the pandemic, Nurma Catering did not expand its marketing channels. With these facts, researchers are trying to add to the marketing channels carried out by SMES Nurma Catering with digital marketing. According to Chaffey & Chadwick (2016), there is a 5S theory (sell – grow sales, serve – Add Value, speak – get closer to customers, save –save costs, and sizzle – extend the brand online) there is a save factor where digital marketing can help companies to save costs. That way, there are several steps taken to create an efficient and cost-

friendly digital marketing program. In the process of improving the Nurma Catering business model, increasing digital marketing channels can be done by improving the appearance of Instagram and Whatsapp Business.

## VI. CONCLUSIONS AND RECOMMENDATIONS

### A. Conclusions

- a. The results of the problem mapping show that SMESs do not have clear guidelines to support the process of recording financial reports and Front Line activities in replying to customer messages. Therefore, based on the results of discussions and agreements with the owner of Nurma Catering, an admin SOP was prepared consisting of process flow diagrams and explanations to make it clear and easier to implement. The admin works from the Nurma Catering office in Pondok Indah 3 times per week and in charge of recording daily, weekly, monthly financial reports, and replying to customer whatsapp. Based on the results of interviews with the owner of Nurma Catering, during the training process the admin has been very helpful and can speed up the process of replying to customer messages.
- b. The mapping result show that Nurma Catering SMEs need a Company Profile to get potential new B2B customers. Because if you are selected to be one of the catering tenders, you will need a complete business letter permit and company background information. Therefore, a Company Profile has been compiled that consists of Background, Permit, Nurma Catering Menu, Location of Nurma Catering and Contacts.
- c. From the mapping results it was found that Nurma Catering does not have a specific digital marketing strategy and has not utilized their social media to its full potential. Therefore, the author and the owner agreed to use Instagram as a promotional tool and take advantage of Whatsapp Business. As a result, since being active on Instagram, Nurma Catering has gotten 23 new customers who ordered the Catering Box, Rantangan and Tumpeng Menu. Through Whatsapp Business which has been set up with auto reply, the addition of a catalog and a location pin has helped Nurma Catering in speeding up replies to its customer messages.

### B. Recommendations

- a. Recruited admin need to be given informal and upgrading training regularly to help Nurma Catering in the long term in managing financial reports and updates to menus or pricelists and must always respond quickly to Whatsapp customers.
- b. Special employees are required for marketing and handling social media. As we can see, it is better for admins specifically for bookkeeping and finance so they can concentrate and not disturbed nor confused about the jobdesk.
- c. Company Profile and existing menus need to be updated regularly if there are changes, they must be updated immediately.
- d. For Inventory recording needs, a Point Of Sale application is needed (Majoo, Moka, and Pawoon)
- e. Improvements are needed in the physical facilitation of Nurma Catering, such as office and kitchen renovations.

## **Improvement In Operational Cost Efficiency And Increasing Net Profit In Duck Egg Farming MSME Business : Business Coaching Of Duck Egg Farming Business**

Bayu Ari Sadewo<sup>1</sup>

<sup>1</sup>Magister Program. Faculty Of Economic And Business, University Of Indonesia.

### **Abstract**

*Among all size categorized and classification of enterprises ranging from micro, small and The large enterprises, Indonesia has the potential in MSMEs due to its large growth of economic Trend and surplus of its population. For accommodate this benefit, especially in product of raw materials enterprises, the business unit needs to have good holistic performance operational cost efficiency. If the cost could be decreased the MSME could handle the budget for taking care of another different potential, for example make the business even broader, In further developing the company performance for gaining more net profit, it is required to have well sense of management in numbers of major areas, one of the important in operational cost and area of management. Located city of Bekasi, Mr. Surya Duck egg farming categorized as small/micro sized enterprise with its core business activities in producing and farming duck egg. This study uses business coaching techniques utilizing qualitative method as data collection to mapping existing condition and problems detection of this MSME in order to development and implement solutions of improvement. Four number problems found indicated by high cost of daily operational and small net profit. The solution for these problems is maximizing MSME potential, uniformed operational procedure, and find substitutive feed for the duck itself. The main goal for this business coaching, more decreasing in operational cost due to operational efficiency then make profit as much as could for gaining more lot of net profit in this MSME duck egg farming Business.*

*Keywords—Business coaching, Operation Efficiency, Net-Profit, Duck Egg farming, MSME Business.*

---

### **I. INTRODUCTION**

Among types of enterprises ranging from micro to macro, MSMEs (micro, small, and medium enterprises) significantly contribute this nation/country economic growth. Retrieved from Kompas.com (Catriana : 2021), MSMEs contribute approximately 61.07 percent to the GDP which estimated 8,573 trillion Rupiah. Ministry of Cooperatives and Small and Medium Enterprise (MenkopUKM : 2021) further states in 2019 MSMEs had contributed 7,034.1 trillion rupiah to GDP. Current amount increased since last year which only recorded at 5,721 trillion. In addition, MSMEs export value has increased by 15 percent dated from 2018 to 2019, estimated 293,8 trillion rupiah. Not just only contribute in the economic growth, MSMEs also contributed huge in employment numbers. Ministry of Cooperatives and Small and Medium Enterprises (2021) stated MSMEs has contributed at least to 96.92% workforce, which in 2019 estimated 119.6 million people.

There are many forms in MSME business in Indonesia, which the most number of them, therefore if we talk about Food business and its production, one of the source is certainly the egg, the egg farms is one of the type of farms in Indonesia, the duck's egg is one of the main components of the many of the Indonesian favourite meals, such as Martabak and thousands of the good meals come from duck eggs as ingredients, also it is believed the duck egg is one of the good supplements for gaining more stamina, especially for the men stamina due to it nutrition that contained in it (Nuruzzakiah : 2016).

Unfortunately the duck's eggs farmers has low on Net-profit to sustaining their Micro sized business, there are many problems they had to dealt without helps or guidance from the research approach, of the greatest problems of the duck's egg farmer is the lack of the net-profit, due to the high maintenance cost also their operational cost. Therefore it is urgently required to take action to improvised this problem into solving effort of this problems, the egg quality which is the main product for this business is depend on the protein intake from what was being consumed / feed the duck who made this egg into the well quality (Mihir Sarma : 2013). Then the next issue for the farmer is lack of the business

process, how to turn their eggs into being Priced Well, these issues need to be solved too as important matters, for answering the main objective, gain the better profit for the duck's egg farmers.

## II. LITERATURE REVIEW

### A. *Operation Cost*

Operational cost is the amount of money, taken from resources budget of a business unit, being use for business unit fuel like fuel that being use in a car (urmanbetova : 2009)

### B. *Micro, Small, and Medium Enterprises (MSMEs)*

According to record in laws and government regulation UU no. 11 year of 2020 article 87 concerning job creation (*cipta kerja*), MSMEs are categorized based on business capital, turnover, net worth, annual sales results, investment value, incentives and disincentives, application of environmentally friendly technology, local content, or the amount of manpower in accordance with criteria of each business sector. The regulation further elaborates MSMEs criteria in government regulation no.7 year of 2021 concerning convenience, protection, and empowerment of MSEs article 35 as:

- a. Micro - Net worth of below 50 million rupiah with lower than one billion business capital and lower than 300 million annual sales.
- b. Small - Net worth between 50 to 500 million rupiah with one to five billion business capital and between 300 million to 2.5 billion annual sales.
- c. Medium - Net worth between 500 million to 10 billion rupiah with 5 to 10 billion business capital and between 2.5 billion to 50 billion annual sales.

### C. *Cost Efficiency.*

As we know, resources or budget are very limited, therefore every effort need to be carefully taken, as for daily operational, there are lot of efficiency need to be implemented, for maximizing the value of our limited resources / budget (Bonnanno : 2013)

### D. *Net Profit.*

Net Profit is a term that amount of money, that has been calculated from our total revenue, and being calculated again against our operation cost that had been spent, therefore if we could implemented well the term of cost efficiency, we could decreased the operational cost, then it would be raised the total of net profit (Jayathilaka : 2020)

## III. RESEARCH METHODOLOGY

This study applied a qualitative research method. Qualitative research is a method to understood how phenomenon happened and its caused (Cooper and Schinder : 2014). (Greener : 2008) stated the focus in data gathering in a qualitative approach is the organization itself, the business difficulties that happened on the field, and its internal and external factors. The data gathering method in this research is by conducted deep interviews and observation for primary sources. The secondary source of data gathered from MSMEs annual sales and marketing documentation, and study literature of the subjects researched. The population of this research is the employees and director of MSME with a total of six people. The sample selected in this study was six employees and director of the MSME with a total of seven people.

To identify problems and devised solutions for the MSME, coach followed several steps by utilizing a variety of analysis tools and data gathering methods. To gather data and information regarding current conditions in the MSME, the coach made an interview guideline based on management basic knowledge in the field of operating efficiency, marketing, and cost structure. The data and information gathered then processed several analyses to identify and compare MSME's current condition to ideal condition on company level, internally, and externally. At the company level, coach analyses data utilizing BMC (business model canvas) to identify the partner. For the external condition

of MSME coach utilizing PESTEL, porter’s five forces, and STP (segmentation, targeting, positioning) tools to identify and compare MSME’s current condition to the market in general. For the internal condition of MSME. Coach then formulates the identified data and information into SWOT-TOWS tools to identify MSME’s strengths, weaknesses, opportunities, and threats. Coach then did gap analysis to compared the current MSME’s conditions with its ideal counterparts. To decide priority and significance of problems to address, the coach along with the director discussed the findings based on MSME’s availability, time allocated, resources, and its short-term target utilizing pareto analysis tool. Lastly, the coach utilizes fishbone diagrams to identify main causes of the problem addressed in pareto to ensure the problem will not recur in the future.

IV. RESULT AND DISCUSSION.

The two main goals of this coach for this MSME are stated below:

- a. Decrease the operational cost and use all resources efficiently as it could.
- b. Gaining more (increasing) Net Profit.

Price Comparations of duck's egg between of Direct Marketing sales vs Collectivication sales by middleman			
Product type	Classification product	Middleman	Remarks
duck's egg product	<b>Middleman collectivication sales</b>		
	duck egg with stadard size	Rp. 1900 / egg	Standard sized duck egg above 75 gram per egg
	small sized duck egg, smaller than stadard egg	Rp. 1700 / egg	small sized egg, due to duck in early stages in laying egg weight below of 75 gram per egg
	<b>Direct Marketing / Direct Sales</b>		
	duck egg with stadard size	Rp. 2250 / egg	Standard sized duck egg above 75 gram per egg
	small sized duck egg, smaller than stadard egg	Rp. 1950 / egg	small sized egg, due to duck in early stages in laying egg weight below of 75 gram per egg
duck meat	price with direct marketing	Rp. 89.000 / duck	<b>duck with productivity below tolerable rates below 45%, should be sold as duck meat product for purchasing another new duck</b>
	Direct Marketing	Rp. 93.000 / duck	

Fig 1. Price comparison of duck egg (Source : coaching analysis study, 2022)

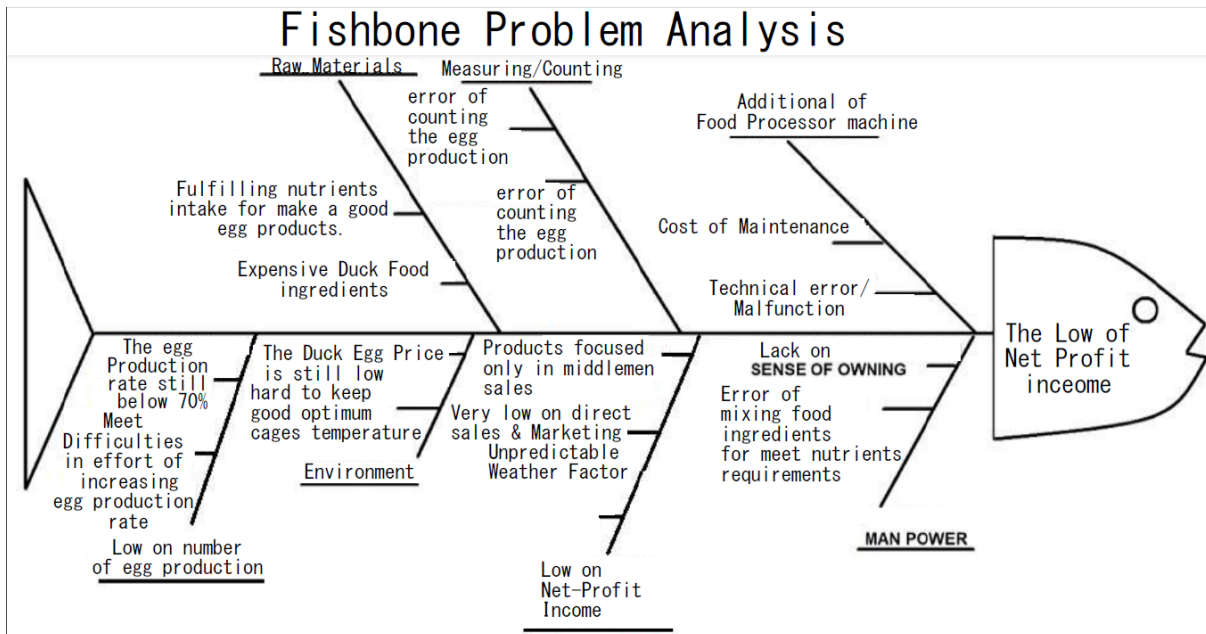

Fig 1 above, is showing the price different between sales by doing direct sales, and sales via middleman, there are price gap been found, in between Rp 350,00 higher than sales through the middle man. Therefore direct marketing must be enforced, due to achieving the main objective of increasing the net profit income.

Fig 2 shows that the most important things as weighted and sorted through pareto diagram analysis, source : coaching analysis, 2022

No.	Important issues	score	wright	contribution	distribution	accumulation
1	Widening and development in product sales	8	9	72	41%	41%
2	Cost and resources efficiency	6	7	63	36%	76%
3	inovation in daily operation	5	6	30	17%	93%
5	logs of detailed financial reports	4	3	12	7%	100%
TOTAL :				177	100	

Based on finding due to the pareto analysis, the most difficulties has been identified number one is, Widening and development in product sales, it is very helping to leveraging to increasing the revenue of this MSME business, beside the number one problems, there are several problems that need to maintained and solved efficiently to accomplished the great objectives in increasing total net profit also decreasing the operational cost in this business. But in the farming of duck egg business, there are several problems is need to take care closely.

The Picture above, show the fishbone of problem analysis, each main problem has the greatest issue and additional factors, Source : Based on researcher field analysis find.

This business very rely on living creature, the main business of this MSME it is the duck itself, if we could handle this smoothly well, increasing net profit would be a piece of cake, There were many difficulties and challenges in this coaching activity that must be solved : the availability of food for the duck, the nutrients should be achieved for the duck could lay the good quality egg, then the good quality egg would be good priced and gained trust from the market(user/buyer of the egg products), to fulfil the nutrients need, there were modification and substitutions, for example the food sometimes being mixed with the vegetable that being left-over from the nearest market, then we used the head of the shrimp for catching the protein requirements for the ducks, as stated from numbers of studies, Duck would be ready laying good quality egg if the duck nutrients requirements for protein achieved in 14% per feed serving, the duck food would be given thrice a day, in the morning around 7:00, afternoon at around 12:00 and last for the day at 18:00, for preparing this feed, it is required numbers of effort, the major things about this duck feed issues are :

- a. Ducks need to achieved the minimum nutrients requirements.
- b. For good quality duck feed, need to be precisely divided as well of all ingredients. Therefore the portioning of duck feed would be another issues/difficulties of timing and work forces.

Those critical risk, if the duck nutrients input compromised, the duck would be delayed to lay her first egg, also affected for full-grown duck in duck laying her egg, the egg number would be decreased if the number of the nutrients not be fulfilled properly. By done some effort that stated as above, the egg production has increasing, since doing coaching activity until the month of march, the egg production counts has ben risen to 75% since the start of this coaching activity. Other major things for achieved the two both objective were, make the market going even broader, we cut the buy process of the duck eggs buying chain, we sale the duck egg directly to the nearby market, by doing this effort the net profit has been increasing by 15%. The main difficulties is gained the new market who want to procured our egg products.

The next challenge is to maintain what has been done, the number of daily eggs production has been increased for now, then the maintaining programs wellness of the coachee and his MSME was another great issue, close watch and close attention of this MSME daily operation and guiding directly sometimes still need to do.

## V. CONCLUSIONS

From the research effort has been done, there are numbers of conclusion from this Business coaching finding activity on this MSME Duck Egg Farming :

- a. The Duck need to be well feed, as well the nutrients intake The egg quality is depends on the how much food required by the ducks, also the nutrients intake need to be enough, to able to produce high quality egg, and also for catching up the target of number of egg being produced by the duck itself.
- b. The Net Profit income could be increased, by the direct marketing effort.

As the middleman could not offer the well price of the products, we have to take a brave action, to make a direct sales to other parties, during this

- c. Innovation make easier way, to maintain this business.

One of the great motivation has been done is by made a food processor mixer, due to using food processor for making the duck food, we could more time to do other works, and decreasing effort of making everyday food for the duck, the food processor mixer is made the duck food more blended well, therefore, the nutrients intake for all of the duck needed is easily monitored and good result is to be more easier to meet.

- d. The Duck Egg Production rate target was met as targeted. As the projected before, for good sustaining this business. The egg production rate is need to be high above 80%, recorded on June 2022, the production rate is on 84.20%.

The Graphic show that egg production rate on each month, as October 2021 – may 2022, the production rate is touched over the 80% egg.

Source: based on the researcher field analysis

#### Recommendations

- The production duck egg rate which recorded in June 2022, as 84.20%, is still being improved, with the better care of many factors, such as food and its well nutrients intake, it is not impossible to make projection target that in July 2022, the duck egg production rate could be risen to 85% more.
- The great effort of this business, to make it gain more net profit, is by the direct sales methods, the middleman offer not too good price, therefore, it is strongly advised that this MSME business needed to make broader their marketing effort, to make a new market channels to make a direct sales of its products.
- The Innovations it the great way, to decreasing the operational cost, such as a food processor devices, which could automatically mixing the all ingredients for the ducks. The devices itself make workers of this MSME less effort due to processing the everyday's need of duck food.

## The Effect of Good Corporate Governance and Ownership Structure on The Profitability of Companies Listed in The Jakarta Islamic Index

Dr. Ir. Nora Amelda Rizal, M.SAE, M.M<sup>1</sup>. and Azmi Syakir Aprianto<sup>2</sup>

<sup>1,2</sup>School of Economic and Business, Telkom University, Indonesia

### Abstract

*This study aims to see the effect of Good Corporate Governance (GCG) and Ownership Structure on profitability. Previous studies have continuously examined the effect of GCG and Ownership Structure on profitability. Good Corporate Governance in this study will be represented by the Board of Commissioners and the Audit Committee, while the Ownership Structure in this study will be represented by Managerial Ownership and Foreign Ownership. In addition, profitability in this study will be represented by Return on Assets (ROA). The sample in this study consisted of 32 companies that were consistently listed on the Jakarta Islamic Index for the 2020-2021 period. The data taken are the proportion of the Board of Commissioners, the proportion of the Audit Committee, the composition of Managerial Ownership, the composition of Foreign Ownership, and the company's Return on Assets (ROA) value. The research method used the panel data regression model selection test, classical assumption test, panel data regression analysis, t statistic test and F statistic test, and R<sup>2</sup> determination coefficient test. The results showed that the Board of Commissioners and the Audit Committee did not have a significant effect on Profitability, while Managerial Ownership and Foreign Ownership had a significant effect on Profitability. However, the Board of Commissioners, Audit Committee, Managerial Ownership, and Foreign Ownership simultaneously have significant effect on Profitability.*

*Keywords—Good Corporate Governance, ownership structure, profitability*

---

### I. INTRODUCTION

The Indonesia Stock Exchange (IDX) offers sharia stocks as an option for investors in the capital market. Islamic stocks are considered to have advantages in terms of relatively stable stock movements and tend to produce a fairly high level of return (CNBC, 2019). Not only that, the Islamic capital market is also considered to have a positive prospect in the future due to the high demand side which encourages the growth of the Islamic capital market. The growth of the capital market over the past 10 years has been supported by millennial investors or young people and this is in line with the population in Indonesia which is dominated by age with categories productive or young age. The Covid-19 pandemic had made the market falter, but throughout 2021 the growth increased again. The Islamic capital market industry grew significantly in terms of the volume of transactions carried out by Islamic stock investors. The growth of the Islamic capital market is supported by regulations, of which here are at least 20 fatwas in the Islamic capital market sector as well as 13 POJK and SE OJK (Republika, 2022).

The prospect of Islamic capital market performance is believed to continue to grow. This is supported by the development of the Islamic capital market over the past 10 years in terms of capitalization, average transactions, and the number of investors (Liputan6, 2021). One type of sharia stock offered by the IDX is the shares contained in the Jakarta Islamic Index (JII). This index is a sharia stock index consisting of the 30 most liquid Islamic stocks listed on the IDX. Over the past 10 years, the market capitalization in JII in 2011 was recorded at Rp1.414 trillion, to Rp2.015 trillion in 2021 (OJK, 2022).

The profitability ratio has an important role in the company. This ratio is also a consideration for stakeholders such as investors when they want to invest in a company. According to Ebert & Griffin (2015:508) profitability ratio is the strength of profit for owners where this ratio is important to know whether the company is able to pay off its short-term or long-term debt. One type of profitability ratio is Return on Asset (ROA). According to Kasmir (2018:201) Return on Asset is a profitability ratio that measures a company's ability to generate returns based on the number of assets owned by the company. The implementation of GCG is an important thing for companies to be able to help achieve their business goals. The principles of GCG implementation must continue to be applied, even though at one time the company is in a bad time due to a disaster or disaster that is certainly undesirable, for example during a

pandemic situation. In 2020, there was a pandemic that resulted in a significant impact in various countries in the world, namely Covid-19. The Covid-19 pandemic has become a very dangerous pandemic due to the very fast rate of spread. In Indonesia, Covid-19 first began to detect in March 2020. At that time, Covid-19 continued to spread and became a problem with a big impact on Indonesia. Almost all industrial sectors have been negatively affected by the covid-19 virus. Of all industries, only 37% of industrial companies operate normally and another 60% are paralyzed or not operating (Putri, 2020). During the current pandemic, Good Corporate Governance (GCG) can help companies to survive during the pandemic and is a foundation of the strategy taken by the company. In this rapidly growing economy and business development, especially during a pandemic like today, companies are required to be able to continue to implement GCG in accordance with existing regulations (Olavia, 2021). According to BPKP (2021) there are reasons why GCG is a necessity for companies, namely practical reasons and academic reasons. If you look at it from practical reasons, GCG is needed because of the experience of the United States which restructured corporate governance due to the market crash in 1929. In addition, the current financial crisis in America is also caused by the non-implementation of GCG principles, so there are several cases of financial scandals, such as in Enron Corp., Worldcom, and Xerox involving the company's top executives. Based on academic reasons, GCG is needed and arises because it is related to principal-agency theory which is a form of avoidance of conflicts between *principals* and their agents. The conflict arises because there are differences in interests that require management so as not to cause losses to the parties. This study will focus on the mechanism the effect of GCG and ownership structure on profitability.

## II. LITERATURE REVIEW

### A. GCG, Ownership Structure, and Profitability

Good Corporate Governance (GCG) is a form of decision by positioning the company in a much more organized and structured manner with a work mechanism that complies with the business rules that have been outlined and is ready to accept sanctions if these rules are violated. This is done as a form of implementing corporate governance to achieve the business goals that have been set (Kuncoro, 2020). The implementation of *Good* Corporate Governance also has the main objective so that the company can be managed properly according to applicable regulations, so that not only the company gets the profit, but also the company's shareholders and all stakeholders involved in it. In this study, Good Corporate Governance will be represented by the Board of Commissioners and the Audit Committee. According to Susilo (2017) the Board of Commissioners has the authority to supervise the policies and processes of the business carried out by the Board of Directors. In addition to supervising general matters, the Board of Commissioners can also supervise matters of a special nature, such as financial audits and supervision of all forms of policies carried out by the Board of Directors, meanwhile, The Audit Committee is a corporate organ that can be appointed and dismissed by the Board of Commissioners. The Audit Committee has the task of assisting the Board of Commissioners in ensuring the effectiveness of internal control and the effectiveness of the implementation of internal and external duties of auditors.

Ownership structure is a governance mechanism in the company that is useful for controlling agency problems that occur. This is especially important in weak governance environments such as external auditors, agencies, market of corporate control, and institutional frameworks. In addition, the ownership structure can control agency matters or the selection of the company's board to carry out management and supervision. The establishment of the company's board structure is a step to balance the interests of different stakeholders (Queiri et al., 2021). The ownership structure in this study is represented by managerial ownership and foreign ownership. According to Munisi et al. (2014) managerial ownership is the share ownership of a company owned by the management of the company which is measured by the percentage of the number of shares owned by management. Meanwhile, according to Herawanto et al. (2017) foreign ownership is a form of individual ownership of foreign nationals, foreign business entities, or foreign governments that invest in the territory of the Republic of Indonesia. These investment activities are carried out to conduct business in the territory of the Republic of Indonesia, both those who use foreign capital fully and those in contact with investors from within the country.

According to Brigham & Houston (2018:139) profitability is a financial ratio that shows a combination of the influence of liquidity, asset management, and debt on the results of operations carried out by a company. This ratio will also describe the final result of all financial policy and operational decisions. One of the profitability ratio is

Return on Assets that measures a company's ability to obtain net income based on the number of assets owned by the company by linking net income to the company's total assets.

#### B. Previous Research and Hypotheses Development

There are previous researches that study about the effect of good corporate governance and ownership structure on profitability. Saidat et al. (2019) and Arief & Susan (2020) in their research revealed that the board of commissioners did not have a significant impact on profitability. This is different from the research conducted by Puni & Anlesinya (2020) and Queiri et al. (2021) which reveals that the board of commissioners has a significant effect on profitability. Bansal & Sharma (2016) and Putra & Nuzula (2017) in their research revealed that the audit committee has no significant effect on profitability. This is different from the research conducted by Darko et al. (2016), Ofoeda (2017), Suttipun (2018), Puni & Anlesinya (2020), and Queiri et al. (2021) which shows that the audit committee has a significant effect on profitability. Putra & Nuzula (2017) in their research revealed that managerial ownership has no significant effect on profitability. This is different from the research conducted by Saifi (2019) and Queiri et al. (2021) which shows that managerial ownership has a significant effect on profitability. Herawanto et al. (2017), Mardnly et al. (2018), Saidat et al. (2019), and Pebriani & Rizal (2020) in their research revealed that foreign ownership has a significant effect on profitability. Based on previous studies, thus we propose our hypotheses

H<sub>1</sub> Board of Commissioners will have significant effect on Profitability

H<sub>2</sub> Board of Audit Committee will have significant effect on Profitability

H<sub>3</sub> Managerial Ownership will have significant effect on Profitability

H<sub>4</sub> Foreign Ownership will have significant effect on Profitability

H<sub>5</sub> Board of Commissioners, Board of Audit Committee, Managerial Ownership, and Foreign Ownership will have significant effect on Profitability

#### RESEARCH METODOLOGY

This research method uses quantitative methods. The population in this study is 42 companies listed on the Jakarta Islamic Index for the 2020-2021 period. The sample was selected using a purposive sampling technique with the criteria of companies that are consistently listed on the Jakarta Islamic Index for the 2020-2021 period. Total of the selected sample is 32 companies for the 2020-2021 period. The data analysis method uses descriptive statistical analysis, panel data regression model selection test, classical assumption test, panel data regression analysis, t statistical test, F statistical test, and determination coefficient test. The following is the operationalization of the variables in this study.

Table 30. Variable Operationalization

Variable	Concept of Variables	Indicators	Scale
<b>Dependent Variables</b>			
Return on Asset (ROA)	Return on Asset is a ratio that measures a company's ability to generate profit based on total assets used (Saifi, 2019).	$ROA = \frac{Net\ Profit}{Total\ Assets}$	Ratio
<b>Independent Variables</b>			
Board of Commissioners (X <sub>1</sub> )	The Board of Commissioners has an important role in overseeing performance and	Board of Commissioners Size = Total members of the board of commissioners	Ratio

	providing advice to the company's directors (Susilo, 2017).		
Ratio	The audit committee is needed in a company because it has the function of assisting the performance of the Board of Commissioners, supervising reports published by the company such as financial statements, and supervising the company's internal implementation of the <i>Good Corporate Governance</i> system (Susilo, 2017).	Board of Audit Committee Size = Total members of the board of audit committee	Ratio
Managerial Ownership (X <sub>3</sub> )	Managerial Ownership is a form of ownership that company managers have over a company (Saifi, 2019).	Managerial Ownership = $\frac{\text{Number of management shares}}{\text{Number of shares}} \times 100\%$	Ratio
Foreign Ownership (X <sub>4</sub> )	Foreign Ownership is a form of ownership of a company owned by a legal entity, government, or organization from abroad (Herawanto et al., 2017)	Foreign Ownership = $\frac{\text{Number of foreign shares}}{\text{Number of shares}} \times 100\%$	

### III. RESULT/FINDING

In Table 2. we present the model of panel data. The selected model for panel data is the random effect model. Only two variables, X<sub>3</sub> and X<sub>4</sub>, that have < 0,10 probability value. Therefore, Managerial Ownership and Foreign Ownership (X<sub>4</sub>) partially has a significant effect on the Profitability (Y) of companies listed on JII. Meanwhile, X<sub>1</sub> and X<sub>2</sub> have > 0,10 probability value. Therefore, Board of Commissioners and Board of Audit Committee has no significant effect on the Profitability (Y) of companies listed on JII. The F test is used to determine simultaneously the influence of the independent variable (X) on the dependent variable (Y) by looking at the F-statistical probability values available in Table 2. The F-statistical probability value is 0.064039 which means have < 0.10 probability value. Therefore, the independent variables of the Board of Commissioners (X<sub>1</sub>), Audit Committee (X<sub>2</sub>), Managerial Ownership (X<sub>3</sub>), and Foreign Ownership (X<sub>4</sub>) simultaneously have a significant effect on the Profitability (Y) of companies listed in JII.

Table 31. Model of Panel Data

Variables	Coefficient	Std. Error	t-Statistics	Prob.
C	0,022277	0,091762	0,242770	0,8100
X <sub>1</sub>	0,041315	0,093307	0,442783	0,6614
X <sub>2</sub>	-0,028703	0,135073	-0,212496	0,8333
X <sub>3</sub>	-0,022385	0,008811	-2,540666	0,0171
X <sub>4</sub>	0,064078	0,024096	2,659247	0,0130
Adjusted R-squared	0,164457			
Prob(F-statistics)	0,064039			
Durbin-Watson stat	1,871941			

#### IV. DISCUSSION

The Board of Commissioners has no significant effect on Profitability (Y). These results are in line with previous research from Saidat et al. (2019) and Arief & Susan (2020) that showed the Board of Commissioners had no significant effect on Profitability. However, other studies from Puni & Anlesinya (2020) and Queiri et al. (2021) have shown that there is a significant influence of the Board of Commissioners on Profitability. The Board of Commissioners has not been optimal in carrying out its performance, so it cannot affect the profitability of the company. In this study, this was proven by the absence of a significant influence between the Board of Commissioners and Profitability.

The Audit Committee has no significant effect on Profitability (Y). These results are in line with previous research from Bansal & Sharma (2016) and Putra & Nuzula (2017) that showed the Audit Committee had no significant effect on Profitability. However, other studies from Darko et al. (2016), Ofoeda (2017), Suttipun (2018), Puni & Anlesinya (2020), and Queiri et al. (2021) have shown that there is a significant audit committee's impact on profitability. The Audit Committee has not been optimal in carrying out its performance in the supervisory and control functions of the company's management, so it cannot affect the company's profitability. In this study, this was proven by the absence of significant influence between the Audit Committee and profitability.

Managerial Ownership has a significant effect on Profitability (Y). These results are in line with previous research from Saifi (2019) that showed Managerial Ownership had a significant effect on Profitability. However, other studies from Putra & Nuzula (2017) have shown that there is no significant effect of Managerial Ownership on Profitability. Amount of managerial shareholdings may indicate a similarity of interests between management and shareholders. Research objects that have a large Managerial Ownership composition may have low agency conflicts due to the similarity of interests between company management and shareholders.

Foreign Ownership has a significant effect on Profitability (Y). These results are in line with previous research from Herawanto et al. (2017), Mardnly et al. (2018), Saidat et al., (2019), and Pebriani & Rizal (2020) that showed Foreign Ownership had a significant effect on Profitability. Companies that have foreign ownership in their share ownership structure can be said to have succeeded in achieving the company's goal of increasing profits for all company stakeholders. This is caused by the large number of foreign parties who invest in a company can increase the value of the company. In addition, the increasing value of the company will also invite more new investors who will invest in the company.

## V. CONCLUSION AND RECOMMENDATION

The findings show that some of the results from this study are consistent with the previous articles which view ownership structure has a significant influence on profitability, although in this study GCG has no significant influence on profitability. The company is expected to improve the composition of managerial management because it is proven that managerial ownership has a significant effect on profitability. The management of companies that also own shares in the companies they manage tend to improve their performance and make policies that can benefit shareholders, including those who also own the number of shares in the companies they manage. If the policies made are profitable, then they will also receive benefits like other shareholders, so that the company's activities can run better to generate profits for all stakeholders. Then, the company is expected to increase foreign ownership as a step to increase the value of the company and become another way so that the company is able to get more capital that will support the company. However, the amount of the composition of Foreign Ownership must be adjusted to the rules and policies of each company regarding the maximum limit of foreign investors who can invest in the company, so that the company can also provide opportunities and space for other investors to be able to invest. Investors are expected to consider Managerial Ownership and Foreign Ownership in a company when they want to invest. The existence of company management who also owns shares in the company it manages makes management will also make policies that benefit investors as shareholders. In addition, investor must consider the profitability ratio as one of the benchmarks when making an investment. One of these profitability ratios is Return on Asset which describes to investors how the company's ability to generate net profit based on the total assets owned by the company. Companies that can attract many investors including foreign investors will be able to raise more capital to support the company's activities, so that the company can carry out its business activities and provide benefits to companies and investors by utilizing aset owned where the assets are of course also financed based on the capital obtained by the company. This research was conducted by focusing on the pandemic situation only, namely 2020-2021. Furthermore, it is expected to be able to extend the period of the research year, for example by focusing on the state of affairs after the pandemic. In addition, researchers can then also focus on comparing the period of the study year, for example comparing research on pre-pandemic, pandemic, and after-pandemic circumstances.

## Analysis of Intellectual Capital Disclosure on the Kompas 100 Index in Indonesia

Vaya Juliana Dillak<sup>1</sup>, Syifa Denali Kairinnisa<sup>2</sup> and Siska P Yudowati<sup>3</sup>

<sup>1,2,3</sup>Departement of Accounting, Faculty of Economics and Business, Telkom University, Bandung, Indonesia

### Abstract

*Intellectual capital disclosure is the delivery of information about the intellectual capital owned by the company to meet the needs of stakeholders. Disclosure of intellectual capital is a form of information transparency that reduces information asymmetry. This study aims to determine the industry type, CEO duality, ownership concentration, and profitability effect on intellectual capital disclosure. Disclosure of intellectual capital needs to be done by the company as a form of management accountability to stakeholders. The implementation of intellectual capital has been implemented since the issuance of PSAK No. 19, which regulates intangible assets. However, in this regulation, PSAK does not explain the provisions for the measurement and recognition of intangible assets, so it can be concluded that PSAK recommends companies to disclose their intangible assets, and disclosure of intellectual capital is voluntary. There are still inconsistent research results on CEO duality, ownership concentration, and profitability variables on intellectual capital disclosure, so further research is needed. This research method is quantitative. This study's population is companies included in the Kompas100 index on the Indonesia Stock Exchange during the 2017-2020 period. The sample selection used purposive sampling to obtain a sample of 187 observations. The results showed that the type of industry positively affected the disclosure of intellectual capital. CEO duality and profitability have a negative effect on intellectual capital disclosure. Meanwhile, the concentration of ownership does not impact intellectual capital disclosure. Investors are expected to consider investing in companies with a high IC-intensive industry category because companies with this category tend to disclose more intellectual capital*

*Keywords— CEO Duality; Intellectual Capital Disclosure; Ownership Concentration; Type of Industry*

---

### I. INTRODUCTION

The company's financial statements are essential for making investment decisions because they contain information on the work that has been achieved by the company in a certain period and can be used as an illustration of its performance in the future. In addition, financial statements also act as accountability for the management of the company's resources. In the disclosure of information, according to Yadiati & Mubarok (2017), financial statements have two types of disclosures, namely mandatory disclosures that must be made based on applicable regulations. Voluntary disclosure is a disclosure that is not required by relevant regulations, namely intellectual capital. Intellectual capital is information and knowledge applied in business activities and processes to manifest company value. In general, intellectual capital consists of 3 elements, namely knowledge about external parties (relational capital), human knowledge (human capital), and learning about the company's internal (structural capital). Intellectual capital that is utilized optimally will increase sustainable competitive advantage. Companies can create value added (added value) by updating products or services that are more qualified and varied (Ulum, 2017).

Disclosure of intellectual capital needs to be done by the company as a form of management accountability to stakeholders. Stakeholders have the right to know all company activities and ensure that the company's activities are carried out as expected. This is in line with stakeholder theory, which states that companies are obliged to report all company information, carry out their activities by stakeholder expectations, and increase company value (Suwarti et al., 2016). Furthermore, disclosure of intellectual capital can provide validity to the company's actual value and reflect the company's ability to generate wealth. The more comprehensive disclosure of intellectual capital will benefit the company because it increases the completeness of financial statements and is one of the bases for decision-making for stakeholders (Widiatmoko & Indarti, 2018). Disclosure of intellectual capital needs to be considered to expand its company exposure due to rapid changes in technology and information, which also impact the world economy. The company's ability to create sustainable innovation, use knowledge, and develop human resources is also essential to maintain sustainability and add competitive value to the company (Delvia & Alexander, 2018).

The implementation of intellectual capital has been implemented since the issuance of PSAK No. 19, which regulates intangible assets. Based on PSAK, intangible assets are non-monetary assets that can be recognized as assets without physical form. Intangible assets include the design and implementation of new systems or procedures, intellectual property rights, science and technology, licenses, knowledge of brands, and trade markets (IAI, 2021). However, in this regulation, PSAK does not explain the provisions for the measurement and recognition of intangible assets, so it can be concluded that PSAK advises companies to disclose their intangible assets, and disclosure of intellectual capital is voluntary (Puspitarini & Panjaitan, 2018).

To facilitate investors in making investment decisions, the Indonesia Stock Exchange provides stock indexes. The stock index is a statistical measure that includes price changes of various stocks, determined using specific techniques and parameters and evaluated periodically. as of November 2021, the Indonesia Stock Exchange has 38 stock indices, one of which is the Kompas 100 index (IDX, 2021). The Kompas100 index is measured based on companies with a significant level of liquidity and market capitalization. This index was published on July 13, 2007, in collaboration with Kompas Media Group, the publisher of the Kompas Daily Letter. This index is updated regularly every six months, namely, in February and August; companies must maintain their performance to remain sound and continue to improve, not to lose competitiveness with other companies, and carry their position. However, not all companies can maintain their role in the Kompas100 Index. The number of companies that came out of the Kompas100 Index in the 2017-2020 period fluctuated. The number of companies that came out of the Kompas100 index was the lowest in 2018, with 15 companies. In comparison, the most significant number occurred in 2019 as many as 26 companies, and in 2020 as many as 23 companies came out of the Kompas 100 Index. This shows that some companies cannot maintain their position on the Kompas100 Index list. There is a risk of uncertainty over investment, so investors need other considerations in making investment decisions. One of them is by looking at the disclosure of the company's intellectual capital. Companies with a high level of intellectual capital disclosure can reduce the uncertainty risk in large market capitalization to become an added value for investors to invest in the company. Based on this phenomenon, it is essential to know the level of intellectual capital disclosure in companies included in the Kompas 100 index.

This study focuses on four variables that investors consider: the type of industry, CEO duality, ownership concentration, and profitability. Many studies influence companies in analyzing the level of intellectual capital disclosure. The results of research conducted by Widiatmoko & Goreti (2018) type of auditor and concentration of ownership do not affect intellectual capital disclosure. Leverage and profitability have a positive effect on intellectual capital disclosure. Similar to the results of Sinaga & Sudarno's research (2018), family ownership, foreign ownership, CEO duality, and the number of audit committee meetings significantly positively affect intellectual capital disclosure. The duality of family and independent directors does not affect intellectual capital disclosure. Kamath's research (2016) shows that the type of industry, type of auditor company, leverage, research and development, profitability, and company size significantly positively affect intellectual capital disclosure. Meanwhile, Alfraih's research (2018) shows that board size, external directors, CEO duality, block holder ownership, and government ownership affect intellectual capital disclosure.

Based on the results of research that has been carried out both in Indonesia and outside Indonesia, there are still inconsistent results; therefore, it is necessary to re-examine the level of intellectual capital disclosure in companies that are included in the Kompas 100 index. This study aims to determine the simultaneous and partial effect of the industry type, CEO duality, ownership concentration, and profitability on intellectual capital disclosure. Research benefits for companies can provide a stimulus and know the urgency to disclose intellectual capital in financial statements. At the same time, for investors, it can be taken into consideration in the decision-making process to invest.

## II. LITERATURE REVIEW

Stakeholder theory states that company management carries out all of its activities based on the expectations and directions of stakeholders and then reports on its activities to related parties. Although there is a possibility that stakeholders do not use this information and do not play a direct role in the company's operations, they have the right to obtain information regarding the implementation of company activities carried out by stakeholder directions and meeting their expectations. The essence of this theory is that companies are required to prosper stakeholders optimally.

Stakeholders are not only shareholders but also employees, suppliers, creditors, owners, and all parties who have an economic interest in the company (Susanto et al., 2019). Managers must have good skills in managing company resources efficiently and effectively to increase the company's value and reduce the risk of possible stakeholder losses. This is supported by understanding the stakeholder environment so that the company can determine the right policies to meet stakeholder expectations of the company. Stakeholders also have the right to know the information and potential of the company (Anna & Dwi, 2018).

Intellectual capital contains information about intangible assets owned by the company to maintain competitive value and help realize the company's strategy effectively and efficiently (Rezki, 2018). According to Bukh in Isnalita & Romadhon (2018), intellectual capital can be defined as intangible assets, including resources, company capabilities, and competencies, to improve performance and add value to the company. Disclosure of intellectual capital is necessary for investors because it can reduce uncertainty about the future and make company valuations more accurate. From this description, it can be said that intellectual capital is an intangible asset owned by a company consisting of human capital, structural capital, and relationship capital. If properly disclosed, intellectual capital can increase the company's value and help investors see the company's future and assess the company's capabilities more accurately.

According to Laurencia & Meiden (2020), intellectual capital disclosure is the delivery of intellectual capital owned by the company to meet the company's information needs to stakeholders. Intellectual capital disclosure includes voluntary disclosures so that companies are given the authority to disclose or not. Disclosure of intellectual capital is a form of transparency of information owned by the company so that it can explain the potential of the company well (Sariningsih & Saputro, 2020). Disclosure of intellectual capital can help increase employee confidence and provide evidence of the company's actual value. Disclosure of intellectual capital has become a concern for companies since the issuance of PSAK 19, which regulates intangible assets. However, in this regulation, PSAK does not explain the provisions for the measurement and recognition of intellectual capital, so it can be said that PSAK advises companies to disclose their intangible assets, and disclosure of intellectual capital is voluntary (Puspitarini & Panjaitan, 2018).

a. *Type of Industry and Intellectual Capital Disclosure*

An organization or corporation with similar business characteristics is the definition of an industry. An industry can be grouped based on the type of company activity (Sariningsih & Saputro, 2020). Based on the Global Classification Standard Criteria in Naimah & Mukti (2019), industries can be grouped based on high IC intensive and low IC intensive industries. High IC intensive industry is a company that utilizes a lot of technology and knowledge in its activities. Common IC intensive industry is a company that still prioritizes tangible assets in the process of its activities and tends to be traditional. The high IC intensive industry tends to disclose more intellectual capital than the low IC intensive industry. This is because high IC intensive industry companies use technology and science a lot in carrying out their company activities, which impact increasing employee knowledge and adding value to the company. To prove the use of intellectual capital, companies disclose intellectual capital to meet stakeholder needs (Naimah & Mukti, 2019). This statement is in line with Sariningsih & Saputro (2020) research that the type of industry positively affects the disclosure of intellectual capital. Companies in the high IC intensive industry category disclose more intellectual capital and optimize intellectual capital more broadly. The results of Rezki's research (2018) also show that the type of industry positively affects the disclosure of intellectual capital.

H<sub>1</sub>: The type of industry affects the disclosure of intellectual capital.

b. *CEO Duality and Intellectual Capital Disclosure*

CEO Duality and Intellectual Capital Disclosure CEO duality is a situation when the CEO of a company holds concurrent positions on the board of directors or board of commissioners in the same company. In addition, CEO duality can also be defined when the leader has a family relationship with the board of directors or commissioners. The duality of the CEO can interfere with independence in decision-making because the CEO prioritizes personal interests, and the delivery of information about the company is not optimal due to inadequate supervision. In the long term, CEO duality will lead to abuse of authority Alfraih (2018). There needs to be a separation of positions to increase

effectiveness and reduce the possibility of conflicts of interest. The duality of the CEO will cause the disclosure of intellectual capital to be not optimal due to a conflict of interest. The results of the research support this statement by Alfraih (2018) and Laurencia and Meiden (2020), which state that CEO duality has a negative effect on intellectual capital disclosure.

H<sub>2</sub>: CEO duality affects intellectual capital disclosure

*c. Concentration of Ownership and Disclosure of Intellectual Capital*

Company concentration is the number of shares owned by groups or individuals with a more significant portion than other parties. In a company, ownership can be concentrated if the share ownership is mainly owned by certain groups or individuals so that the parties have a larger share of shares than other parties. The concentration of ownership will affect the level of supervision of the company's management and its board of directors. This is due to differences in voting rights for majority and minority shareholders, thereby increasing the possibility of conflicts of interest between internal and external parties of the company (Indrayati et al., 2021). This is in line with research by Ulfah et al. (2021) and Indrayati et al. (2021), which state that ownership concentration has a positive effect on intellectual capital disclosure.

H<sub>3</sub>: Concentration of ownership affects intellectual capital disclosure

*d. Profitability and Intellectual Capital Disclosure*

The profitability ratio measures the company's ability to earn profits from assets, sales, profits, and own capital (Sujarweni, 2017). The ratio calculation measures the company's profitability in several periods, which will then be used as the basis for making policy decisions and evaluating the company. While for external parties, the profitability ratio is also used to assess the company's ability to generate profits, see the company's prospects in the future, and as a basis for making investment decisions (Hery, 2016). Profitability measures the company's ability to generate profits from sales, assets, profit, and own capital. Companies with a high level of profitability tend to disclose their intellectual capital more widely than companies with a low level of profitability. This is because the company provides an overview to stakeholders regarding its future capabilities (Rezki, 2018). This is in line with the results of research by Widiatmoko & Indarti (2018) and Rezki (2018) that profitability positively affects intellectual capital disclosure.

H<sub>4</sub>: Profitability affects intellectual capital disclosure

### III. RESEARCH METHODOLOGY

The method used in this research is quantitative research. The data used in this research is secondary data. The population used in this study are companies included in the Kompas100 Index on the Indonesia Stock Exchange for the 2017-2020 period. The sample in this study was determined using the purposive sampling technique. Purposive sampling is a sampling technique with specific considerations. The purposive sampling criteria used in this study are companies included in the Kompas100 Index in a row in the 2017-2020 period, companies included in the non-financial sector, and companies that consistently publish financial reports and annual reports during the study period. Based on the preparation of sample criteria, 51 companies were obtained for four years so that 204 observations were received; for better data quality, an outlier test was carried out so that the total data used in this study were 187 observations. The data analysis technique used is panel data regression analysis, which shows the relationship between the independent variable and the dependent variable of more than one object. Panel data regression is a regression by combining both cross-section and time series data in an equation. This regression was developed to overcome various problems when performing regression with cross-section or time series data separately. These problems include the adequacy of data availability, heteroscedasticity problems often encountered in cross-section data, and autocorrelation problems often in time series data. This regression was also developed for reasons of efficiency in estimating. To find out that the obtained regression equation has estimation accuracy and is consistent, it is necessary to test the classical assumption. In the classic assumption test panel data, only the multicollinearity test and the heteroscedasticity test Basuki & Prawoto (2016). The model used is as follows:

$$ICD = \alpha + \beta_1 TOI_{it} + \beta_2 CD_{it} + \beta_3 OC_{it} + \beta_4 Prof_{it} + \varepsilon$$

Where :

ICD	= Intellectual Capital Disclosure
$\alpha$	= Constant
$\beta_1, \beta_2, \beta_3, \beta_4, \beta_5$	= Regression Coefficient
TOI	= Type of Industry
CD	= CEO Duality
OC	= Ownership Concentration
Prof	= Profitability
$\varepsilon$	= error

In this study, the disclosure index consists of 36 items with a maximum cumulative score of 57. The identification process for intellectual capital disclosure uses four numerical code systems with a score of 0 if it is not disclosed in the annual report, a score of 1 if it is disclosed in narrative form, and a score of 2 if it is disclosed in the form of a narrative. Numeric, and a score of 3 when expressed in monetary form. The calculation of the intellectual capital disclosure assessment is determined by comparing the acquisition value of intellectual capital disclosure with the maximum number of intellectual capital disclosures carried out by the Ulum company (2017). Calculate the type of industry using a dummy with criteria 0 for low IC intensive industry and 1 for high IC intensive industry. The calculation of CEO duality uses a dummy with criteria 0 if there is no family affiliation between directors and commissioners and 1 if there is a family affiliation between directors and commissioners. Calculate ownership concentration by comparing the most significant number of shareholdings with the number of outstanding shares. What the same time, profitability in this study uses return on assets by comparing net income with total assets.

#### IV. RESULT / FINDING

The descriptive statistical analysis aims to explain the characteristics of all variables in this study. The following are the results of descriptive statistical analysis with a ratio scale:

Table 1. Descriptive Statistics on Ratio Scale

	ICD	OC	PROF
Mean	0.562343	0.591948	0.057649
Std. Dev	0.112494	0.093177	0.051755
Maximum	0.280700	0.831500	0.211900
Minimum	0.789500	0.429300	-0.057200
Observation	187	187	187

Source: Data processed, 2022

The average value of intellectual capital disclosure of companies included in the Kompas100 index on the Indonesia Stock Exchange in 2017-2020 is 0.562343 (56.23%). The results show that companies' disclosure of intellectual capital tends to be low because it is below 60%. The variable concentration of company ownership included in the Kompas 100 index on the Indonesia Stock Exchange during 2017-2020 has an average value of 0.591948 (59.19%). This indicates that company ownership tends to be concentrated or centralized. While the company's profitability variable included in the Kompas100 index on the Indonesia Stock Exchange in 2017-2020 is 0.057649 (5.76%), which shows the company's ability to utilize assets to generate net profit has not been maximized.

Table 2. Descriptive Statistics with Nominal Scale

Variable	Criteria	Total	Presentage (%)
Industry Type	0: High IC Intensive Industry	112	59,89%
	1: Low IC Intensive Industry	75	40,11%
	Observation	187	100%
CEO Duality	0: No CEO Duality	126	67,37%
	1: There is a duality between CEO	61	32,63%
	Observation	187	100%

Source: Data processed, 2022

Table 2 shows that the variable type of industry, 112 samples or 59.89% of companies included in the Kompas100 index on the Indonesia Stock Exchange in 2017-2020 are included in the category of high IC intensive industry. While the CEO duality variable, as many as 126 samples or 67.37% of companies included in the Kompas100 index on the Indonesia Stock Exchange in 2017-2020 did not apply CEO duality in their management.

This study carried out classical assumption testing, namely multicollinearity and heteroscedasticity tests. Multicollinearity testing aims to see the linear relationship between independent variables. If the correlation value is  $< 0.80$  (80%), then there is no multicollinearity problem between independent variables in the regression model. The results show that each variable has a correlation value below 0.80 (80%) type of industry is 0.245191, CEO duality is -0.307454, ownership concentration is -0.088506, and profitability is - 0.239380. From these results, it can be concluded that this study does not have a correlation problem between independent variables. Next is the heteroscedasticity test. This test is carried out to determine the issue of variance inequality on different independent variables in the regression model. The data can be categorized as good if there is no heteroscedasticity or homoscedasticity problem and has a probability value of  $> 0.05\%$  (5%). Based on the results of heteroscedasticity testing on the independent variables in this study, all independent variables have a probability value of  $> 0.05$  (5%), so it can be concluded that there is no heteroscedasticity problem in the regression model in this study.

Selection of panel data regression model, consisting of common effect model, random effect model, and fixed effect model. Then three stages of testing are needed to determine the model to be used: the Chow test, the Hausman test, and the Lagrange multiplier test.

a. *Chow Test*

In the chow test, the models tested are the common effect model and the fixed effect model. If the probability value is  $> 0.05$  (5%), then the common effect is the appropriate model to use. Suppose the chi-square cross section value is  $< 0.05$  (5%), then the fixed effect model is more suitable for research. The following are the results of the chow test for this study:

Table 3. Chow Test

Redundant Fixed Effects Tests			
Equation: Untitled			
Test cross-section fixed effects			
Effects Test	Statistic	d.f.	Prob.
Cross-section F	2.181004	(46,136)	0.0003
Cross-section Chi-square	103.328351	46	0.0000

Source: Data processed, 2022

The result of the probability value (cross-section chi-square) is 0.0000. This value is smaller than the p-value of 0.05 (5%), so based on the decision-making criteria,  $H_0$  is rejected. The panel data regression model suitable for this research is the fixed effect model.

b. *Hausman Test*

In the Hausman test, the models tested are the random effect model and the fixed effect model. The criteria for the provisions in this test are if the probability value is  $> 0.05$  (5%), then the appropriate model is a random effect. The suitable model is a fixed effect if the probability value is  $< 0.05$  (%).

Table 4. Hausman Test

**Correlated Random Effects - Hausman Test**

Equation: Untitled

Test cross-section random effects

Test Summary	Chi-Sq. Statistic	Chi-Sq. d.f.	Prob.
Cross-section random	5.432989	4	0.2457

Source: Data processed, 2022

Based on the results obtained, the probability value of a random cross-section is 0.2457 or greater than 0.05 (5%). The decision-making criteria, then H<sub>0</sub> is accepted, and the random effect model is appropriate for this research.

c. *Lagrange Multiplier Test*

The Lagrange multiplier test was carried out due to differences in the Chow and Hausman test results. Then the Lagrange multiplier test is needed to determine the outcome of the panel data regression model that will be used in the study. The models to be tested are random effects and fixed effects models. The significance level in the lagrange multiplier test is 0.05 (5%).

Table 5. Lagrange Multiplier Test

**Lagrange Multiplier Tests for Random Effects**

Null hypotheses: No effects

Alternative hypotheses: Two-sided (Breusch-Pagan) and one-sided (all others) alternatives

	Test Hypothesis		
	Cross-section	Time	Both
Breusch-Pagan	13.85418 (0.0002)	0.284464 (0.5938)	14.13864 (0.0002)

Source: Data processed, 2022

The probability value of the Breusch-Pagan cross section is 0.0002 or less than 0.05 (5%). The random effect model is the most suitable panel data regression model for this study.

Based on the results of testing the three models that have been carried out, namely the Chow test, Hausman test, and the Lagrange multiplier test, it can be concluded that the best model to be used in this study is the random effect model.

Table 6. Hasil Uji Model Random Effect

Dependent Variable: ICD  
Method: Panel EGLS (Cross-section random effects)  
Date: 03/23/22 Time: 12:25  
Sample: 2017 2020  
Periods included: 4  
Cross-sections included: 47  
Total panel (unbalanced) observations: 187  
Swamy and Arora estimator of component variances

Variable	Coefficient	Std. Error	t-Statistic	Prob.
C	0.644803	0.048764	13.22292	0.0000
JINDS	0.053781	0.015414	3.489105	0.0006
DCEO	-0.064778	0.015379	-4.212055	0.0000
KPEM	-0.123399	0.075552	-1.633300	0.1041
PROF	-0.375365	0.139972	-2.681715	0.0080

Effects Specification		S.D.	Rho
Cross-section random		0.048182	0.2222
Idiosyncratic random		0.090158	0.7778

Weighted Statistics			
R-squared	0.210974	Mean dependent var	0.384733
Adjusted R-squared	0.193633	S.D. dependent var	0.101171
S.E. of regression	0.090497	Sum squared resid	1.490529
F-statistic	12.16607	Durbin-Watson stat	2.113754
Prob(F-statistic)	0.000000		

Unweighted Statistics			
R-squared	0.182164	Mean dependent var	0.562343
Sum squared resid	1.925044	Durbin-Watson stat	1.636644

Source: Data processed, 2022

Based on the table above, the adjusted R-squared is 0.193633 (19.36%) and the probability value (F-statistic) is  $0.000000 < = 0.05$  (5%). From the results obtained, it can be interpreted that the variable type of industry, CEO duality, ownership concentration, and profitability can explain the disclosure of intellectual capital by 19.36%. At the same time, the other 80.64% is explained by other factors that are not in the study. Furthermore, the probability value (F-

statistic) means that the type of industry, CEO duality, ownership concentration, and profitability simultaneously affect intellectual capital disclosure.

## V. DISCUSSION

The following is a discussion of the research results, namely:

- a. Based on the results of the panel data regression test, the type of industry has a coefficient value of 0.053781 with a probability value of  $0.0006 < 0.05$ . This shows that the type of industry partially has a significant positive effect on intellectual capital disclosure. Companies with high IC intensive industries tend to disclose more intellectual capital than companies with low IC intensive industries. In other words, the more companies utilize technology in their operational activities, the more disclosure of intellectual capital. From the results obtained, it can be seen that companies on the Kompas100 index listed on the Indonesia Stock Exchange in 2017-2020 that are included in the high IC intensive industry category tend to disclose more intellectual capital than companies in the low IC intensive industry category. This is because the company has an obligation to meet the information needs of the stakeholders for the disclosure of the use of intellectual capital owned by the stakeholders. The results of this study are supported by the results of previous studies conducted by Rezki (2018) and Sariningsih & Saputro (2020), which state that the type of industry has a positive effect on intellectual capital disclosure.
- b. Based on the results of the panel data regression test, the coefficient value of the CEO duality variable is -0.064778 with a probability value of  $0.0000 < 0.05$ , this indicates that CEO duality has a significant negative effect on intellectual capital disclosure. These results are from the research hypothesis, which states that CEO duality negatively impacts intellectual capital disclosure. The application of CEO duality can interfere with independence in decision-making because the CEO prioritizes personal interests, so the delivery of information about the company is not optimal. This result is in line with Alfraih's research (2018) and also (Laurencia & Meiden, 2020), which states that CEO duality has a negative effect on intellectual capital disclosure. This is because the duality of the CEO can limit the company's disclosure of intellectual capital due to a conflict of interest and also reduces the independence of the board of directors in making decisions.
- c. Based on the results of the panel data regression test, the coefficient of ownership concentration variable is -0.123399 with a probability value of  $0.1041 > 0.05$ ; this indicates that ownership concentration does not affect intellectual capital disclosure, which suggests that the more concentrated or not ownership is, the company will continue to disclose intellectual capital to the fullest. This disclosure is the company's obligation to meet the information needs of stakeholders, which will then be used to assist in making investment decisions. In addition, the company also discloses intellectual capital to report on the realization of the use of intellectual capital owned. This is not in line with the research hypothesis, which states that ownership concentration positively affects intellectual capital disclosure. The absence of the influence of concentration of ownership is also due to the company's obligation to meet the information needs of stakeholders, which will then be used to assist in making investment decisions. In addition, the company also discloses intellectual capital to report on the realization of the use of intellectual capital owned. These results align with research conducted by Widiatmoko & Indarti (2018) and Maulana et al. (2020), which state that ownership concentration does not affect intellectual capital disclosure.
- d. Based on the results of the panel data regression test, the variable coefficient value is -0.375365 with a probability value of  $0.0080 < 0.05$ , indicating that profitability negatively affects intellectual capital disclosure. The lower the profitability value, the higher the intellectual capital disclosure value. Conversely, intellectual capital disclosure will be more deficient if the profitability value is high. This is because the company continues to strive to disclose its intellectual capital even though profitability has decreased. Because the disclosure of intellectual capital to stakeholders is something that the company must do to meet the information needs and form of realization of the use of intellectual capital owned by the company. Disclosure of intellectual capital can also illustrate to stakeholders the value and competitive ability of the company in the future so that companies continue to maximize the disclosure of their intellectual capital even though the company's profitability declines. In addition, disclosure of intellectual capital is also voluntary or voluntary, so companies do not disclose their intellectual capital to the fullest. This study's results align with Murhadi (2009) that profitability has a significant negative effect on

intellectual capital disclosure. Companies tend to limit intellectual capital disclosure when profitability increases and expand intelligent capital disclosure when profitability decreases.

## VI. CONCLUSION AND RECOMMENDATION

This study aims to determine the industry type, CEO duality, ownership concentration, and profitability effect on intellectual capital disclosure. The study's results found evidence that the kind of industry has a significant positive impact on intellectual capital disclosure, and CEO duality and profitability significantly negatively affect intellectual capital disclosure. In contrast, ownership concentration does not affect intellectual capital disclosure. In addition, this study also has several practical implications, namely for companies to use and utilize technology optimally so that the intellectual capital disclosed is maximized. At the same time, investors can consider investing in companies with high IC-intensive industry categories because companies with these categories tend to disclose capital. Intellectual property is more than companies with low IC intensive industry category.

## Analysis the Effect of Macroeconomics on Equity Mutual Funds Performance in Indonesia During the Covid-19 Pandemic

A.Thanthowie Jauharie<sup>1</sup>, B. Eko Rizkianto<sup>2</sup>

<sup>1,2</sup>Department Economic and Business, Universitas Indonesia, Jakarta, Indonesia

### Abstract

*Mutual funds are one type of investment that many people are interested in, because they are carried out by investment managers where investors can feel more secure. There are seven types of mutual funds, stock mutual funds are the type of mutual funds that can provide the biggest returns. However, mutual funds cannot be separated from system risk, the purpose of this study is to analyze the effect of macroeconomic factors such as inflation, exchange rates, JCI, and the case of Covid-19 on the return of stock mutual funds in Indonesia. A sample of 172 mutual funds were selected using purposive sampling technique and tested in this study, data were collected from Thompson Reuters and Bank Indonesia. The method used in this research is multiple linear regression analysis. The result of this research is JCI and exchange rate have a negative significant effect and inflation have a positive significant effect on equity mutual funds performance in Indonesia, while the covid-19 cases has no significant effect on equity mutual fund performance.*

*Keywords—Covid-19; Equity Mutual Funds; Exchange Rate; JCI; Inflation; Macroeconomic,.*

### I. INTRODUCTION

The condition of the Covid-19 pandemic greatly affects the condition of the Indonesian capital market which in turn will affect the investment decisions taken by investors. One of the actions taken is to look for safer investments to avoid greater losses. The form of investment that is then widely ogled and in demand by the public is mutual funds. There are 7 types of mutual funds; Money market funds, equity funds, fixed income funds, balance and income funds, asset allocation funds, index funds, and specialized sector funds. In the selection of mutual funds, there are several indicators that can be used as a reference for assessment, including return and Net Asset Value (NAV).

The increase in mutual fund managed funds was supported by the increase in the number of investors and the issuance of new products. OJK noted that the number of capital market investors as of December 30, 2021 reached 7.49 million people, an increase of 92.99 percent from the end of 2020 which reached 3.88 million people. More than 50% of the number of investors is dominated by domestic investors under 30 years old.

However, Mutual Funds are also inseparable from risk, there are 2 risks that must be faced, namely; systematic risk and non-systematic risk. Systematic risk or market risk will have an impact on all investors without exception and without anyone being able to control it because it is a risk associated with overall market conditions and cannot be avoided by diversification. In Covid-19 pandemic situatuin the systematic risk faced by Mutual Funds is increasing, where macroeconomic conditions are affected by the Covid-19 pandemic, suchs as the decrease of JCI, Rupiah weakened agains US Dollar, and inflation, where Covid-19 was the reason of this situation. Where on these factors can affect the capital market, and become a challenge for mutual funds, especially equity mutual funds.

This research try to find out and explain how JCI, Inflation, Exchange rate, and Covid-19 cases affecting the equity mutual fund performance during Covid-19 pandemic.

### II. LITERATURE REVIEW

No	Researcher	Title	Year	Research Results
1	Aang Syahdina dan Andi Setiyawan	Determinants of Mixed Mutual Fund Performance Factors in Indonesia	2021	The results is inflation had a significant negative effect, the JCI had a significant positive effect, and gold prices had no significant effect on the performance of mixed mutual funds.
2	Khoirunnisa Azzahra dan Baiq Fitri Arianti	Macroeconomic Determinants That Affect	2021	The results is inflation had no significant effect, the rupiah exchange rate had a significant positive effect,

		Net Asset Value of Sharia Mutual Funds		Bank Indonesia Syariah Certificates (SBIS) had a significant negative effect on the Net Asset Value of Islamic Mutual Funds.
3	Larisa Yarovaya et al	Human Capital efficiency and equity funds' performance during the COVID-19 pandemic	2021	The results is equity funds that ranked higher in human resource efficiency outperformed the other mutual funds. Most mutual funds show negative returns and Jensen's alpha. However, mutual funds with higher Human Capital Efficiency (HCE) continued to show resilience with significant positive risk-adjusted returns and Jensen's alpha.
4	Chandra Setiawan dan Ni Putu Kanila Wati	Factors Affecting the Performance of Sharia Equity Funds in Indonesia	2019	The results is stock selection skills, percentage change in AUM, and inflation rate had a significant positive effect on the performance of Islamic equity mutual funds in Indonesia, while market timing ability had a positive but not significant effect. In addition, the percentage change in the exchange rate has a significant effect on the performance of Islamic equity mutual funds, but in a negative direction.

#### A. Previous Research

#### B. Mutual Fund

Based on Law No. 8 of 1995 article 1 paragraph 27, it is stated that mutual funds are containers used to collect funds from the investor community and then subsequently invested in securities portfolios by Investment Managers. In the financial dictionary, a mutual fund is defined as a diversified portfolio of financial assets, listed as a publicly traded investment company, which selling shares to the public at the offer price and withdrawals at the net asset value (Adler Manurung, 2003). Bodie (Bodie et al, 2005,) divides mutual funds into 7 types, namely: Money Market Funds, Equity Funds, Fixed Income Funds, Balance and Income Funds, Asset Allocation Funds, Index Funds, Specialized Sector Funds.

To find out whether or not the investment performance of a stock mutual fund portfolio managed by an investment manager is good or not, it is strongly influenced by the investment policies and strategies carried out by the appointed investment manager. Therefore, we need to understand the benchmark or calculation of the price of share mutual funds, as well as to know the development of the investment value of equity mutual funds which we can see from the increase in Net Asset Value because investment performance in managing a portfolio of equity mutual funds is reflected in it ( Soemitra, 2009). This is because an increase in NAV indicates that the shareholder's investment value per unit of investment increases, whereas if there is a decrease in NAV, it means that the value of shareholder's investment per unit of investment decreases

From the NAV we could see the return of the mutual fund, which can also be indicate as the mutual fund performance. The rate of return on an investment in mutual fund is measured as the increase or decrease in net asset value plus income distributions such as dividends or distribution of capital gains (Bodie et al, 2014), the formula as below;

$$\text{Rate of return} = \frac{\text{NAV}_1 - \text{NAV}_0 + \text{Income and capital gain distributions}}{\text{NAV}_0}$$

#### C. Equity Fund

Equity funds investing primarily in stocks, Equity funds are typically riskier and respond more dramatically to changing economic conditions than income funds. (Body, et al). Equity mutual fund is a type of mutual fund that invests at least 80 percent of its assets in the form of equity securities or shares. Because the majority of the portfolio is in stock securities, the nature and movement of these mutual funds are similar to the nature and movement of stocks. The risk is relatively higher than money market mutual funds and fixed income funds, but has the highest potential return (high risk high return).

#### D. Macroeconomic

Macroeconomics is an economic variable that relates to aggregate economic variables, such as the rate and rate of growth of national output, interest rates, unemployment, and inflation. (Pyndick. et al 2013).

#### E. Composite Stock Price Index

According to IDX, JCI stands for Composite Stock Price Index, which is a stock chart that shows the average movement of all stocks on the stock exchange. With the JCI chart, the public and capital market participants can see a summary of the IDX's capital market conditions in real-time without having to analyze each stock instrument one by one.

*F. Inflation*

Inflation is an event that shows an increase in the price level in general and continuously, in the aggregate in an economy (Murni, 2013). This increase will result in a decrease in people's purchasing power and also an increase in the company's operational costs. This increase in operating costs will result in a decrease in company profits which has an impact on the possibility of a decrease in shareholder income and also a decrease in share prices. This of course makes investing in equity funds less attractive and will cause the price of mutual funds to fall. If inflation occurs continuously, it will cause a decline in overall economic conditions and be able to reduce the performance of the Indonesian capital market and the investment power of its investors (Dalimunthe and Lestari, 2019).

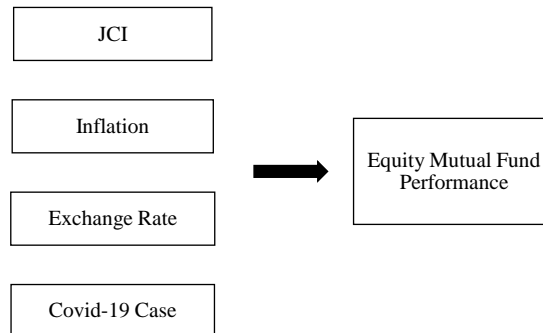

*G. Exchange Rate*

One of the functions of international trade is to maintain the balance of the international market by following the rules for equalizing payment instruments that have been formalized. The transaction tool is the exchange rate. Understanding the exchange rate in general is the value or price of a country's currency measured or expressed in the currency of another country. The definition of the exchange rate according to the Regulation of the Minister of Finance No.114/PMK.04/2007 Article 1 is the price of the rupiah against foreign currencies. A sharp increase in the exchange rate of the rupiah against the rupiah will lead to two sides of gain and loss. Losses can be felt by importers because the raw materials needed must be purchased at high prices. This can lower stock prices on the Stock Exchange and have a negative impact on the Net Asset Value (NAV) of equity funds. This opinion is in line with the statement that the rupiah exchange rate has a negative effect on the Net Asset Value (NAV) of equity funds (Saraswati, 2013).

*H. Covid-19*

According to the World Health Organization (WHO), COVID-19 is an infectious disease caused by a newly discovered coronavirus. This new virus and the diseases it causes were unknown before the outbreak began in Wuhan, China, in December 2019. COVID-19 is now a pandemic occurring in many countries around the world.

*I. Framework*

Where:

- Y= Dependent variable Equity Mutual Fund Performance
- X1= JCI independent variable
- X2= Independent Variable Exchange Rate of US Dollar against Rupiah
- X3= Independent Variable Inflation
- X4 = Independent Variable Covid-19 Case

2.10 Hypothesis

From introduction and literature review above, this study hypothesis as below;

$X1 \Rightarrow Y$

H<sub>0</sub>: There is no significant effect of the JCI on Equity Mutual Fund Performance.

H<sub>1</sub>: There is a significant effect of the JCI on Equity Mutual Fund Performance.

X2 => Y

H<sub>0</sub>: There is no significant effect of US Dollar Exchange against Rupiah on Equity Mutual Fund Performance.

H<sub>1</sub>: There is a significant effect of US Dollar Exchange against Rupiah on Equity Mutual Fund Performance.

X3 => Y

H<sub>0</sub>: There is no significant effect of Inflation on Equity Mutual Fund Performance.

H<sub>1</sub>: There is a significant effect of inflation on Equity Mutual Fund Performance.

X4 => Y

H<sub>0</sub>: There is no significant effect of the Covid-19 case on Equity Mutual Fund Performance.

H<sub>1</sub>: There is a significant effect of the Covid-19 case on Equity Mutual Fund Performance.

### III. RESEARCH METHODOLOGY

In conducting this research, the determination of the sampling technique used is a probability technique, namely purposive sampling. This technique is carried out by the researcher first determining the criteria that must be possessed by the sample, so that the sample selection is based on these criteria. Where in this study the criteria are as follows;

- a. Equity Mutual Funds registered in The Financial Services Authority before 2020
- b. Equity Mutual Funds that have historical Net Asset Value (NAV) data since 2020

From the purposive sampling, There are 172 equity mutual funds meet the criteria and selected for this study.

The data collected by researchers in this study were obtained based on:

#### *Documents*

In this study, researchers will use secondary data in the form of monthly Net Asset Value (NAV) equity mutual funds, JCI, Inflation, Exchange rate, and Covid-19 monthly data. This research uses time series data. According to Widarjono (Basuki and Yuliadi, 2015:165), panel data regression has several advantages, including having a greater degree of freedom, and reducing problems when omitted-variables occur because more data is available.

This study uses the panel data regression model equation which is formulated as follows:

$$Y = \beta_0 + \beta_1 X_1 + \beta_2 X_2 + \beta_3 X_3 + \beta_4 X_4$$

where:

Y: Mutual Fund Performance

X1: JCI

X2: Dollar Exchange Rate against Rupiah

X3: Inflation

X4: Cases of COVID-19

This test is conducted to determine whether the residual values are normally distributed or not. The test procedure is carried out using the Kolmogorov-Smirnov test, with the following conditions:

Hypothesis used:

H<sub>0</sub> : residual is normally distributed

H<sub>1</sub>: residual is not normally distributed

If the value of sig. (p-value) > 0.05 then H<sub>0</sub> is accepted, which means normality is met.

Multicollinearity test is conducted to find out that there is no very strong relationship or there is no perfect linear relationship or it can also be said that the independent variables are not interrelated. The test method is to compare the correlation values obtained from the Panel regression calculation, if the correlation value between variables < 0.8 then there is no multicollinearity.

This autocorrelation test is used to determine the correlation between residuals ordered by time (as in time series) or space (as in cross section data). In the context of regression, the classical linear regression model assumes that there is no autocorrelation in the remainder ( ). This shows that the classical model assumes that the residual elements associated with the observations are not affected by the residuals associated with any other observations.

This test can be performed using the Durbin-Watson test (DW-test). The hypothesis that underlies the test is:

$$H_0 : \rho = 0 \text{ (there is no autocorrelation among the remainders)}$$

$$H_1 : \rho \neq 0 \text{ (there is an autocorrelation among the remainders)}$$

The Durbin-Watson statistic formulated by the d statistic is:

$$d = \frac{\sum (e_t - e_{t-1})^2}{\sum e^2}$$

Heteroscedasticity test is used to determine whether there is an inequality in the value of the residual deviation due to the size of the value of one of the independent variables. Or there is a difference in the value of variance with the increasing value of the independent variable. The test procedure was carried out by the Glejser test. Testing the homogeneity of residual variance is based on the hypothesis:

H0 : homogeneous residual variance

H1 : variance is not homogeneous

F-testing or model testing is used to determine whether the results of the regression analysis are significant or not, in other words the model that is suspected to be appropriate or not. If the result is significant, then H0 is rejected and H1 is accepted. Meanwhile, if the results are not significant, then H0 is accepted and H1 is rejected. It can also be said as follows:

H0 is rejected if F count > F table

H0 is accepted if F count < F table

t test is used to determine whether each independent variable partially has a significant effect on the dependent variable. It can also be said if t count > t table or -t count < -t table then the result is significant and means H0 is rejected and H1 is accepted. Meanwhile, if t count < t table or -t count > -t table then the result is not significant and means H0 is accepted and H1 is rejected.

In this study, there were 172 stock mutual funds tested, the 172 mutual funds were then divided into 10 groups based on the largest and smallest NAV, then each group was tested with independent variables; JCI, Rupiah exchange rate, Inflation, and Covid-19 cases.

#### IV. RESULT/FINDING

Table 4. 1

Source: Processed data

Based on Table 4.1, the results of descriptive statistics for each variable are as follows:

- a. The JCI variable has the lowest value of 4716,400 and the highest value of 7210,830. The JCI variable has an average of 5935,486 with a standard deviation of 728,8787.
- b. Rupiah exchange variable has the lowest value of 14084.00 and the highest value of 15157.00 Rupiah exchange variable has an average of 14435.92 with a standard deviation of 252.1540.
- c. Inflation variable has the lowest value of 0.013200 and the highest value of 0.034700. Inflation variable has an average of 0.018400 with a standard deviation of 0.510883.
- d. The Covid case variable has the lowest value of 6311c and the highest value of 1231386. The Covid case variable has an average of 241810 with a standard deviation of 334784.2.
- e. Mutual Fund Performance variable has the lowest value of -0.045900 and the highest value of 0.086400. The Mutual Fund Performance variable has an average of 0.010872 with a standard deviation of 0.034489.

The results of the calculation of the normality test obtained the value of sig. as follows:

Fig 2. (Source, Processed data)

From	Mutual Fund Performance	JCI	Exchange Rate	Inflation	Covid-19 Case	the
Mean	0.010872	5935.486	14435.92	0.018400	241810.7	
Median	0.007200	5985.520	14374.00	0.016300	125303.0	
Maximum	0.086400	7210.830	15157.00	0.034700	1231386.	
Minimum	-0.045900	4716.400	14084.00	0.013200	6311.000	
Std. Dev.	0.034489	728.8787	252.1540	0.510883	331387.8	
Observations	25	25	25	25	25	

calculation results obtained the value of sig. of 0.071826 or greater than 0.05; then the condition of H0 is accepted, the assumption of normality is met.

The results of the multicollinearity test can be seen in table 4.2 that each independent variable have a VIF value less than 10. From the test results it can be concluded that there is no multicollinearity between the independent variables. Thus the assumption test of the absence of multicollinearity can be fulfilled.

Table 2.

Variable	Coefficient Variance	Uncentered VIF	Centered VIF
JCI	8.44E-11	143.1547	2.042833
Exchange Rate	5.32E-10	5263.774	1.541290
Inflation	0.000112	18.52197	1.336158
Covid-19 Cases	2.34E-16	1.841551	1.193149

Source: Processed data

For Durbin Watson is 2,025 which lies between 1,766 and 2,234, it can be concluded that the assumption of no autocorrelation has been fulfilled. Which can be seen on table below;

Table 3.

Model	Durbin-Watson
1	2.025

Source: Processed data

From the heteroscedasticity test the prob value of all variables is  $> (\alpha = 0.05)$ , which can be seen on table below;

Table 4.

Variable	Coefficient	Std. Error	t-Statistic	Prob.
C	0.315181	0.184351	1.709674	0.1028
IHSG	2.06E-06	4.66E-06	0.441704	0.6634
Nilai Tukar	-2.00E-05	1.17E-05	-1.711294	0.1025
Inflasi	-0.010951	0.005372	-2.038304	0.0550
Kasus Covid-19	-1.04E-08	7.75E-09	-1.348598	0.1925

Source: Processed data

It can be concluded that the remainder has a homogeneous (constant) variance or in other words there are no symptoms of heteroscedasticity.

Regression analysis is used to calculate the affect of independent variables to dependent variables, the independent variables, namely JCI (X1), Rupiah Exchange (X2), Inflation (X3), Covid-19 Cases (X4) an the dependent variable, namely Mutual Fund Performance (Y). The results of regression can be seen on table below;

Variable	Coefficient	Std. Error	t-Statistic	Prob.
JCI	-3.03E-05	9.19E-06	-3.300631	0.0036
Exchange Rate	-0.000117	2.31E-05	-5.067394	0.0001
Inflation	0.028591	0.010599	2.697477	0.0139
Covid-19 Cases	2.42E-09	1.53E-08	0.158178	0.8759
C	1.826106	0.363702	5.020881	0.0001

Table 3.	R-squared	0.631030	Mean dependent var	0.010872
	Adjusted R-squared	0.557236	S.D. dependent var	0.034489
	S.E. of regression	0.022949	Akaike info criterion	-4.534230
	Sum squared resid	0.010533	Schwarz criterion	-4.290455
	Log likelihood	61.67788	Hannan-Quinn criter.	-4.466617
	F-statistic	8.551251	Durbin-Watson stat	2.024589
	Prob(F-statistic)	0.000342		

Source: Processed data

The regression equations obtained based on Table 4.5 are as follows:

$$Y = 1.826 - 0.00000303 X1 - 0.000117 X2 + 0.028591 X3 - 0.00000000242 X4$$

From the above equation can be interpreted as follows:

- The regression coefficient b1 is -0.00000303, which means Mutual Fund Performance will increase for every decrease in X1 (JCI). So if the JCI decreases, the Mutual Fund Performance will increase by 0.00000303 units assuming the other variables are held constant.
- The regression coefficient b2 is -0.000117, which means Mutual Fund Performance will increase for every decrease in X2 (Rupiah Exchange).
- The regression coefficient b3 is 0.028591, which means Mutual Fund Performance will increase for every increase in X3 (Inflation).
- The regression coefficient b4 is 0.00000000242, which means Mutual Fund Performance will decrease for every increase in X4 (Covid Cases).

The results of the regression from table 4.5 can be concluded as follows;

- JCI has probability value < 0,05 and t stat > 2,086, which means JCI has a negative significant effect on mutual fund performance
- Rupiah exchange rate has probability value < 0,05 and t stat > 2,086, which means Exchange rate has a negative significant effect on mutual fund performance
- Inflation has probability value < 0,05 and t stat > 2,086, which means Inflation has a negative significant effect on mutual fund performance
- Covid-19 Cases has probability value > 0,05 and t stat < 2,086, which means Covid-19 Cases didn't have a significant effect on mutual fund performance

To determine the contribution of the independent variables (JCI (X1), Rupiah Exchange (X2), Inflation (X3), and Covid cases (X4)) to the dependent variable (Mutual Fund Performance) adjusted R2 value is used. From the analysis

in Table 4.5, the adjusted results are obtained. R (coefficient of determination) is 0.557. This means that 55% of the Mutual Fund Performance variable will be influenced by the independent variables, namely the JCI (X1), Rupiah Exchange (X2), Inflation (X3), and Covid Cases (X4). While the remaining 45% of Mutual Fund Performance variables will be influenced by other variables that are not discussed in this study.

## V. DISCUSSION

JCI has a significant negative effect on mutual fund performance, this can be indicated by panic selling and panic buying by investors. So investors tend to sell mutual fund units when prices fall and buy when prices go up, quoted from Kontan.co.id, Investors withdrew Rp 167.9 trillion in funds in March 2020, the total net asset value (NAV) also decreased by around 8.5 % which is also affected by the withdrawal of funds by investors. In addition, individual investors also experience psychological pressure related to liquidity problems, which triggers panic selling.

The rupiah exchange rate has a significant but negative effect on mutual fund performance. When the rupiah exchange rate strengthened against the US dollar, it actually became an attraction for foreign investors to invest in Indonesia, but in the midst of the Covid-19 pandemic, it was the opposite. This is not because foreign investors do not trust Indonesia, but because of fears of a global recession that will occur, so that when the rupiah strengthens foreign investors tend to withdraw their funds. Quoted from Bisnis.com, foreign funds leaving the money market reached Rp. 142.56 trillion in 2020. This can have a negative impact on mutual fund performance.

Inflation has a significant positive effect on mutual fund performance, when inflation increases it is usually bad news, and the capital market is no exception. However, when inflation increases during the Covid-19 pandemic, mutual fund performance tends to increase as well, this can be caused by global inflation, not only in Indonesia. So that this momentum can be used by companies or issuers to improve their business margins by increasing the selling price of their products, so that it will have a positive effect on the value and performance of the mutual fund.

The Covid-19 case does not significantly affect the performance of mutual funds, so the increase in Covid-19 cases will not have much effect on the performance of the mutual fund. In fact, the increase in Covid-19 cases is the basis or reason for the enactment of regulations or rules that limit community activities or activities that also limit economic activities.

## VI. CONCLUSION AND RECOMMENDATION

### *Conclusion*

- a. The results showed that the JCI variable had a negative and significant effect on the performance of stock mutual funds.
- b. The results of the study show that the Rupiah exchange variable has a negative and significant effect on the performance of stock mutual funds.
- c. The results show that the inflation variable has a positive and significant effect on the performance of stock mutual funds.
- d. The results of the study show that the Covid case variable has a negative and not significant effect on the performance of stock mutual funds.

### *Recommendation*

- a. Company can further improve their products in the midst of the Covid-19 pandemic, especially on inflation, because the inflation variable has a significant positive influence on the performance of stock mutual funds.
- b. Investors don't need to be doing panic selling and panic buying in the midst of the Covid-19 pandemic, even though market conditions appear to be decrease, because market conditions in the Covid-19 pandemic tend to improve over time.
- c. This study could be a reference for further study by accommodating the limitations of the research previously mentioned by adding other macroeconomic variables or company internal variables that can affect the performance of stock mutual funds.

### *Study Limitations*

- a. This study only uses data for 2 years during the Covid-19 pandemic, there is no comparison of the effects before and during the Covid-19 pandemic
- b. This study does not include the company's internal factors to measure the performance of stock mutual funds.
- c. This study only studying the effect of 3 macroeconomic factors on the performance of stock mutual funds.

## **Determinants Of Capital Adequacy Ratio Before And During The Covid-19 Pandemic: Evidence From Asean Banking Sector**

Mamat Rohimat<sup>1</sup> and Viverita<sup>2</sup>

<sup>1,2</sup>Department of Management, Faculty of Economics and Business Universitas Indonesia, Depok Campus, Indonesia

### **Abstract**

*This paper examines the factors that influence the capital adequacy ratio in ASEAN banking before and during the Covid-19 pandemic. Panel data regression is used to analyze the effect of bank-specific and macroeconomic variables on CAR by adding incorporating the period of the Covid-19 pandemic. This study used the Lerner index to assess the effect of market power on CAR. Results of this study indicate that loan to deposit ratio, and inflation negatively affects CAR. In contrast, loan quality and the increase in GDP significantly increase CAR. In addition, CAR significantly increased during the Covid-19 period. The increase of CAR during the pandemic may be caused by a reduction in the main activities of banks in providing credit so that the cash flow can be used to increase capital. The results of this study will assist banks in determining their capital adequacy ratio, especially in crisis conditions, and become a reference for more in-depth research on capital adequacy during a crisis.*

*Keywords—Commercial banks; capital adequacy ratio; Covid-19 pandemic; ASEAN*

---

### **I. INTRODUCTION**

Banking plays an essential role in developing a country's economy and overall development. Banks have the primary function of carrying out financial intermediation by collecting funds from the public in the form of savings as surplus units and channeling them in the form of a credit to deficit units. With such an important role, banks must prepare and ensure their security for any national and international economic changes. The government also needs policies and regulations to support the banking system (Dao & Nguyen, 2020).

The spread of disease outbreaks will lead to a decline in economic activity in a country, region, or even the world and will ultimately impact banking performance. Sy & Copley (2015) shows that the Ebola virus has significantly affected bank performance in African countries. Several banks stopped their activities due to risk aversion, and credit growth experienced a significant decline. The surge in deposit withdrawals occurred because of a decline in confidence in the ability of banks to supply capital and the threat of high non-performing loans.

The Covid-19 pandemic has had a massive impact and produced crises in various industries, including the banking sector. Restrictions are made to suppress the spread of the virus so that business activities will be disrupted, resulting in a decline in credit distribution and ultimately impacting banking profitability. This phenomenon is in line with a study by (Özlem Dursun & Schandlbauer, 2021), where general lending declined at the start of an unprecedented crisis, and banks with higher exposure to COVID-19 reduced their lending significantly.

Data on banking performance in ASEAN-5 countries from 2017 to 2021 shows that the Non-Performing Loan (NPL) increased from 3.2% in 2019 to 3.5% in 2020. This increase was due to bad loans caused by a disruption of economic activity. In this situation, banks will reduce their lending to be more careful, resulting in a decrease in the LDR ratio from 90.9% (2019) to 80.7% (2021). Loans are the main activity of banks, so the decline in credit growth will decrease bank profitability, as indicated by the ROE ratio from 7.2% (2019) to 3.5% (2020). In conditions of uncertainty because of the Covid-19 pandemic, banks will face more significant risks, so they will increase their capital adequacy to absorb these risks. Data shows that there is an increase in CAR in ASEAN-5 banking from 20.2% (2019) to 22.2% (2020) and 24.1% (2021). The increasing CAR is in line with de-Ramon et al. (2021) research that banks emphasize increasing capital after the crisis.

There are two dominant theories related to bank capital and risk level, namely the franchise value theory and the moral hazard theory. Franchise value is the value that will be lost if the bank goes bankrupt. To avoid the possibility of franchise value, banks will behave very carefully by holding capital and reducing their own risk which is set internally to match the actual level of capital and risk (Diamond and Rajan, 2020). Furthermore, moral hazard theory argues that banks have an incentive to bet on the risk because of information asymmetry, and deposit insurance in the banking system protects banks from disciplinary actions of depositors and equity holders (Jensen and Meckling, 1976). Banks with high capitalization will reduce moral hazard incentives and implement good management practices because shareholders are actively involved in controlling and controlling cost management and capital allocation (Fiordelisi, Marques-Ibanez, and Molyneux, 2011).

This arrangement is included in the provisions related to the obligation to provide minimum capital by banks referring to the BASEL provisions which were first issued in 1988 and are continuously being refined by Basel II and Basel III. Banks are required to provide a minimum capital based on RWA which also regulates additional capital buffers in the form of capital conservation and counter cycle buffers as well as additional capital costs. From the regulator's point of view, an increase in the capital adequacy ratio has a positive and security effect on the banking sector. Determination of bank capital for RWA according to regulations always has a negative effect on the possibility of a crisis (Cardot-Martin et al., 2021).

The regulation regarding the minimum capital adequacy requirement by banks refers to the BASEL provisions which were first issued in 1988 and are continuously being refined by Basel II and Basel III. Banks are required to provide minimum capital based on RWA which also regulates additional capital buffers in the form of Conservation capital and counters cycle buffers as well as additional capital costs. From the regulator's point of view, an increase in the capital adequacy ratio has a positive and security effect on the banking sector. Determination of bank capital for RWA according to regulations always has a negative impact on the possibility of a crisis (Cardot-Martin et al., 2021). On the commercial bank side, the high amount of capital that must be provided will lead to limited business expansion (Raza et al., 2019). The results of the negative relationship between the amount of capital and performance provide recommendations for banks to improve market performance by managing and utilizing capital effectively and efficiently (Dao & Nguyen, 2020).

ASEAN has inherited a more liberal financial system than other developing regions that offer a competitive banking industry and less stringent cross-border capital flows. According to World Bank data, Southeast Asia showed faster economic growth compared to other developing economic regions from 2009-2017, however, the increasing global advantage added to the economic uncertainty of the ASEAN economy which has a long history of economic relations with the Western world. After the Asian financial crisis, banks in ASEAN increased their capital adequacy ratios to a higher level. World Bank data shows that in 2019 the average capital-to-asset ratio of banks in ASEAN was 11%, almost the same as banks in the United States and much higher than banks in Europe, China, and India. With these conditions, banks in ASEAN can handle the crisis caused by the Covid-19 pandemic well and can even assist policymakers in overcoming problems in the decline (Zurich, 2021).

One of the functions of capital is to absorb emerging risks caused by aggressive credit growth or in crisis conditions. Determination of bank capital for RWA according to regulations always has a negative effect on the possibility of a crisis (Cardot, Labondance, and Refait, 2021). Therefore, the role of capital during the COVID-19 pandemic is very important so that banks can survive. However, the determination of the capital adequacy ratio must be carried out efficiently because only maintaining a high capital adequacy ratio will result in lower profitability (Dao and Nguyen, 2020). Previous studies were conducted to look at the determinants of the bank's capital adequacy ratio so that the banking industry can determine a more efficient capital ratio by the company's strategy Kodra and Salko (2016); Ahmad and Albaity (2019); Sudiyatno et al. (2020); Smaoui, Salah, and Diallo (2020); Thoa, Anh and Minh (2020). The results of empirical studies conducted show that there is a different relationship between each variable to the capital adequacy ratio and most of the research is carried out under normal economic conditions. With the current abnormal conditions caused by the Covid-19 pandemic, banks must adjust their capital management policies to anticipate emerging risks.

Empirical research related to bank capital during the Covid-19 pandemic has been carried out by Cao, Y., & Chou, J. (2022) who evaluated the role of bank capital according to regulations in strengthening the resilience of bank credit

activities during the crisis caused by the Covid-19 pandemic. Toh, M. Y., & Zhang, Y. (2022) examined how banks in ASEAN adjust their capital and risk amidst the economic uncertainty caused by the Covid-19 pandemic. The results show that banks are pursuing stability amid increasing economic uncertainty mainly by accumulating more capital buffers. However, to find out the factors that influence the capital increase, further research needs to be done.

The remainder of this article is divided into four sections. Section 2 presents a literature review on the capital adequacy ratio and its determinants. Section 3 describes the methodology and variables. Section 4 analyzes the estimated model. Finally, in Section 5, the conclusion of the article is presented.

## II. LITERATURE REVIEW

Capital adequacy is a regulation that establishes a framework for banks and depository institutions in managing their capital. Internationally, the Basel Committee encourages all countries to implement capital requirements. In 1988, the Basel Committee introduced the Basel Capital Accords, a capital measurement system. This regulation contains the need for banking institutions to have a minimum capital of 8% and the calculation of capital uses the forward-looking concept, which considers the credit risk contained in the portfolio of banking assets.

Then, in 2004, Basel II was published which was motivated by changes in the banking industry and the financial crisis that occurred from 1997-to 1998. Basel II emphasizes increasing the scope of regulation not only on minimum capital requirements but also on supervisory review processes and market discipline. In addition, it also adds operational risk calculations in calculating bank risk.

In 2010, the Basel Committee was officially introduced to Basel III as a result of the global financial crisis in 2007-2009. Basel III regulates three things, namely improving the quality of capital by relying on Tier 1 and adding the obligation to provide capital reserves (buffers), changes in the calculation of RWA, especially for market risk, and the obligation of banks to manage liquidity risk by preparing stable and liquid funds as indicated by the LCR ratio and NSFR.

Franchise value theory, which was first introduced in 1990 by Keeley, states that banks in a less competitive environment will benefit greatly because banks can enjoy the benefits of market power and their franchise value and can avoid taking excessive risks to provide returns for their customers. Franchise value is defined as the present value of future profits that are expected to be obtained by the company as a going concern (Demsetz, Saldenberg, and Strahan, 1996). Franchise value arises from two main sources, first, competition has been limited by regulations, giving banks greater access to profits or so-called "market-related". Second, franchise value arises from "bank-related" sources such as differences in efficiency and variations in the value of loan relationships. Companies that are successful in building franchise value will try to maintain it. As a result, companies with large amounts of franchise value may tend to operate more safely than those with little or nothing.

The capital adequacy of a bank depends on several factors, namely the type of assets owned and the level of risk, asset quality, total assets, and the bank's ability to increase capital. According to Mishkin (2018), there are several strategies for managing bank capital. Strategies to reduce capital are carried out in several ways including buying back some shares, paying higher dividends to shareholders, and increasing bank assets by keeping capital at a fixed value. The strategy to increase capital can be done in several ways, such as issuing shares to increase capital, reducing dividend payments to shareholders to increase retained earnings, reducing bank assets such as selling securities or reducing loans, and using the proceeds to reduce liabilities.

Previous studies to analyze the determinants of the capital adequacy ratio (CAR) have been carried out using several independent variables including GDP, ROE, LDR, ROA, firm size, and NPL conducted in various countries. Aktas et al. (2015) examine the determinants of the bank's capital adequacy ratio (CAR) of 71 commercial banks in Southeast European countries. The results show that the variables of bank size, leverage, bank risk, and GDP growth have a significant negative effect on CAR. While the variables that have a positive and significant effect are ROA, liquidity, and NIM.

Kalifa & Bektaş (2018) examined the impact of bank-specific factors and macroeconomic variables on the capital adequacy ratio of 28 Islamic banks. The result is that ROA, credit risk, leverage, market capitalization, and exchange

rate have a significant positive effect on CAR, namely. ROE, bank size, and inflation have a significant negative effect, while GDP has no significant effect on CAR.

Smaoui et al. (2020) in their research examine several determinant variables of the capital adequacy ratio in 122 Islamic banks around the world. The results show that the variables of bank size and Deposit to Total Assets have a negative and significant effect on CAR. The variables that have a positive significant effect are Law and Order and Lerner Index. The variables NLTA, liquidity, ROA, inflation, GDP, and credit growth have no significant effect on CAR.

Dao & Nguyen's research (2020) related the determinants of the capital adequacy ratio and profitability in banking in Vietnam using several independent variables. The results show that there is a positive significant effect for the variables of credit growth, GDP, and Equity to Deposit Ratio (ETD) on CAR. Meanwhile, the ROA, TOBINQ, LTD, CTI, and bank size variables have a significant and negative effect on CAR.

#### A. Hypothesis Development

The profitability reflects the net result of all financing policies and operating decisions of the company, one of which is measured by the ROE ratio to assess the rate of return to shareholders (Brigham & Houston, 2019). The balance of profit and/or profit for the current year is included in the bank's core capital which is included in the calculation of the capital adequacy ratio. So the relationship between ROE and the capital adequacy ratio is expected to be positive. The results of Kalifa & Bektaş's research (2018) on the capital adequacy ratio in Islamic banks show that profitability has a significant effect on the capital adequacy ratio although negatively. Thus, the hypothesis is as follows:

H1: Profitability has a positive effect on the capital adequacy ratio

One of the ways to measure cost efficiency at a bank is the BOPO ratio, which compares operating costs with operating income. Banks that perform operations efficiently will increase the ability to earn profits, where the profit becomes one of the core capital increases in banking. Therefore, the relationship between the BOPO ratio and the level of capital adequacy ratio is expected to be negative. The results of Lotto's (2019) research on the capital adequacy ratio in banks in Tanzania show a positive and significant effect of bank efficiency on the capital adequacy ratio. The proposed hypothesis is:

H2: Cost efficiency has a positive effect on the capital adequacy ratio

LDR is a ratio that represents the level of bank liquidity which indicates the level of lending by banks using third-party funds and their core capital. Banks will lower their capital when they have more liquidity i.e. when they fund a larger portion of illiquid assets with liquid liabilities (Distinguin et al., 2013). Therefore, the relationship between liquidity and capital adequacy ratio is expected to be negative. The results of research conducted by Dao & Nguyen (2020) on banking in Vietnam show that there is a significant influence between liquidity and CAR. Likewise, Ahmad & Albaity's research (2019) shows that there is a significant influence of bank liquidity on the capital adequacy ratio. Thus, the hypothesis is:

H3: Liquidity has a negative effect on the capital adequacy ratio

Credit quality is usually measured using the Non-Performing Loan (NPL) ratio which shows the number of non-performing loans to total loans. High NPLs require large reserves which can reduce company profits and capital (Kodra & Salko, 2016). Therefore, the relationship between credit quality and the bank's capital adequacy ratio is expected to be negative. Empirical research conducted by Kartal (2019) also shows that there is a significant and negative relationship between NPL and the capital adequacy ratio in Turkish banking.

H4: Credit quality has a negative effect on the capital adequacy ratio

The dividend Payout Ratio shows the number of dividends paid by the company to the bank which comes from the company's net profit. High dividend payments to shareholders will reduce the portion of retained earnings which will ultimately reduce the bank's capital level (Mishkin, 2018). So that the relationship between the Dividend Payout Ratio and the bank's capital adequacy is expected to be negative.

H5: The dividend Payout Ratio has a negative effect on the capital adequacy ratio

Large and well-established companies will find it easier to gain the trust of investors so that it will be easier for them to cover their capital needs from external sources. In addition, large companies also have better risk management techniques so they will need less capital to maintain the same level of uncertainty (Klepczarek, 2015). Therefore, the relationship between bank size and capital adequacy ratio is expected to be negative. Empirical research conducted by Kodra & Salko (2016), Aktas et al. (2015) and Kalifa & Bektaş (2018) also shows a significant and negative relationship between bank size and capital adequacy ratio.

H6: Bank size has a negative effect on the capital adequacy ratio

The level of market power can be measured by the Lerner index which is an indicator of the level of market power with a strong position to measure banking competition (Berger et al., 2009). A low Lerner Index indicates low market power or more competitive competition. Market forces will affect bank stability (Danarsari et al., 2018) and the more stable a bank will set lower the capital. So the relationship between market power and capital adequacy is expected to be negative in line with research conducted by Allen et al. (2011).

Hypothesis 7: Market power has a negative effect on the capital adequacy ratio

GDP growth (GDP) indicates improving economic conditions that will encourage credit growth. The growth of a bank's assets is expected to occur because of an increase in credit demand which is part of economic activity (Kodra & Salko, 2016). Credit risk is one of the components in the calculation of Risk-Weighted Assets (RWA), as a divisor in the bank's capital adequacy ratio. So that the relationship between GDP growth and the capital adequacy ratio is expected to be negative. This theory is in line with Kodra & Salko's (2016) research on banking in Albania and Huang & Pan's (2016) which shows a negative relationship between GDP and CAR.

H7: GDP growth has a negative effect on the capital adequacy ratio

Inflation is one indicator that is of concern to the government, especially the central bank. High inflation often has a negative effect on a country so the central bank intervenes by increasing interest rates, which will encourage companies and banks to borrow less (Smaoui et al., 2020). Low credit will result in high bank liquidity and high capital adequacy. So, the effect of inflation on capital adequacy will be positive. However, research conducted by Kalifa & Bektaş (2018) on 28 Islamic banks shows different results where inflation has a significant negative effect on CAR.

H8: Inflation has a positive effect on the capital adequacy ratio

### III. RESEARCH METHODOLOGY

The study was conducted to analyze the effect of some variables that have been set on the bank's capital adequacy. This study used panel data regression of 63 banks in five ASEAN countries from 2017 to 2021, with a total of 315 observations. To determine the most appropriate panel data regression model, several tests the Chow test, Hausman test, and the Brush-Pagan Lagrange Multiplier test were conducted. The result advised using panel data regression with a fixed-effect model.

In addition, to examine the effect of the Covid-19 pandemic, this study uses a dummy variable, using a value of zero for the period before the Covid-19 pandemic (2017-2019) and taking a value of one for the duration of the Covid-19 pandemic (2020-2021). The model is as follows:

$$CAR_{it} = \alpha + \beta_1 ROE_{it} + \beta_2 BOPO_{it} + \beta_3 DPR_{it} + \beta_4 NPL_{it} + \beta_5 LDR_{it} + \beta_6 SIZE_{it} + \beta_7 LERNER_{it} + \beta_8 GDP_t + \beta_9 INF_t + D*Covid + \varepsilon_{it} \quad (1)$$

Where  $CAR_{it}$  is the dependent variable Capital Adequacy Ratio;  $ROE_{it}$  is the independent variable Return on Equity;  $BOPO_{it}$  is Efficiency Ratio;  $DPR_{it}$  is the Dividend Payout Ratio;  $NPL_{it}$  is Non-Performing Loan,  $LDR_{it}$  is Loan to deposit ratio,  $SIZE_{it}$  is bank size (natural logarithm of total assets),  $LERNER_{it}$  is Lerner Index which represents market power,  $GDP_t$  is Gross Domestic Gross Growth,  $INF_t$  is inflation and  $D*Covid$  is the dummy period of the Covid pandemic.

### IV. RESULT AND DISCUSSION

Table 1 shows a description of the data which includes 10 (ten) variables, namely CAR, return on assets (ROE), BOPO ratio, non-performing loan (NPL), loan to deposit ratio (LDR), dividend payout ratio (DPR), bank size (SIZE), Lerner Index, GDP growth (GDP), and Inflation (INF) as well as the Covid-19 dummy variable.

Table 1: Variable Description

	Abbrev	Formula
<b>Dependent variable</b>		
Capital Adequacy Ratio	CAR	Total Equity / Risk-Weighted Assets
<b>independent variable</b>		
Return on Equity	ROE	Net Income / Total Equity
Efficiency Ratio	BOPO	Operating Expenses/Operational Income
Loan to Deposit Ratio	LDR	Total Loans / Total Deposits
Non-Performing Loan	NPL	Non-Performing Loan / Total Loan
Dividend Payout Ratio	DPR	Dividend / Earning After Tax
Bank Size	SIZE	ln (Total Asset)
Market Power	LERNER	(Pit-MC <sub>it</sub> )/Pit Marginal Cost (MC) is derived from the translog of the cost function (labor, funds dan fixed capital) (Repková, 2012).
GDP growth	GDP	GDP (t) - GDP (t-1) / GDP (t-1)
Inflation rate	INF	(CPI <sub>t+1</sub> - CPI <sub>t</sub> ) / CPI <sub>t</sub>

Data in Table 2 shows that during the observation period the average CAR of ASEAN banks was 21.5% or much higher than the minimum capital requirement. The lowest CAR of 9% is the CAR of PT Bank Pembangunan Daerah Banten Tbk which in 2019 experienced difficulties with negative performance and a high level of NPL so that the CAR level is almost close to the regulator's minimum obligation. When compared with CAR between countries, banks in Indonesia have a higher CAR than other countries in ASEAN-5 with an average CAR of above 20%, this indicates that banks in Indonesia are more stable in facing risks. Meanwhile, the lowest CAR is in the Philippines with an average CAR of 15.9%.

Profitability which is represented by the ROE indicator shows that the average ROE of banks in ASEAN in the research period is 6%. The average banking performance between countries shows a significant difference where the lowest is banking in Indonesia with an average ROE of 3.4% while the highest is Singapore at 10%. It can be explained that in Indonesia, there are many banks, many of which have recorded losses, while in Singapore, there are only three large banks with good performance.

The level of bank efficiency is measured by the BOPO ratio which is a comparison between operating costs and operating income. The data results show that the average BOPO ratio from 2017-to 2021 is 84.7%. Meanwhile, the liquidity ratio represented by the LDR ratio has an average of 87,1% or is at a safe level. Credit quality is represented by the NPL ratio, which compares the number of non-performing loans with total loans. The data shows that the average NPL for banks in ASEAN is 3.2%. This value occurred due to an increase in NPL at the beginning of the COVID-19 pandemic to 3,5%, but it improved again the following year to 3.4%.

The dividend Payout Ratio shows the level of dividend payments made by the company to its shareholders. A high DPR indicates the bank's performance is in good condition but will reduce the company's growth because retained earnings will be smaller. The average DPR for banking in ASEAN is 25.8%. This can show a good thing for bank growth, but it also shows that there are still many banks that have low performance, so they do not pay dividends. Market power is measured by the Lerner Index which shows a bank's ability to set prices above its marginal cost. The average Lerner Index of 0.249 shows that the market strength of banks in ASEAN is relatively low or the market is quite competitive.

For the variables GDP growth and inflation are macroeconomic variables that affect the adequacy of banking capital. In general, countries in ASEAN-5 have the same pattern for these two variables, where at the beginning of the pandemic, namely in 2020, all countries had negative economic growth due to the inhibition of economic activity which eventually resulted in deflation. However, in 2021, along with the declining number of Covid-19 cases and economic activity starting to run, GDP and inflation have shown positive numbers.

Based on the Chow and Hausman tests, the fixed-effect model (FEM) model with the General Least Squared (GLS) procedure was chosen as the best model. Estimation using the GLS method is used to overcome the problem of heteroscedasticity to be able to produce estimators that have BLUE criteria (Damodar, 2009).

Table 3 shows the results of the estimation of the empirical model. Based on the regression results, the probability value of F is 0.000, which indicates that simultaneously the independent variables affect CAR. The adjusted R2 value of 0.8578 shows that the regression model can explain the CAR diversity of 85.8%. The results of the regression analysis show that the LDR, NPL, GDP growth, Inflation, and Covid-19 dummy variables have a significant effect on CAR. Meanwhile, the ROE, BOPO ratio, DPR, SIZE, and Lerner Index, have no significant effect on CAR.

Table 3: Factors affecting Capital Adequacy Ratio

Variable	Coefficient	Prob.	
C	0,690892	0,0184	
LDR	-0,072122***	0,0000

The LDR variable coefficient shows a value of -0,072122 which indicates a negative influence on CAR. LDR is one of the ratios to measure liquidity where a high value indicates low liquidity and vice versa. High liquidity indicates the bank's ability to meet the withdrawal of funds that will be made by customers so that the bank will reduce and keep capital low to be more efficient. The results of the regression analysis show different results from the existing theory and research conducted by Distinguin et al. (2013) which states that liquidity has a negative effect on CAR. This can be explained because a high level of liquidity or a low LDR indicates a decrease in the bank's credit portfolio so that risk-weighted assets will decrease which in turn will increase the bank's CAR value. LDR in the study period experienced a significant downward trend due to more selective lending because of uncertain conditions. The Bank takes more careful steps to maintain franchise value, especially in uncertain economic conditions by increasing its capital adequacy ratio.

NPL represents credit quality that compares the number of non-performing loans with total loans disbursed by banks. The results of the regression analysis show the NPL coefficient value of 0.489053 which means that there is a positive effect of NPL on CAR. This is not in line with the existing theory where a high NPL will require a large reserve burden so that it will reduce the bank's ability to increase capital. This condition occurs because low credit quality (high NPL) indicates the high risk that must be faced by banks, so banks must adjust their capital adequacy according to existing risks to protect their franchise value (Diamond and Rajan, 2020).

Based on the results of the regression analysis, it was found that the effect of GDP growth on CAR showed positive results. This is not in line with existing theory and previous research conducted by Kodra & Salko (2016) and Huang & Pan (2016) which showed a negative relationship between GDP and CAR. When GDP growth is negative, companies will experience difficulties in fulfilling their obligations to banks so that the quality of bank credit will decline, and banks must form loss reserves. This will ultimately result in a decrease in capital adequacy reserves.

In the first year of Covid-19 in ASEAN (2020), the GDP growth of all ASEAN countries experienced negative growth with an average of -4.3%. Furthermore, although in 2021 GDP growth in ASEAN has been positive (an average of 3.7%), the Covid-19 pandemic still occurs, although with a smaller effect, so banks view risks as still occurring. According to the franchise theory, banks would safeguard their franchise values from current risks to boost their capital adequacy and prepare for potential threats. Additionally, a higher capital adequacy ratio might lessen the moral hazard that management faces when pursuing corporate expansion by taking significant risks to make significant profits to make up for a drop in earnings from the previous year.

The inflation variable has a coefficient value of -0,349149 which shows a negative effect on the capital adequacy ratio. This is different from the existing theory where high inflation conditions will trigger the issuance of central bank policies to increase interest rates. With high-interest rates, bank credit will decrease and cause the CAR to be larger because credit is one of the calculations in the RWA. However, the results of this analysis are in line with research conducted by Kalifa and Bektaş (2018) on 28 Islamic banks showing that inflation has a significant negative effect on CAR. Low inflation indicates low prices of goods, one of which is caused by a decrease in public demand due to a decrease in purchasing power. The decline in people's purchasing power will pose a risk to the business world which can lead to bad loans. With the magnitude of this risk, the bank will protect its franchise value, one of which is by increasing its capital adequacy.

The Covid-19 dummy variable is intended to see the effect of the Covid-19 pandemic on the bank's capital adequacy ratio. The results of the regression analysis show that there is a significant and positive effect of the pandemic on the capital adequacy ratio. This is in line with de-Ramon et al. (2022) research that after the crisis, banks put more emphasis on increasing capital. Even though there is an increase in several indicators during the pandemic that in theory or research during normal conditions will affect the decrease in CAR, banks will increase their capital to anticipate the increased risk during a crisis (Hadjixenophontos & Christodoulou-Volos, 2018).

If you pay attention to the characteristics of the financial structure of each country, a country with bank-based characteristics such as Indonesia, its banking sector is more affected by the crisis caused by Covid-19. This can be seen from the decrease in LDR reaching 14.5% and an increase in NPL by 0.7% from before the pandemic, which then with the increasing risk of banks having to anticipate increasing the capital adequacy ratio significantly by 6.4%. Meanwhile, for countries with market-based characteristics such as Singapore, the impact is lower with a low decrease in LDR (3.5%) and a stable NPL (increase of 0.1%) so that banks only make adjustments to the capital adequacy ratio that is not too material by 0.7%. This is in accordance with research by Bats and Houben (2020) which shows that market-based financial structures are more resilient in dealing with systemic risks than bank-based ones.

## V. CONCLUSION AND RECOMMENDATION

The results of the study show that efficiency, credit quality, GDP growth, and inflation have a significant effect on CAR in banking in ASEAN-5 before and during the Covid-19 pandemic. The effect of these ratios is not in line with existing theory and previous studies. Rising NPLs and deteriorating macroeconomic conditions as indicated by negative GDP growth and declining inflation indicate an increase in risk for banks.

The increased risk caused by the Covid-19 pandemic has become a consideration for companies to increase their capital adequacy ratio as an anticipatory measure to protect franchise value, which is sourced from the company's cash flow due to a decrease in bank activity in lending. This is proven by the results of the analysis where the Covid-19 dummy variable has a significant and positive effect on the capital adequacy ratio.

The results of this study can be used as a reference for banks in determining their capital adequacy ratio, especially in crisis conditions caused by disease outbreaks by considering determinant factors such as LDR, NPL, GDP growth, and inflation. So that banks can manage their capital at a safe level in the face of crisis by paying more attention to risk aspects in addition to the level of efficiency and the company's business strategy.

This study has limitations, namely the variables that affect the level of banking CAR only consist of 10 variables, and other variables are not included in this study that affect banking CAR. In addition, this study only includes listed conventional banks in ASEAN-5. For further study, it might be interesting to include Islamic banks that conduct different business models. The research was conducted using the panel data regression method with GLS which has not been able to anticipate endogeneity problems that usually appear in banking data. Further research should also use methods such as dynamic panel data that can anticipate endogeneity problems properly.

### Abstract

*This study aims to explain, and predict the intentions of Micro, Small and Medium Enterprises (MSMEs) in Palu City, Palangkaraya City, Manado City, Palngkaraya City and Ambon City to apply chatbot technology in running their business. Explained by using the Technology Acceptance Model (TAM). Although many theoretical perspectives have been proposed to explain and predict this phenomenon. This study develops a Technology Acceptance Model (TAM) by including subjective norm variables as an antecedent of perceived usefulness (PU) and computer enjoyment as an antecedent of perceived ease of use (PEOU) in explaining and predicting attitudes and intentions to use chatbot technology. This study involved 405 respondents who are MSME actors in the five big cities which were obtained using purposive sampling technique. The data analysis technique applied in this research is Covariance-based Structural Equation Modeling (CB-SEM. Indicate that the five hypotheses proposed are well supported, indicating that the TAM model developed in this study has the ability to understand, explain, and predict well the behavior of MSME actors in adopting Artificial Intelligence technology systems, namely chatbot technology. Behavioral intentions can be explained and predicted well by the attitude of MSME actors towards the use of chatbot technology and implication of this study can be used as a basis for internet technology service providers in identifying and understanding the antecedent factors of prospective users' intentions in adopting the new internet system and technology.*

Keywords— TAM; PU; PEOU; SEM; MSME

---

### I. INTRODUCTION

AI (Artificial Intelligence) technology increasingly has an important role in various companies' businesses around the world as they enter the industry 4.0 era. According to the results of the Accenture research institute, it is predicted that AI can increase company productivity by 40% in 2035 and provide Gross Added Value (GVA) in 16 industries of USD 14 trillion (Fachrizal, 2019). urthermore, by adopting AI technology, the value for profit sharing in the industry will increase by 84% in the education sector, 74% in accommodation and food services, 71% in construction, 59% in wholesale and retail, and 55% in the health sector (Fachrizal, 2019). Fachrizal (2019) also emphasized that in the manufacturing industry itself, AI can save 20%-50% overall inventory costs and reduce the potential for supply chain prediction errors by 50%, as well as logistics costs by 5-10%.

Therefore, the benefits of implementing AI technology are enormous, so companies in Indonesia need to implement this technology which in turn can advance the company's business. Afrillia (2022) in his writing states that McKinsey's Global Survey Research the State of AI in 2021, shows evidence that during 2021 the adoption rate of machine learning, computer vision, and natural language processing (NLP) reached 57 percent, an increase of 45 percent from 2020. Furthermore, this shows that the application of artificial intelligence continues to increase, and business actors are starting to feel many benefits (Afrillia, 2022).

One form of industry in Indonesia that has the potential to apply chatbot technology for business continuity is Micro, Small and Medium Enterprises (MSMEs). MSMEs have been proven to be able to survive in economic situations and conditions that experienced ups and downs during the 1997-2021 monetary crisis, the 2008 banking crisis, and the 2020-2021 COVID-19 pandemic.

However, the results of a survey conducted by Pancake on MSMEs in Indonesia show that only 15% of businesspeople have used chatbots (Amalia, 2021). Even though all business actors have digital marketing or sales

channels, such as Facebook, Instagram and Whatsapp and more than 65% of respondents have heard or know about artificial intelligence (AI) and automation technology (Amalia, 2021). Based on the author's initial interview with 100 MSME actors, 21 people said they didn't know its use, 23 people said it was complicated, 33 people said it depended on their friends, and 23 said they weren't comfortable. Thus, this phenomenon can be explained by using the Technology Acceptance Model (TAM). Although many theoretical perspectives have been proposed to explain and predict this phenomenon, the technology acceptance model (TAM) proposed by Davis (1986) is the most widely used theoretical model to explain the intention and behavior of new technology acceptance by users.

Thus, this phenomenon can be explained by using the Technology Acceptance Model (TAM). Although many theoretical perspectives have been proposed to explain and predict this phenomenon, the technology acceptance model (TAM) proposed by Davis (1986) is the most widely used theoretical model to explain the intention and behavior of new technology acceptance by users.

The research gap that will be discussed in this study relates to the TAM model itself, especially regarding the inconsistency of the relationship between the variables contained in the model. Furthermore, several studies have found a very high correlation between the predictor and the criterion or dependent variable, namely behavioral intention, even though several meta-analyses that have been conducted have shown conflicting results (Feng et al., 2021).

For example, some researchers such as Khor (2014), and Yen et al (2010) found a very strong correlation (that is, greater than 0.9) between PU and intention as well as between PEOU and intention. However, the results of the meta-analysis conducted by Rana et al. (2015) and Sumak et al. (2017) found a weak correlation (about 0.10 between the PEOU and intention variables). Furthermore, Sumak et al (2017) also found a weak correlation (around 0.30) between the PU and intention variables. Therefore, through this research, any substantial gaps in the TAM study will be addressed and filled following the background of this research.

The original TAM model showed that the influence of external variables on intention was mediated by corebeliefs namely, PEOU and PU (Davis et al., 1989). However, Legris et al (2003) stated that although a number of external variables had been tested in previous studies, the existing literature revealed no clear pattern with respect to the external variables included in the TAM model. Legris et al (2003), Yousafzai et al (2007a), and Yousafzai et al (2007b) state that several variables need to be considered for inclusion in the TAM model that has been proposed by Davis (1985) with the aim of increasing the model's predictive ability on intention to adopt a new technology. Furthermore, according to these researchers, these variables include subjective norms, image, output quality, and job relevance which are considered capable of influencing PU. The variables that affect PEOU are computer enjoyment, computer anxiety, and computer self-efficacy.

Based on the research gap discussed, the TAM model used and developed in this study will add subjective norm variables as predictors of PU and computer enjoyment as predictors of PEOU. Furthermore, PU and PEOU predict attitudes towards the use of chatbot technology, and attitudes will predict intentions to use them. Thus, this study aims to understand, explain, and predict the intentions of MSME actors in Palu City, Palangkaraya City, and Ambon City to apply chatbot technology in running their business.

## II. LITERATURE REVIEW

In this study, the development of the TAM model was carried out by adding subjective norm variables as an antecedent of perceived usefulness (PU) and computer enjoyment as an antecedent of perceived ease of use (PEOU) which in turn formed attitudes towards the use of new technologies that had an impact on the intention to use new technologies, namely chatbots.

### A. Subjective norms and their influence on perceived usefulness

In the TRA (Ajzen and Fishbein, 1980) and TPB (Ajzen and Madden, 1986) models, subjective norms have a direct influence on behavioral intentions as in this study. However, in this study also formed a relationship between the influence of subjective norms on the intention to utilize chatbot technology indirectly through perceived usefulness. Based on the influence of subjective norms on behavioral intentions mediated by perceived usefulness, there are two processes underlying the relationship, namely internalization and identification. Identification according to Hopp

(2013) and Igwe et al (2020) is a process that shows the incorporation of individual beliefs with the beliefs of the reference group regarding the behavior to be displayed. The concept of internalization here is following that proposed by Baierl et al (2014) that internalization as a process is an informational social influence. In other words, it is an influence because it receives information from other parties as evidence that shows a reality Baierl et al (2014).

As in the context of this study, if the reference group (other people who are considered important) states that chatbot technology is useful, then MSME actors in the cities of Ambon, Palangkaraya, and Palu, as individuals will have confidence in chatbot technology, and subsequently, that belief will shape their beliefs. intention to use the technology. According to the type of power according to French and Raven's taxonomy (1958), namely expert power, that internalization is based on that power (Baierl et al., 2014). The basis for this statement is a reference group (other people who are considered important) who approve or suggest individuals behave in a certain way and are considered to have expertise and credibility related to the behavior displayed (Baierl et al., 2014).

The TAM model developed in this study, states that the internalization process in relation to the influence of subjective norms on behavioral intentions mediated by perceived usefulness, will occur in the context of using a technology system that is voluntary or mandatory (Wang, 2017). Thus, when the perception of MSME actors in the cities of Ambon, Palangkaraya, and Palu regarding the benefits of chatbot technology is formed because of the reference group, then this is the result of a response to persuasive social information.

**H1: Subjective norms have a positive effect on the perception of MSME actors regarding the usefulness of using chatbot technology.**

*B. Computer enjoyment and its effect on perceived ease of use*

Most of the research on perceived acceptance of new technologies has been conducted from the perspective of extrinsic motivation. Davis et al (1992) investigated the relativity effect of extrinsic and intrinsic motivation on intentions to use computers in the office. Furthermore, Davis et al (1992) describe perceived usefulness as extrinsic motivation while perceived computer enjoyment as intrinsic motivation. Furthermore, they found that computer enjoyment and perceived usefulness (PU) mediate the effect of perceived ease of use (PEOU) on intentions to use computers. The results of the research of Davis et al (1992) are that PU has an important role related to the individual's intention to use computers in the office. Computer enjoyment has a significant effect on motivation to use in addition to enjoyment.

Computer enjoyment is the extent to which an activity in using a computer is considered enjoyable without considering any performance consequences (Davis et al., 1992). This is a form of intrinsic motivation that refers to the pleasure and satisfaction of doing the behavior (Doll and Ajzen, 1992). van der Heijden (2003) shows that computer enjoyment has a significant and positive effect on people's attitudes and intentions to adopt websites. In addition, in a study on the intention to use mobile games in a wireless broadband access environment, Ha et al (2007) stated that computer enjoyment should be one of the characteristics of computer games and it should be considered when analyzing the system. Therefore, the two hypotheses that we propose in this study are:

**H2: Subjective norms have a positive effect on the perception of MSME actors regarding the usefulness of using chatbot technology.**

*C. Perceived usefulness, perceived ease of use, and their influence on attitudes towards technology use*

Various theoretical perspectives have been applied to provide an understanding of the determinants of the use of a technology. Many researchers in the field of information systems (IS) have suggested the behavioral intention model in social psychology as a potential theory. These theories serve as the basis for conducting research on the determinants of behavior in the use of a technology. For example, Theory of Reasoned Action (TRA) (Ajzen and Fishbein, 1980) and Theory of Planned Behavior (Ajzen, 1991).

Based on these two theories, the Technology Acceptance Model (TAM) (Davis et al., 1989), which is an adaptation of TRA, has emerged as a strong and robust mode l for use in research in the field of information systems. The TAM

model states that the antecedents of technology use are formed by two beliefs/two perceptions: perceived usefulness (PU) and perceived ease of use (PEOU) of a new technology adopted.

Figure 1 shows that a person's acceptance of a technology is hypothesized by his voluntary intention to use the technology. Furthermore, intention, in turn, is determined by a person's attitude towards the use of technology and his perception of its usefulness. Attitude is a positive or negative evaluation carried out by individuals on the behavior to be displayed (Fishbein and Ajzen, 2010).

Therefore, in accordance with the background of this research, namely the context of technology acceptance, it is necessary to measure attitudes and beliefs regarding the use of technology rather than attitudes and beliefs that are directed at the technology itself. This is because individuals may have a positive view of a technology without having a favorable tendency towards its use. Based on this description, the hypotheses proposed in this study are:

**H3: The perception of MSME actors regarding usability has an effect on attitudes towards the application of chatbot technology**

**H4: The perception of MSME actors regarding the ease of use has an effect on attitudes towards the application of chatbot technology**

Attitudes toward behavior have been described in various social psychology literature as “an individual's positive or negative feelings (evaluative effect) about attempting to perform a behavior (Fishbein and Ajzen, 1975). Ajzen and Fishbein (1980) argue that attitudes toward a behavior influence subsequent intentions. will affect behavior with respect to the object, namely its use DeLone and McLean (1992) stated that user satisfaction in the application of a new technology as an attitude towards the object. In research in the field of information systems to date, most researchers assess that the attitude formed is an attitude on the output of a system application, Brown et al (2002) stated that one of the social psychological factors that is often neglected in research in the field of information systems is the attitude towards the use of the system which forms the intention to use it. This theory based on the relationship between attitude and behavioral intention is:

**H5: The attitude of MSME actors towards the use of chatbot technology has an effect on the intention to implement it.**

Based on the literature review and the development of the hypothesis, the research model is as follows:

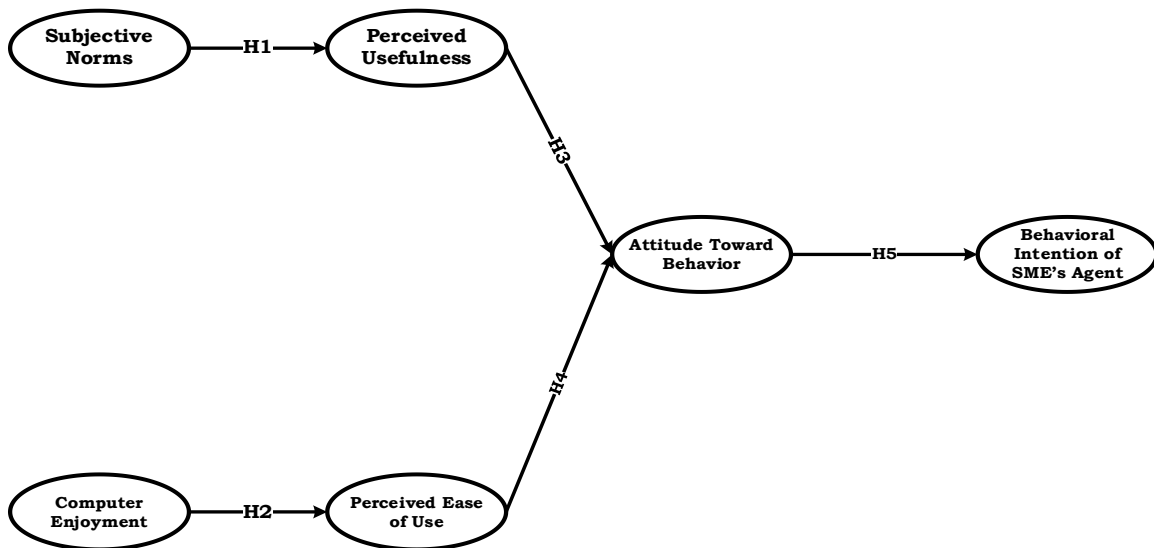

Fig 1. Research Model

### III. RESEARCH METHODOLOGY

#### A. *Qualitative Stage*

This study used an exploratory sequential research design. It consisted of two stages, namely the qualitative stage which conducted in Oct-Dec 2021. The determination of respondent was based on the following considerations: (1) understanding the use of internet network technology, (2) MSME actors, and (3) willing to be involved in research.

The author conducted initial interviews with 100MSME actors in Ambon City, Palangkaraya City, and Palu City through a google form filled out with the help of co-authors who were in the relevant government agencies in each of these cities. This is in accordance with Krippendorff (2004) which states that a minimum of 50 respondents who are involved in the preliminary study will produce good ideas or ideas as initial information to go to the next stage. The results of the initial interviews were used by the authors as the basis for forming a questionnaire to perform confirmatory factor analysis with the help of the IBM SPSS 23 application.

After the questionnaire was formed, the authors redistributed the questionnaire to MSME actors in the three cities with the help of co-authors from local government agencies. The first distribution was carried out in November 2021 with a total of 150 questionnaires. However, only 123 copies were returned, and which deserve further analysis. The results of the questionnaire were then analyzed by factor analysis and resulted in six factors.

The factor loading value for each question/indicator in the distributed questionnaire is 0.6 – 0.7. As stated by Hair et al (2014) and Cooper and Schindler (2015) that the loading indicator factor value above or equal to 0.6 is acceptable for confirmatory research. For example: if my friend applies chatbot technology in his business then I will do the same (0.78) (subjective norm); I feel comfortable interacting with customers through chatbots (0.69) (computer enjoyment); the application of chatbot technology in business will provide a significant difference (0.81) (Perceived Usefulness/PU); chatbot technology is very easy to operate (0.83) (Perceived Ease of Use/PEOU); I think the application of chatbot technology is very useful (0.75) (Attitude); i plan to implement chatbot technology in my business (0.89) (intention to implement chatbot technology).

Thus, in this phase, six variables were produced with a total of 17 indicators. Intention to apply chatbot technology (3 indicators), attitude (4 indicators), PU (3 indicators), PEOU (2 indicators), computer enjoyment (3 indicators), and subjective norms (2 indicators). The results of this exploratory stage are used as a basis for smoothing the improvement of the questionnaire which will be redistributed when the quantitative stage.

#### B. *Measurement*

The development of the measurement scale in the study was carried out by combining the results at the qualitative stage with the measurement scales used by previous researchers, such as: indicators for variables of perceived usefulness, perceived ease of use, and behavioral intentions adapted from Davis (1989) and Davis et al (1989). Indicators of subjective norm variables were adapted from Taylor and Todd (1995), for computer enjoyment adapted from Doll and Ajzen (1992), while intentions and attitudes were adapted from (Ajzen and Fishbein, 1980; Ajzen, 1991; Fishbein and Ajzen, 2010). The measurement scale for each indicator used in the study is 1-7 which has two continuums.

Validity and reliability in this measurement to ensure that the indicators of each construct in this study are valid and reliable. The validity test uses a construct validity test (discriminant and convergence) which is indicated by an AVE value of more than or equal to 0.5 (convergence validity) (Hair et al., 2014). for the discriminant validity test is indicated by the results of the Principal Component Factor Analysis. if the indicators of each construct are separate according to the construct being measured, then the discriminant validity is good (Hair et al., 2014). See Table 2

#### C. *Population, Sample, and Sampling Technique*

The population in this study were MSME actors located in five cities in Indonesia, namely: Ambon, Makassar, Manado, Palu, and Palangkaraya. The main reason the author chose the five cities is because the majority of MSME actors in the five cities have not implemented chatbot technology in their business. The sample size used in this study was 500 respondents obtained through purposive withdrawal techniques. The determination of the sample size in this study is closely related to the data analysis technique used. The data analysis technique used in this research is Structural Equation Modeling (SEM). There are no clear directions for determining the appropriate sample size for using SEM. Hair et al (2014) stated that the minimum sample size used when conducting SEM analysis was 300-500 for a research model consisting of 5-7 constructs.

#### D. Quantitative stage

This stage the author carried out in December 2021-January 2022 by redistributing 200 questionnaires to MSME actors in three cities (Ambon, Palu, and Palangkaraya) using a google form assisted by co-authors in relevant government agencies. The results at the confirmatory stage produce good (discriminant) construct validity test results with a loading factor value between 0.72 - 0.94. Thus, the questionnaire that has been formed is ready to be distributed to MSME actors who are the main targets in this study. The distribution of the questionnaire was carried out in February- April 2022.

#### IV. RESULT / FINDING

The number of questionnaires distributed initially was 500 copies. But only 410 copies returned, and the number of questionnaires that were worthy of further tested were 405 questionnaires. Thus, the response rate in this study was 81%. In accordance with what was stated by Aaker et al (2013) and Hair et al (2014) that the minimum response rate that was best in avoiding non -response bias was 80%.

Table 1. Responden Profile

Profile	Amount	Persentation
<b>Gender</b>		
Man	264	65,19
Women	141	34,81
<b>Age (years)</b>		
< 25	6	1,5
25 – 35	95	23,46
36 – 45	100	24,69
46 – 55	104	25,68
> 55	100	24,69
<b>Level Of Education</b>		
Senior High School	114	28,15
D3	32	7,90
Bachelor	186	45,93
Magister	73	18,02
<b>Length of Business (years)</b>		
1 – 5	34	8,40
6 – 10	84	20,74
11 – 15	113	27,90
> 15	172	42,47
<b>Cost</b>		

0 – 1.000.000	0	0
1.000.001 – 2.500.000	0	0
2.500.001 – 5.000.000	98	24,20
5.000.001 – 10.000.000	156	38,52
Above 10.000.000	151	37,28

Based on Table 1, the majority of MSME owners in this study are male with the age of 46-55 years. The majority have high school education and the duration of their business has been running for more than 15 years. Most have a monthly expenditure of Rp. 5.000,001 – Rp. 10,000,000.

#### *Reliability Validity Test Results*

Table 2. Reliability Validity Test Results

Variable	Item	Load Factor Value	Average Variance Extracted (AVE)	Composite Reliability (CR)	Cronbach Alpha ( $\alpha$ )
<b>1</b>	<b>Intention to apply chatbot technology</b>				
	<ul style="list-style-type: none"> <li>I plan to implement chatbot technology in my business.</li> <li>I will apply chatbot technology in my business</li> <li>I want to implement chatbot technology in my business.</li> </ul>	0,86  0,88  0,87	0,522	0,884	0,766
<b>2</b>	<b>Perceived Ease of Use</b>				
	<ul style="list-style-type: none"> <li>I think chatbot technology is very easy to operate.</li> <li>I think chatbot technology is very easy to access anywhere.</li> </ul>	0,94  0,83	0,659	0,862	0,771
<b>3</b>	<b>Subyektif Norm</b>				
	<ul style="list-style-type: none"> <li>I'm sure my friends recommend using chatbot technology</li> <li>I'm sure my friends also use the chatbot technology.</li> </ul>	0,86  0,73	0,636	0,889	0,876
<b>4</b>	<b>Computer Enjoyment</b>				
	<ul style="list-style-type: none"> <li>I feel comfortable interacting with customers via chatbot</li> <li>Using chatbot technology when interacting with customers is something fun.</li> </ul>	0,91  0,85	0,556	0,822	0,739

	I think the application of chatbot technology in business is something different compared to other parties.	0,82			
<b>5</b>	<b>Perceived Usefulness</b>				
	<ul style="list-style-type: none"> <li>• With our chatbot technology it is easy to understand customer desires.</li> </ul>	0,72	0,579	0,833	0,822
	<ul style="list-style-type: none"> <li>• With chatbot technology, we are able to determine the level of customer satisfaction with our products</li> </ul>	0,77			
	<ul style="list-style-type: none"> <li>• With chatbot technology, we can get input for product development</li> </ul>	0,80			
<b>6</b>	<b>Attitude</b>				
	<ul style="list-style-type: none"> <li>• Implementing chatbot technology in business is something that is not useful/beneficial.</li> </ul>	0,76	0,529	0,833	0,712
	<ul style="list-style-type: none"> <li>• Implementing chatbot technology in business is something that is not wise/wise</li> </ul>	0,79			
	<ul style="list-style-type: none"> <li>• Implementing chatbot technology in business is something negative/positive</li> </ul>	0,80			
	<ul style="list-style-type: none"> <li>• Implementing chatbot technology in business is not a good thing</li> </ul>	0,84			

Based on Table 2, it shows that the results of the validity and reliability tests of the constructs and their indicators used in this study are good. The loading factor value is in the range of 0.72 – 0.94. The AVE value above 0.5 indicates that the constructs used in this study have good convergence validity. Composite Reliability and Cronbach Alpha values above 0.6 indicate that the constructs in this study have good reliability.

#### *Structural Model Test Results*

Data analysis in this study applied Structural Equation Modeling (SEM) with the help of IBM SPSS AMOS 23 software. The selection of SEM estimation techniques for this study was based on the consideration that the data contained outliers and were not normal. Thus, the Maximum Likelihood (ML) estimation technique was determined to be used. This is because it is very suitable for the assumption of data normality that is not met (Tabachnick and Fidell, 2019; Kock, 2019; Ringle and Sarstedt, 2016).

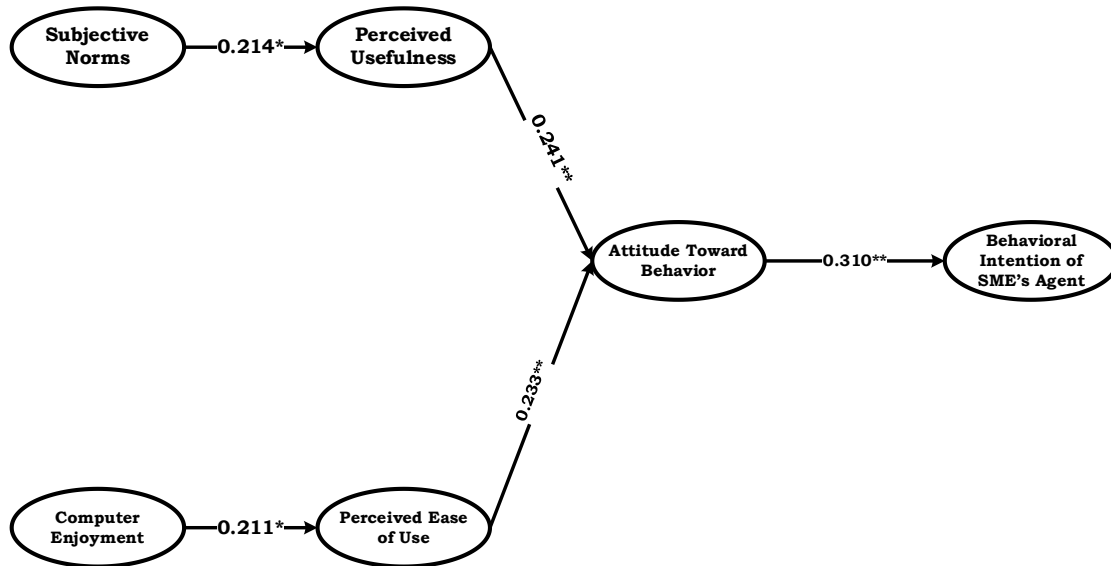

Fig 2. Structural model test results  
 Notes: \* significant at  $p < 0.05$ ; \*\* significant at  $p < 0.001$

Table 3. The Goodness of fit model

Type goodness of fit model	Index goodness of fit model	Recommended value	Result	Information
Absolute fit measures	Chi-square statistic ( $\chi^2$ or CMIN)	Small	21,801	Good
	P	$\geq 0,05$	0,104	Good
	GFI	$\geq 0,90$	0,913	Good
	RMSEA	$\leq 0,08$	0,060	Good
	Normed $\chi^2$ (CMIN/DF)	$2 \leq \text{Normed } \chi^2 \leq 5$	1,551	Good
Incremental fit measures	CFI	$\geq 0,90$	0,921	Good
Parsimonious fit measures	AGFI	$\geq 0,90$	0,933	Good

Table 4. Estimated Structural Parameters

Path Hypothesis	Path coefficient	t-value	Conclusion
H1	0.214	2.013*	Supported
H2	0.211	2.002*	Supported
H3	0.241	2.329**	Supported
H4	0.233	2.200**	Supported
H5	0,310	3.100**	Supported

The results of this study indicate that the TAM model developed can explain and predict the intentions of MSME actors in the cities of Ambon, Makassar, Manado, Palu, and Palangkaraya to want to apply chatbot technology in their

business. The technology acceptance model (TAM) which was originally developed by Davis (1986) is one of the most widely applied technology acceptance models in the field of information systems and technology research.

TAM was developed by adapting the theory proposed by Ajzen and Fishbein (1980) namely the Theory of Reasoned Action (TRA) to explain the causal relationship between the user's internal beliefs (usability and ease of use), and attitudes, intentions, and usage behavior. computers (Davis et al., 1989). Although, in the last 20 years TAM has become well established as a model capable of explaining and predicting user acceptance of the technology (Venkatesh, 2000), several studies have tried to validate the developed TAM model with all its original constructs including this study.

The Technology Acceptance Model is a trendy model for understanding, explaining, and predicting the use of new information technology systems. To date, there have been many impressive studies on the application of the TAM model. Although several studies have confirmed the ability of the TAM model to explain and predict new information systems and technologies, there is still some skepticism among researchers regarding the application and theoretical accuracy of this model. As a result, the authors interested in conducting research on TAM may have reached a saturation level, so future research will focus on developing new models that will take advantage of the strengths of the TAM model while improving its weaknesses.

This study uses the TAM model which was developed by combining two additional variables, namely subjective norms, and computer enjoyment. In general, the two main variables in the TAM model, namely perceived usefulness and perceived ease of use, can explain and predict the attitude of MSME actors towards the use of chatbot technology. Furthermore, the attitude of being able to explain and predict the intentions of MSME

## V. DISCUSSION

The first hypothesis in this study states that subjective norms have a positive effect on the perception of MSME actors regarding the usefulness of using supported chatbot technology. The direct relationship between subjective norms and behavioral intentions in TRA and TPB is based on the principle of compliance. The TAM model in this study includes two additional theoretical mechanisms that subjective norms can influence intentions indirectly through perceived usefulness. The two mechanisms are internalization and identification as proposed by Venkatesh and Davis (2000). Internalization refers to the process when an individual feels that people important to him think he should accept and use the system. Furthermore, Venkatesh and Davis (2000) incorporate the beliefs of the important person into their belief structure. This internalization is equivalent to that referred to by Deutsch and Gerard (1955) as quoted by Sharma et al (2016), namely informational social influence (as opposed to normative), which is defined as "the influence of receiving information from others as evidence of the existence of reality. . In this case the internalization process, unlike compliance in general, will occur depending on the context of using the system which is voluntary or mandatory. That is, when the use of the system is carried out following the mandate of the organization, the user's perception of use may increase in response to persuasive social information.

The second hypothesis in this study states that computer enjoyment has an effect on the perception of MSME actors regarding the ease of using supported chatbot technology. In Table 4, the value of the t statistic (Critical Ratio) is above 1.96. In other words, the more positive the computer enjoyment, the more positive the perception of MSME actors regarding the ease of using chatbot technology will be.

Davis et al (1992) in their research stated that computer enjoyment is a level when computer system activities can affect a person other than the value of the facility itself. Another definition of computer enjoyment (Carroll & Thomas, 1988; Malone, 1981) is the level of computer use activity that affects him. It does not depend on something that has been done before.

It can be said that it will be easier for MSME actors when they happily assume that the system (chatbot technology) will have ease of use. As a result, it can lead to enjoyment if users use the system (Venkatesh & Davis 2000). This is further emphasized by van der Heijden (2003) who shows that perceived enjoyment has a significant and positive influence on people's attitudes and intentions to adopt new technology because it is also perceived as helpful.

The third hypothesis which states that perceived usefulness affects the attitude of MSME actors towards the use of chatbot technology is supported. Table 4 shows the critical ratio (t-statistic) value that exceeds 1.96. In other words, the more positive the perception of the usefulness of chatbot technology, the more positive the attitude of SMEs towards its application will be.

As in the previously stated TAM study, the first fundamental relationship is perceived ease of use and perceived usefulness will have an impact on increasing user attitudes towards use. Eriksson et al (2005) in their research stated that the perceived benefits will be influenced by the level of individual trust further, Pikkariainen et al (2004) in their research also found that the perceived usefulness of information systems is the most influential factor in determining its use. Researchers such as Davis (1989), Eriksson et al (2005), and Guriting and Ndubisi (2006) found that perceived usefulness had a significantly stronger relationship with usage behavior, compared to the effect of perceived ease of use on user behavior.

In this study, MSME actors who feel the benefits of implementing chatbot technology in their business will form a positive attitude towards the technology. Regardless of whether mandatory or voluntary, the application of chatbot technology has benefits that will be felt by MSME actors when entering an increasingly complex world of competition in the future.

The fourth hypothesis states that perceived ease of use affects the attitude of MSME actors towards the application of supported chatbot technology. This can be seen in Table 4 which shows the critical ratio (t-statistic) value of more than 1.96. In other words, the more positive the perception of the ease of using chatbot technology, the more positive the attitude of SMEs towards its application will be.

Fishbein and Ajzen (1975) state that attitudes toward actual use is determined by the expectation of how easily a user thinks he or she can use the system. Although Fishbein and Ajzen (1975) have recommended the use of the self-declared term evaluation, it has become a point of considerable debate in psychology. TAM argues that PEOU has a direct positive effect on attitudes toward system use (Venkatesh and Davis, 2000).

The fifth hypothesis which states that the attitude of MSME actors towards the use of chatbot technology affects the intention to implement it in business is supported. The results in Table 4 show the value of the critical ratio (t statistic) which exceeds 1.96. In this case, the more positive the attitude of MSME actors towards the use of chatbot technology, the more positive their intention to implement it in business will be.

The Theory of Planned Behavior (TPB) is a development of The Theory of Reasoned Action (TRA) which was created to overcome the limitations of the original TRA model in dealing with behavior that is beyond the control desired by the individual. Both TPB and TRA have the same goal of understanding human behavior through identifying and analyzing the determinants of behavioral intention. Ajzen and Madden (1986) introduced the TPB in an attempt to provide a better conceptual framework for the TRA model regarding individual behavior that is out of control at will.

Attitude toward a behavior is defined as a person's general feeling to like or dislike the behavior" (Ajzen & Fishbein, 1980; Schifter & Ajzen, 1985; Ajzen & Madden, 1986; Ajzen, 1991). Attitude toward a behavior is a function of salient underlying beliefs. from a person that performing a behavior will lead to a certain outcome, and evaluation of the outcome i.e., the degree of desirability regarding the outcome of the behavior.

In this study, the attitude of MSME actors towards the use of chatbot technology was positively formed as a result of their perceptions/beliefs about the usefulness and ease of using the technology. Furthermore, this attitude will affect his intention to want to apply chatbot technology in his business.

## VI. CONCLUSION AND RECOMMENDATION

In this study broadly speaking, the TAM model developed can explain and predict the behavior of people who adopt a new information technology system. The background of the research, namely the behavior of MSME actors in the cities of Ambon, Manado, Makassar, Palu, and Palangkaraya.

Furthermore, the results of this study indicate that the five hypotheses proposed are well supported, indicating that the TAM model developed in this study can understand, explain, and predict well the behavior of MSME actors in the

cities of Ambon, Manado, Makassar, Palu and Palangkaraya are related to the behavior of adopting a new information technology system, namely chatbot technology.

Behavioral intentions can be explained and predicted well by the attitude of MSME actors towards the use of chatbot technology. Furthermore, these attitudes can be explained and indicated perceived usefulness and perceived ease of use. Several additional variables which in this case are considered as antecedents of perceived usefulness (PU), namely subjective norms and antecedents of perceived ease of use (PEOU), namely computer enjoyment, can explain both variables (PU and PEOU) well

#### A. Managerial Implications

The results of this study can be used as a basis for internet technology service providers in identifying and understanding the antecedent factors of prospective users' intentions in adopting the new internet system and technology. To increase the intention of potential users of the technology services offered, service providers must focus on the usefulness and ease of use of the system. Service providers do not need to reproduce features that are redundant, but preferably features that are user-friendly so that users can feel more useful and easier when using them. Furthermore, service providers must consider reference group factors and fun factors that can influence potential users to want to adopt the new technology system. Therefore, the resulting technological system must be able to be accessed and used by various levels of society so that the system can be well received.

#### B. Limitations And Suggestions

This study only measures up to the behavioral intention. Thus, the actual behavior of MSME actors in the cities of Ambon, Manado, Makassar, Palu, and Palangkaraya has not been seen in adopting chatbot technology applications. Henceforth, it is hoped that the research carried out can measure up to the stage of actual behavior.

This research is cross-sectional in nature to determine the causal path of several variables being measured. Future research is expected to be able to be carried out longitudinally so that it can be carried out until the measurement of actual behavior. In addition, future research should consider experimental or longitudinal studies so that better conclusions regarding causality can be drawn.

This study only covers the people of Palu City in the scope of Central Sulawesi Province. In the future, it is hoped that the research carried out will be able to cover all districts/cities in Central Sulawesi Province and even throughout Indonesia so that generalization of research results can be carried out.

#### ACKNOWLEDGEMENT

Thanks to the author's promoter team, Prof. Dr. Sabrina O. Sihombing, Dr. Shine Pintor Siolemba Patiro, ST.,MM and Dr. Maklon Felipus Killa who have provided direction, guidance, and support in this research process in an effort to fulfill my dissertation requirements. Thank you to the contact person who has helped in the data collection process in five cities in central Indonesia. Thank you to all the parties involved who cannot be mentioned one by one so that this article can be completed

## Factors Affecting Employment in the Tourism Sector: A Case Study from West Java Province

Siti Aisyah<sup>1</sup> and Salma Audiena Alfaizah<sup>2</sup>

<sup>1,2</sup>Muhammadiyah Surakarta University : Economic Development, Faculty of Economics and Business Muhammadiyah Surakarta, Sukoharjo, Central Java, Indonesia.

### Abstract

*This purpose of this study is to prove the influence of the number of foreign tourist visits, the number of domestic tourist visits, the number of restaurants and hotels, and the level of income of the population on the employment of labor in the tourism sector in West Java Province. This study uses panel data regression, which is a combination of time series data and cross section data from 27 districts/cities in West Java Province in 2018-2020. Partially, foreign tourist visits and the level of income of the population, the number of restaurants and hotels has a significant effect on employment, while the number of domestic tourist visits and the number of tourist attractions has no significant effect on employment in the tourism sector in West Java Province.*

*Keywords—Employment, Number of Foreign Tourists Visits, Number of Domestic Tourists Visits, Number of Restaurants and Hotels, Population Income Levels*

---

### I. INTRODUCTION

Tourism is an industry that has the potential to become an instrument for increasing employment because the tourism industry is a labor-intensive industry and its development is currently fairly fast. The Tourism Industry is one of the highest job creators in the world requiring diverse skill levels and opening up opportunities for young workers, women and migrants to enter quickly into the workforce (ILO, 2011: 4).

One of the efforts to increase job opportunities is through development in the tourism sector in general. Tourism development is expected to be one of the reliable foreign exchange earners outside of non-oil and gas. Therefore, in the context of developing the world of tourism, it is necessary to increase efforts in the form of the tourism industry, both by the government, all relevant levels such as the Department of Arts and Culture, the Tourism Office, and private companies engaged in the tourism industry. To support these efforts, in this case through cooperation between the government and the private sector, various policies such as promotion, service quality, and quality of tourism objects through integrated sectoral cooperation are carried out in an effort to increase the number of foreign and domestic tourist visits where the impact is expected to expand employment opportunities. and business opportunities.

Tourism development programmed by both the government and the private sector will be directed at efforts to increase the number of tourist visits because it is a significant source of income. and tourist attraction. With the support of tourism, the number of tourists visiting is expected to increase, which in turn leads to the creation of jobs and business opportunities, and can also affect the level of community productivity in economic activities, especially in the tourism industry.

Tourism is one of the leading sectors for West Java Province. Besides West Java having very beautiful natural beauty, West Java also has great potential to develop its regional income through one of the tourism sectors. This will have an impact on the absorption of labor to fill vacancies in job positions, especially in the tourism sector.

### II. LITERATURE REVIEW

According to (Bassam, 2018) found that the variable number of restaurants and the amount of GRDP had a positive and significant effect on employment in the tourism sector in East Java in 2010-2016. While the variable number of hotels, the number of tourists, has a negative and significant effect on employment in the tourism sector in East Java in 2010-2016. As can be seen, the concept of GRDP itself is the added value generated by all business units in a certain

area, the result of which is the value of the final goods and services of a sector in the economy. So that it can be interpreted that the number of hotels and the number of tourists have the maximum effect on employment in the tourism sector in East Java in 2010-2016.

(Toreh, 2019) found that the variables of the number of hotels, the number of restaurants, the number of tourists, and the number of GRDP have a positive and significant effect on the employment of the tourism sector in the Riau Islands in 2012-2017. These results indicate a positive relationship between the independent variable and the dependent variable. The increase in the number of restaurants and hotels is proportional to the increase in the number of tourists. GRDP in the sector has increased every year, in relation to the production function, the increase in output will increase if there is an increase in the workforce in it. Currently, demand in the tourism sector continues to grow accompanied by the growth in the number of the tourism industry, resulting in employment.

(Pertiwi, 2018) shows that the results of tourism objects and PAD have a positive and significant effect, the number of tourists has a negative and insignificant effect, the number of hotels has a negative and significant effect on employment in the tourism sector in Yogyakarta in 2006-2015. In this study, it shows that the number of tourist attractions increases the quantity of labor demanded. The number of tourists does not have an influence on the employment, possibly due to the labor absorbed not due to an increase in the number of tourists but the workforce being absorbed due to an increase in the number of tourist attractions. In addition, the increase in the number of tourists occurs at certain times. The number of hotels is not able to absorb energy optimally because the required workforce is not appropriate, for example workers who have special education provisions in the hospitality sector such as being able to communicate in foreign languages or have special expertise in the hospitality sector.

Therefore, special education is needed in the hotel sector such as vocational high schools in the hotel sector so that the workforce is absorbed by the increasing number of hotels. Meanwhile, the increase in PAD indicates that the amount of value added output in the economic unit of the tourism sector in the Special Region of Yogyakarta is also increasing. The greater the output generated from the tourism sector, it will encourage the tourism sector to increase the demand for labor so that regional income can be increased. So that the absorption of labor will increase, such as if the original regional income increases, it can be used to open new tourism objects such as creating tourist villages whose funds are from local revenue.

### III. RESEARCH METHODOLOGY

To determine the magnitude of the influence of an independent variable on the dependent variable, this study uses a panel data regression model, which is a combination of time series data with cross section data from 27 regencies/cities in West Java Province in 2018-2020. The dependent variable in this study is Employment (PTK), while for the independent variables there are 4 variables, namely, Number of Hotels (JH), Number of Restaurants (JR), Number of Tourist Attractions (JW), Population Income Level (TPP). The object of this research is West Java during the period 2018-2020, the data used is sourced from the official website of the Central Statistics Agency (BPS). The econometric model is as follows:

$$\log PTK_{it} = \beta_0 + \beta_1 \log JH_{it} + \beta_2 \log JR_{it} + \beta_3 \log JW_{it} + \beta_4 \log TPP_{it} + e_{it}$$

where :

$\log PTK$	: Employment
$\log JH$	: Number of Hotels
$\log JR$	: Number of Restaurant
$\log JW$	: Number of Tourist
$\log TPP$	: Income Level of Population
$\beta_0$	: Constant or intercept
$\beta_1, \beta_2, \beta_3, \beta_4$	: Independent Variable Regression Coefficient
$i$	: Cross Section Data in 27 West Java regencies/cities
$t$	: Time Series data for the period 2018-2020
$e$	: error terms

#### IV.RESULT / FINDING

The results of panel data regression estimation on econometric models using Pooled Least Squares (PLS), Fixed Effect Model (FEM), and Random Effect Model (REM) approaches are shown in Table 1.

Tabel 1.. Results Summary

Variable	Coef		
	PLS	FEM	REM
C	82.927,31	959.642,2	836.100
Log(JH)	167.926,9	1.615,283	16.524,91
Log(JR)	84.638,27	13.451,51	21.479,13
Log(JW)	-50.546,37	10.833,10	11.935,19
Log(TPP)	44.004,37	-33.013,15	-30.683,16
$R^2$	0,363624	0,997902	0,112025
Adjusted $R^2$	0,311675	0,995166	0,039537
F-Stat	6,999618	364,7281	1,545430
Prob.F Stat	0,000154	0,000000	0,203811

In determining the best estimation model, the Chow test and Hausman test are used. *Chow* test can be seen in Table 2.

Table 2.Chow Test

Effect Test	Statistic	d.f.	Prob.
Cross-section F	267,490990	(26, 23)	0,0000

Because the *p-value* for F (0.0000) (0.05), it is rejected. So the best model to use is the *Fixed Effect Model* (FEM). Test *Hausman* is a test used to determine the *Fixed Effect Model* or *Random Effect Model* in estimating panel data. *Hausman Test* can be seen in Table 3.

Tabel 3. .Hausman Test

Test Summary	Chi-sq.Statistic	Chi-sq.d.f.	Prob.
Cross-section random	15,122168	4	0,0045

Because the *p-value* for F (0.0045) (0.05), it is rejected. So the best model to use is the *Fixed Effect Model* (FEM).

The coefficient of determination ( $R^2$ ) indicates the predictability or goodness of the estimated model. From the Table 4.1. it can be seen that  $R^2$  of the estimated model, namely Fixed Effect Model (FEM) is 0.9979. This means that 99.79 percent of the variation in Labor Absorption in West Java Province is explained by variations in Log(JH),

Log(JR), Log(JW), and Log(TPP). While the rest, which is 0.21 percent, is explained by variations of other variables that are not included in the model.

Simultaneous significance test (F test) was conducted to determine the significance of the effect of all independent variables on the dependent variable simultaneously or together. Based on Table 4.1, it can be seen that the F-statistical probability value is 0.0000 ( $<0.01$ ) which means  $H_0$  is rejected, so it can be concluded that together Log(JH), Log(JR), Log(JW), and Log(TPP) has a significant effect on Employment.

Based on Table 4.1, it can be seen that the probability t-statistics for Log(JW) 0.0501 ( $\leq 0.10$ ) and Log(TPP) 0.0772 ( $\leq 0.10$ ) so that Log(JW) and Log(TPP) has significant effect on Employment, while Log(JH) 0.9381 ( $> 0.10$ ) and Log(JR) 0.2255 ( $> 0.10$ ) so that Log(JH) and Log(JR) has no significant effect on Employment.

## V. DISCUSSION

The results of the validity of the effect (t test) on the econometric model indicate that the number of hotels has no significant effect on the employment in the province of West Java. This proves that the results of this study are in accordance with the initial hypothesis and are in line with the results of research by Julianto (2016) which states that the number of hotels has a negative effect on employment in West Java. This is in line with the number of tourists who come. Because there are various tourists from other regions whose attendance cannot be ascertained.

The results of the validity of the effect (t test) on the econometric model show that the number of restaurants has no significant effect on employment in West Java Province. This proves that this study is in line with the results of research by Astina (2013) which states that the number of restaurants has no significant effect on employment in West Java. This happens because the small number of restaurants results in a small absorption of labor, so the scope covered is smaller.

The results of the effect validity test (t test) on the econometric model show that the number of tourists has significant influence on employment in West Java Province. This proves that the results of this study are in accordance with the initial hypothesis and are in line with the results of research by Toreh (2019) regarding the Effect of Number of Hotels, Number of Restaurants, Number of Tourists, and Total GRDP on Employment in the Tourism Sector in Riau Islands in 2012-2017. Which shows that the number of tourists has a significant influence on the employment of the tourism sector in the Riau Islands in 2012-2017.

The results of the effect validity test (t test) on the econometric model indicate that the Population Income Level has significant influence on Employment in West Java Province. This proves that the results of this study are in accordance with the initial hypothesis and in line with the results of research by Sulistiawati (2012) Population income or wages have a significant effect on employment in West Java Province. Because this variable is one of the important variables in the formation of employment.

Table 4. Constant Effect

	District / City	Effect	Constant
1	Bogor	1610362.	2.570.004,2
2	Sukabumi	225133.1	1.184.775,3
3	Cianjur	166013.4	1.125.655,6
4	Bandung	798558.8	1.758.201
5	Garut	250652.8	1.210.295
6	Tasikmalaya	56908.82	1.016.551,02
7	Ciamis	-180527.3	779.114,9
8	Kuningan	-341294.3	618.347,9
9	Cirebon	122746.6	1.082.388,8

10	Majalengka	-184312.6	775.329,6
11	Sumedang	-222649.5	736.992,7
12	Indramayu	73359.82	1.033.002,02
13	Subang	-42641.88	917.000,32
14	Purwakarta	-414853.2	544.789
15	Karawang	202169.7	1.161.811,9
16	Bekasi	839369.8	1.799.012
17	Bandung Barat	-158659.0	800.983,2
18	Pangandaran	-619443.6	340.198,6
19	Bogor City	-367519.4	592.122,8
20	Sukabumi City	-660677.9	298.964,3
21	Bandung City	349578.9	1.309.221,1
22	Cirebon City	-679734.5	279.907,7
23	Bekasi City	492297.5	1.451.939,7
24	Depok City	293448.1	1.253.090,3
25	Cimahi City	-485782.9	473.859,3
26	Tasikmalaya City	-450934.3	508.707,9
27	Banjar City	-671569.2	288.073

Based on the results of the constants above, it is known that the one with the lowest constant is in Banjar City with a constant value of 228,073, which means that Banjar City has the lowest employment compared to districts/cities in West Java Province. Meanwhile, the highest constant is in Bekasi City with a constant value of 1,451,939.7, which means that Bekasi City has the highest employment compared to other regencies/cities in West Java Province.

## VI. CONCLUSION AND RECOMMENDATION

It was found that the variable number of restaurants and the amount of GRDP had a positive and significant effect on employment in the tourism sector in East Java in 2010-2016. While the variable number of hotels, the number of tourists has a negative and significant effect on employment in the tourism sector in East Java in 2010-2016. So it can be interpreted that the number of hotels and the number of tourists have the maximum effect on employment in the tourism sector in East Java in 2010-2016. Finding that the variables of the number of hotels, the number of restaurants, the number of tourists, and the number of GRDP have a positive and significant effect on the employment of the tourism sector in the Riau Islands in 2012-2017.

The increase in the number of restaurants and hotels is proportional to the increase in the number of tourists. Currently, demand in the tourism sector continues to grow accompanied by a growth in the number of the tourism industry, thereby absorbing labor. Shows that the results of tourism objects and PAD have a positive and significant effect, the number of tourists has a negative and insignificant effect, the number of hotels has a negative and significant effect on employment in the tourism sector in Yogyakarta. In this study, it is shown that the number of tourist attractions increases the quantity of labor demanded.

The number of tourists does not affect the absorption of labor, possibly because the labor absorbed is not due to an increase in the number of tourists but the workforce is absorbed due to an increase in the number of tourist attractions. In addition, an increase in the number of tourists occurs at certain times. Meanwhile, the increase in PAD indicates that the total value-added output in the economic unit of the tourism sector in the Special Region of Yogyakarta is also increasing.

ACKNOWLEDGEMENT

Thank you to all those who have supported the writing of this scientific paper. And thanks to Mrs. Salma Audiena Alfaizah, S.E.,M.E as the supervisor and all parties who have helped in this study so this study can be completed properly.

## Improvements of the layout of retail Store And Warehouse Facilities At SMEs In Pot Selling Shop

Muhammad Arifin<sup>1</sup> and Sisdjiatmo<sup>2</sup>

<sup>1,2</sup>Faculty of Economics and Business, University of Indonesia, Central Jakarta, Indonesia

### Abstract

*A proper and good retail store layout can create good customer experience and it can create customer loyalty and repeat purchases from customer. In addition, the layout of warehouse facilities needs to be considered because it can avoid losses caused by unsold old products, defective products, lost products, and invalid data collection. The arrangement of these facilities layouts applies at the level of SMEs or large companies, and since SMEs have had an important role in improving the economy in a country, the management of facility layout in SMEs needs to be managed properly. The aim of this Business Coaching (BC) process is to help SME Pot Selling Shop management that store and sell pots in offline and online store outlets to improve the layout of its retail stores and product storage areas. This study use three data collection method, namely in-depth interview, observation, and documentation. In depth interview conducted with owner, employees, and customers and observations performed on offline shop and online trading processes. Through this study, the new layout design can reduce product defects due to storage and and improve the experience of customers who come directly to the store to buy products. To create sustainable process and continous improvement for the SMEs employee, we conduct the 5S (Seiri, Seiton, Seiso, Seiketsu, Shitsuke) methodology for better store management.*

*Keywords—Business Coaching; Customer Experience; Retail Layout; SMEs; Warehouse Layout; 5S.*

## I. INTRODUCTION

Small and Medium Sized Enterprises (SMEs) constitute an essential component of social-economical structure of a country. They create the driving force for proper urbanization, trade operation, optimum distribution, and industrialization (Hakim & Masyhur, 2019; Pudjowati et al., 2018). The growth in the number of SMEs will increase the number of jobs and can contribute to the movement of the economy in Indonesia. Each year an average increase of number SMEs in Indonesia up to 2.5% per year (kemenkopukm.go.id).

On 11 March 2020, COVID-19 was designated as a pandemic. Indonesia first reported 2 positive cases on March 2, 2020 and a positive case continued to increase (Susilawati et al., 2020). The second wave of the Delta and Omicron variant of Covid-19 pandemic that appeared in mid-2021 until now made more stringent restrictions on community activities in Jawa and Bali (beritasatu.com, 2021). The Covid-19 pandemic hit Bali's economy ad tourist industry. Bali is in a very deep slump where all services are oversupply because Covid-19 (Gusti Ayu Diah Yuniti et al., 2020.).

The situation of the COVID-19 pandemic in Indonesia has begun to improve. The number of positive and daily patients continued to decline. In addition, the hospital occupancy rate (RS) has also been below 10 percent and the positive rate has returned to normal below five percent (arahkata.pikiran-rakyat.com, 2022). The Indonesian government said the daily cases of Corona had fallen very significantly. This decline occurred in almost all provinces in Java and Bali (detik.com, 2022).

Since the restrictions on people's mobility in Indonesia have decreased, it requires the preparation of an attractive customer journey to increase the traffic of incoming buyers and create an attractive customer experience at retail sales stores (Khan et al., 2020). Customer journey management (CJM) involves understanding and managing customer's experience throughout their shopping journey (Grewal & Roggeveen, 2020).

Semesta Pot, one of the SMEs in Indonesia that has an offline store in Ciledug, Jakarta and stores its products for sales online in the same place. The current condition is that there is no product layout that is neat and grouped so it is not uncommon to have trouble finding products and defective products are found in stores. Layout is one of the key decisions that determines the long-run efficiency of operations. Layout has strategic implications because it established an organization's competitive priorities in regard to capacity, processes, flexibility, and cost, as well as quality of work life (Heizer et al., 2017; Mowrey et al., 2018).

In this paper, we focus on retail layout design for the store that serve customer who come to the store. We group the product, create customer journey to build a good customer experience in buying the products. We also make design improvements in the product storage warehouse. This is because the stored products are products that will be sold in offline stores or those sold online through e-commerce. Product quality needs to be maintained properly to maintain the trust of customers who buy products at this store. Clearly the retail store provides a critical interface between retailers and shoppers (Dunne et al, 1995). A better customer experience will improve the performance of MSMEs as one of the drivers of the economy in Indonesia.

## II. LITERATURE REWIEW

### A. *Types of Layout*

Layout decisions include the best placement of machines, offices and desks, or services centers. An effective layout facilities the flow of materials, people, and information within and between areas (Heizer et al., 2017).

### B. *Office Layout*

Office layout require the grouping of workers, their equipment, and spaces to provide for comfort, safety, and movement of information. The main distinction of office layouts is the importance placed on the flow of information. On the other hand, some layout considerations are universal. They have to do with working conditions, teamwork, authority, and status. (Heizer et al., 2017). Sustainable office design layout gave big impact to the employees in the organization because they work in the office for a long period of time and because it should be convenient and comfortable. Although convenient workplace conditions in many organizations were requirements for improving productivity and quality of outcomes, working conditions in many organizations may present lack of safety, health and comfort issues such as improper lighting and ventilation, excessive noise and emergency excess (Ahmad et al., 2020).

### C. *Retail Layout*

Retail layouts are based on the idea that sales and profitability vary directly with customer exposure to products. The operations manager can change exposure with store arrangement and the allocation of space to various products within that arrangement (Heizer et al., 2017). Five ideas are helpful for determining the overall arrangement of many stores: (1) Locate high-draw items around the periphery of the store. (2) Use prominent locations for high-impulse and high-margin items. (3) Distribute what are known in the trade as “power items”. (4) Use end-aisle locations because they have a very high exposure rate. (5) Convey the mission of the store by carefully selecting the position of the lead-off department (Heizer et al., n.d.). The physical layout of a retail store affects the attitude and behavior of shoppers as well as the performance of the store. An important role of the layout is to expose customers to products (Mowrey et al., 2018).

### D. *Servicescapes*

To provide a good service layout, a firm considers three elements: (1) Ambient conditions, which are background characteristics such as lighting, sound, smell, and temperature. (2) Spatial layout and functionality, which involve customer circulation path planning, aisle characteristics and product grouping. (3) Signs, symbols, and artifacts (Heizer et al., 2017).

### E. *Warehouse And Storage Layout*

A warehouse is one of supporting and an important part of a production system. Good conditions and arrangements in the warehouse are expected to avoid corporate losses and minimize the costs incurred and speed up operations and services at the warehouse (Muharni et al., 2019). Warehousing has a function to maximize the utility of various resources in order to fulfill customer demand or maximize customer demand within the limited resources (Tompkins, J.A. et al., 2003). The objective of warehouse layout is to find the optimum trade-off between handling cost an costs associated with warehouse space. Consequently, management’s task is to maximize the utilization of the total “cube” of the warehouse—that is, utilize its full volume while maintaining low material handling costs. We define material handling costs as all the costs related to the transaction. This consists of incoming transport, storage, and outgoing transport of the materials to be warehoused. These costs include equipment, people, material, supervision, insurance, and depreciation (Heizer et al., 2017).

### III. RESEARCH METHODOLOGY

The SME, that have been operating for almost 4 years, started their business by selling plant pot products online using e-commerce. Over time, sales have grown and finally have offline stores that function as warehouses for storing products that will be sold online or offline, retail stores, and offices to carry out the product packing process and online business operations. The main products sold at these SMEs are plastic pots, then added with plant seeds, planting media, and farming equipment. Since the rules for restricting people's mobility due to the pandemic effect have decreased, many direct activities have taken place. This has resulted in many offline store locations reopening their stores and starting to fix the layout of their respective stores.

This study applied a qualitative research method. The data collected are primary data from in depth interviews, observations, and documentations. In depth interviews is a process of digging in depth, open, and free information with problems and research focus and is directed at the research center (Moleong, 2005). The interviewees include the owner of the SME, the SME's employees, and direct buyers. The duration of interviews is about two hour for six months during the business coaching before and after the solution implementation. There were 5 buyers who were interviewed to find out their shopping experience at SME retail stores. The purpose of this interview is to get the real condition of the SME from more than one perspective.

Observation is a technique in which to monitor behavioral and non-behavioral activities and conditions (Cooper and Shindler, 2014). Behavioral observations carried out include analyzing conversations, body movements from being studied, tone of voice, to the choice of words chosen by employees. In non-behavioral observation, this includes the analysis of the physical state of a place, the analysis of a process, also the analysis of historical records. The observation activities are about six months to record the improvement of the solution implementation.

The documentation method is looking for data about things or variables in the form of notes, transcripts of books, newspapers, magazines, inscriptions, quick methods, legends, and so on (Arikunto, 2011). In this paper, the documentation collected is in the form of placing products that are stored in warehouses, placing products in retail stores, and office layouts to serve online and offline customers which are currently applicable daily. This is done to get a portrait of the current condition plan so that the repair process can then be carried out. The following is the condition of the existing shop layout:

Fig. 1. Existing shop layout (source: author)

The analysis tools used to analyze data collected are BMC Analysis, PESTLE Analysis, Porter's Five Forces, Segmentation Targeting and Positioning Analysis, and SWOT Analysis. Gap analysis is carried out after analyzing the results of the data collected and carrying out the Pareto process to get priority for solving problems that arise and determine the problems to be solved. The following is a recap of the results of the analysis of the collected data:

Table 1. Gap Analysis of Data Collected.

Analysis Method	Ideal Condition	Actual Condition	GAP
<b>Fishbone</b>	Customers are easy to find the desired product	Customers have difficulty in finding the item they are looking for.	Need to group products and provide clear information regarding product locations
<b>Fishbone</b>	Old pot products can be sold soon	There are pot products that have been in the warehouse for a long time	There need to be a place to store old products so they can be sold immediately.
<b>BMC</b>	There are detailed financial reports related to expenditure and income transactions.	There has been no preparation of financial statements in the form of profit and loss.	Need to create a financial reporting system
<b>BMC</b>	The stock of products in the field matches those in the Inventory application system.	The inventory application has not been fully integrated with the cost of capital for product sales and offline sales.	There needs to be an ideal product placement to simplify the product stock validation process on site with the system.
<b>BMC</b>	Customers feel comfortable and easy in finding the desired product.	Customers need to inquire about the availability of goods and inquire about product prices.	There needs to be clear product location and price information.
<b>Five Force of Competition</b>	Have an interesting and eye-catching offline store and have clear information.	Do not have complete information in store for each product.	There needs to be clear product location and price information.
<b>Five Force of Competition</b>	Marketing activities that are consistent and acceptable to Indonesian society as a whole.	The marketing process is not optimal to face the tight online sales competition.	Passive and unattractive use of social media.
<b>STP</b>	Carry out optimal marketing strategies through social media.	Have not done product promotion marketing on social media actively.	Need to do a marketing strategy through social media.
<b>SWOT</b>	The existence of a detailed and detailed financial reporting system	There is no detailed financial report yet	It is necessary to carry out daily financial records of online and offline transactions.
<b>SWOT</b>	Products storage system with FIFO (First In First Out) system.	Improper product storage	It is necessary to prepare a store layout using the FIFO principle.

Source: Author

#### IV. RESULT / FINDING

We use the Activity Relationship Chart (ARC) to connect all activities that occur in SME. The terminology used in ARC are A, E, I, O, U, and X, where A means absolute, E is very important, I means important, O means

sufficient/ordinary, U means not important, and X means unwanted (Apple, 1990). Activities that occur in SME are (1) Receive Goods from Supplier, (2) Product Packing, (3) Payment on Cashier, (4) Invoice Printing for Online Order, (5) Online Service, (6) Product Storage, and (7) Submission of Product Storage. The following is the result of the ARC analysis:

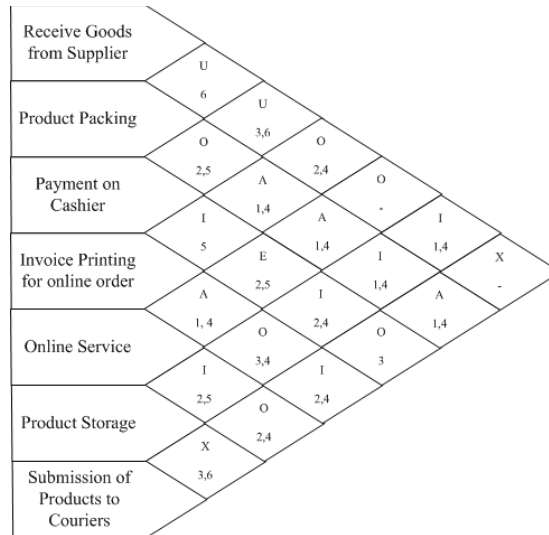

Fig. 2. ARC Analysis (source: author)

Based on the in depth interview and analysis result, the SME need to improve the layout of warehouse facilities and the retail stores. This is because there is no structured and orderly product placement system. This causes defective products and old products that are not immediately sold. In addition, there are many differences in the number of products contained in the SME logistic system with the number of real products in the warehouse.

The second thing that must be addressed is that repairs are needed in retail stores. It takes the preparation of a layout design to improve the customer journey that comes directly to the store. This is because the results of interviews with visitors who come still feel confused during the product purchase process and product payment process. There is no sign of product and price instructions found in retail stores. This causes customers to feel confused about finding the product they are looking for at the initial visit to the store. After getting the product you are looking for, the location of the cashier for payment processing tends to be difficult to find.

Improvements in the warehouse are carried out by implementing the FIFO (first in first out) system to ensure that products that initially enter the warehouse can be sold to retail stores first if they are not sold immediately online. A special place is prepared in retail stores to place products that have not been sold for a long time with a product bazaar system so that they do not become defective products if stored for a long time. There are sample products that are hung throughout the store as an example so that visitors can point to the desired product directly without having to go to the warehouse. The location of products with frequent transactions are placed at the front to facilitate the process of placing stock and customers immediately know the existence of these products. The implementation of 5S (Seiri, Seiton, Seiso, Seiketsu, Shitsuke) has also contributed to the continuous improvement process in terms of organization of durable products and non-durable products such as growing media.

## V. DISCUSSION

The result of the achievement of implementation is in the form of a percentage obtained from the difference in the value of the presentation of the initial condition of SMEs with the final percentage of the results of the implementation of Business Coaching. The following is a table of the evaluation of the solution implementation achievements:

Table 2. Gap Analysis of Data Collected.

Category	Implementation	Initial Presentation	Final Presentation	Achievement Presentation
Retail Store Setup	Pot Rack Positioning	0%	100%	100%
	Old pot products can be sold soon	0%	100%	100%
	Iron shelf location repair	0%	80%	80%
	Labeling and table of pot price information	0%	80%	80%
	Hanging pot laying	0%	100%	100%
Warehouse Setup	Bubble wrap arrangement	0%	100%	100%
	Arrangement of planting media	0%	100%	100%
	Put the big black pot	0%	100%	100%
Office Setup	Rearrangement of office position	0%	50%	50%
Overall Average				91%

Source: Author

The improvements made have reached 100%, meaning that the implementation is in accordance with the initial plan and is in accordance with the design agreed. There are several activities that still do not get 100% achievement percentage, because the implementation process need to be completed in next stage due to the problem lack of time and budget.

## VI. CONCLUSION AND RECOMMENDATION

The final result of this business coaching research are improvement product storage systems by coaching the SME owners and employees of the new design layout and importance of a good and orderly facility layout. The final layout of retail store affects the attitude and behavior of shopper as well as the performance of the store. For the warehouse layout, defective products have been minimized because regular placement makes defective products easily visible. Improvements to the office have made the packing process easier to monitor and does not interfere with the retail store area. Customers who previously made purchases feel a change and a more pleasant experience in shopping for products at this SMEs. Those Changes that have occurred starting from retail stores to the process of storing products in warehouses can reduce costs for defective products which in turn can increase the efficiency of MSME operational costs. This can be useful for MSMEs in facing the increasingly widespread digital era.

## Estimating The Effect of Investment, Money Supply, and Interest Rates on Economic Growth in Indonesia in 2010-2020

Cindi Prasestesia<sup>1</sup> and Salma Audiena Alfaizah<sup>2</sup>

<sup>1,2</sup>Muhammadiyah Surakarta University ; Economic Development, Faculty of Economics and Business Muhammadiyah Surakarta, Sukoharjo, Central Java, Indonesia

### Abstract

*This study is entitled "Estimating The Effect of Investment, Money Supply, and Interest Rates on Economic Growth in Indonesia Over The Period 2010-2020 ". The purpose of this study is to determine how the influence of investment, money supply and interest rates on economic growth in Indonesia. The data used in this study is secondary data type time series from 2010 to 2020 obtained from Badan Pusat Statistik (BPS). The quantitative analysis method used in this study is OLS (Ordinary Least Square) by treating Indonesia's economic growth as a variable, investment arrangements, money supply and interest rates as independent variables.. The results of this study indicate that investment has a significant effect in the short and long term. The amount of money has a significant effect in the short and long term. Interest rates have a significant effect in the short and long term on economic growth in Indonesia over the period 2010 to 2020.*

*Keywords—Economic Growth, Money Supply, Interest Rate, Investment*

---

### I. INTRODUCTION

Economic growth is the process of changing the economic conditions of a country on an ongoing basis towards a better state over a certain period. Economic growth can also be interpreted as a process of increasing the production capacity of an economy which is realized in the form of an increase in national income.

Economic growth is one of the macroeconomic indicators that shows the level of welfare of the people of a country. No exception for developing countries such as Indonesia, economic growth will always be the center of attention to see the level of the country's economy. To be able to achieve a high level of economy but remain stable is not easy, it must be followed by the ability of macroeconomic variables to overcome every problem (Seprillina, 2013).

Various countries are not always able to achieve economic growth in accordance with the development of the production capacity possessed by the increasing factors of production. In many countries, there are often situations where economic growth which is actually much lower than the achievable growth potential, particularly in Indonesia. Economic growth is a long-term macroeconomic problem. In actual economic activity, economic growth means the development of the production of goods and services in a country, such as the increase and number of goods produced by industrial goods, infrastructure development, the increase in the number of schools, the increase in the production of the service sector and the increase in the production of capital goods (Sukirno, 2011).

According to Sadono, the term investment can be interpreted as investment or company spending to buy capital goods and production production equipment to increase the ability to produce goods and services available in the economy. Meanwhile, according to Sayekti, investment is an expenditure to buy goods and production equipment with the aim of replacing and especially increasing capital goods in the economy that will be used to produce goods and services in the future.

Money supply is all types of money in the economy, namely the amount of currency in circulation plus demand deposits in commercial banks. Money supply in a broad sense is also known as economic liquidity or M2. Because M2 includes time deposits, the liquidity is lower. The narrow definition of money in circulation is abbreviated as M1 and is the most liquid money, because this money can be used immediately (Sukirno, 2012; 267). (Langi et al, 2014).

The interest rate is a measure of the investment profit that can be obtained by the owner of capital and is also a measure of the cost of capital that must be incurred by the company for the use of the owner of capital. For investors, the deposit interest rate is profitable because the interest rate is relatively higher than other forms of deposit, in addition

to the risk-free deposit interest. A low interest policy will encourage people to choose investment and consumption instead of saving, on the other hand, a policy of increasing deposit interest rates will cause people to prefer saving rather than investing or consuming.

## II. LITERATURE REVIEW

Santos and Nurcahyaningtyas (2016) in their research entitled “factors effecting economic growth in Indonesia in 1986-2013”. by using estimation test using the ordinary least square (OLS) method on the partial adjustment model (PAM) and classical assumption test. found that, economic growth in Indonesia during 1986-2013, human resource investmen has not been able to show a significant effect on economic growth. However, on the independent variable the money supply and export activities are significant to economic growth.

(Linda, 2013) found that the monetary policy using the money supply and interest rate instruments SBI has an influence on economic growth in Indonesia. Money supply instruments and SBI interest rates in the short term and long-term both affect economic growth but have different effects. For instruments, the money supply against Economic growth in the short term has a positive effect, while in the long term the money supply instrument responded negatively by economic growth. Meanwhile, the SBI interest rate instrument in short term has a negative effect on economic growth while in the long term it has a positive influence on economic growth. The two monetary policy instruments, the rate policy instrument SBI interest rates are more effective in influencing economic growth by speed time three (3) quarters. This is because if you use response of the money supply instrument on economic growth will requires a longer time, namely at the speed of four (4) quarter.

Differences in effectiveness of money supply instruments and SBI interest rates in affect economic growth is caused by the ability of the response o the banking sector and the real sector which serve as a bridge to influence economic growth is more likely to respond more quickly to rate policy SBI interest rates rather than looking at the condition of the money supply. When you see the condition of the money supply that increases in the long run, is not necessarily the banking sector intervenes in its policy by determining prices or interest rates in the banking sector with a decision to increase or lowered. So that economic growth is increased faster when monetary authorities use the SBI interest rate instrument as an intervention the policy. However, in this case, it cannot be used as a benchmark by Bank Indonesia in intervening in monetary policy. BI must continue to see conditions the Indonesian economy at that time, if there is a state of the economy after the recession, So, to restore economic growth, it is better to use policies Expansive monetary expansion is increasing the money supply so that what happens is a decrease in interest rates and can increase economic growth. This is right for use by BI in its policy interventions. And not closing possibility that the two monetary policy instruments can be used in affect economic growth together.

(Budiyanto, 2021) found that monetary policy boosted economic growth in Indonesia by 83.6%. In particular, the results show that inflation has a significant negative effect to economic growth. The money supply (M2) and the exchange rate are important variables that affect Indonesia's economic growth. At that time At the same time, interest rates do not have a large or negative impact on economic growth Indonesia. The financial sector in Indonesia should be more regulated and supervised by ministry of finance and central bank to achieve monetary policy efficiency. Economic growth should be a major consideration when implementing policies monetary

According to (Afriza, 2022) found that the money supply has no effect on economic growth, the BI rate and the rupiah exchange rate have a negative effect on economic growth, and inflation has a positive effect on economic growth. The government and monetary authorities should be able to maintain the stability of the BI Rate by lowering lending rates in order to increase consumption and capital expenditures, which are the main drivers of economic growth. Furthermore, the government and monetary authorities are expected to be able to maintain the rupiah exchange rate by increasing domestic output in order to reduce import activities and increase consumption of domestic products so as to encourage economic growth. In addition, the government and monetary authorities should also not always suppress the inflation rate because an increase in inflation can encourage job creation so that the unemployment rate can be reduced and cause wages to increase which in turn can develop economic growth.

## III. RESEARCH METHODOLOGY

To determine the magnitude of the influence of the independent variable on the dependent variable, this study uses the OLS (Ordinary Least Square) model. the dependent variable in this study is economic growth, while for the independent variables there are three, namely, investment, interest rates, money supply. The object of this research is Indonesia in 2010-2020, the data used is sourced from the official website of the Central Statistics Agency (BPS). The econometric model is as follows:

$$GROWTH_{it} = \beta_0 + \log \beta_1 INVES_{it} + \log \beta_2 JUB_{it} + \beta_3 INRATE_{it} + E_{it}$$

where,

<i>GROWTH</i>	: Economic Growth
<i>INVES</i>	: Investment
<i>JUB</i>	: Money Supply
<i>INRATE</i>	: Interest Rate
<i>log</i>	: e .-Based Logarithmic Operator
<i>E</i>	: Error term (error factor)
<i>β<sub>0</sub></i>	: Constant
<i>β<sub>1</sub> . . . β<sub>3</sub></i>	: Regression coefficient of independent variable
<i>it</i>	: Indicates Region and Year

Variable	Coef	Error	t-Stat	Prob
C	0.102476	0.022322	4.590715	0.0025
INVES	1.000000	9.110000	1.099939	0.3077
JUB	-1.530000	8.320000	-1.832709	0.1095
INRATE	-0.000906	0.002209	-0.410001	0.6941
R <sup>2</sup>	0.735327			
Adj. R <sup>2</sup>	0.621896			
f.statistik	6.482577			
Prob(F-statistic)	0.019782			
Durbin-Watson Stat	1.256549			

## IV. RESULT / FINDING

$$\text{Growth} = 0.102476 + 1.000000\text{inv}^* - 1.530000\text{jub}^* - 0.000906\text{sb}^*$$

(0.3077)      (0.1095)      (0.6941)

$$R^2 = 0.735327 \text{ DW-stat} = 1.256549 \text{ f-stast} = 6.482577 \text{ Prob. F-stat} = 0.019782$$

- a. Multicollinearity Test (VIF)
  - inv = 40.31536 jub = 38.64269 sb = 1.551977
- b. Jarque-Bera Test
  - JB = 1.690779 Prob.JB = 0.429390
- c. Breuch Godfrey Test
  - X<sup>2</sup> (4) = 10.12990 Prob. X<sup>2</sup> (4) = 0.0383
- d. White Test
  - X<sup>2</sup> (9) = 10.99503 Prob. X<sup>2</sup> (9) = 0.2760
- e. Ramsey Riset Test
  - F(1,6) = 5.825336 Prob. F(1,6) = 0.0523

## f. t-stat Test

Variable	Prob. t-Stat	$\alpha$	Result
INV	0.3077	0.10	Significant
JUB	0.1095	0.10	Significant
SB	0.6941	0.10	Significant

the result of the test explain that the investment plays an important role in determining the amount of output and income. The economic power that determines investment is the return on investment costs determined by interest rate and tax policies, as well as expectations about the future (Samuelson and Nordhaus, 1993). With increasing investment, especially domestic investment in public goods, it is hoped that it will encourage the growth of the private sector and households in allocating existing resources in an area.

The results of the test explain that the money supply has a positive and significant effect on economic growth in Indonesia. The results of this study indicate that if the money supply increases, economic growth will increase. On the other hand, if the money supply decreases, economic growth will decline. This research is in line with previous research conducted by Santos and Nurcahyaningtyas (2016). This research is supported by Keynes's hypothesis, namely money supply has a positive influence on output and economic growth.

The results of the test explain that interest rates have a significant effect on Indonesia's economic growth. Based on previous research shows that if interest rates rise, then economic growth will decrease. On the other hand, if interest rates fall, economic growth will increase. Bank Indonesia generally raises interest rates if future inflation exceeds the predetermined target, on the other hand, Bank Indonesia will lower interest rates if future inflation is estimated to be below the predetermined target. Therefore, it is hoped that Bank Indonesia will always maintain the efficiency of its financial institutions in order to remain stable and optimally to influence economic growth.

the three variables have a relationship to affect economic growth in Indonesia. The money supply is positively related to Indonesia's economic growth. This means that as the money supply increases, Indonesia's economic growth will increase. the money supply has a positive and significant effect on economic growth. Based on the Keynes hypothesis, namely, the money supply has a positive influence on output and economic growth. If there is an excess of money supply, Bank Indonesia will take a policy (lower) the interest rate. This condition encourages investors to invest, which in turn will create an increase in output and trigger economic growth. Conversely, the demand for money will have a negative relationship to output, an increase in the demand for money will have an impact on increasing interest rates and ultimately result in a decrease in output.

## V. DISCUSSION

The results of the test carried out on Indonesia's economic growth explain that the interest rate variable has a significant effect on economic growth in Indonesia. The investment variable has a regression coefficient of -0.000906. The pattern of the relationship between the independent variables of interest rates and economic growth is logarithmic, so that if investment decreases by 1%, it causes a decrease in economic growth of -0.000906%.

The results of the test explain that the money supply variable has a significant effect on economic growth in Indonesia in the short and long term. The money supply variable has a regression coefficient of -1.530000. The pattern of the relationship between the independent variable money supply and economic growth is logarithmic so that if the money supply increases by 1 percent, economic growth will increase by 1.530000%. Conversely, if the money supply decreases by 1 percent, economic growth will lead to -1.530000%.

The results of the test explain that the interest rate variable has a significant effect on economic growth in Indonesia. The interest rate variable has a regression coefficient of -0.000906. The pattern of the relationship between the independent variable Interest Rate and economic growth is linear-logarithmic so that if the Interest Rate decreases

by 1 percent, economic growth will decrease by -0.000906%. The increase in the Interest Rate will have an impact on the economy and the real sector.

## VI. CONCLUSION AND RECOMMENDATION

From the results of the research and discussion that have been described, it can be concluded that all variable independent has statistically significant effect on economic growth in Indonesia during the period 2010-2020.

Based on the results of this research and discussion that have been carried out, several recommendation were put forward, among others. To the Indonesian monetary authority, namely Bank Indonesia, to always maintain financial efficiency so that monetary policy instruments can be optimally affected to influence the banking sector. If the response from the banking sector can be optimal, then economic growth will continue to increase. The government is expected to pay more attention to economic growth, so that the rate of economic growth continues to increase and is stable. And for further research, it is expected to extend the research period and to be able to use more macroeconomic variables in order to obtain results that are closer to the actual conditions.

## ACKNOWLEDGEMENT

Thank you to all those who have supported the writing of this scientific paper. Thanks to Mrs. Salma Audiena Alfaizah, S.E.,M.E as the supervisor and thanks to all parties who have helped in this study so this study can be completed properly.

## Marketing Plan Implementation in SME

Yordi Hikmawan<sup>1</sup>, Fandis Ekyawan<sup>2</sup>

<sup>1,2</sup>Master of Management, Faculty of Economics and Business, University of Indonesia

### Abstract

*MSMEs have an important role for the Indonesian economy. With the contribution of 62% of GDP, the empowerment of MSMEs is becoming very strategic, as one of the most important thing is the SME being a large source of income for Indonesian people. COVID-19 has had a significant impact on MSMEs, due to the policy of social activities restriction. Little House Baked Goods, the object of this Business Coaching, has a problem with unstable demand that caused production inefficiency, so it needs to increase its sales to increase daily production capacity. The purpose of this Business Coaching process is to help MSMEs optimize marketing channels and online consumer reviews by implementing marketing planning. This study uses qualitative research with descriptive analysis methods with data collection models such as interviews, observations, and documentation. Then collected data will be analyzed using the Business Model Canvas, Internal and External Analysis, SWOT, TOWS, Gap Analysis and Pareto to determine problems and solutions. Through this Business Coaching, the marketing plan helps MSMEs to optimize marketing channels and increase online consumer reviews in each channel.*

*Keywords—Business Coaching, Marketing Planning, MSME*

---

### I. INTRODUCTION

Micro, Small and Medium Enterprises (MSMEs) have an important role in the Indonesian economy. The Ministry of Cooperatives and MSMEs has developed various programs to show its support for Indonesian MSMEs. Empowerment of MSMEs is very strategic, because of its great potential in driving the economic activities of the community, as well as being a large source of income for the community in improving their welfare. Micro Enterprises are productive businesses owned by individuals and/or individual business entities that meet the criteria for Micro Enterprises as regulated in UU no. 20 of 2008. MSMEs have a significant role in encouraging economic growth, providing job opportunities, and creating a balanced market. Furthermore, the MSME business creates competition and can increase productivity across industries.

COVID-19 had a significant impact on the bakery industry. The social activities restriction policies limit business activities such as hotels, restaurants, cafes, shopping centers and also affect the bakery industry. The Ministry of Cooperatives and Small and Medium Enterprises conducted a survey of 202 bakery businesses in Surabaya and Jakarta which showed that 94% were directly affected by the Covid-19 pandemic (Kompas, 2021). The Asia bakery products market is segmented by product types, such as cakes and pastries, biscuits, bread, morning goods, and other product types and is projected to witness a CAGR of 3.5% during 2020-2025, taking into account consumption growth, trends, and the impact of Covid-19, the bakery business at the Asian level (Mordor Intelligence, 2020). The potential for development can be influenced by the increasing middle class economy, the increasing income of the millennial group, and changes in people's consumption patterns that tend to follow an urban lifestyle. Bakery daily consumption is considered as more practical, and has also changed people's consumption patterns which have an impact on increasing bakery consumption and can save the bakery industry from developing. Per capita consumption of bread, cakes and pastries jumped by nearly 60% from 2016 to 2018 (EIBN Report, 2019).

The development of the pastry industry is also supported by technological advances. Technological advances affect developments in pastry processing, sales, and consumer behavior. The machines used to produce pastries are more sophisticated and productive. Now business units can market pastry products with a wider reach, not only through stores, but also penetrate into online marketing utilizing digital advances. Now consumers no longer make purchases at direct stores, but through online channels, namely ordering through social media, e-commerce like Tokopedia, to ride-hailing applications such as Gojek and Grab.

Little House Baked Goods produces and sells pastry in Tebet, South Jakarta. The business, which was started in July 2019, has experienced inefficiency in its production process. The oven it is using has the capacity to produce 500-800 croissants per day yet only to sell 130-150 croissants per day. This is due to unstable demand and even tends to

be low daily demand. Little House Baked Goods needs to make a marketing plan to reach more market segments, so that the customer base grows. The objective of business coaching is to improve the marketing activities by creating a marketing plan. The marketing plan is created and implemented based on the marketing channels that have to be optimized, both the existing channels and the new channels. The channels are through Instagram, WhatsApp, GoFood, GrabFood, Google My Business, and Tokopedia. These channels have features that let customers provide reviews for Little House Baked Goods, related to the products and the service. The reviews are expected to make it easier for the other customer to make purchasing decisions at Little House Baked Goods.

## II. LITERATURE REVIEW

### A. *Marketing Plan*

A marketing plan is a written document that summarizes what the market has learned about the market place and shows how the company plans to achieve its marketing objectives (Kotler, 2007). A marketing strategy according to the American Marketing Association is a plan of action by an organization or person to sell or advertise a product or service. According to the U.S. Small Business Administration, the marketing plan must contain the central elements of the marketing strategy. The elements of marketing according to the U.S. Small Business Administration are Target market, Competitive advantage, Sales plan, Target marketing and sales, Marketing action plan, Budget, Measure and update plan, Operations, Choose how the company will receive payment.

### B. *Online Consumer Review*

Online Consumer Reviews (OCR) contain positive or negative things about the product or company (the seller) and are made by consumers via the internet (C. Park & Min, 2009), and describe characteristics (advantages and disadvantages) of the product (Lackermair et al., 2013). Online consumer review is a form of electronic word of mouth and can be regarded as a new marketing communication and can influence and play a role in the consumer decision process (Sutanto & Aprianingsih, n.d.). Information from other consumers, like online reviews, is viewed to be more convincing because it is reputedly written by other consumers rather than brands, and is therefore considered as being more credible and trustworthy (Willemsen, 2012). The role of online customer reviews according to a number of studies consist of playing two roles at the same time, one as a source of information and the other as a source of recommendation (D. Park & Lee, 2008). (Lee & Han, 2007) stated that the OCRs as an informant are likely to be highly oriented toward customers whereas as a recommender, it comes in as a format containing various recommendations regardless of being negative or positive.

According to (Zhao & Wang, 2015) there are six requirements for Online Consumer Reviews to be effective, these are 1) Usefulness of Online Consumer Reviews, given the sheer amount of information, only comments and opinions of value will influence consumer decision making; 2) Reviewer Expertise, one of the special characteristics of Online Consumer Reviews is that they are made by anonymous individuals; 3) Timeliness of Online Consumer Review, in the information search process, consumers are faced with large amounts of relevant information associated with a certain time span; 4) Volume of Online Consumer Reviews, the number of comments or testimonials from a reviewer about a more specific product or service. 5) Valence of Online Consumer Reviews, the value of a message given in an Online Consumer Reviews can be divided into 2 categories, namely messages that focus on things that contain positive things (benefit-gain) and vice versa, namely messages that contain negative things (benefit-lost); 6) Comprehensiveness of Online Consumer Review, completeness in Online Consumer Review is used to measure how detailed and complete a review is. (Vermeulen & Seegers, 2020) has analyzed the indicators of Online Consumer Reviews, these are 1) Awareness, consumers are aware of the online consumer review feature and use this information in the selection process; 2) Frequency, consumers often use the online consumer review feature as a source of information; 3) Comparison, before buying, consumers read product reviews to be purchased one by one and compare these reviews; 4) Influence or effect, online consumer review features have an influence on product selection.

### C. *Channels*

Cross-channel marketing is used by businesses to grow the customer base, increase exposure, and to increase the demand. The channels could be in the form of brick and mortar, mail-order catalogs, direct mail, e-mails, social media, and e-commerce. Kotler, Kartajaya, and Setiawan (2019) explain that digital marketing is not intended to replace traditional marketing. Digital marketing is a way or bridge for marketers to connect with consumers with content and in a much more varied and innovative way (Ryan & Jones, 2009). Social media is an online environment, which allows people to share information virtually with each other This interpersonal interaction allows the occurrence of strong customer and seller relationships Because there is feedback in real time at a low cost (Chung Han Kim, 2016).

According to Khan A.G. (2016), e-commerce, is the buying and selling of goods and services on the internet Other than buying and selling, many people use the internet as a source of information to compare prices or look at the latest products on offer before making a purchase online or at a traditional store.

### III. RESEARCH METHODOLOGY

This study applied a qualitative research method. Qualitative research aims to describe, test, and translate themes or patterns that emerge from data (Malhotra, 2010). The three steps in conducting qualitative data analysis are as follows, (1) Data Reduction, selects the things that are needed, minimized, and set aside to focus on the things that are important, and then look for patterns and themes from the project at hand; (2) Data Display, the researcher develops the interpretation of the data through explanations, diagrams, pictures, tables, and others. Then, the interpretation of the data made can be organized so that the pattern of problems that need to be corrected can be easily recognized and identified; (3) Drawing conclusions and verification. The researcher concludes the business coaching by analyzing the results of data interpretation and its implications for research purposes.

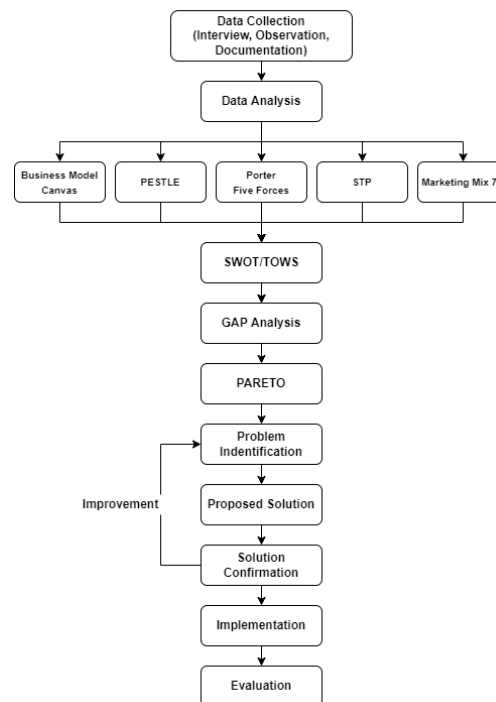

Fig. 1. Business Coaching Process

The data collected from in depth interviews, observations, and surveys. In-depth interviews were conducted with the owner and the employees of Little House Baked Goods to determine the business processes, including the internal and external problems that occurred. Observations were made during the operating hours of Little House Baked Goods to determine the customers' behaviors. A mini survey of 30 the respondents was then conducted to determine customers' opinions regarding the strengths and weaknesses of Little House Baked Goods. The supported data used in this study were the related research journals discussing marketing planning. The collected data were analyzed using Business Model Canvas, external analysis using PESTEL and Porter's Five-Forces Model, then internal analysis using STP and Marketing Mix, as well as SWOT and TOWS analysis. To set the priority and significance problems to address, the researcher discussed the findings based on SME's availability, time allocated, resources, and its short-term target using PARETO to determine the alternative solutions and implement these solutions.

The objective of business coaching is to improve the marketing activities by creating a marketing plan. The marketing plan is created based on the marketing channels that have to be optimized, both the existing channels and the potential new marketing channels. The use of each marketing channel was measured and optimized by utilizing

its respective features. The success indicators from the results of implementing the solutions provided are the level of consumer growth in the marketing channels that were optimized.

#### IV. RESULT / FINDING

In this business coaching, data collection is done by in-depth interviews, observation, and documentation which will be followed by a mini survey using the questionnaire method. Interviews were conducted with the owners and employees of Little House to find out the business processes to the internal and external problems faced. Observations were made during Little House's operating hours to determine consumer behavior while in the store. Then documentation is done by documenting business processes, store layouts, and capturing social media and e-commerce activities. The questionnaire was conducted on 18 consumers to find out consumer opinions about Little House products. The aim is to obtain a comprehensive conditions of the SME.

The collected data were analyzed using Business Model Canvas (BMC) analysis, external analysis using PESTEL and Porter's Five-Forces Model, then internal analysis using STP and Marketing Mix, SWOT and TOWS analysis, and GAP Analysis. Pareto analysis conducted to determine the solutions.

Table 1. GAP Analysis Summary

Analysis	Actual	Ideal	GAP
STP	The segment is too specific	Broad segmentation	Many segments are not touched, sales are stagnant
BMC	No E-Commerce channel	Maximize Tokopedia	Stagnant sales
Marketing Mix	CMO doesn't have a marketing plan	CMO has a marketing activity plan	Marketing activities are not optimal
Marketing Mix	CFO doesn't have a finance plan	CFO has a finance plan	Ineffective financial reporting
BMC	Marketing activities are not optimal, there is no marketing plan.	Marketing activities done based on marketing plan	Marketing activities are not optimal
Marketing Mix	The number of Instagram followers is low	Growing Instagram followers	Promotion on Instagram is not optimal
Marketing Mix	Low Google Review	Growing Google Reviews	No driver rating attempt
BMC	Financial reports are not optimal	Financial reports are carried out optimally	Do not have the required financial statements
BMC	Low production ratio	Minimum daily production reaches 30% of capacity	Inefficient production ratio
BMC	No monthly marketing cost	Set marketing cost	Stagnant sales
BMC	Marketing activities are not intense	Intense marketing activities	Stagnant sales
BMC	Daily, weekly, and monthly financial records have not been carried out properly	Good daily, weekly and monthly financial records	Do not have the required financial statements
Business Process	Operational activities do not run according to SOP	Operational activities are ran according to SOP	SOPs are outdated and irrelevant

Based on the gap analysis above, it can be concluded that the problems that occurred are caused by the gaps between factual and ideal conditions. Furthermore, the existing problems were assessed and weighted to measure the level of importance of the problem and the level of convenience to be carried out based on ideal conditions and the level of ability of Little House Baked Goods.

Table 2. Pareto Analysis

GAPs	Value	Weight	Score	%
Marketing Planning	9	8	72	23%
Improvement of financial reports	9	7	63	20%
Marketing Channel Optimization	8	7	56	18%
Production Efficiency	8	7	56	18%
Product Development	7	6	42	13%
SOP updates	5	5	25	8%
			314	100%

Based on the data and the analysis, Little House Baked Goods needs to make a marketing plan to reach more market segments, so that the customer base grows. The objective of business coaching is to improve the marketing activities by creating a marketing plan. The marketing plan is created based on the marketing channels that have to be optimized, both the existing channels and the new channels. The channels are through Instagram, WhatsApp, GoFood, GrabFood, Google My Business, and Tokopedia. These channels have features that let customers provide reviews for Little House Baked Goods, related to the products and the service. The reviews are expected to make it easier for the other customer to make purchasing decisions at Little House Baked Goods.

## V. DISCUSSION

The implementation of this business coaching was carried out for 2.5 months, starting from April 1, 2022 to June 15, 2022. The implementation went well where SME owners and employees were very open to change and growth, so they were enthusiastic about running this program. Implementing marketing planning is the main objective of this business coaching. Marketing plan implementation is carried out by optimizing the marketing channels used and increasing online consumer reviews for each channel. The following are the achievements of the implementation of the business coaching process at Little House Baked Goods:

Table 3. Key Performance Indicators

No.	Activities	Target	Realization	Results	Percentage
1	Selling hampers products	Selling 75 hampers packages	Sold up to 75 hampers packages	Achieved	100%
2	Instagram	Gaining 1,000 followers, from 0	Gained 684 followers	Not Achieved	68%
		Planning daily and weekly post	Uploaded daily and weekly contents	Achieved	90%
		Interactive Instagram Stories	Gained consumer interactions through Instagram Stories	Achieved	90%
3	Google Business	Gaining 60 Google Reviews, from 29	Gained Google Review	Achieved	90%
		Increasing exposure through Google Ads	Gained 20k impressions, 95 clicks, 13 local actions	Achieved	90%
4	Tokopedia	Moving Instagram and WhatsApp sales to Tokopedia	Instagram and WhatsApp sales shifted to Tokopedia	Achieved	90%
		Moving wholesales to Tokopedia	Only 50% B2B Wholesales moved to Tokopedia	Not Achieved	70%
		Contributing 5% sales	Contributed 11.7% sales	Achieved	100%
		Gaining 100 reviews	Gained 108 reviews	Achieved	100%
Performance Score					89%

In the process of selling hampers products, the sales achievement reached 100% where the sales contributed 25% of sales in April 2022. The performance score on Instagram optimization was 83%, because the increase in the number of followers on Instagram has not been in accordance with the specified target. Optimization on Google My Business

went well where Google Review and Google Ads activities reached the specified target with an average achievement of 90%. Optimization on Tokopedia has obstacles where some Little House wholesale consumers are reluctant to transfer their transactions to Tokopedia due to the delivery system which has the potential to add large shipping costs. On the average, the optimization went smoothly where the average achievement reached 90%. From the achievement of the specified target, it can be concluded that the business coaching process is running as expected.

## VI. CONCLUSION AND RECOMMENDATION

Based on the results of the analysis conducted through business coaching activities, it can be concluded that the main problems experienced by Little House can be improved by implementing the marketing plan by optimizing marketing channels and increasing online consumer reviews. Based on several considerations, the optimization of Instagram and the Google My Business are carried out to support efforts to increase exposure through Instagram Ads and Google Ads. Marketing planning needs to be done because as a business, Little House does not have a marketing activity plan. Marketing planning is done by determining indicators such as target market, competitive advantage, sales plan, marketing and sales targets, marketing action plan, budget, measure and update plans, operations, and choose how Little House will receive payments. Determination of these indicators focuses on optimizing each marketing channel and increasing online consumer reviews.

The low production ratio of Little House is caused by the static level of consumer demand for Little House products. This is exacerbated by the condition of the loss of the Little House Instagram account as the main medium in conducting marketing activities. In fact, the products owned by Little House have good quality at affordable prices. Thus, it is necessary to optimize each marketing channel in order to increase demand and sales. After the optimization, it can be concluded that the level of marketing activities and the level of interactions with consumers increases along with increasing the exposure of Little House and has the potential to increase the selling power of Little House. The level of Little House consumer reviews on each marketing channel is relatively low, so it needs to be increased to get the effect of electronic word of mouth. The high level of reviews from consumers can help make purchasing decisions for prospective consumers, so that they can increase their confidence to make transactions. Based on the results obtained, consumers are enthusiastic about the invitation to do a review. The high level of consumer reviews also has the potential to increase Little House's sales. The overall percentage of efforts implementing marketing plan by optimizing marketing channels and increasing online consumer reviews has reached 89% of the set target.

Taking into account the limitations that have been faced, marketing planning need to be made and developed periodically. Marketing planning could be done weekly and monthly which is important to do as a routine guide for marketing activities to increase demand and sales of Little House. The optimization of all marketing channels is expected to be continued and managed properly. Because, marketing channels are a source of income for Little House. The moment of truth felt by consumers takes place in each marketing channel. Marketing channels need to be managed by a person in charge who is specifically responsible for each marketing channel so that their activities are optimal. Online Consumer Reviews need to be managed properly. Reviews are an important medium to maintain interaction and engagement with consumers. The large amount of information in reviews, both only valuable comments and opinions, will influence consumer decision making in making a purchase.

## Factors Affecting Continuance Intention to Reuse Telemedicine Apps

Elizabeth Stefani Sitohang<sup>1</sup>,

<sup>1</sup>Master of Management, Faculty of Economics and Business, Universitas Indonesia, Jakarta, Indonesia

### Abstract

The main objective of this research is to identify the main factors predicting the e-satisfaction with Telemedicine Apps and customer's intention to reuse such app in Indonesia. Telemedicine Apps have been widely known as a digital-based disruptive innovation in the health sector that is convinced to be very beneficial when patients are required to maintain physical distance or unable to visit health centers because public has access to various treatment options provided through the use of wireless technology. There are important questions regarding the impact of implementing Telemedicine Apps on customer e-satisfaction and customer continuance intention to reuse such app. A survey was built using specific constructs to measure the perception of Telemedicine Apps, which is based on the UTAUT2 combined with the perspectives of perceived privacy, perceived security, and trust. The sample was composed of 235 populations who have used Telemedicine Apps and data were analyzed using Partial Least Square Approach. Trust was found to be the most significant driver of customer e-satisfaction, followed by performance expectancy and hedonic motivation. In addition, habit and e-satisfaction were identified as the strongest predictors of continuance intention. These findings extend our understanding of users' satisfaction and continuance intention in the context of Telemedicine Apps. Conclusion and implications are provided.

*Keywords*— Telemedicine App; Continuance Intention; E-satisfaction; UTAUT2; IS Success Model

## I. INTRODUCTION

In the digital era 4.0, the development of technology and information is very rapidly, one of which is the development of the internet. The internet today affects every aspect of society (Leung & Chen, 2019). Based on the 'Global Digital Reports 2021', until January 2021, the number of internet users in Indonesia reached 202.6 million people (We Are Social, 2021). When compared to the previous year, the number was 27 million higher. The increase in internet users does not escape the increase in smartphones. The Ministry of Communication and Information stated that smartphone users in Indonesia reached 167 million of the total population of Indonesia (Media Indonesia, 2021).

Industry 4.0 completely revolutionized digital health and its entire ecosystem (Aceto et al., 2020; Arfi et al., 2021). Through the presence of the internet and smartphones, health sector companies create a digital-based service innovation with the term Telemedicine that is used by people in Indonesia. Minister of Health Regulation No. 20 of 2019 defines Telemedicine as the delivery of health services, where distance is an important element for patients and health practitioners by using information and communication technology that is used to exchange valid information regarding diagnosis, treatment, prevention of disease and injury, research and several uses related to research and education for the benefit of the health of each person and society (Persi, 2019).

The presence of Telemedicine provides many conveniences in society because Telemedicine enables people to choose better health care options, improve the quality and performance of emergency services, reduce time in making diagnoses, and save costs for doctors and patients by optimizing clinical procedures, and reducing costs trips to the hospital (Weinstein et al., 2014; Parimbelli et al., 2018; Haleem et al., 2021). Telemedicine uses technology that is believed to be very helpful for patients when patients are required to maintain physical distance or cannot visit health centers because public has access to various treatment options provided through the use of wireless technology such as laptops and smartphones (Vasquez-Cevallos et al., 2018; Kerleau & Pelletier-Fleury, 2002; Ishfaq & Raja, 2015 in Haleem et al., 2021).

Beside its advantages of being able to provide various solutions to improve the quality of services for patients and doctors, Telemedicine also has various limitations and obstacles in its implementation (Haleem et al., 2021). There are some very typical and common barriers to consider when implementing telehealth-related practices for healthcare, such as 1) lost patient privacy; 2) disclosure of patient data confidentiality; 3) the complexity experienced by the

patient; 4) misdiagnosis of the patient's illness; 5) the administration of drugs that must be carried out is controlled by a doctor; 6) fraud and abuse; 7) medical responsibility; and 8) the accuracy of patient data. In addition, when compared to conventional health services, Telemedicine is deemed inappropriate in every situation, such as imaging tests (x-rays), blood tests, and diagnoses that require professional health personnel (Harvard Medical School, 2020).

Based on a survey conducted by Statista, there are five digital health app that are most often used by residents in Indonesia, namely Halodoc, Alodokter, KlikDokter, Good Doctor, and YesDok (Statista, 2021). Currently, these Telemedicine app compete to provide the best service. The services they offer look almost the same as each other that makes users have many choices in using app which certainly can be a threat to various Telemedicine app because users have high bargaining power.

The large variety of Telemedicine app choices to obtain health services, makes users more selective in downloading app that will be used in the future. Regardless of the potential benefits of an app, its ultimate success depends on whether users use their initiative to use the app. The benefits of an app will decrease if users do not use it (Keen & Roberts, 2017; Amin R et al., 2017; Binyamin & Zafar, 2021). When users feel optimistic, innovative, comfortable, and safe about health-related communication technology, they tend to feel that the technology is useful, in accordance with their initial expectations, and arises satisfaction and continuance intention (Leung & Chen, 2019).

Users' satisfaction and continuance intention to reuse a system or technology refers to four determinants of acceptance and use of technology, namely performance expectancy, effort expectancy, social influence, and facilitating conditions. These four determinants are described by Venkatesh et al. (2003) in the UTAUT (Unified Theory of Acceptance Use of Technology Model) model, a model that presents a theoretical framework that describes what potential factors influence acceptance (Blut et al., 2021). The basic concept underlying UTAUT is that the intention to use information technology is a direct predictor of actual use (Philippi et al., 2021). Then, Venkatesh et al. (2012) developed the UTAUT model into UTAUT2 to cover different contexts, where UTAUT2 focuses on consumers or customers. Thus, UTAUT2 explains consumer behavior with the four original constructs from UTAUT by adding three new constructs, namely hedonic motivation, price value, and habit. When associated with this research, UTAUT2 will explain consumer behavior of a service which in the context of this research is a Telemedicine app.

Another thing that affects user satisfaction and continued intention to use a system or technology is perceived privacy and perceived security. Users feel security is important, even though it is not sufficient for perceived privacy (Morton & Sasse, 2012; Nepomuceno et al., 2014; Maqableh et al., 2021). Perceived security and perceived privacy have been shown to protect users from risk and uncertainty, he also suggested that both increase user trust when using technology platforms (Culnan & Armstrong, 1999). Furthermore, perceived security and perceived privacy increase and have a positive impact on trust (Culnan & Armstrong, 1999; Flavian & Guinaliu, 2006). The more Telemedicine app that appear, this study intends to explore the relationship between the UTAUT2 model, perceived privacy, and perceived security so that users use technology, trust is the side of trust, and the e-satisfaction obtained by users in using Telemedicine app that are believed to be factors that can increase continuance intention to reuse.

## II. LITERATURE REVIEW

Performance expectancy refers to the more convenient and productive benefits offered by a new system and app to users (Venkatesh et al., 2003). Customers tend to have more positive reactions and intentions to use a new system if they feel that the system will save more time and effort than the conventional one (Dwivedi, Rana, Janssen et al., 2017; Dwivedi, Rana, Jeyaraj, Clement, & Williams, 2017; Sharma & Sharma, 2019; Tamilmani et al., 2019; Venkatesh et al., 2003). When customers feel a high degree of benefit value when using innovative apps, customers will have an experience that tends to be satisfying and enjoyable (Alalwan, 2020). Performance expectancy is a significant predictor to determine user intention to adopt new technology (Zhao & Bacao, 2020). When users perceive higher utility from an app, they will have a greater intention to use the app continuously (Yeo et al., 2017; Park et al., 2007).

**H1.** Performance expectancy will positively impact users' satisfaction with Telemedicine app

**H2.** Performance expectancy will positively impact users' continuance intention to reuse Telemedicine app

Venkatesh et al. (2003) and Alalwan (2020) provides the view that effort expectancy is also referred to as ease of use, which is how far the user gets the ease and requires little effort when using a new system. This means that the effort expectation refers to the effort required to use the system, whether it is simple or complex. With the easy technology can be easily accepted and adopted by users. Most users prefer technologies that provide flexibility, usability and ease of use (Catherine et al., 2017). In the context of the use of connected health devices, effort expectancy is associated with an increase in the perception that a system or technology has benefits. In the medical context, effort expectancy is a strong predictor of continuance intention (Alaiad & Zhou, 2014; Quaosar et al., 2018).

**H3.** Effort expectancy will positively impact users' satisfaction with Telemedicine app

**H4.** Effort expectancy will positively impact users' continuance intention to reuse Telemedicine app

Social influence provides a view of how far a person feels that other people he considers important believe that he should implement a new system (Venkatesh et al., 2003). When a system or technology is considered new to a person and he is not very familiar with it, then other people (friends, family, leaders) whose opinions or thoughts he considers important can influence the acceptance or use of the system (Alalwan, Dwivedi et al., 2017; Okumus et al., 2018). It is also known that customers are more interested in returning to their social system either to pocket more information and expand their awareness or to gain social approval for their decision to use the new system (Khalilzadeh, Ozturk, & Bilgihan, 2017; Verkijika, 2018). Research conducted by Alazzam et al. (2016), Hennemann et al. (2017), and van der Vaart et al. (2016) confirmed that based on studies in the context of health with patients, social influence is often the most important predictor of technology acceptance (Moon and Hwang, 2016; Okumus et al., 2018; Tavares and Oliveira, 2017). Because many people are not experts in health issues, they are influenced by other people they consider important in their social group (family members or experts) (Moon and Hwang, 2016; Okumus et al., 2018; Tavares and Oliveira, 2017).

**H5.** Social influence will positively impact users' satisfaction with Telemedicine app

**H6.** Social influence will positively impact users' continuance intention to reuse Telemedicine app

Technical facilities and support from others are available when needed, based on user experience and customer satisfaction when using a new system or app that is considered modern (Venkatesh et al., 2003). Users also pay more attention to the quality and ability of an app to work consistently without any perceived obstacles (Alalwan, 2020). In addition, another thing that is very important to note is service for quality customers, where this service requires the role of human support such as customer service, call centers, and delivery (Alalwan, 2020). Facilitating conditions are strong predictors of the older generation (Venkatesh et al., 2003). Facilitating conditions have a close relationship with satisfaction also proven in the research of Maillat et al. (2015) in the context of health informatics. Furthermore, Li et al. (2019) and Tao et al. (2020) prove that improving facilitating conditions can increase users' behavioral intentions towards technology acceptance because a higher level of facilitating conditions can reduce the effort required to use technology.

**H7.** Facilitating conditions will positively impact users' satisfaction with Telemedicine app

**H8.** Facilitating conditions will positively impact users' continuance intention to reuse Telemedicine app

Hedonic motivation refers to the feelings of pleasure and enjoyment that users get when using a technology (Brown & Venkatesh, 2005). Hedonic motivation can be described as intrinsic motivation such as comfort, enjoyment, pleasure obtained after using a new product, service, or service so that this feeling of pleasure can be associated with the level of innovation and novelty in using the new system (Van de Heijden 2004); Venkatesh et al., 2012). The comfortable and pleasant experience will lead to positive feelings which in turn increase user satisfaction and intention to reuse (Hsiao et al., 2016).

Hedonic motivation has a close relationship with e-satisfaction and continuance intention as proven in Alalwan's research (2020). This can happen because users get a sense of pleasure, comfort, and enjoyment when using the app. When users obtain functional benefits (eg usefulness, performance expectancy), it is sufficient to guarantee customer satisfaction which in turn will lead to further behavior, such as continuance intention (Venkatesh et al., 2012).

**H9.** Hedonic motivation will positively impact users' satisfaction with Telemedicine app

**H10.** Hedonic motivation will positively impact users' continuance intention to reuse Telemedicine app

Price value is the use of new products and systems related to financial aspects (Alalwan, 2020), where users are more likely to compare the benefits of using the new system with the financial costs paid (Alalwan et al., 2017; Dodds et al., 1991; Venkatesh et al., 2012 in Alalwan, 2020). Venkatesh et al. (2012) revealed that price value is the user's cognitive exchange between the perceived benefits of the app and the monetary cost of using it (Alalwan, 2020).

Research conducted by Baudier et al. (2020) regarding the Telemedicine cabin, proves that the price value has a positive influence when the user's perception of the benefits of using a technology is greater than the costs he incurs.

**H11.** Price value will positively impact users' satisfaction with Telemedicine app

**H12.** Price value will positively impact users' continuance intention to reuse Telemedicine app

Perceived privacy discusses the possibility that a company will process its customers' personal information in an unauthorized manner or sell it to other companies (Castañeda et al., 2007). In today's technology-driven environment, one of the most important issues is personal data and customer concerns (Miyazaki, 2000; Miyazaki, 2001). The user's privacy concerns when using the app can break the benefits of it (Keith et al., 2016). Customers may be willing to share their personal information if they are rewarded with tangible benefits (Culnan, 1999). User behavior and attitudes, such as trust, willingness to use, intention to use, and intention to disclose personal information will be influenced by perceptions of privacy.

In the context of healthcare, providers must take into account the cultural values and beliefs of their patients because these values and beliefs inform patient privacy concerns. Patients prefer to have the freedom to decide when to disclose their health information (Ngwenya et al., 2016; Xiao et al., 2015). Good handling of customer privacy can be one source of customer satisfaction (Trivedi & Yadav, 2020).

**H13.** Perceived privacy will positively impact users' satisfaction with Telemedicine app

**H14.** Perceived privacy will positively impact users' continuance intention to reuse Telemedicine app

When a person adopts technology, the gap between actual security and user-perceived security raises various questions about the effect of perceived security (Zhang et al., 2019). Perceived security is defined as the level of trust on the internet to transmit sensitive information (Salisbury et al., 2001). Meanwhile, Mekovec & Hutinski (2012) and Shin (2010) state perceived security is about how far users feel that technology service providers are able to act appropriately to ensure that customers are free from any risk when using a technology. Every company has their own security measures (anti-virus software, intrusion detection and prevention system, port scanner, vulnerability scanner) to protect their hardware, software, company data and customer data. When companies feel worried that they are wary of cyber security measures, customers are more likely to have confidence in internet services (Maqableh et al., 2021). Lighner et al. (2004) and Liao et al. (2017) found that intention to use technology in web services is continuously shaped by one important factor, namely perceived security.

**H15.** Perceived security will positively impact users' satisfaction with Telemedicine app

**H16.** Perceived security will positively impact users' continuance intention to reuse Telemedicine app

Vijayasathy (2004) & O'Cass & Fenech (2003) in their research have tested the relationship between perceived privacy and attitude, the results obtained that both have a positive relationship. Research conducted by Mukherjee & Nath (2007) identified that the privacy and security features of websites are key antecedents of trust. Therefore, according to Flavia'n and Guinali'u (2006), the development of trust can influence a person's intention to buy but the trust is also influenced when he feels that an app can handle their personal data securely.

The relationship between perceived security and trust has been explored in several studies. As research conducted by Tsiakis & Stephanides (2005), if the user's perceived security level on an app is too low, customers may no longer participate in using the app until a solution is implemented to rebuild their trust. That is, if the user's perceived security level in an app is high, the customer may participate continuously in using the app. Thus, it can be concluded that he trusts the app because he feels safe when using it.

**H17.** Perceived privacy will positively impact users' trust with Telemedicine app

**H18.** Perceived security will positively impact users' trust with Telemedicine app

Mayer et al. (1995) defines trust as a user can trust other parties related to him and be sure of it. His confidence with other parties is based on self-confidence (Rempel et al., 1985). In a medical context, consumers can only rely on the diagnosis made by the service provider. Handing over personal details to providers based on trust is an important factor in the acceptance of technology in healthcare. Trust is one of the determining factors in such exchanges, where uncertainty is present. Practically, trust is a prerequisite for interactions carried out in an uncertain environment (Ba & Paulov, 2002). In such situations, beliefs about the service provider (besides usability and ease of use) also become important. If service providers fail to convey trust, consumers are unlikely to engage in transactions (Heravi et al, 2018). Similarly, in terms of health care, if the patient trusts the health care provider to meet his needs, then the patient is more likely to see technology as something that is beneficial to him (Lalseng & Andreassen, 2007). Ensuring trust, by creating a positive attitude towards service providers, is likely to reduce consumers' fear of service provider opportunism.

Research conducted by Lee & Kim (2012) found that trust can increase customer satisfaction and thus positively affect reuse intention. Many studies have shown that trust as a factor influencing satisfaction has been carried out because trust offers an emotional assessment to customers, which also proves that the company is honest (Gustafsson et al., 2005). Therefore, when customer satisfaction increases, customers will appear attached to the company and its products or services (Chen et al., 2009 & Chen & Sue, 2013).

**H19.** Trust will positively impact users' satisfaction with Telemedicine app

Customers who are happy with their experience when using an app are more likely to have habitual behavior using the app (Alalwan, 2020). The results of previous experiences and interactions of customers can shape their perceptions and attitudes which in turn predict their intensity to act in the same way (Ajzen & Fishbein, 2005). Amoroso and Limös (2017) in their research have tested the relationship between e-satisfaction and habit, and they were able to prove that there is a relationship between the two. Furthermore, Amoroso and Limös (2017) also add that while customers are satisfied with their experience using an app, customers are expected to get used to using the app.

**H20.** E-satisfaction will positively impact users' habit with Telemedicine app

Habit is defined as the extent to which people tend to perform behavior automatically (Venkatesh et al., 2012 in Alalwan, 2020). Once users have had a positive experience with a new technology, the strength of the habit becomes a determinant of their future behavior and intention to use it in the future (Lin and Wang, 2006). Habits have been included in several studies on continued intention to use IT-based technology, because users who frequently use technology or apps, their behavior becomes automatically formed (Hsiao et al., 2016). When a behavior becomes a habit or well-practice behavior, it becomes automatic and is carried out without a deliberate decision (Ouellette & Wood, 1998; Lin & Wang, 2006).

The relationship between habit and continuance intention has been carried out in various studies. Hsiao et al. (2016) found that habit is a significant determinant of continued use of mobile apps. In the context of health apps, Peng et al. (2016) have proven that habit is a significant predictor of mobile health app. Habit theory supports the relationship between habit and continuance intention because previous habitual behavior can lead to favorable feelings towards behavior, thereby increasing continuance intention (Kim & Malhotra, 2005; Hsiao et al., 2016).

**H21.** Habit will positively impact users' continuance intention to reuse Telemedicine app

Satisfaction is a crucial and essential construct in marketing (McQuitty et al., 2003). In online marketing, customer satisfaction is considered more complicated than offline marketing because it involves the interaction between marketing and technology characteristics (Tang et al., 2005). In the context of online shopping (e-commerce), customer satisfaction consists of customer satisfaction when making purchases and user satisfaction when using IS (website). Therefore, prospective marketing and prospective IS are combined and conclude satisfaction as e-satisfaction. E-satisfaction is used to research customer satisfaction when making online purchases. Satisfaction along with continuance intention is considered the key to maintaining and maintaining a loyal relationship with users (Hsiao et al., 2016).

Users will feel satisfied if they feel that the service performance of the app they use exceeds their expectations, which in turn leads to positive action on the continuance intention to reuse an app (Zhao & Baca, 2020). In the context of the online environment, users who have a higher degree of satisfaction tend to have a stronger continuance intention to use online channels again (Bhattacharjee, 2001; Hsiao et al., 2016). A study conducted by Alalwan (2020) proves that there is a strong relationship between e-satisfaction and continuance intention because a person's intention to use an app in the future will depend on how satisfied he is with the experience of using the new system.

**H22.** E-satisfaction will positively impact users' continuance intention to reuse Telemedicine app

### III. RESEARCH METHODOLOGY

#### A. *Sample And Data Collection*

The empirical part of this study was conducted in Indonesia using questionnaire survey. During the one month from October to November 2021, the required data was collected from a purposive sampling size of 265 smartphone users who had already adopted and used Telemedicine app (Halodok, Alodokter, KlikDokter, Good Doctor, YesDok, and such app).

#### B. *Measures*

In the first part of the questionnaire, the main purpose of the study was explained, and Telemedicine app were clarified with examples (Halodoc, Alodokter, KlikDokter, Good Doctor, YesDok, and such app). The second part was devoted to screening questions to ensure that respondents are over the age of 18 years old and are Telemedicine users. The third part was for the main construct items and the last part was for the demographic questions. The main construct items part, Venkatesh et al.'s (2012) scale was adopted to measure PE, EE, SI, FC, HM, PV, HB, and CI. E-satisfaction was validated using scale items extracted from Anderson and Sullivan (1993), Wang, Tseng et al. (2019) and Lee and Chung (2009) in Venkatesh et al. (2012). Items for PP and PS were adapted from Balapour et al. (2020), Susanto et al. (2016), and Nepomuceno et al. (2014) in Maqableh et al. (2021). TR was tested from items suggested by Susanto et al. (2016) and Yang & Lin (2014) in Maqableh et al. (2021). All of the constructs items are measured using a seven-point likert scales ranging from 1 strongly disagree to 7 strongly agree.

As Indonesian is the official language in Indonesia, the questionnaire was translated into Indonesian. More over, the Indonesian version of the questionnaire was checked by seven peoples. A pre-test was also conducted with 30 participants with different backgrounds. The vast majority of participants reported that the language used was very clear and understandable. To check the reliability of the constructs' scale used, Cronbach's Alpha was tested for all the constructs. All constructs were able to capture a value not less than 0.60 according to Malhotra (2020) suggestions in this regard.

### IV. RESULT / FINDING

The result section will begin by providing preliminary data analysis of the demographic statistics. Then, a Partial Least Square approach was mobilized using SmartPLS3 to analyse the relationships between the constructs of the model.

#### A. *Demographic Statistics*

Out of 300 distributed questionnaires, 265 (75.9%) were returned and found to be valid for more advanced analysis. More than half (80.4%) the participants were female; accordingly males accounted for 19.6% of participants. As for the age categories, the vast majority (69.4%) of respondents were within the age group of 23-27, with 12.8% in the age group of 28-32, and the smallest percentage (2.3%) in the group of those aged 40 and over. In the terms of

educational level, holders of Bachelor's degrees constituted the largest group in the current sample size, accounting for 78.1% of the total sample size, followed by those who have Master's degrees (12.5%). Regarding the average expenditure per month level, the largest part (28.7%) of the current sample was for those who have a monthly expenditure higher than 5.000.000, about 16.2% current study participants reported having a monthly expenditure level ranging from 500.000 to 1.000.000. Finally, most participants (50.2%) in the current study had experience with Telemedicine app of 1 to 2 years.

### B. Reliabilities And Validities Of The Outer Model

The loadings of the variables, the Composite Reliability and Cronbach's Alpha, mobilized to control the reliability of the model, were above the recommended threshold of 0.6. The discriminant validity of all constructs was controlled by verifying that the square root of the Average Variance Extracted (AVE) of the construct was superior to the correlations of this construct with the other constructs. Convergent validity was confirmed as all the values of the AVE were above the recommended threshold of 0.50. Thus, results of on the analysis of the outer model confirm the validity and reliability of the research model.

Table 1. Validity and Reliability

Variabel	Item	Cronbach's Alpha	Composite Reliability	Outer Loadings	AVE

### 1. IV.3 Inner model

The inner model was tested by controlling the value of  $R^2$  and  $Q^2$  of the endogenous variables. The relationships between constructs were controlled using the following parameters: t-value at more than the recommended threshold at 1.65 and p-value below 0.05. To explain the variance of the constructs, the  $R^2$  were examined. Our model explains 72.2 percent of E-satisfaction, determined by Trust (Path Coef = 0.358,  $t = 5.111$ ,  $p = 0.000$ ) and two of the UTAUT2 variables: Performance Expectancy (H1: Path-Coeff = 0.244,  $t = 3.710$ ,  $p = 0.000$ ) and Hedonic Motivation (H9: Path-Coeff = 0.209,  $t = 3.335$ ,  $p = 0.000$ ). With  $R^2$  at 0.676, our model explains 67.6 percent of Continuance Intention determined by E-satisfaction (H20: Path Coef = 0.326,  $t = 3.374$ ,  $p = 0.000$ ) and two of the UTAUT2 variables: Performance Expectancy (H2: Path Coef = 0.114,  $t = 1.723$ ,  $p = 0.042$ ) and Habit: (H13: Path Coef = 0.412,  $t = 4.575$ ,  $p = 0.000$ ). Our model also explains 52.4 percent of Trust, determined by Perceived Security (H19: Path Coef = 0.717,  $t = 19.812$ ,  $p = 0.000$ ). At last, with  $R^2$  at 0.448, our model explain 44.8 percent of Habit, determined by E-satisfaction (H21: Path Coef = 0.669,  $t = 17.855$ ,  $p = 0.000$ ).

The Blindfolding procedure was mobilized to calculate the  $Q^2$ . The  $Q^2$  of E-satisfaction, Continuance Intention, Trust, and Habit are greater than zero, indicate an acceptable predictive of relevance the model. In summary, eight hypotheses were validated and fourteen rejected as seen in Figure 1.

2. Fig 1. Bootstrapping Model

## V. DISCUSSION

With the growing popularity of Telemedicine app in medical context, understanding user Telemedicine apps continuance intention has become an essential topic for both practitioners and academics. This study investigates the factors that influence the Telemedicine app continuance intention of users through UTAUT2 and the integration of IS success model. The results reveal that only eight hypotheses are accepted (H1, H2, H9, H18, H19, H20, H21, H22) and fourteen hypotheses are rejected.

In discussing the hypotheses, H1 proposed that performance expectancy influences e-satisfaction, and H2 proposed that performance expectancy influences continuance intention. The findings of this research supported both of these hypotheses. This finding confirmed the significant positive impact of performance expectancy on user e-satisfaction and users' continuance intention to reuse Telemedicine app, and the result was supported by previous research studies by Alalwan (2020). This demonstrates that the ability of Telemedicine X apps that can help users accomplish tasks more quickly gives satisfaction to the use of Telemedicine X apps, and increase users continuance intention.

Hypothesis (H9) proposes that hedonic motivation positively impact users' satisfaction. This means that Indonesian users are more likely to be pleased about the usage experience of Telemedicine app. These result could be attributed to the fact that, in consumer context, functional benefits are sufficient on their own to guarantee customer satisfaction (Venkatesh et al., 2012; Alalwan, 2020). The considerable role of hedonic motivation could be explained by Telemedicine app still being a new and innovative technology in Indonesia, hence, using such app could accelerate the users' feelings of pleasure and enjoyment.

According to the results, (H18) perceived security was confirmed to have a crucial impact on continuance intention, the results showed ample support for this hypothesis. The findings confirm that perceived security is the key determinant of Telemedicine app user continuance intention. The results consistent with Maqableh et al. (2021) that found user's trust is positively influenced by perceived security. This demonstrates that the perception of higher control of Telemedicine apps and their services greatly affects the trust of the majority of users towards these apps.

H19 proposed that trust increases users' satisfaction while using Telemedicine app. The findings of this study supported previous research by Maqableh et al. (2021). They found that trust increased user satisfaction. Regarding to the result, the finding demonstrated the positive impact of trust as a key determinant of Telemedicine apps users' satisfaction. Thus, the user's trust and confidence in the telemedicine application they utilize will lead to satisfaction with the services offered by the application.

Hypothesis (H20) proposes that e-satisfaction positively impact users' habit with Telemedicine apps. This means that those users who are pleased with their experience of using Telemedicine apps are more likely to have a habitual behavior of using Telemedicine apps. In general, people who are happy about the outcomes of their prior behavior and experience are more likely to keep repeating such behavior. This is in line with Alalwan (2020) finding of a significant relationship between satisfaction and habit.

Hypothesis H21 proposed that habit influences users' continuance intention to reuse Telemedicine apps. Adopters of any new systems are more likely to cognitively evaluate the actual outcomes with the expected ones. Alalwan (2020) confirmed the impact of habit on the users' continuance intention. Alalwan argues that customers who formulate a habitual behaviour towards a new system will retain their motivation to use such a system in the future. Such results are similar to those of Amoroso and Lim (2017) and Sun and Chi (2018).

Finally, H22 proposed that e-satisfaction influences users' continuance intention to reuse Telemedicine app. According to Alalwan (2020), someone who adopts each new system, is more likely to cognitively evaluate the actual results with the expected. Thus, their future intention to reuse will be highly predictable by the extent to which they are satisfied with their experience using the new system. Maqableh et al. (2021), argues that to increase user satisfaction with continuance intention, an application can provide new services and tools to ensure that satisfaction.

## VI. CONCLUSION AND RECOMMENDATION

Based on the information and results of research that has been done, obtained several things that can be used as suggestions for companies that provide Telemedicine services that intend to develop these apps so that companies can improve their effectiveness.

First, regarding to performance expectancy, company needs to focus on continuing to carry out promotional campaigns on social media, websites, and in the Telemedicine app itself to convince users that by using the app users will save time, money, and effort when compared to having to come directly to the hospital. to make an appointment and consult a doctor, ask for a prescription from a personal doctor, buy medicine directly at the pharmacy, and so on. Moreover, Telemedicine companies can add features such as search filters that will make it easier for users to search for more specific products or services. That way, the filter search feature will limit the search results based on categories. For example, in medical services, the search can be filtered by doctor gender, doctor experience, consultation price, doctor rating, and so on. Filter search is also applied to the search for products that are sold, such as by price, generic and prescription drugs, age, and so on. Thus, users can get search results that match their needs.

Second, related to hedonic motivation, to increase the hedonic motivation of users, Telemedicine companies can focus on campaigns that promote that by using Telemedicine apps, users will experience an interesting and enjoyable experience. The campaign can be delivered by users who have used it by delivering an appealing message that the Telemedicine app is an innovative technology and part of modern medical services. The campaign can be carried out through digital media such as websites, social media (Instagram, Twitter, Youtube), as well as conventional media, such as television, radio, newspapers, and so on. In addition, Telemedicine companies can also develop gamification strategies to increase the hedonic motivation of users. The form of the gamification strategy can be in the form of challenges that must be carried out which later if the user succeeds in going through the challenge, the user will get various attractive prizes such as free consultation vouchers, free vouchers for medicine purchases, free vouchers for home care health checks, and other attractive prizes.

Concerning trust, Telemedicine apps can design a clear and detailed arrangement of terms and conditions of use as well as a privacy policy which will later be approved by the user. Furthermore, also provide an explanation that the terms and conditions of use as well as the privacy policy that has been attached must be read carefully and thoroughly before making the first transaction on the Telemedicine app so that users believe that the sensitive information they provide will not be misused by the app. In addition, Telemedicine companies need to implement good security standards, such as implementing ISO 27001, the international standard for the implementation of Information Security Management System (ISMS). The company is also obliged to provide dissemination to its users regarding guaranteed security through the company's official channel so that the trust of Telemedicine app users increases when using services or purchasing products.

Marketers should also work on the aspect of habit associated with using Telemedicine app. In this vein, there are user habits that are formed in using services on Telemedicine apps in the midst of the COVID-19 pandemic. Therefore, Telemedicine apps can design daily check-in programs to increase user habits and interest in using Telemedicine apps. The daily check-in program can be linked to shaping techniques. Shaping technique is a new behavior development technique that is carried out by continuously strengthening the approach (Martin and Pear, 2015). So that users routinely check-in on Telemedicine apps, users will receive positive reinforcers every time the user succeeds in checking-in. Positive reinforcers can also be referred to as rewards which are everything that is given as soon as possible after the user performs a behavior that ultimately increases the behavior (Martin and Pear, 2015). Through the provision of positive reinforcers, users can earn points after doing daily check-in. Points that have been accumulated can be exchanged for backup reinforcers (bigger prizes) such as discount vouchers for product purchases, discount vouchers for treatment at beauty clinics, and others. In addition to designing daily check-in programs, Telemedicine apps can also design subscription packages to increase the user's habit and sense of connectedness to the use of Telemedicine apps. Subscription packages can be in the form of unlimited consultations with doctors 24 hours a day, medical recommendations from private doctors, and prescriptions from private doctors after consultations, and so on. Thus, subscription packages for more active use can encourage users to return to using Telemedicine apps.

Finally, to increase user satisfaction based on the most influential variable, namely trust, app managers must maintain user trust by tightening the maintenance of user data and information to avoid all risks of cyber crime. The second most influential variable is performance expectancy, where the ability of the app to help users get what they want in a more comfortable and productive way will increase their satisfaction. Thus, the authors suggest that Telemedicine companies can improve the performance of these apps so that users feel more satisfied than they expected. So, users have positive actions by using Telemedicine apps on an ongoing basis in the future because this depends on their experience when using the app.

## Investigating the Effect of Brand's Social Media on Consumer Purchase Intention

Yanet Kemala Putri<sup>1</sup>, Daniel Tumpal Hamonangan Aruan<sup>2</sup>

<sup>1,2</sup>Master of Management, Faculty of Economics and Business, Universitas Indonesia, Jakarta, Indonesia

### Abstract

*This study examined the influence of information quality, brand familiarity, involvement, and attitude toward brand's social media on the purchase intention of superfood in the oats category within the scope of Instagram. Consumer's preference for healthy food has been on the rise through the pandemic and there has been a surge in both of social media usage and online shopping activities. Few studies suggest that the use of social media impacts eating behavior, lifestyles, and one's perception of a superfood brand. However, no studies have ever been conducted regarding the effect of brand's social media on Indonesian consumer's purchase intention in the context of superfood oat during pandemic and post pandemic era. Previous research suggested to consider various age ranges and focus on brands or product categories. Therefore, this study targeted Generation Y and Z respondents in the oats category. A convenience sampling method was conducted, and questionnaire was built using specific constructs to measure purchase intention of an oat brand. The sample was composed of 360 respondents who are active Instagram users that have consumed oats in the past year and data were analyzed by using partial least squares-structural equation modeling. This research shows that consumer's involvement on brand's social media has a negative effect on the purchase intention. Further, the results indicate that both brand familiarity and attitude toward brand's social media have significant effects on purchase intention, but the information quality of social media content does not influence purchase intention of the brand.*

*Keywords— Marketing; Oats Consumption; Purchase Intention; Social Media; Superfood.*

---

### I. INTRODUCTION

Covid-19 has changed people's lifestyles in a massive way. Starting from the emergence of new regulations, increasing use of the internet and social media to the habit of adopting a healthy lifestyle. The trend that has emerged recently is supported by the Covid-19 crash, namely the trend of consuming healthy food (superfood). When a market-wide lockdown came into effect in the spring of 2020 due to the COVID-19 pandemic, consumers turned to online grocery shopping due to movement restrictions and fears of being exposed to the virus from others in public spaces, causing online grocery sales to soar. Health products such as healthy foods, supplements, nutrient-rich drinks such as milk and yogurt, are the most sought-after items. Because currently consumers are more focused on products that have value for their health.

Based on a survey conducted by Hootsuite (2021), there are 4.2 billion active social media users out of a total world population of 7.83 billion. In other words, 53.6% of the population are active social media users. Meanwhile, within Indonesia, active social media users are 170 million or 61.8% of the country's population. This data shows how active the Indonesian population is as a virtual society. The use of social media is not limited to just individuals as social media can act as a platform for organizations, businesses, even brands. A brand can use social media to create content and engagement, which is when an entity is able to leverage its content to reach others and meet at social media connection points. Social media is also widely used for health promotion by health professionals, researchers, governments, and non-governmental organizations (Balatsoukas et al., 2015). Mersey et al. (2010) noted that social media provides opportunities for businesses to participate and interact with potential customers. Prospective consumers in this case mean the audience or followers of the social media page in question, while participation means engagement or involvement. Hudson et al. (2016) suggest that when brands interact with followers on social media pages by replying to comments, solving problems, and inviting participation, consumers have stronger relationships with brands that feel connected and thus experience higher levels of relationship quality.

Social media as a low-cost and easy-to-use platform can offer a brand direct link to its consumers, so it is important to understand the factors that influence consumers to engage with brands on social media platforms and the influence of involvement on social media. In fact, in the context of Instagram, this lies in several features in Instagram stories, "Ask me a question", quizzes, polls, and reaction stickers which can increase intimacy between business actors and the audience (consumers and potential customers) as well as building relationships (even bonding) with potential

customers. In addition, the Instagram story feature that is often used by content creators to insert a CTA (call to action) function, such as “support small business” sticker, “food orders” sticker, and swipe-up-link. The Instagram post feature that is used to market a product or service is Instagram Ads which is usually accompanied by a CTA in the form of a link insertion feature and a boost post service so that the promotional content reaches Instagram users according to business targets.

Brandessence Market Research and Consulting Pvt Ltd. (2021) released Global Health Food Market: Global Size, Trends, Competitive, Historical and Forecast Analysis, 2021-2027 stating that the increasing adoption of healthy food consumption habits and increasing awareness about health are the main factors driving the growth of the Global Healthy Food Market. The Brandessence report says that a healthy diet is a diet that improves, maintains, or enhances overall health. This market research found that the Health Food Market is expected to grow at a CAGR (Compound Annual Growth Rate) of 4.91% during the forecast period. The Brandessence report also reveals that the global healthy food market is divided into the United States, Mexico, Canada, United Kingdom, France, Germany, Italy, China, Japan, India, Southeast Asia, West Asia, Africa. Meanwhile, according to distribution channels, the healthy food industry is categorized into retail stores and online stores. In this paper, the thing that will be raised is the oats category superfood which is marketed online in one of the countries in Southeast Asia, namely Indonesia.

Certain terms such as “nutraceutical” and “superfood” have been used to describe compounds or foods with potential health benefits beyond basic nutritional functions (Sohaimy, 2012; Mohammadian et al., 2021). Superfoods with their health-promoting labels are believed to improve the function of the human body (Mohammadian et al., 2021). However, it should be noted that the term superfood is used as a marketing tool and there is no generally accepted definition (Driessche et al. 2018).

Fortune Business Insight (2020) reports that the global oats market has reached USD 5.18 billion and is projected to reach 6.9 billion by 2027. Furthermore, the report states that oat-based foods are increasingly popular in society as health awareness increases and the transition their lifestyle to grain-based foods that are fast and healthy. Japankuru (2021) reports that health-conscious consumers have begun to pay attention to the nutritional quality of oatmeal and its convenient shelf life. Furthermore, Japankuru (2021) reports that sales of oats have increased as consumers buy more basic breakfast ingredients that are easy for daily use, even to stock up in the event of a disaster. Japankuru (2021) also reported that a basic breakfast using oats is a coronavirus dieting trend for those who gain weight when they work from home because COVID-19 means a surge in WFH (Work From Home) activities which means an increasingly sedentary lifestyle and access which is too easy for any snacks you might have in the kitchen. It also noted that oatmeal is not the only oats-based product that has seen increased interest since the start of the COVID-19 pandemic, but almond milk and oatmilk as well.

Buchholz (2019) reported that the highest age group that consumed oats for breakfast was 15-34 years. Ridder (2019) stated that in 2019 the proportion of the age group that regularly consumed oats for breakfast in Denmark was the younger age group, namely 15 to 34 years, while the older age group (55-74 years) was the group that consumed the least. oats for breakfast. As of November 2019, 13% of Swedes aged 65 to 75 said they had eaten oatmeal for breakfast. In comparison, among the youngest age group between 16 and 24 years, the share reaches almost 12%. Previous research examined consumer behavior of oats and superfoods in all age groups and gave mixed results regarding the highest age group for oats consumers in developed countries, but the highest age group in general is 16 to 34 years, which means targeting Generation Y and Generation Z. Therefore, the author intends to look at this trend by focusing on the age group ranging from 17 to 41 years and with coverage of Indonesia as a developing country.

## II. LITERATURE REVIEW

Referring to a previous study by McClure and Seock (2020) regarding purchase intention involving brand social media pages, the quality of information on social media content and brand familiarity is quite an impact on consumer involvement on brand social media pages and involvement also has an influence on consumer attitudes of a brand's social media. Furthermore, their research also found that involvement and attitude also influence purchase intention. According to Ajzen (1991), intentions include motivational factors that influence behavior and indicate the efforts that people will make to perform the behavior. According to Kotler (2016) the definition of purchase intention is consumer behavior when consumers are stimulated by external factors and participate in purchasing decisions based on their personal characteristics and decision-making processes. Savolainen (2011) states that the issue of information quality and credibility is increasingly important, especially in the context of the World Wide Web. Savolainen (2011) also

suggests that future research should investigate the quality of information on internet platforms other than discussion forums and how the quality of this information may affect the use of online platforms. Rieh (2002) specified information quality as “a user criterion which has to do with excellence or in some cases truthfulness in labeling”. Chung and Muk (2017) found that consumer attitudes towards messages on social media were highly correlated with interactivity and information on social media pages. They also suggest that active interactions and useful information on social media pages result in positive perceptions of corporate social media pages, which leads to their impulsive shopping behavior from companies. Accordingly, the following hypotheses have been developed:

H1. Information quality of a brand’s social media content will positively influence consumer’s purchase intention from the brand.

Laroche et al. (1996) found empirical results that brand familiarity affects consumer confidence in the brand, which in turn affects their intention to buy the same brand. Alba and Hutchinson (1987) note that brand familiarity serves as an important source of information about the brand, which is enhanced by the accumulation of experience in the brand or frequent exposure to the brand. Consumers tend to think the brand is familiar when the brand is often advertised in the media. Previous studies have shown that brand familiarity plays an important role in consumers' perceptions of a brand or product, and in the purchase intention of that brand (Gefen, 2000; Laroche et al., 1996). A study conducted by Doong et al. (2011) show that increasing brand familiarity leads to consumers' offline brand loyalty and higher shopping intentions. Complexity in the online environment can lead to purchase avoidance; however, familiarity with the brand can increase customer participation in the brand's social media community seeking information from companies and users. Previous studies in the context of online shopping have shown that brand unfamiliarity is a greater disadvantage online than offline especially with products that require a sensory experience (Degeeratu et al 2000; Danaher et al 2003; Saini and Lynch, 2016). Thus, the following hypotheses have been developed:

H2. Consumer’s brand familiarity will positively influence their purchase intention.

Previous studies have found that engagement or involvement affects factors such as brand attitudes, purchase intentions, advertising attitudes, and online shopping behavior (Huang et al., 2010; Yang, 2012). For example, Bosnjak et al. (2007) studied online purchase intention and found that affective involvement is a significant indicator of online purchase intention. Huang et al (2010) who investigated the involvement of travel bloggers found that high-involvement bloggers have more positive opinions about advertising and rank it as a significant indicator of purchase intention when managing brands. Previous research (Teng, 2016) used the concept of involvement which is considered a driver to form attitudes and behavioral intentions. Hudson et al. (2016) suggest that when the brand interacts with followers on the social media page by replying to comments, solving problems, and inviting participation, consumers have stronger relationships with the brand having a feeling of connection and thus experiencing a higher level of relationship quality.

In a study on the effect of social media communication on consumer perceptions of brands, Schivinski and Dabrowski (2016) found that user-generated and company-generated social media communications significantly influence consumer brand attitudes. Kotler and Armstrong (2018) say that attitude is a person's evaluation, feelings, and tendencies towards an object. According to Mitchell and Olson (1981), brand attitude is defined as, "the consumer's overall evaluation of the brand". Brand attitude is often conceptualized as a global evaluation based on favorable or unfavorable reactions to brand-related stimuli or beliefs (Murphy and Zajonc, 1993) and is cited as a major component of being considered in consumer-based brand equity and relational exchange (Lane and Jacobson). 1995; Morgan and Hunt, 1994). Accordingly, the following hypotheses have been developed:

H3. Consumers’ involvement with a brand on social media will positively influence their purchase intention from the brand.

H4. Consumers’ attitude towards a brand’s social media presence will positively influence purchase intention from the brand.

### III. RESEARCH METHODOLOGY

This research is an empirical study using a quantitative approach which is measured on a numerical scale. Data were collected from 360 respondents which then the eligible data were 358 samples of active Instagram users who have consumed oats in the past year. This study used a questionnaire with a Likert rating scale of 7 as a tool to collect

data. Respondent data used in this study will be processed using the Partial Least Square - Structural Equation Model (PLS-SEM) method. The following is the operationalization of each variable in this study along with its meaning, source, and measurement scale.

Table 1. Operationalization.

Construct	Source
Information Quality	McClure and Seock (2020)
I find the brand's social media to be:	
• Useful	
• Specific	
• Objective	
• Valuable	
• Factual	
• Comprehensive	
• Interesting	
• Reliable	
• Official	
• Good Variety	
Brand Familiarity	McClure and Seock (2020); Ha and Perks (2005)
• The brand gives me a feeling of goodwill.	
• I have made a purchase from this brand.	
• I know the meaning of this brand.	
• I am familiar with this brand.	
• I have a clear understanding of the person who would use this brand.	
Involvement on Brand's Social Media	McClure and Seock (2020); Huang et al. (2010)
• I frequently interact with other members of this brand's social media site	
• I have an interactive communication with other members of this brand's social media	
• I cooperate with other members of this brand's social media	
• I am actively involved in the brand's social media	
• I spend a lot of time engaging in the brand's social media	
• I provide feedback related to participation in the brand's social media	
Attitude toward Brand's Social Media	McClure and Seock (2020); Huang et al. (2010)
• I like this brand's social media.	
• I think this brand's social media is reliable.	
• I think this brand's social media is friendly.	
• I think this brand's social media is valuable.	
• I think this brand's social media is of good quality.	
Purchase Intention	Park et al. (2021); McClure and Seock (2020); Hu et al. (2011)
• I have a strong possibility to buy oat products from this brand.	
• I tend to make a purchase from this brand.	
• In the future, I am very likely to make a purchase from this brand.	
• I expect I will purchase this brand in the future.	
• I intend to purchase this brand in the future.	

Source: Researcher (2022)

In the first part of the questionnaire, the main purpose of the study was explained, and the second part was devoted to screening questions to ensure that respondents are active Instagram users who have consumed oats in the past year. Thereafter, it was the main part where each respondent was required to choose an answer for each construct items with a seven-point Likert scales ranging from 1 strongly disagree to 7 strongly agree. Finally, demographic questions were given to understand respondent's profile.

As seen in the Table 1, ten construct items were adapted from Savolainen (2011) in McClure and Seock (2020) to measure information quality. Participants were asked to rank how they agree or disagree with statements such as "I find the brand's social media to be useful", "I find the brand's social media to be specific", "I find the brand's social media to be objective", etc. To measure brand familiarity, five items were adapted from McClure and Seock (2020) and Ha and Perks (2005). Consumer's involvement on brand's social media was measured with six items from Huang et al. (2010) in McClure and Seock (2020). Consumer's attitude toward a brand's social media was measured with five items which were adopted from Huang et al. (2010) in McClure and Seock (2020). Lastly, consumer's purchase intention on an oat brand was measured with two items from Park et al. (2021) which conclude "I have a strong possibility to buy oat products from this brand" and "I tend to make a purchase from this brand"; and three items from Hu et al. (2011) in McClure and Seock (2020) which concluded "In the future, I am very likely to make a purchase

from this brand”, “I expect I will purchase this brand in the future”, and “I intend to purchase this brand in the future”. Thenceforth, the data was analyzed by using SmartPLS ver. 3.

#### IV. RESULT / FINDING

Data gathered from the survey was analyzed using the PLS-Algorithm function on SmartPLS which resulted in the following table (See Table 2.).

Table 2. Reliability and Validity.

	Outer Loading	Cronbach's $\alpha$	Composite Reliability	AVE
Information Quality		0.920	0.933	0.582
IQ1	0.790			
IQ2	0.773			
IQ3	0.802			
IQ4	0.778

Source: SmartPLS (2022)

Cronbach's alpha values were computed to assess the internal consistency aspect of reliability of the multitem scales measuring information quality (0.920), brand familiarity (0.815), involvement (0.967), attitude (0.877) and purchase intention (0.903) (See Table 2.). The respective alpha values for all the variables included in the study deemed sufficiently reliable for use. Thus, the main-test was conducted by using SmartPLS on Bootstrapping function. PLS-SEM was implemented to examine the relationship between information quality (H1), brand familiarity (H2), involvement toward brand's social media (H3), attitude toward brand's social media (H4), and purchase intention. Thus, we developed the following hypothesis testing:

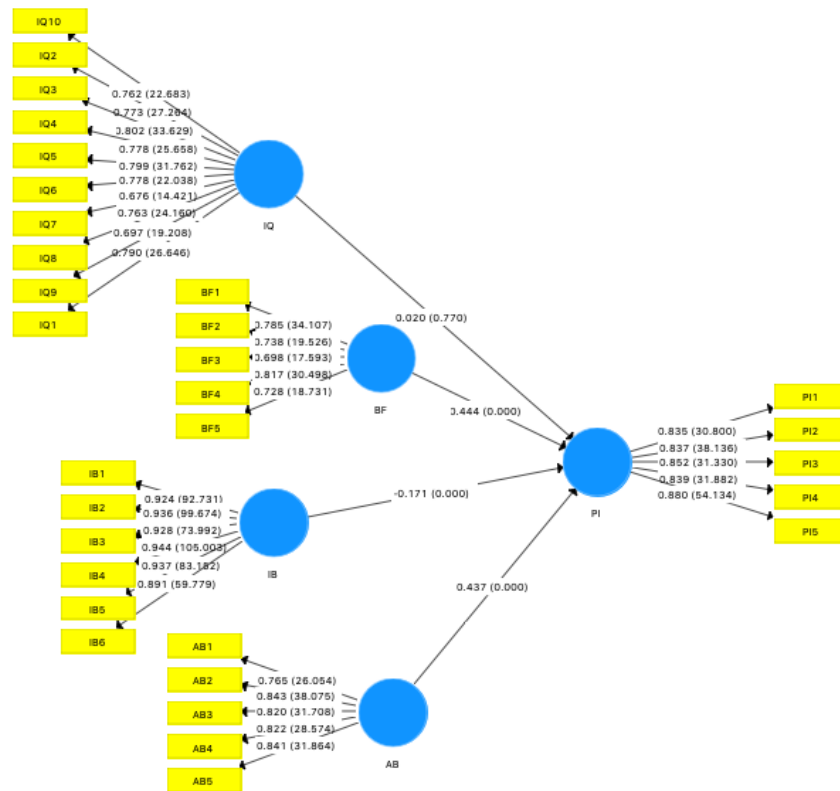

Fig. 1. Bootstrapping Result of Research Model with p-value (SmartPLS, 2022)

The main-test was conducted by using bootstrap in PLS-SEM in order to examine the relationship between information quality (H1), brand familiarity (H2), social media involvement (H3), and consumer's attitude toward a brand's social media (H4) with purchase intention. Based on the bootstrapping result above (see Fig. 1), there is a significant negative influence of involvement of brand's social media on purchase intention with path coefficient = -0.171 and  $p < 0.05$ , which suggests that H3 is not supported. Meanwhile, the results indicate that both brand familiarity (path coefficient = 0.444) and attitude toward brand's social media (path coefficient = 0.437) have significant and positive effects on purchase intention ( $p < 0.05$ ) which make H2 and H4 are supported. Nonetheless, it appears that information quality of social media content does not influence purchase intention due to its insignificant result with  $p > 0.05$  which denotes that H1 is not supported. Hence, H2 and H4 are the only hypotheses which are supported.

## V. DISCUSSION

In this study, it is found that brand familiarity and consumer's attitude have a positive and significant effect on consumer's purchase intention toward an oat brand in the scope of Instagram. Both brand familiarity and consumer's attitude toward a brand's social media significantly influence consumers' purchase intention, yet brand familiarity has greater influence on purchase intention as shown by the path coefficient ( $0.444 > 0.437$ ); brand familiarity and consumer's purchase intention on an oat brand has stronger positive relationship. Meanwhile, information quality of an oat brand's social media content does not influence purchase intention of the brand which contradicts with the previous study (McClure and Seock, 2020) where there was a significant importance of information quality affecting future purchase intention. Also, the research showed that consumers' involvement with a brand's social media had a negative influence on purchase intention due to its coefficient path that resulted in minus score, that is -0.171 (see Fig.1). In contrast to previous study which said that there was no significant relationship between involvement and

future purchase intention (McClure and Seock, 2020), the hypothesis testing shows that consumer's purchase intention decreases with the increasing of consumer's involvement on a brand's social media.

In this study, brand familiarity and consumer's attitude toward an oat brand have positive and significant influence on purchase intention. The findings align with previous studies saying that brand familiarity plays an important role as the increasing of brand familiarity leads to higher purchase intention (Gefen, 2000; Laroche et al., 1996; Doong et al., 2011). Previous study (Wardhani and Alif, 2018) stated that the possibility of brand purchase would be higher if consumers already had positive attitude toward the advertiser's product, service, or brand. Therefore, the more positive the consumers' attitude toward brand's social media the more likely they will make a purchase from the brand. Previous studies have shown that brand attitude corresponds to consumers' overall evaluation of a brand, and it is likely to significantly influence consumers' choice of one brand over others (Colliander and Marder, 2018; Augusto et al., 2018; Wang et al., 2019). Interestingly, this study revealed that consumers' attitude toward brand's social media had less impact than familiarity with a brand on the intention of brand's oats products. These findings suggest an opportunity for brands to gain potential followers and eventual customers by targeting those who are not familiar with their brand. By presenting brand campaign that gain audience's trust and provoke positive attitude, this may facilitate both parties (brand and audience) to connect and build relationship, which in the end, hopefully, may trigger purchase intention. This finding aligns with a study by Mersey et al. (2010) that social media provides an opportunity for companies to engage and interact with potential customers and build relationships with them. The result also aligns with previous study by Schivinski and Dabrowski (2016) stating that consumer brand attitudes formed from their communication on a brand's social media page have a significant and positive influence on the brand's purchase intention.

The findings contradict with the prior studies which have found connections between information quality and purchase intention (McClure and Seock, 2020) and involvement and purchase intention (Bosnjak et al., 2007; Huang et al., 2010). The hypothesis testing results indicate that there is no relationship between information quality of brand's social media content with consumer's purchase intention. Also, the result shows that involvement on brand's social media negatively influences purchase intention in a significant way which means as the involvement increases, purchase intention is predicted to decrease. That being the case, companies' active interactions with the people through a brand's social media pages may not bring a strong trust and commitment toward the brand. This is, perhaps, caused by individual's personality that has been found to influence consumers' usage of mass media and online behaviors, moreover, individual's beliefs, attitudes, and behaviors related to Internet usage may vary as a function of his/her personality traits (Ryan and Xenos, 2011; Kim and Jeong, 2015; Islam et al., 2017). This finding aligns with previous study (McClure and Seock, 2020) the relationship between involvement with brands through social media and future purchase intention from the brands was not significant,

## VI. CONCLUSION AND RECOMMENDATION

Based on the results of data processing and discussion, it is known that within the scope of Instagram social media, the quality of information content, consumers' involvement on brand social media, brand familiarity, and consumers' attitudes on a brand's social media can be a set of influence or consideration for someone to make a purchase on a brand of oats. The findings offer meaningful implications for interactive marketing practitioners, online advisers, and social media marketers. Oats companies require to present social media content with good quality of information in the sense that it has benefits and is objective and comprehensive, so that it looks attractive for the audience. In addition, it should be noted that consumers tend to feel familiar with a brand of oats if they have already made a purchase or consumed that brand of oats. Therefore, oats brand companies need to focus on increasing sales figures to create a strong understanding in consumers' minds about the brand.

How deeply the audience or consumers and potential customers are involved on the Instagram social media page of an oats brand can be a factor that influences the purchase intention of the product. If the audience has been actively involved on the brand's Instagram page, it means that there is a personal interest that individuals feel when they spend time in interactive communication, be it with the brand, or with other people on the brand's social media platform. These interactions can take the form of comments to reply to comments, repost each other on the Instagram story feature, reply to DM (Direct Messages), and so on. Not only consumer engagement, but companies also need to take action to build and maintain positive consumer attitudes on brand social media pages. This positive attitude has been formed when the audience feels that the brand's Instagram page is trusted and of good quality, to the point where it

provides feedback in the participation space created by the brand. For example, an audience who likes the oats brand's Instagram page will participate in a quiz or challenge held by the brand.

The more positive a person's attitude towards a brand, the higher the purchase intention because consumer attitudes are closely related to consumer beliefs and behavior. With feedback related to audience participation in brand events or campaigns, a positive attitude of the audience (consumers and potential customers) has been formed, which in the end, purchase intention is also formed in the minds of consumers. To create positive consumer attitudes, oats companies need to gain consumer trust through their social media pages. This can be obtained by creating promotional activities or campaigns that are interactive and require feedback or active consumer participation. In other words, this positive attitude can be built and maintained through promotional activities that trigger audience's engagement on the brand's Instagram social media page. Therefore, oats companies need to focus on campaign activities that are interactive and require feedback.

#### ACKNOWLEDGEMENT

I would like to express my special thanks of gratitude to my lecturer, Daniel Tumpal Hamonangan Aruan, S.Si., M.S.M., Ph.D, who gave me the golden opportunity to do this wonderful project on the topic of consumers' purchase intention on oats brands and I wish to extend my special thanks to a fellow researcher as well as my special someone, Hanry Harlen Tapotubun, S.Si.Teol., M.A, who also helped me in doing a lot of research and I came to know about so many new things.

## In Search of Leadership Competency Model for Millennials in Energy Sector: A Literature Review

Bently N. Tobing<sup>1</sup>, Jann H. Tjakraatmadja<sup>2</sup>, Donald C. Lantu<sup>3</sup>, Henndy Ginting<sup>4</sup>

<sup>1,2,3,4</sup>School of Business & Management, Bandung Institute of Technology, ITB, Bandung, Indonesia

### Abstract

*Leadership competency model has become critical as the emergence of millennials in energy sector and the business shifting to new era caused by VUCA and COVID-19 pandemic. In order to promoting and maintaining high-performing millennial employees and reduce the maturity gap compared to the Gen – X employees, there is needs to enrich the content and implementation process of leadership competency to meet current and future necessities. However, little is known about related researches of competency model existing in energy sector organizations particularly for the case of millennials. This paper aims at reviewing literature of leadership competency model in different workforce area and organizations with focus intention is on the energy sector. It will also examine competency model approaches used by undertaking a comparative analysis of practices and techniques when developing the leadership competency models. Findings suggested that 24 leadership competency model have been used in the literature obtained with very limited number of the implementation in energy sector yet none has been done for millennials case. Most of the models reviewed are using interviews and surveys as the main approach. Behavioral Event Interview is very effective way to build new leadership competency model. The result can be used by the energy sector organizations to craft their leadership competency models. It can also be utilized by other researchers for future potential researches.*

*Keywords—Energy; Competency; Leadership; Millennials; Model*

---

### I. INTRODUCTION

XYZ as an energy company is currently entering its transformation that coincides with the COVID-19 pandemic, being considered as clear sign of the awakening of a new era of doing business (Annual Report, 2021). The transformation processes should achieve several main objectives including the creation of an organization that is focused, lean, agile and efficient with the associated work culture, mindset and talents (Internal, 2020). The business landscape is dealing with the volatility, uncertainty, complexity & ambiguity (VUCA) and being worsened by the presence of COVID – 19 pandemic.

Currently, the company is facing leadership challenge as an impact of massive senior leader retirement within the upcoming years. In securing the capability in delivering energy, the government has put concerns for XYX to assure the process of leadership regenerations (EFMD, 2021). There is likely an emergent phenomenon on the maturity gap as these new leaders may not have and apply the specific competences to be able to answer the challenges of transformation of the new era despite the programs are prepared with particular leadership contents. The competency gap phenomenon will dominantly impact and shape the future of the company (Annual Report, 2021).

There is still limited evidence from the literatures and contextual experiences in describing and developing the specific leadership competencies for millennials specifically in energy sector business in Indonesia. The readiness of millennials equipped with the required leadership competencies is critical for the company to sustain and grow in facing the challenges of business transformation as the trend of global energy will transit to a cleaner and renewable energy basis (Berkhout, Marcotullio, & Hanaoka, 2012).

This article will focus at reviewing literature of leadership competency model in different workforce area and organizations with focus intention is the search for implementation on the energy sector. It will also examine competency model approaches used by undertaking a comparative analysis of practices and techniques when developing the leadership competency models.

## II. LITERATURE REVIEW

Leadership competencies are leadership skills and behaviors that contribute to superior performance (SHRM, 2008). The future business trends and strategy will drive the development of new leadership competencies. While some leadership competencies are fundamental and essential to all organizations, there should be leadership attributes that are distinctive to the particular organization to create competitive advantage.

Competency concept was first introduced by an American management teacher, David McClelland when argued that the competency assessment could be the alternative for better predictor as the intelligence and aptitude tests were inadequate to predict job performance (D. C. McClelland, 1973). Empirical evidence showed that competencies did predict the occupational success (D. McClelland, 1998) such as McBer and Company, a consulting company who have completed dozens of studies that competency assessments predict success among high-level executives (R. Boyatzis, 1982).

In many organizations, competency model is the key importance to improve the personal performance and enhance the organizational effectiveness thus increase the competitive edge. As the behaviors necessary for effective performance vary in different organizations and within organizations from one role to another, it is critical to determine whether the workforce has the critical needed abilities (Lucia & Lepsinger, 1999). A competency model is collection of required competencies in responsibility, process, function or organization (Marrelli, Tondora, & Hoge, 2005) as a tool for selection, training, employee development, and succession planning (Spencer and Spencer, 1993; Lucia & Lepsinger, 1999). Competency model will provide performance standards (Chung-Herrera, Enz, & Lankau, 2003) and predict the workforce performance against several key performance indicators (Dainty, Cheng, & Moore, 2004). Competency modelling is the best way to match the people and jobs in the organization (Vathanophas & Jintawee, 2006) so the employees may improve performance to be superior (Chouhan & Srivastava, 2014).

Table 1 Competency Definitions

Author	Definition
<b>McClelland, 1973</b>	Knowledge and skills, social role, self-image, traits and motive. Knowledge and skills are 'threshold competencies' while social role, self-image, traits and motive are 'differentiate competencies'
<b>Boyatzis, 1982</b>	'An underlying characteristic of an individual which is causally related to superior performance in a job.'
<b>Spencer and Spencer, 1993</b>	'An underlying characteristic of an individual that is causally related to criterion-referenced effective and/or superior performance in a job or situation.'
<b>Dubois, 1993</b>	Those characteristic-knowledge, skills, mindsets, thought patterns, and the like, that when used singularly or in various combinations, results in successful performance
<b>Mansfield, 1996</b>	'Skills and traits that are needed by employees to be effective in a job.'
<b>Marrelli, 1998</b>	'Measurable human capabilities that are require for effective work performance demands.'
<b>Draganidis and Mentzas, 2006</b>	'A combination of tacit and explicit knowledge, behaviour and skills that gives someone the potential for effectiveness in task performance.'
<b>Boyatzis, 2008</b>	'A capability or ability. It is a set of related but different sets of behaviours organized around an underlying construct, which we call the "intent". The behaviours are alternate manifestations of the intent, as appropriate in various situations or times.'
<b>Tripathi and Ranjan, 2009</b>	'Competencies are not simply concrete actions that are easily imitated. Instead, competencies can be manifestations of some underlying intent driven by a person's basic personality, ability, knowledge and skills.'

There are three common components to the above definitions. First, most of the definitions suggest that competencies are the characteristics that underlie effective or successful job performance; second is that these attributes must be observable or measurable; and third, the underlying attributes must distinguish between superior and average performers (Megahed, 2018).

Throughout the past 25 years, many researchers have contributed to the extensive literature concerned with competency modelling in variety of fields, such as management, scientific research, technical and also engineering. The competency literature during this period can be classified into five research paradigms as depicted below (Megahed, 2018).

Fig. 1 Competency Modelling Paradigms (Megahed, 2018)

The behavioural paradigm was first introduced by McClelland (1973), introduced the term in his paper ‘Testing for competence rather than for intelligence’ in which he suggested the competency testing as a better predictor successful job performance rather than intelligence and aptitude test. Competency is considered as independent variable include an underlying traits sand skills that impact on the management performance and behaviour. Prominent researchers linked with this paradigm such as McClelland, 1973; Boyatzis, 1982; Spencer, 1993; Draganidis and Mentza, 2006; Markus, Cooper-Thomas, and Allpress, 2005.

The Behavioural Interview Technique (BEI) was developed by McClelland which focuses on identifying the “characteristic of people who did a job well” and aims to find out what people actually ‘do’ at workplace (D. McClelland, 1998). Over the last 30 years, some empirical studies have showed the effectiveness and validity of the behavioural approach in competency modelling, such as on (i) the identification of criteria defining effective performance; (ii) the identification of criterion sample group of superior performers and average performers; (iii) data collection through behavioural event interviews and other ways; (iv) the identification of competencies that distinguish superior from average ones; (v) the validation of the competency model; and (vi) the application of the model to a range of HRM functions (Spencer, M & Spencer, 1993).

The business paradigm was introduced to the literature in the late 1980s which is based on the idea of “core competencies” that contributed to the interest of many organizations (Shippmann et al., 2000). A core competencies act as the foundation for strategic direction of the company (Hamel & Prahalad, 1994). The dimensions of competencies included organization-based competencies, individual-based competencies, technical competencies and behavioural competencies (Prahalad & Hamel, 1990).

The functional paradigm perceives competence more as a list of tasks to perform in particular job role (Megahed, 2018). It reflects the minimum level of performance acceptance and focuses on actual outputs (Jackson, 2009).

The educational paradigm is originated from an educational discipline (Megahed, 2018). Competencies are based on the functional role analysis, as the statements of behaviour and attitude that are needed for job role performance, and will be assessed against accepted standard/criterion of work outcomes (Markus, Cooper-Thomas, & Allpress, 2005).

The situational paradigm was based on the exploration of the factors that may influence the required competencies (Megahed, 2018). A research in the USA, UK, France and Germany explored the concept by incorporating knowledge, skills and competences within a holistic competence typology found that one-dimensional frameworks of competence were inadequate and given way to multi-dimensional frameworks. The research argued that holistic

framework was useful in identifying the combination of competences that were necessary for particular occupations and to promote labour mobility (Deist & Winterton, 2005)

Competency models should identify competencies that enable a long term fit with the organization (Clardy, 2008). There is linkage between competency and job performance as the three of the fundamental parts, include working conditions (or environment), job requests, and a person's competencies, must be matched (R. E. Boyatzis, 2008).

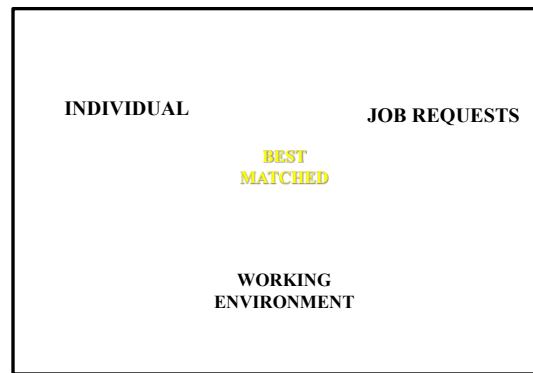

Fig. 2 The Linkage Between Competency and Job Performance (Boyatzis, 2008)

Spencer and Spencer has made concerns on the application of generic competency dictionaries (Spencer, M & Spencer, 1993). The generic competency dictionary scales are never precise since those are applicable to all kind of jobs. Many competencies in generic competencies might not be relevant to any given job although when a particular competency is important to a certain kind of job, the scale levels can be irrelevant. The generic competency dictionary comprised of 20 most common competencies, however, most jobs are unique thus required different characteristics that are not well represented on the generic dictionaries.

In his paper, Mansfield proposed three different job competency models. The first one is the 'single-job' competency model which focused only to one job. Data collection includes resource panel, focus group and interview with the job holders. A distilled competency model may include 10-20 traits or skills, each with a definition and a list of specific behaviors that describe what effective performers do and how to achieve effective results. The second approach is the 'one-size-fits-all' competency model which defined one set of competencies for a broad range of jobs (e.g. all managerial jobs). The third approach is a 'multiple-job' model which identified a common set of building block non-technical competencies to be commonly used to all jobs. This may include 20 – 40 competencies, each with a definition and a set of 5 – 15 behaviors describing common ways in which employees demonstrate the competency (Mansfield, 1996).

Lucia and Lepsinger introduced two approaches for developing competency model. The first approach is by starting from scratch by collecting internal data from interviews, focus groups, or observations. The data then are analysed to identify the significant competencies for effective performance. This approach may take longer time but result on more organization-specific. The second approach is suggesting to use the existing validated generic model as starting point to develop a new competency model (Lucia & Lepsinger, 1999).

There are many literatures that reported different development practices for competency models. The process used to develop a model must be straightforward and easy to implement. The final product must have immediate practical application, commitment and buy-in fro those who will be expected to implement or change their behaviour and correlates with the effectiveness on the job (Sanghi, 2016). These practices include :

- a. Job Competence Assessment Method (Dubois, 1993).
- b. Modified Job Competence Assessment Method (Dubois, 1993).
- c. Generic Model Overlay Method (Lucia & Lepsinger, 1999).
- d. Customized Generic Model Method (Dubois, 1993).

- e. Flexible Job Competency Model Method (Dubois, 1993).
- f. System Method (Lucia & Lepsinger, 1999).
- g. Accelerated Competency Systems Method (Dubois, 1993).

Some of the classic and well-known techniques for competency modelling development from the literature review are as follow (Wong, 2020) :

- a. The Critical Incident Technique
- b. This technique was introduced by Flanagan who explained that “the critical incident technique” consists of a set of procedures for collecting direct observations of human behavior in such a way as to facilitate their potential usefulness in solving practical problems and developing broad psychological principles” (Flanagan, 1954).
- c. The Behavioral Interview Technique (BEI)
- d. This technique was developed by McClelland to identify the “characteristics of people who did a job well” and find out what the participants actually ‘do’ at their workplace (D. McClelland, 1998). This technique allows the participants to describe specific critical incidents that lead to effective or ineffective performance in a specific job role in the organization (Vathanophas & Jintawee, 2006). The BEI compared two different perspectives of data, positive and negative outcomes per interview (Dias , Murillo de Oliveira & Aylmer , Roberto, 2019). ‘STAR’ technique is suggested to prepare the potential questions to guide the interview process (Uddin, Tanchi, & Alam, 2012).
- e. The Delphi Technique
- f. Delphi technique is applied “to elicit, distill, and determine the opinions of a panel of experts from a given field, seek consensus among the experts, and make predictions or decisions using the expert opinions of the panelists involved in the study” (Nworie, 2011). Three rounds are typically enough to reach a consensus among the experts (Delbecq, de Ven, & Gustafson, 1976).
- g. The Job Competence Assessment Technique (JCA)
- h. The technique was developed and used by Boyatzis when analyzing the data of 2,000 samples who worked in 41 management jobs from 12 organizations (R. Boyatzis, 1982).
- i. The Classic Competency Design
- j. For the past 20 years, Spencer and Spencer conducted 286 studies on competency modelling in many organizations and industries such as education, health care, military, etc. A full competency study may take two to three months, depending on the logistics of scheduling and conducting the BEIs. The classic competency studies include the six steps as shown in the Fig. below.

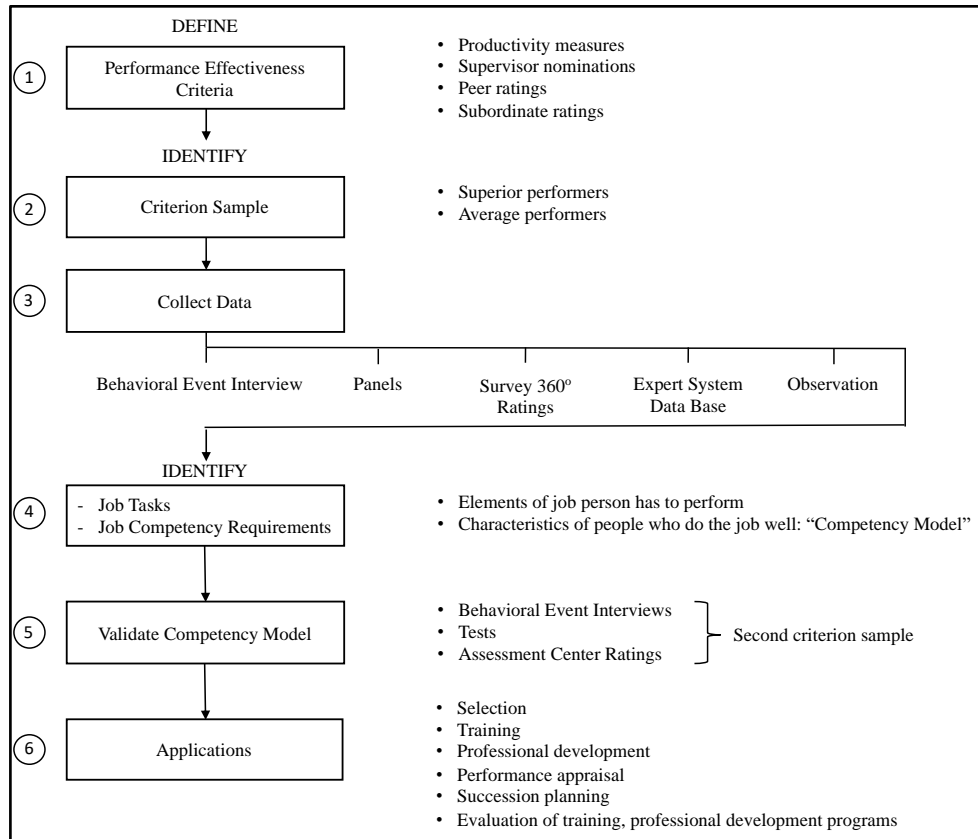

Fig. 3 Job Competency Assessment Process (Spencer & Spencer, 1993)

### III. RESEARCH METHODOLOGY

Research methodology, The research method describes the design of activities, scope or object, main materials and tools, place, data collection techniques, operational definitions of research variables, and analytical techniques. [Times New Roman, 10, normal].

In this paper, a literature review was applied to identify competency model existing in different workforce area and organizations with focus intention is the search for implementation on the energy sector. It will also examine competency model approaches used by undertaking a comparative analysis of practices and techniques when developing the leadership competency models. Thus it is descriptive rather than statistical approach.

The searching is done through several e-journal access databases, including ProQuest, researchgate and semanticscholar. Other sources for report analyses are included. The search was limited to literature written in English and was conducted by scanning specific words or phrases, such as leadership, competency, millennial, new era, VUCA and energy sector. The possible years of publication was limited to the last 10 years and placed in the database.

Articles were selected on the basis of abstract, title and keywords. All articles obtained, then, were reviewed. Related articles that presented studies to develop competency models were examined. Selected competency model approaches are carefully examined used by undertaking a comparative analysis of practices and techniques when developing the leadership competency models.

## IV. RESULT / FINDING

Findings suggested that 24 leadership competency model have been used in the literature obtained with very limited number of implementation in energy sector yet none has been done for millennials case. Most of the models reviewed are using interviews and surveys as the main approach. Behavioral Event Interview is very effective way to build new leadership competency model.

Monang *et al.* (2019) conducted a leadership competency study for 20 middle managers from several public agencies in Indonesia using the behavioral event interview technique to investigate a set of competencies that characterizes effective public middle managers. They proposed that communication, organizing, information seeking, analytical thinking and planning competencies are essential for effective public middle managers. (Iman Sudirman, Joko Siswanto, Joe Monang, 2019).

Shi *et al.* (2019) studied using a mixed method of behavioral event interview and random stratified sampling survey (3245 participants was 18–65 years old) to construct a general model of the competencies required by Chinese public health physicians. The research found the public health practitioner competency model comprised seven competency dimensions: basic knowledge of medicine, public health knowledge, health management and health promotion, specialized skills, research and development, comprehensive abilities and professionalism (Shi et al., 2019).

The research presented the study on technical competencies required by the construction manager in Malaysia using multi-layered thematic analysis of literature and interviews then followed with questionnaire surveys to test the validity of the technical competencies. Technical competency for Construction manager encompassed the ability to manage: staff, materials, labour, plant, sub-contractors, safety, money, quality, time, environment, site administration, pre-construction activities, project closeout and handover, third parties, computer literacy, and construction contract (Abdullah, Yaman, Mohammad, & Hassan, 2018).

A dentist competency index was developed with an expert consultation questionnaire using a literature review, focus group interviews and in-depth personal interviews, The competency model conformed to the characteristics and quality requirements of dentists in China and has a strong scientific basis (Geng et al., 2018).

Dainty *et al.* (2004) conducted study to identify the key behaviors leading to performance excellence amongst construction project managers in UK in which a total of 40 participants. A mixed method using Job Competence Assessment Technique (JCA) with behavioral event interviews, expert panels and the one-way analysis of variance (ANOVA) statistical technique was conducted to identify the competencies distinguishing superior managers from average managers. 12 competencies distinguished the superior from average performers: achievement orientation, initiative, information seeking, focus on client's needs, impact & influence, directiveness, teamwork & cooperation, team leadership, analytical thinking, conceptual thinking, composure and flexibility (Dainty et al., 2004).

A study to determine the required competencies for effective performance at the Chief of General Administrative Sub-Division position level in the Department of Agriculture using the Behavioral Event Interview (BEI) technique and survey to validate the competency model. The recommended competency model can be organized into four types of competency characteristics: motives, self-concept, knowledge, and skills and ability

A study in construction company in Indonesia on evaluation the effectiveness of the competency assessment to individual development was made by using mixed method, where in-depth interviews with purposively selected participants and questionnaires for 40 employees. The results of the study shows that there were many constraints in applying competencies model successfully due to some reasons such as: the assessment process relies too heavily on managers' judgment, and the managers and subordinates were hesitant to rate individual with his/her actual rating, the item of the assessment are not cleared enough, validity of the instrument is still questionable, and the employees have not been given any feedback regarding the results of the assessment (Mangundjaya, Aprilianti, & Poerwadi, 2009).

Research in Srilanka was made to present an empirical investigation on managerial competency need using quantitative methodology. The study was confined to a fully integrated telecommunication service provider where 198 managerial employees participated in the survey. The findings led to identify perceived levels of current competency expertise, current and future competency gaps and competency that managers wished to improve at present and in near future (Wickramasinghe & de Zoyza, 2009).

Research based on the McClelland/McBer job competence assessment questionnaires was conducted in Taiwan to construct a competency model for superior personnel directors. It was found that the competency model of superior personnel directors in the study was similar to Spencer's generic competency model for helping and human service workers with the exception of self-control (Chung & Wu, 2011).

Momin (2018) studied about the competencies of middle managers leading successful strategy implementation in Singapore. There were 152 total sample population participated in the survey and quantitative approach was applied. The finding was that business leaders and top managers were more likely to end up with mismatched middle managers that lack the required abilities to successfully execute strategy if they did not know the competencies needed to implement strategy successfully, or the competencies that exist in their management pool, thereby setting a course for failure from the start (Momin, 2018).

Study aimed at identifying competency components of project managers of small to medium-sized firms in the Palestinian construction industry. The study used questionnaire surveys to 150 construction companies. The study identified four competence dimensions, namely, knowledge competence, functional competence, personal/behaviour competence, and value/ethical competence (Omran & Suleiman, 2017).

Darling and Cunningham's study (2016) focused on exploring unique values and competencies linked to private and public sector managers. 15 senior leaders were involved as the participants in Critical Incident Interviews. They found several competencies that were important and distinct to public sector including managing competing interests, managing the political environment, communicating in a political environment, interpersonal motivational skills, adding value for clients and impact assessment in decision making. These were very different than those identified as critical for the private sector: business acumen, visionary leadership, marketing communication, market acumen, interpersonal communication, client service, and timely and opportunistic decision-making (Darling & Cunningham, 2016).

A study were conducted to seek the role of leadership competencies for implementing TQM in 265 companies in Thailand using quantitative survey approach. The findings were cross-validated using exploratory factor analysis (EFA). The research confirmed the necessity for top management to perform as leaders for implementing TQM. Companies with high leadership competencies execute each of the nine TQM principles more effectively and are able to produce higher quality products (Das, Kumar, & Kumar, 2010).

In order to fill a gap between theory and practice, a study was conducted that involved 22 Belgian organizations. The main purpose was to fill this gap by unraveling the process of competency development in organizations. The research method used organizational records, semi-structured interviews with HR managers and focus groups. It was found that organizations develop the competencies of their employees through a combination of training, on-the-job learning and career management (Vos & Hauw, 2021).

Ryan, et al. (2012) reported that competencies of individual leaders to business profitability were linked and demonstrated that competencies were cross-culturally valid. 15 high performing managers were involved in developing the initial competency study using Critical Incident Interview. The study found that a set of competencies was identified as predictive of unit profit growth in managers in both North America and the European Union. Subsequent regression analysis showed that 17 per cent of the variance in business unit profitability could be accounted for by four competencies, specifically team leadership, developing others, achievement orientation, and impact and influence (Ryan, Spencer, & Bernhard, 2012).

A research to design a managerial competency framework for Indonesian state-owned enterprises in the face of era 4.0 was made and used two studies, with mixed-methods techniques; questionnaire to 66 post-graduate students in three colleges, interviews with the Human Resources Department and questionnaires to company managers from three sectors; banking, oil and gas and telecommunications. The survey questionnaire was developed based on the competency concept formulated by the ministry of state-owned enterprise of Indonesia. The study found that managerial competencies including "integrity", "building partnership", "know the business", "customer focus" and "planning and organizing" are core competencies and important for the success of managers in state-owned enterprises (Syarifuddin & Ade Irma Susanty, 2019).

The research was done to identify the competency of human resources and management best practices related to advancing employee performance in a palm oil mill company owned by Indonesian SoE. The research applied a quantitative approach using interviews and questionnaires with 76 employees in the company and analyzed the data using the Likert scale and Partial Least Square Structural Equation Modelling (PLS-SEM). The result showed three implications. Firstly, competency affected employee performance in the palm oil mill company. Secondly, competency had an insignificant result on management best practices. Thirdly, management best practices affected employee performance (Evianisa, Sukmawati, & Setiawan Slamet, 2021).

Another empirical study was done of managerial competencies in first-line and middle managers in the banking industry (SoE) in Indonesia where the managerial competencies were identified using literature review, competency menu and database of “A Generic Competency Model for Managers” by Spencer & Spencer (1993), and a questionnaire-based survey by assessing the importance and frequency of the use of managerial competencies in the work. The results of the study proposed a preliminary generic competency model for managers in the banking industry in Indonesia and described the necessity to classify managerial competencies at different levels of management (Wulandari, Raharja, Nurasa, & Abdul, 2014).

A research has investigated competencies that facilitate new graduates’ success in the workplace in Hongkong. Samples were 289 full-time employees of various organization and the methodology involved the use of a questionnaire. The findings indicated that all of the competencies examined are important to a degree. ‘Ability and willingness to learn’, ‘teamwork and cooperation’, ‘hardworking and willingness to take on extra work’, ‘self-control’ and ‘analytical thinking’ are the five highest-ranking competencies measured (Pang, Wong, Leung, & Coombes, 2019)

Research was made to determine a soft competency model and its development for the Commitment–Maker Officer in land acquisition for public interest in Indonesia. The used method in this research is a qualitative approach to study existing problems and applicable work procedures. Data collection techniques were conducted through Focus Group Discussion (FGD) interviews, observation and documentation. The result of data analysis indicates that the soft competency model of Commitment–Maker Officer in land acquisition consists of 3 (three) criteria namely self concept, individual traits and motives (Prawesto & Wardiyanto, 2017).

A study attempted to identify important competencies that are deemed essential for culinary professionals in the hospitality industry in Malaysia. The qualitative research design composed of document analysis and purposively sampling of experts produced culinary professionals from the hotel industry and culinary educational institutions as participants. Semi-structured interviews were conducted with 9 participants who were purposely selected based on their background in the culinary industry. The current study adopted the BEI method. The qualitative data were used to form the framework of the Star-Chef Competency Model, which consists of six identified competency constructs. (Suhairom, Musta’amal, Mohd Amin, Kamin, & Abdul Wahid, 2019).

Another study in Germany was to establish a competency model for students working with a learning factory. Semi-structured interviews were conducted with 4 lecturers and 4 students who had experiences working with the learning factory. In results, 12 competencies were identified which can further be assigned to the three main clusters professional/methodological, social and personal competencies (Müller-Frommeyer, Aymans, Bargmann, Kauffeld, & Herrmann, 2017).

An empirical study in Thai manufacturing industry confirmed the significance of specific leadership competencies such as customer focus, continuous improvement and employee involvement to the better product quality (Das et al., 2010).

Aldulaimi (2018) conducted a qualitative case study in SoE energy company in Saudi Arabia discovered that participating in a leadership development program resulted in leader’s performance that could fill leadership gaps. A purposeful sample of 32 participants was drawn from in structured interviews conducted by the researcher. The results provided evidence that using leadership development programs to fill a leadership gap was productive, and that the effectiveness of this strategy was enhanced when organizations purposefully select and support participants through all stages of their leadership development (Aldulaimi, 2018).

In their research in oil and gas company in UAE, Saeed, et al (2015) identified five coaching constructs on leadership development: empowerment, coaching process, building trust, feedback and leadership role on leadership

development. 469 respondents involved to the surveys and a one-way between subject ANOVA was conducted to compare the effect of coaching constructs on leadership development (Saeed, 2015).

V. DISCUSSION

Based on findings from literature review, there was not founded any research conducted specifically on developing leadership competency model for millennial leaders in energy sector. As seen in Table 2, researches on State Own Enterprise (SoE) mostly used interviews and surveys as the approach. JCA – BEI and FGD is used to develop competency model on qualitative study. On project construction, mixed method combining the interview and survey is used dominantly to develop the model of competency as depicted in Table 3. In public administration sector, JCA – BEI is dominantly used in qualitative and mixed method study as described in Table 4. In Table 5, many researches in private sector are choosing qualitative and quantitative method to define the competency models as interviews and surveys are the most selected approach. Limited research in education sector used JCA – BEI and survey as seen in Table 6.

Fig. 4 shows proposed competency model development for miilennial leaders in energy sector in Indonesia, which will be part of authors’ future research, after taking into consideration those findings. The research will be conducted by choosing qualitative method with the application of JCA – BEI.

Study 1 included 14 superior personnel and study 2 included 34 average personnel directors. By using the procedures of job competence assessment method, the authors constructed and analysed the competencies for these two groups.

## VI. CONCLUSION AND RECOMMENDATION

Several researched have been undertaken to develop competency models in some focused area. The competency model approaches and the results in some focused area could only provide picture about the leadership competency model development in the respective sector as the organization vision, mission and need are different between one and another. In addition, all the sectors have different challenges.

However, there was no evidence that the similar type of research for developing the leadership competency model has been conducted specifically for the millennials in energy sector. Thus, the study on that particular area become very important to conduct especially when considering the VUCA and COVID – 19 challenges as the new era of doing

business become critical while the millennials are ready to take more important roles at the organization in energy sector.

#### ACKNOWLEDGEMENT

This research was conducted as part of the authors' doctoral study in the leadership competency area. The author thanks the promotor and co-promotors from School of Business & Management of ITB, which greatly assisted the research.

## **Pull Strategy Concept Implementation On MSME's Social Media And E-commerce Digital Marketing For Sales Improvement**

Jongkey Mulia<sup>1</sup> and Yeshika Alversia<sup>2</sup>

<sup>1,2</sup>Master of Management, Faculty of Economics and Business, University of Indonesia, UI, Jakarta, Indonesia

### **Abstract**

*Pull strategy concept implementation on MSME's digital marketing in Indonesia during Covid-19 pandemic aims to establish a new target market penetration strategy for sales improvement. ROTI DOTI as the object of study, produce Bandung toast white bread since 2018, located on Jalan Lumbu Timur Raya, Rawalumbu, Bekasi. The Covid-19 pandemic has decreased the production capacity and of course, the revenue itself. Therefore, MSME needs a quick solution to maintain the business continuity. Further study carries out qualitative research with descriptive analysis methods using data collection models such as interviews, observations, and literature reviews. Later, business process review, business model canvas, internal-external factors analysis, PESTEL, STP, SWOT, TOWS, gap analysis and pareto contribution give a perspective for this study to develop the exploration of digital ecosystem as priority for a better way in order to improve the sales revenue. In the end of study, we found that implementation of pull strategy concept on MSME's digital platform could acquire non-retail consumers as new target market and became an alternative to gain the sales revenue better than recruit more peddler. From the implementation, it can be conveyed that, effectively and precisely, the objectives of study have been achieved, ROTI DOTI now has several large-scale customers from other Bandung toast dealers who are the new target market for MSME, acquiring these new customers gave real contribution to increase sales revenue, as the result of the efforts to improve the pull strategy concept in product marketing through the digital ecosystem, both social media and e-commerce for being the best alternative way rather than relying on the recruiting more peddler partner.*

*Keywords—Covid-19, Digital Marketing, MSME, Pull Strategy, Sales Improvement*

---

### **I. INTRODUCTION**

According to IPSOS (2021), in article of Kontan.co.id (2021), base on survey conducted in February 2021, Micro, Small and Medium Enterprises (MSMEs) are the most popular product providers for the Indonesian people, both before and during the Covid-19 pandemic. The decline in purchasing power that occurred due to pandemic, however, still confirmed MSMEs as the highest contributors to consumer products, when compared to other non-SME products, both from within and outside the country, with the consumption level parameter pointing to a figure of more than 40%. As for the results of recorded transactions, the dominant sales channel was contributed by transactions via social media including online transportation applications at 33% and followed by e-commerce at 64%. Meanwhile, the most in-demand MSME products are food or culinary category products which reach 66% (Ipsos, 2021). Restrictions on community activities due to the Covid-19 pandemic have had a major impact on economic activities, including the MSME sector. The closure of schools, offices, shopping centers and traffic access affects the level of consumer demand. No exception for The bread industry. Quoting KEMENKOPUKM (2021), in article of Kompas.id (2021), 202 bakers in Greater Jakarta, 94% of whom were affected by the pandemic with a significant decrease in revenue, due to a decrease in the number of outlet visitors and reseller partners. Uncertainty about when the crisis will over, forces MSME to find a quick solutions, thus adapting to settle the business. There is ROTIDOTI, the object of business coaching. A white bread production MSME for Bandung-style toast culinary located in Bekasi, West Java, Indonesia, which conventionally sell the product through mobile cart trader. The main priority as conveyed by the owner is to penetrate the market for large-scale customers, such as restaurants, catering and other seller, through the concept of Pull Strategy digital marketing. Digital marketing is a concept used to describe all marketing activities that utilize all digital channels to sell the product (Batra & Keller, 2016) with the increasing trend of internet users nowadays. One of the effective way to increase the exposure of a product in the market is through social media and e-commerce (Taiminen & Karjaluoto, 2015). Digital marketing give more incentivizes in promotion cost efficiency, ability to reach a wider market and probability to get a faster consumer response, so that MSME able to compete more with the bigger company (Bala & Verma, 2018). Now, the challenge is how to start properly implementation of digital marketing

strategy, which can increase consumer awareness about the product. Pull strategy take a place, the concept aim at a specific target market, who already know the product they want, producers then ensure that the promotion is delivered and take a position steady to responds any discussions or questions about the product, which lead them to loyal customer (Bazaza, 2020). The purpose of business coaching is to provide an example of applying a digital marketing pull strategy concept to Indonesian MSMEs as an effort to survive in todays condition or even better could increase the Revenue greater than before.

## II. LITERATURE REWIEW

### A. *Pull Strategy Digital Marketing*

COVID-19 pandemic will have long term implications for the business, but, there's always the possibility of turning a tragedy into an opportunity. Digital Marketers have the chance to redefine their business goals, get extra focused, keep an eye on the trends and strive to evolve continuously. It is likely that for many, using the internet more for shopping, gaming, keeping in touch and other activities will have become something of a habit. As the world goes increasingly digital, so will marketing. What digital marketers need to do is respond with update strategies and buyer personas for a the new post-pandemic era (Gogia & Nanda, 2020). Digital Marketing such as search engine optimization (SEO), search engine marketing (SEM), content marketing, influencer marketing, content automation, e-commerce marketing, campaign marketing, and social media marketing, social media optimization, e-mail direct marketing, display advertising, e-books, optical disks and games and are becoming more and more common in our advancing technology. It is demonstrated that we all are connected through whatsapp and facebook and the increasing use of social media is creating new opportunities for digital marketers to attract the customers through digital platform (Bala & Verma, 2018).

Two different concept of product information delivery to the customer, there are pull and push marketing strategies. In the push strategy, the producers push their products toward the customers, focus on the intermediaries. In pull strategy, the customers search for the products that satisfy their needs, a promotional strategy focuses on facilitating communication flow directly from a manufacturer and in this scope the customer is centre of the process (Brocato, 2010). Push marketing is concerned with short term sales whereas pull marketing seeks to create loyal customer (Robertson, 2017). Pull marketing strategy is targeted toward certain customers building good relations, leading to loyal customers, no need for huge advertising campaigns because the customers already know the product and know what they expect form it (Bazaza, 2020). In addition, it can be seen from that the pull effect is relatively stronger than the push effect when it comes to driving switching the product (Nguyen et al., 2021).

Social media and firm applications are two mobile service marketing mechanisms that rely on push or pull promotions to be effective. First, we create and manage a supermarket's Instagram profile, posting to the account (push promotion). Next, we compare performance measures with a third-party mobile app (pull promotion), which provides aggregated customer views and access to the supermarket profile. A time-series analysis reveals a sequential chain from push promotion to pull promotion to performance, the temporal effect of a push to pull. Results are important to those balancing push and pull promotional efforts and those involved with digital marketing and promotion in retailing (Vieira et al., 2021). Push tactics are more normally prioritised to promote products through distributor channels, where pull strategies of this type that create demand among end-users are common in consumer markets (Marjan et al., 2021).

### B. *Sales Performance Enhancement of SME through Social Media and E-Commerce*

Broadly, a country's economic stability is reflected in successful business organizations. Certainly, SMEs play key roles in developing a country. Over the last few years, social media penetration has increased, consequently, using traditional media such as television, newspapers, and radio has become absolute and is not effective in maintaining competitive advantages. SMEs have begun using social media widely as an important marketing tool. (Alraja et al., 2020). They use social media according to the company's business goals. The impact obtained is mostly related to the SMEs sales and marketing processes, such as the relationship between the company and customers, the company with stakeholders, the company with business partners, and the company's relationship with competitors (Wardati & Er, 2019). The further literature (Bocconcelli et al., 2017), tell social media are a key resource in improving SME sales process, thereby assisting SMEs to overcome their size-related limitations.

As companies are realizing the important role that social media has as an effective marketing tool, it becomes crucial to understand and explore the factors that mediate the relation between the online social media platforms environment and the actual purchase behavior. Particularly, it sheds the light on the company-consumer relationship and finds that brands should adapt their content and communication strategies on social media platforms to engage more users, create awareness and as result encourage them to buy their products. Findings highlight the importance of the content quality offered by brands on the social media, brands should prepare well designed marketing messages and only post good quality content on their social media websites. Moreover, brands are advised to deploy various social media marketing tools and solutions to try to increase brand and users’ interactivity (Dabbous & Barakat, 2020).

Early studies in e-commerce suggested that e-commerce is a strategy for growth especially by SMEs (Grandón et al., 2011), assisting them to compete with large firms by gaining new customers in global markets (Torres et al., 2014). Researchers have argued that “A socially constructed feature of e-commerce entrepreneurship that draws from innovative ability could increase sales through its niche market” (Shemi & Procter, 2018). According the study by Jahanshahi et al. (2013), an enhanced company brand and corporate image are an e-commerce advantage and security and privacy are key concerns.

### III. RESEARCH METHODOLOGY

The schedule and deadline for business coaching are designed to be a guide for work by researchers, so that the stages of the process until the evaluation of the implementation of the results of business coaching can be completed according to academic calendar.

Table 1. Timeline of Business Coaching

No	Activity	Jul-21	Aug-21	Sep-21	Okt-21	Nop-21	Dec-21	Jan-22	Feb-22	Mar-22	Apr-22	Mei-22

6	Evaluation											■

Source: Author

The researcher applied a qualitative research method. The method was chosen as means of finding specified issues that form the conceptualization and establishment of e-commerce in an authentic setting, moreover, qualitative studies allow for in-depth understanding when investigating process-related issues (De Cock et al., 2021).

There is ROTIDOTI, the object of business coaching. A white bread production MSME for Bandung-style toast culinary located in Bekasi, West Java, Indonesia, which conventionally sell the product through mobile cart trader.

The main priority as conveyed by the owner was penetrating the new market for large-scale customers, such as restaurants, catering and other seller as an effort to increase sales of product. Base on interview and observation the researcher look for engagement with the owner and staffs of the SME to earn the primary data, to get the the main ideas of their wants and imagine what we can do to help with the most suitable approach according to the conditions of their abilities. Interviews were held of four times from July to September 2021 during the business coaching process. Observation of the working station were also conducted at the close of the process.

Table 2. Interview and Observation Data

Interview and Observation Data
--------------------------------

Interviewees and Object	Occasion
Owner at Working Place	July, 8th 2021
All Staff at Working Place	August, 14th 2021
Owner at Working Place	September, 2nd 2021
Owner at Working Place	September, 8th 2021

Source: Author

The questions were asked in an informal vibe to make sure the owner could describe various issue that happen in the SME. Interviews and observation were written on the short notes and later summarised for further analysis. The primary data, especially about the MSME’s sales report from 2020 – 2021 period have been analyzed for preparing this paper extensively. Furthermore the secondary resources information have been collected from different scholars and researchers, previous related journals, published e-books, and articles published in national newspaper. This is the best practice for a research which is a critical review type.

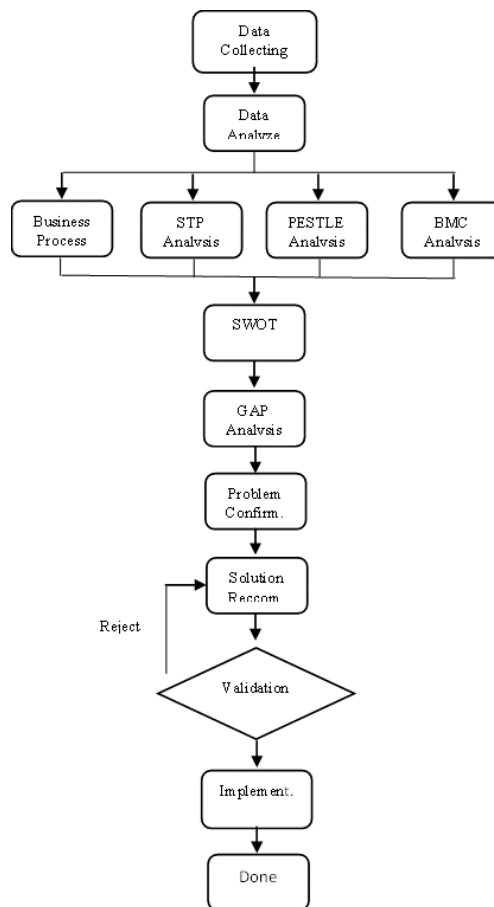

Fig. 1. Business Coaching Study Process (Author)

The business coaching study process was carried out with several stages which can be seen in Fig. 1 above. The collected data retrieved before will then be analyzed sequently through business process diagram analysis, STP analysis, PESTLE analysis, BMC analysis, SWOT – TOWS analysis and give comprehensive perspectives for GAP Analysis attributes before the researcher conducted face to face discussion with the owner of MSME to define the main problem together and start to get best solution in the most effective and efficient way to increase the sales of

product.

Researcher find proper data through the qualitative approach based on theory as suggested by Maholtra (2010), the study is began from three stages, 1) Data Reduction, selected just only the important and relevant information for the study gathered from owner and staff, reduced many of statement, such as profile of staff worker, supplier or material composition 2) Data Display, researcher gave visual informative data like graphics, matrix and diagram in the study, to gain the understanding of reading 3) Data Drawing and Verification, for this stage, researcher analyzed the MSMEs data through the suitable method based on projection of the problems implication result.

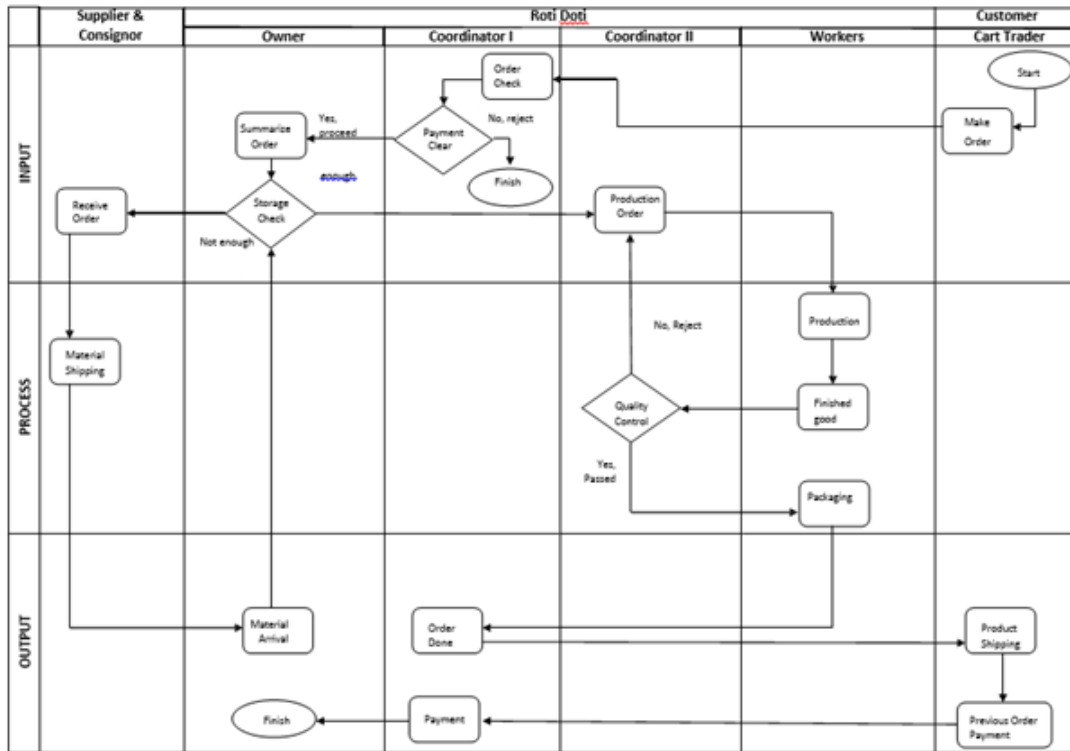

Fig. 2. Business Process Diagram (Author)

From the Figure 2 above, researcher could tell that the business process ran in very conventional way, there was no pull strategy digital marketing concept implemented. Researcher suggest the owner to learn and consider that concept to build the better foundation of business in relation to the new normal condition.

Table 3. Segmentation Of Roti Doti

Demographic	Geographic
- Children	- Penggilingan, East Jakarta
- Teen	- Tanjung Priok, North Jakarta
- Adult	- Yasmin, Bogor
Within low-med expenditure allocation	- Bintara – Pekayon – Rawalumbu, Bekasi
Psychographic	Behavioral
Big fan of sweets with affordable price	Fan of sweet toast

Source: Author

Segmentation is the process of dividing a larger market into smaller pieces based on one or more meaningfully shared characteristics (Solomon, Marshall & Stuart, 2018). Figure 3 was given an initial segmentation according to type of consumer mentioned from interview. Later, the owner convinced that target of the product was people from low-mid expenditure family who lived in colony around Jakarta. Talk about positioning, the MSME offered the value proposition fresh from the oven soft toast with affordable price and free preservatives.

According to Thompson et. al. (2016), Developing strategies is one of the tasks needed to achieve unity and coherence between the firm's internal ability, sources and skills with the external factors which are related to the firm. In short, the strategies designing stage involves the process of identifying the internal and external factors that might affect the firm's overall performance. One of many tools we usually use in external factors was PESTEL (Politics, Economics, Social, Technology, Environment and Legal) method. Based on the results of the PESTEL, it can be conveyed that, in the difficult conditions due to the current Covid-19, there was no other way for business actors other than to seek new breakthroughs in their business processes, especially in optimization of marketing scheme through digital media.

Politics, restrictions on community activities, including economic activities in the context of dealing with the Covid-19 pandemic, have an impact on all business sectors, including MSMEs. Through the Instruction of the Minister of Home Affairs Number 15 of 2021 concerning the Enforcement of Restrictions on Emergency Community Activities for Covid-19 in the Java and Bali Regions, the provisions for the closure of workplaces, schools and public places, including shopping centers and the implementation of curfews in many areas, affect the sales of MSMEs. With no certainty when its over. MSMEs must find the best way. One thing that's quite helpful in these difficult times is the government's incentives, referring to the Minister of Finance Regulation No. 9/PMK.03/2021, which frees MSMEs from the tax burden. Economics, according to data from the Association of Indonesian Food and Beverage Entrepreneurs, the bakery industry in Indonesia has also been affected by the Covid-19 pandemic, a growth of 10% from the 2014-2020 period, believed will not be better at this time, given the declining revenue and fluctuations (Kompas.id, 2021). Furthermore, people's purchasing power could be worst. Social, referring to a survey by the Indonesian Institute of Sciences published by Kompas.id in January 2021, it is known that more than 70% of respondents have started cooking, one of which is making bread, which is expected to develop into a home-based business in the future. Another social factor that needs to be considered is the shift in consumer behavior, which tends to rely on online transactions with the support of a digital ecosystem. Technology, in line with the increasing trend of using internet services, the development of digital technology provides incentives for business actors to take advantage of all the features available in their business activities, from marketing, sales transactions to customer's product delivery. Social media such as Instagram and Facebook, which accommodate marketplace features as previously offered by e-commerce such as Tokopedia, Shopee, and GrabFood and GoFood services, are now commonly used by home bakery industry players. Environment, customer concern about cleanliness and hygiene in the midst of the Covid-19 pandemic is one of the main parameters for consumer considerations in choosing a product. Therefore through the use of the digital ecosystem, MSME needs to insert messages and vitae/videos related to the production process that upholds cleanliness and hygiene. referred to through social media channels and e-commerce. Legal, MSMEs should ensure the continuity of clear business processes at the place, starting from managing business permits, paying salaries and daily working hours base on agreements and regulations. Furthermore, MSMEs must be vigilant and thorough in every work contract with stakeholders, both for business premises rental, employee contracts and trading partners, including terms and conditions related to the maturity of debt to suppliers.

Continuing what we have identified through the previous analysis, according to Thompson et al (2016), deepening reveal internal conditions in the form of strengths and weaknesses, as well as to unravel external potentials such as opportunities. and threats (threats) that may affect business conditions.

Table 4. Matrix of SWOT

<b>Internal Factor</b>	
<i>Strengths</i>	<i>Weaknesses</i>

1. Affordable price	1. There's no online sales channel
2. Fresh From The Oven product	2. There's no computerize record for sales, stock, A/R and financial.
3. Best ingredient with no preservative	3. There's no cashless feature in business process.
4. Experienced personnel	4. There's no focus on brand exposure
5. Lean organizational structure	5. Area sales limited in 6 points nearby Bekasi
6. Quite complete production equipment	
7. Tight quality control	
8. Guaranteed material stock	
9. Productive cart dealer partner	
10. A/R concept for cart dealer partner	
11. <i>Free</i> shelter for personnel and cart dealer partner	
12. <i>Free delivery</i> to partner	

**External Factor**

<i>Opportunities</i>	<i>Threats</i>
1. Indonesian in all segmen are big fan of toast	1. Competitive market.
2. Raw material and ingredient are easy to find	2. Fluctuations in raw material price
3. Supplier could give owe facility to MSME	3. People's purchasing power has decreased due to the pandemic
4. New innovation and creation of toast	4. There's a lot substitute product
5. Government support to MSME	5. Shelter cost for the personnel and cart dealer partner become financial burden
6. Increasing trend of using social media and e-commerce	
7. Open access to banking financial service support the easiness of transaction	
8. The open access to more modern financial reporting records through various applications	
9. Opportunity to reach a wider marketing area Jakarta and surrounding city	

Source: Author

Furthermore, the results of discussions and observations in the field provide a complete picture of the interrelationships between stakeholders in business processes.

<b>Key Partners</b> - Supplier of Raw Material - Cart Trader	<b>Key Activities</b> - Receive the Order - Production at Factory - Distribution to Partner	<b>Value Proposition</b> - Soft Tasty Toast - fresh from the oven - Affordable prices - No Preservative	<b>Customer Relationship</b> - Trading through cart dealer - Word of mouth/ customer references	<b>Customer Segment</b> <b>Demografis</b> Children, Teen, and adult within low-med expenditure <b>Geografis</b> Penggilingan- East Jakarta Tj. Priok- North Jakarta Yasmin- Bogor Bintara, Pekayon, Rawalumbu- Bekasi <b>Psikografis</b> Big fan of sweet within affordable price <b>Behavioral</b> Fan of Sweet toast
<b>Key Resources</b> - Production Staff - Asset (equipment and machine) - Courier/Transporter - Cart Trader			<b>Channel</b> Cart Trader Partner	
<b>Cost Structure</b> <b>Fixed Cost:</b> Employee salary, rental cost for factory and partner shelter, sinking and service maintenance fee <b>Variable Cost:</b> Electricity and water bill , LPG , material and <i>packaging</i> , Transportation and maintenance cost			<b>Revenue Streams</b> - Deposit Payment From Cart Trader Partner - Walk in customer sales - Consignment sales	

Fig. 3. Business Model Canvas Roti Doti (Source Author)

Based on the results of the Business Model Canvas analysis above, MSMEs has to maintain the value proposition that has been formed, through tight screening of raw material selection, and strict quality control. Even so, as the owner expects to increase sales, revenue streams are expected to increase with the addition of channels through digital marketing both through social media and e-commerce, requiring key activities, key resources and customer relationships to be adjusted.

Table 5. Analytics Tools Summary

<b>Analytics Tools</b>	<b>Ideal Condition</b>	<b>Actual Condition</b>	<b>GAP</b>	<b>Solution</b>
Business Process	Cashless payment directly to owner	Cart Dealer Partner pay cash the order to Coordinator	Payment still very conventional	Digital Financial Services
Business Process	Comprehensive report for inventory, order and production plan through digital recap/ record	Manual report for all things by the owner.	There was possibility of lack of material, deficit of production target	Computerize Report
BMC	Sales Channel through offline and online media	Sales rely on cart dealer partner conventionally	There was no online media channel for sales	<i>Pull Marketing &amp; Digital Marketing</i>

BMC	Targetting the big fish customer not only retail end customer	The only focus in sales was offered the product to retail end customer with small quantity.	There was no plan to acquire big fish customer	<i>Company Profile and Business Proposal</i>
BMC	Targetting <i>Revenue stream</i> from big fish customer	<i>Revenue stream</i> only from cart dealer partner and consignment also walk in customer	There was no plan to acquire big fish customer	<i>Pull Marketing &amp; Digital Marketing</i>
STP	Targetting wider segmen in Jakarta	Sales point area limited in few spots	Sales point area limited in few spots	<i>Pull Marketing &amp; Digital Marketing</i>
PESTEL	MSMEs adopt the new trend of transaction among the customer through gadget/ smartphone online ways	Conventional sales through cart dealer partners were not optimal during the pandemic.	There was no alternative channel for sales, especially through online media	<i>Pull Marketing &amp; Digital Marketing</i>

Source: Author

Later, the gap analysis process is carried out according to the results of the expose based on the analysis that has been done previously referring to business processes, business model canvas, STP and PESTEL, and the researcher found out the SWOT factors followed by discussions with MSMEs.

Fig. 5. Pareto Graphics of Roti Doti (Source Author)

From the results of the analysis, it was found that the focus of the study was on implementing the concept of Pull Strategy Digital Marketing for MSMEs Roti Doti, which contributed the most for improvement according to the owner, based on their capability. Researchers and owners have agreed that the development of online sales channels through social media and e-commerce is the best way that can be pursued in an effort to increase revenue, then

researchers have the task of presenting an initial prototype of content and selecting the right media as part of the implementation plan.

IV. RESULT / FINDING

In the use of social media, Facebook and Instagram are option, in the e-commerce marketplace, Tokopedia is an alternative, reseacher also create a website and google my business which contains all information and profile of Roti Doti MSMEs to be used as promotional and communication centre media.

Table 6. Media Platform Optimalization Summary

No	Platform	Type	Utilization
1	Instagram	Social Media	Awareness
2	Facebook	Social Media	Awareness, Interest
3	Website	Owned Media	Interest, Desire
4	Google My Business	Search Engine; Geo Tagg	Awareness, Desire
5	Tokopedia	e-commerce	Awareness, Interest, Desire, Action

Source: Author

Selection of media and information content using the AIDA hierarchy of effect concept, which gradually and synergistically leads prospective customers cognitively into the realization of product purchases as part of the customer experience journey. Utilization of social media is used as a tool for Roti Doti to increase brand awareness, through increasing product exposure to new target markets, which are slices of active users of social media, whether they are end users or Bandung toast seller. Through the Instagram platform, Roti Doti profile is loaded, content is displayed on photos of factory production according to a similiar template and content that displays processed products with attractive color choices

The owner is quite happy in conveying the increase in revenue, starting in the first quarter of 2022 or the January-March 2022 period since the digital marketing pull strategy was implemented, product demand through online channels grew by 50% of the historical average turnover in the second semester of 2021 recorded.

Fig. 6. Graphics of Revenue (Source Author)

Based on the figure above, the Offline sign means product sales come from the cart dealer partner and walk-in customers, while Online sign means that the realization of product sales comes from digital media channels. Furthermore, the growth of average revenue 51,5% contributed to 18,5% in the growth of total revenue.

## V. DISCUSSION

This study answered the following question 1) Who are the new target market client for ROTI DOTI? 2) What is the best alternative way to increase the revenue instead of recruit more peddler partner 3) How do Roti Doti implementate the pull strategy digital marketing through the social media and e-commerce? Those question came from the results of discussions and observations of researchers on the business process of MSME Roti Doti. Researcher devided several category indicators from gap analysis and rank the priority things to be solve baseon weights valuation that MSMEs applied.

a. Evaluation on the Implementation of Determining the New Target Market for ROTI DOTI and Alternativeway for Increasing Sales Revenueinstead of recruit more peddler partner

The stage of determining a new target market and an alternative to increase sales revenue has been agreed with the owner based on the results of a series of discussions and analysis of current business conditions, focusing on large-scale customers is a wise step to encourage increased turnover, customers who have been seen as competitors for MSME before, in the future become MSME business partners, this approach to new potential customers was initiated through the development of the Roti Doti brand exposure through the concept of pull strategy in the a digital marketing ecosystem, the use of various social media and e-commerce by prioritizing the AIDA hierarchy of effect model as a series of customer journey for new potential customers.

In this implementation, business coaching has succeeded in achieving it with the following arguments.

1. Large-Scale Customer Acquisition as New Target Market

Table 7. Top Large-Scale New Customer

Rank	Customer	Location	Amount (Pcs.)	
			A Day	A Month
1	Roti Bakar Robek	Margahayu, Bekasi	120	3.120
2	Roti Bakar Sari Rasa	Rawalumbu, Bekasi	40	1.040
3	Roti Bakar 5 Saudara	Dewi Sartika, Bekasi	40	1.040
4	Roti Bakar Alfian Kuningan	Cakung, Jakarta Timur	40	1.040
5	Roti Bakar Dori	Tambun, Bekasi	40	1.040
<b>Total Amount</b>			<b>280</b>	<b>7.280</b>

Source: Author

2. Increasing Product Sales Revenue through Online Channels as an Alternative Instead of Recruit More Peddler Partner

Table 8. Product Sales Revenue

Sales Source	Average 2021	Average 2022	% Growth
	May – Dec	Jan - Apr	
Online	10.156	15.386	51%
Offline	11.519	10.294	- 10,6%
Total	21.675	25.681	18,5%

Source: Author

b. Evaluation on the Implementation of Pull Strategy Digital Marketing through ROTI DOTI's Social Media and E-Commerce Channels

Achievements of digital channels optimalization, both social media and e-commerce can be claimed based on the foundation that has been formed, from creation to initial management of ROTI DOTI's accounts on Instagram and Facebook platforms, as well as Tokopedia, Google My Business also websites. The most important thing for further concern is how ROTI DOTI will continue to manage existing accounts, starting from the creation of ideas for

developing content concepts, technical content creation to the discipline of routinely updating activities according to the suitable timing, both posting, updating profiles to reply all messages from customers that may exist.

The record of success from the implementation could be declared by confirmation from new large-scale customers, one of them is Roti Robek, which knows the existence of ROTI DOTI through social media accounts. The reputation of ROTI DOTI obtained by customer's testimonials and ratings via Tokopedia e-commerce.

## VI. CONCLUSION AND RECOMMENDATION

In the end of the study, MSME, which previously rely on applied conventional sales methods through peddler and began to develop sales penetration by utilizing pull strategy concept on digital marketing channels, Social Media and E-Commerce could acquire new non-retail consumers, thus increase the production capacity as well. For the brighter future, to maintain the good performance, MSME should look for new staff to control and manage the digital marketing of product sales.

### LIMITATION

This study take a point to increase the sales revenue due to conventional product marketing channels through mobile peddler partners which are no longer popular in today's new normal era. The productivity of peddler partner wasn't concern of study.

### ACKNOWLEDGEMENT

We would like to thank Andy Prasetya and his staff for the permission to take UMKM Roti Doti as the object of study. We also would like to thank Universitas Indonesia for the chance to explore our knowledge and implement our discipline. Last but not least, we would like to greet Taufiq Rachman and Yordi Hikmawan, our colleagues for the support to finish this journal.

## The Analysis of Labor Absorption in the Industry Sector in Central Java Province 2015-2019

S. Distika Safara<sup>1</sup>, F. Sitti Retno<sup>2</sup>

<sup>1</sup>Development Economic, Muhammadiyah University of Surakarta, Sukoharjo, Indonesia

<sup>2</sup>Development Economic, Muhammadiyah University of Surakarta, Sukoharjo, Indonesia

### Abstract

The main objective of economic development is to create economic growth and provide employment opportunities for the sake of creating public welfare in general. Then, one of the policies carried out by the government to accelerate the implementation of economic development is through industrialization. Development in the industrial sector is a top priority for economic development without neglecting development in other sectors. The purpose of this study was to analyze the effect of economic growth in the industrial sector, PMA in the industrial sector, PMDN in the industrial sector, and the UMK in the industrial sector on employment in the industrial sector in Central Java in 2015-2019. The type of research used in this research is quantitative. The analysis technique in this study uses panel data regression from 35 districts/cities in Central Java Province from 2015-2019. The results obtained in this study are stated that the variable Economic Growth (PE) in the industrial sector and Domestic Investment (PMDN) in the industrial sector has no effect on employment in Central Java Province from 2015 to 2019. While the variable Foreign Investment (PMA) the industrial sector and the Regency/City Minimum Wage (UMK) of the industrial sector statistically have a positive and significant impact on employment in Central Java Province from 2015 to 2019.

**Keywords**—Economic growth; employment absorption; industrial sector; industrial sector investment; panel data

### I. INTRODUCTION

Central Java is one of the provinces that contributes greatly to Central Java's Gross Regional Domestic Product (GRDP). The value of Central Java's GRDP at current prices in 2018 is 1,268.45 trillion rupiah. Meanwhile, in 2019 it was 1,362.46 trillion rupiah, meaning that nominally the GRDP value had increased by 94.01 trillion rupiah. During the last five years starting from 2015-2019, the economic structure of Central Java was dominated by five sectors, namely the manufacturing industry and education services; wholesale and retail trade, respiration of cars and motorcycles; agriculture, forestry, and fishing; construction; and educational services. The largest role in the formation of Central Java's GRDP in 2015 was generated by the manufacturing industry category which reached 35.08%, while in 2019 it was 34.42%.

Fig. 1. Distribution of Central Java GRDP on Current Prices by Category (Percent) 2015-2019

According to (Mankiw, 2000) unemployment is a macroeconomic problem that directly affects human survival. For most people, losing a job is a drop in the standard of living. So, it is not surprising that unemployment is a topic that is often discussed in political debates which often study that the policies they offer can help create jobs.

Based on the Central Statistics Agency (BPS) of Central Java Province, employment in the industrial sector in Central Java Province has increased over the last five years. In 2015-2019 there was an increase, where the absorption of labor in the industrial sector in 2018 was 946,283 people. Meanwhile, in 2019, employment in the industrial sector was 1,133,790 people.

Fig. 2. Number of Workers in the Industrial Sector of Central Java in 2015-2019

It can be seen in Figure 1.2, the absorption of labor in the industrial sector has increased every year, this could be influenced by factors such as the minimum wage, economic growth and investment in the industrial sector, this is reinforced by research (Djupiansyah, 2017) which states that there is an effect of the minimum wage, economic growth and investment to employment.

Employment absorption is also inseparable from the role of the government as a policy maker to support good investment, income standards for labor welfare and strategies undertaken to achieve high economic growth. The government's policy in setting minimum wages is a reason for entrepreneurs to prefer capital intensive industries. Meanwhile, the relationship between wages and employment can be illustrated that the higher the wage level, the higher the production cost and consequently the company will make efficiency by reducing the workforce employed (Simanjuntak, 2001). This condition results in low levels of job opportunities. In other words, wages have a negative effect on employment.

Based on the problems described above, researchers are interested in seeing the effect of economic growth in the industrial sector, Foreign Investment (PMA) in the industrial sector, Domestic Investment (PMDN) in the industrial sector, and the Regency/City Minimum Wage (UMK) in the industrial sector on employment in the industrial sector in Central Java in 2015-2019.

## II. LITERATURE REVIEW

### Based On Theory

#### Employment

According to (Iryani & Anwar, 2019), labor absorption is the number of jobs that have been fulfilled and can be reflected in the large number of working people spread across various economic sectors. The company employs labor not for direct consumption, but is used as a means of production, so the absorption of labor or the demand for labor in

the company depends on consumer demand for the goods produced or produced by the company. Meanwhile, according to (Handoko, 2014), labor absorption is a certain number of workers used in a certain business unit or in other words labor absorption is the number of workers working in a business unit. The absorption of labor is influenced by two factors, namely external factors and internal factors. These external factors include economic growth rates, inflation rates, unemployment and interest rates. In the business world it is not possible to influence these conditions, so only the government can handle and influence external factors. While internal factors are influenced by the level of wages, labor productivity, capital and non-wage expenditures.

### **Industrial Sector Economic Growth**

Economic growth can be interpreted as a process of changing the economic conditions of a country on an ongoing basis towards a better state over a certain period. There are three basic components needed for economic growth, namely: 1) a continuous increase in the supply of goods; 2) advanced technology as the main factor that determines the degree of growth in providing a variety of goods to the population; 3) and the widespread and efficient use of technology requires adjustments in the institutional and ideological fields, so that the innovations produced by human science and technology can be utilized appropriately (Hasyim, 2016).

### **Foreign Investment**

According to (Arsyad, 2010), the benefits of foreign investment or Foreign Investment (PMA) for developing countries, among others: to create jobs; process technologists and useful skills; as well as a source of savings or foreign exchange. With the existence of Foreign Investment (PMA) can create jobs so as to reduce unemployment, in addition to the presence of foreign investment will get new skills for developing countries. Foreign Investment (PMA) is also a source of savings, because with the presence of foreign investors who invest their capital, economic growth will increase. Meanwhile, according to (Igamo, 2015), Foreign Direct Investment (FDI) occurs when a company from one country invests its capital in the long term into companies in other countries. The country of origin of the company investing is called the host country, while the country where the investment is intended is called the home country.

### **Domestic Investment**

According to Law no. 25 of 2007 Article 1 states that the definition of domestic capital is “capital owned by the Republic of Indonesia, individual Indonesian citizens, or business entities in the form of legal entities or not legal entities”. Domestic Investment (PMDN) according to Law no. 15 of 2007 is “activities to invest to conduct business in the territory of the Republic of Indonesia carried out by domestic investors and using domestic capital”. It can be concluded that Domestic Investment (PMDN) is an investment activity carried out by investors using domestic capital in the territory of Indonesia.

### **Regency/City Minimum Wage**

The minimum wage is directed to the achievement of KHL each determination of the minimum wage must be adjusted to the stages of achieving the comparison of the minimum wage with the needs of a decent living, the amount of which is determined by the Menaker (Minister of Manpower). The achievement of KHL needs to be done gradually because the minimum living needs are very much determined by the ability of the business world, (Hardijan Rusli, 2011). The Iron Wage Theory by F. Lassale, says that the average wage for workers is the same as the minimum cost of living for workers, because employers tend to pressure workers for profit. Meanwhile, according to John Stuart Mill (Wage Fund Theory), the amount of wages will be determined by the available wage funds and the number of workers. The Fair Wage Theory (naturally) by David Ricardo. This theory explains that wages according to nature are wages that are sufficient for the maintenance of a worker's life with his family (Saputra, 2013). The wages given by employers are theoretically considered as the price of the labor sacrificed by workers for the sake of production. According to (Sukirno, 2010) the wages received by workers can be divided into two types, namely:

- a. Nominal Wages, which are a number of wages expressed in the form of money which are routinely received by workers.
- b. Real Wage is the nominal wage ability received by workers when exchanged for goods and services, which is measured based on the number of goods and services that can be obtained from the exchange.

### **Based On PreVIOUS Research**

Chusna (2013), with the title *The Effect of the Growth Rate of the Industrial Sector, Investment, and Wages on the Absorption of Manpower in the Industrial Sector in Central Java Province 1980-2011*. This study uses multiple linear regression analysis, showing that the growth of the industrial sector shows a declining trend while investment, wages and employment in the industrial sector show an increasing trend, the growth rate of the industrial sector has no effect on employment in the industrial sector, while investment and wages affect the absorption of labor in the industrial sector in Central Java.

Purwaningsih, Rochmani & Suryantoru (2016), with the title *Analysis of Labor Absorption in the Industrial Sector in Central Java Province*. The analysis technique used is panel data regression. The results showed that the level of economic growth and the Regency/City Minimum Wage (UMK) had a positive effect on employment, while the number of industrial business units had no effect on employment in the industrial sector in Central Java Province.

Boedirochminarni & Rakhmawati (2018), with the title *Analysis of the Level of Labor Absorption in the Industrial Sector in Gresik Regency*. Panel data regression analysis was used, three estimation models were used, namely the Common Effect Model, Fixed Effect, and Random Effect. The results obtained in this study are stated that the Regency Minimum Wage (UMK) variable and the population of the workforce have a positive and significant effect on employment in the industrial sector in Gresik Regency, while the variable number of industries has a negative and significant effect on employment in the industrial sector in Gresik Regency.

Handayani, Muslihatinningsih & Saleh (2018), with the title *Determinants of Labor Absorption in the Manufacturing Sector in Jember Regency 2001-2015*. The data analysis method used in this research is multiple linear regression. From the results of simultaneous data analysis shows that the value of production, investment and the Regency Minimum Wage (UMK) together have a significant effect on the absorption of labor in the manufacturing sector in Jember Regency. Partially, the results of data analysis show that the value of production and investment is not significant on employment, while the Regency Minimum Wage (UMK) has a positive and significant effect on employment in the manufacturing sector in Jember Regency in 2001-2015. And in the classical assumption test, it is stated that there is no problem in the multicollinearity, heteroscedasticity, autocorrelation and normality tests.

Anggraini, Prihanto & Safri (2020), with the title *The effect of minimum wages, economic growth and investment on employment in the industrial sector in Jambi Province in 2000-2018*. The research analysis tool uses multiple linear regression analysis tools. Based on the results of the F test, it is known or obtained that the probability significance of 0.000 is smaller than the 5 percent alpha, which is 0.05. This means that the variables of minimum wage, economic growth and investment together have a significant effect on the variable of employment. The variable that has a significant effect on employment in the industrial sector in Jambi Province is the minimum wage variable because the probability value is 0.018 where the probability value is less than 0.05, while the variables of economic growth and industrial investment have no significant effect on employment in industrial sector in Jambi Province because the probability value is greater than 0.05.

Destiningsih, Indrawati & Kurniasari (2020), with the research title *Analysis of Factors Affecting the Number of Workers in Central Java Province 2004-2018*. The research analysis tool uses multiple linear regression with the OLS or Ordinary Least Square method. In this study the results obtained that; GRDP has a positive and significant effect on the number of workers; PMA has a positive and no significant effect on the number of workers; PMDN has a negative and no significant effect on the number of workers; The number of industries has a positive and no significant effect on the number of workers; The influence of GRDP, PMA, PMDN, the number of industries simultaneously has a significant influence on the number of workers in Central Java Province in 2004-2018.

Kadarwati, Ramdani & Supardi (2021), with the title *Factors Affecting Labor Absorption in Central Java 2014-2019*. The purpose of this research is to analyze the effect of Gross Regional Domestic Product, Inflation, Regency/City Minimum Wage (UMK) and Human Development Index on labor absorption in Central Java in 2014-2019. The method of analysis in this study is to use multiple linear regression analysis. The results of this study indicate that Gross Regional Domestic Product and inflation have no effect on employment in Central Java Province in 2014-2019. Meanwhile, the Regency/City Minimum Wage and Human Development Index have a positive and significant impact on employment in Central Java Province in 2014-2019.

### III. RESEARCH METHODOLOGY

#### Types of research

This study uses a quantitative approach which basically emphasizes the analysis on numerical data which is processed by statistical methods to determine the significance of the relationship between the variables studied. This research was conducted to analyze the effect of labor absorption in the industrial sector in Central Java in 2015-2019. The research location was conducted in Central Java Province in 2015-2019. This research was conducted in February 2022.

#### Research Object

The object of the research is the absorption of labor in all districts/cities in Central Java Province in 2015-2019. In this study, to analyze the influence of the Industrial Sector Economic Growth, Foreign Investment (PMA), and Domestic Investment (PMDN) in the Industrial Sector, as well as the Regency/City Minimum Wage (UMK) on the Absorption of Manpower in the Industrial Sector of Central Java Province.

#### Data collection technique

Secondary data used in this research is in the form of studies from various relevant literature and published by related parties or institutions such as the Central Statistics Agency (BPS) and the National Single Window for Investment (NSWI), Manpower and Transmigration Office, Central Java Province in Figures, Gross Regional Domestic Product of Central Java Province by Field of Business 2015-2019, and previous research reports, journals, and other literature. The data used in this study from 2015-2019 are all research variables in Central Java Province.

#### Data analysis method

This study uses a quantitative approach with panel data. Descriptive statistical analysis is used to provide an overview by analyzing and presenting quantitative data. According to (Nuryanto and Pambuko, 2018), panel data is a combination of time series and cross section data. The long-term estimator model is as follows:

$$TK_{it} = \beta_0 + \beta_1 PE_{it} + \beta_2 PMA_{it} + \beta_3 PMDN_{it} + \beta_4 UMK_{it} + \varepsilon_{it}$$

where:

$TK$  = Number of workers by industrial sector

$PE$  = Economic growth by industrial sector

$PMA$  = Foreign Investment by industrial sector

$PMDN$  = Domestic Investment by industrial sector

$UMK$  = District Minimum Wage based on industrial sector

$\varepsilon$  = *Error term* (error factor)

$\beta_0$  = Constant

$\beta_1 \dots \beta_4$  = Independent variable regression coefficient

$i$  = observation to  $i$

$t$  = year to  $t$

#### Estimation Results

According to (Gujarati, 2013), regression models with panel data generally result in difficulties in model specifications. The residual will have three possibilities, namely residual time series, cross section or a combination of the two. So, there are three approaches in using this panel data, namely: 1) Common Effect Model, by combining time series and cross section data, 2) Fixed Effect Model, a technique for estimating panel data with dummy variables to capture differences in intercepts, 3) Random Model Effect, to overcome the weakness of the fixed effect method that uses pseudo variables, so that the model experiences uncertainty.

### Panel Data Method Selection

#### Chow test

The Chow test is used to determine which test between the two methods, namely the common effect method and the fixed effect method, should be used in panel data modeling. The hypothesis in this Chow test is as follows (Ghozali, 2016).

$H_0$  = Model Common Effect

$H_1$  = Model Fixed Effect

#### Hausman test

#### Lagrange Multiplier Test

The Lagrange Multiplier or LM test is used to determine whether the random effect model is better than the common effect. To choose the best method, random effect and common effect, the LM test is carried out with the following hypothesis (Widarjono, 2009):

$H_0$  = Model Common Effect

$H_0$  = Model Random Effect

### Classic Assumption Test

#### Normality test

This is done to find out whether the error term is normally distributed or not (Shochrul, 2011).

#### Multicollinearity Test

Used to determine and determine whether there is a relationship between two or more interrelated variables in a model.

#### Heteroscedasticity Test

Used to determine and determine whether there is a relationship between two or more interrelated variables in a model.

#### Autocorrelation Test

Used to determine and determine whether there is a relationship between two or more interrelated variables in a model. The way to check the presence or absence of autocorrelation is the Durbin-Watson Test (DW). The Durbin-Watson test is one of the most widely used tests to determine the presence or absence of autocorrelation.

### Statistical Test

#### Determinant Coefficient (Adjusted R<sup>2</sup>)

Adjusted R<sup>2</sup> value is also known as the coefficient of determination. The coefficient of determination (adjusted R<sup>2</sup>) shows how big the percentage of independent variables can explain the dependent variable (goodness of fit test).

#### Joint Testing (F Test)

The F test is a statistical test tool jointly or as a whole from the regression coefficient of the independent variable on the dependent variable. In the F test, the  $F_{count}$  formulation is carried out as follows:

$$f = \frac{R^2 (k - 1)}{(1 - R^2)/(n - k)}$$

Information:

$F$  = F-count value

$N$  = Number of observations

$R^2$  = Coefficient of determination

$K$  = Number of variables

Partial Test (t Test)

Statistical t test was conducted to determine whether the independent variables individually affect the dependent variable. The degree of confidence is 95 percent ( $\alpha = 0,05$ ) and the degrees of freedom are  $n(df) = n - k - 1$  where  $n$  is the number of samples and  $k$  is the number of coefficients. One end t-test has degrees of freedom ( $df$ ) =  $a, n - k$ , while two-end t-test has degrees of freedom ( $df$ ) =  $a/2, n - k$ . The following is the t-test formula, namely:

$$t = \frac{b_j}{sb_j}$$

Information:

$t$  = Value  $t_{count}$

$b_j$  = Regression coefficient

$sb_j$  = Standard error of regression coefficient

#### IV. RESULT / FINDING

##### Panel Data Method Selection

Chow test

Table 1. Summary Table of Chow Test Results.

Effects Test	Statistic	d.f.	Prob.
Cross-section F	13.236602	(23,92)	0.0000
Cross-section Chi-square	175.288892	23	0.0000

Source: Regression Output, eviews 9

The Chow test table shows that the cross-section F probability value of 0,0000 is less than the probability value  $\alpha = 0,05$ , meaning that the best model used is the Fixed Effect Model.

Hausman test

Table 2. Summary Table of Hausman Test Result.

Test Summary	Chi-Sq. Statistic	Chi-Sq. d.f.	Prob.
Cross-section random	123.362001	4	0.0000

Source: Regression Output, eviews 9

The Hausman test table shows that the random cross-section probability value of 0,0000 is less than the probability value of  $\alpha = 0,05$ , meaning that the selected model is the Fixed Effect Model. So, the Lagrange Multiplier Test does not need to be carried out because the two tests above have shown the same results, namely the Fixed Effect Model is the model chosen in this study.

**Classic assumption test**

**Normality Test**

The regression results show that the p-value of Jarque-Bera is 288,7207 where the value is greater than the value of  $\alpha = 0,05$ , so the data used in this study is normally distributed.

### Multicollinearity Test

Table 3. Summary Table of Multicollinearity Test Results.

	PE	PMA	PMDN	UMK
PE	1.000000	0.002362	0.154869	0.230272
PMA	0.002362	1.000000	0.010887	0.317277
PMDN	0.154869	0.010887	1.000000	0.085849
UMK	0.230272	0.317277	0.085849	1.000000

Source: Regression Output, evIEWS 9

The Multicollinearity Test table shows that the correlation value of each independent variable is less than 0,90, meaning that there is no multicollinearity problem.

### Autocorrelation Test

From the autocorrelation test that has been carried out, the results can be seen in the table below.

Table 4. Summary Table of Durbin Waston Autocorrelation Test Results.

No.	DW <sub>hitung</sub>	Nilai dL	Nilai dU
1	1.766013	2.3836	2.2104

Source: Regression Output, evIEWS 9

From the Autocorrelation Test Table, it shows that the DWcount has a value of 1,766013 where this value lies between the values of DU and 4-DU so that there is no autocorrelation problem.

Table 5. Summary Table of Autocorrelation Test Results.

Breusch-Godfrey Serial Correlation LM Test:

F-statistic	5.285760	Prob. F(2,113)	0.0064
Obs*R-squared	10.26598	Prob. Chi-Square(2)	0.0059

Source: Regression Output, evIEWS 9

Based on the table above, the value of Prob Chi square (which is Obs\*R-square) is  $0,0059 > 0,05$ , so there is no autocorrelation

### Heteroscedasticity Test

Table 6. Summary Table of Heteroscedasticity Test Results.

Heteroskedasticity Test: Glejser

--	--	--	--

F-statistic	8.821071	Prob. F(4,115)	0.0000
Obs*R-squared	28.17403	Prob. Chi-Square(4)	0.0000
Scaled explained SS	49.19461	Prob. Chi-Square(4)	0.0000
<hr/> <hr/>			
Variable		t-Statistic	Prob.
C		2.532516	0.0127
PE		3.324293	0.0012
PMA		-0.136912	0.8913
PMDN		-0.129994	0.8968
UMK		3.819303	0.0002

Source: Regression Output, evIEWS 9

From the results of the heteroscedasticity test using the glejser test, it can be seen that the probability value of the variables of economic growth, PMA, PMDN and UMK is greater than  $\alpha = 0,05$  so there is no heteroscedasticity problem.

### Regression Output

In selecting the right panel data regression model using the Chow test and the Hausman test, it was found that the fixed effect model is the right regression model in this study. The output of the fixed effect model can be summarized as in the following table:

Table 7. Summary Table of FEM Uji Test Results.

Variable	Coefficient	Std. Error	t-Statistic	Prob.
C	28845.54	3641.463	7.92 1415	0.0000
PE	-0.000164	0.000132	-1.242802	0.2171
PMA	0.037518	0.018274	2.053102	0.0429
PMDN	-0.000273	0.000714	-0.382551	0.7029
UMK	1.41E-05	1.43E-06	9.825508	0.0000
<hr/> <hr/>				
R-squared	0.985740			
Adjusted R-squared	0.981555			
F-statistic	235.5425			
Prob(F-statistic)	0.000000			

Source: Regression Output, evIEWS 9

From the Summary Table of Multicollinearity Test Results, it can be seen that the coefficient of determination (adjusted R<sup>2</sup>) is 0,981555, meaning that the independent variable used in this study is able to explain the dependent variable of 98.15 percent and the rest is explained by other variables not included in this study regression model. Meanwhile, the Fcount value is 235,5425 with a Prob value (F-statistic) of 0,00 and a significance level of 5%. This shows that the value of Fcount is greater than the value of Ftable, so statistically the variables of Economic Growth (PE), PMA, PMDN and UMK simultaneously affect employment in Central Java Province in 2015 to 2019.

Table 8. Summary Table of t Test Results.

Variable	t-Statistic	Prob.	Alfa	Ket
PE	-1.242802	0.2171	0.05	Sig (< $\alpha$ )
PMA	2.053102	0.0429	0.05	Sig (< $\alpha$ )
PMDN	-0.382551	0.7029	0.05	Sig (< $\alpha$ )
UMK	9.825508	0.0000	0.05	Sig (< $\alpha$ )

Source: Regression Output, evIEWS 9

Based on the regression results above, it can be seen that: 1) The  $t_{count}$  value of the economic growth variable (PE) is -1,242802 and the  $t_{table}$  value is 1,65810 with a level of 5%. It can be seen that the value of  $t_{count} < t_{table}$ , so  $H_0$  is accepted and  $H_1$  is rejected. This means that the economic growth variable does not statistically affect employment in Central Java Province from 2015 to 2019. 2) The  $t_{count}$  value of the PMA variable is 2,053102 and the  $t_{table}$  value is 1,65810 with a level of 5%. It can be seen that the value of  $t_{count} > t_{table}$ , so that  $H_0$  is rejected and  $H_1$  is accepted. This means that FDI statistically has a positive and significant effect on employment in Central Java Province from 2015 to 2019. 3) The  $t_{count}$  value of the PMDN variable is -0,382551 and the  $t_{table}$  value is 1,65810 with a level of 5%. It can be seen that the value of  $t_{count} < t_{table}$ , so that  $H_0$  is accepted and  $H_1$  is rejected. It means, that PMDN statistically has no effect on employment in Central Java Province from 2015 to 2019. 4) The  $t_{count}$  value of the UMK variable is 9,825508 and the  $t_{table}$  value is 1,65810 with a level of 5%. It can be seen that the value of  $t_{count} > t_{table}$ , so  $H_0$  is rejected and  $H_1$  is accepted. This means that the UMK has a statistically positive and significant effect on employment in Central Java Province from 2015 to 2019.

## V. DISCUSSION

Economic growth (PE) has no effect on employment in Central Java Province from 2015 to 2019. The results of this study differ from the hypothesis that has been compiled which states that economic growth has a negative effect on employment in Central Java Province in 2015 to 2019. This is not in line with the research of Purwaningsih, Rochmani & Suryantoru (2016) which concludes that economic growth has a positive and significant effect on employment in Central Java Province.

Foreign Investment (FDI) has a statistically positive and significant effect on employment in Central Java Province from 2015 to 2019. The results of this study are in accordance with the hypothesis that has been compiled which states that FDI has a positive and significant effect on employment in the Province Central Java from 2015 to 2019. This is in line with the research of Destiningsih, Indrawati & Kurniasari (2020) which concludes that FDI has a positive and no significant effect on the number of workers.

Domestic Investment (PMDN) has no effect on employment in Central Java Province from 2015 to 2019. The results of this study are different from the hypothesis that has been compiled which states that economic growth has a negative and positive effect on employment in Central Java Province. 2015 to 2019. This is in line with the research of Destiningsih, Indrawati & Kurniasari (2020) which concludes that PMDN has a negative and no significant effect on the number of workers.

The Regency/City Minimum Wage (UMK) has a positive and significant effect on employment in Central Java Province from 2015 to 2019. The results of this study are in accordance with the hypothesis that has been compiled which states that the MSE has a positive and significant effect on employment in Java Province. Middle of 2015 to 2019. This is in line with research by Handayani, Muslihatinningsih & Saleh (2018), and Kadarwati, Ramdani & Supardi (2021), and Purwaningsih, Rochmani & Suryantoru (2016), which states that the District Minimum Wage (UMK) together have a positive and significant effect on the absorption of labor in the industrial sector.

## VI. CONCLUSION AND RECOMMENDATION

### Conclusion

Based on the results of the research and discussion in this study, several conclusions can be drawn, including the following: 1) Economic Growth (PE) variable in the industrial sector has no effect on employment in Central Java Province in 2015-2019; 2) The variable of Foreign Investment (FDI) in the industrial sector has a statistically positive and significant effect on employment in Central Java Province from 2015 to 2019; 3) The variable Domestic Investment (PMDN) in the industrial sector has no effect on employment in Central Java Province from 2015 to 2019. 4) The Regency/City Minimum Wage (UMK) in the industrial sector has a positive and significant effect on employment in the Province Central Java from 2015 to 2019.

### Implication

This research implies the need to encourage the industrial sector to further increase activities in order to spur and support the growth rate of the industrial sector. Here, the government needs to develop the medium and small industrial sector, because the small industrial sector absorbs more workers in the industrial sector. This can be supported by increasing investment, both Foreign Investment (PMA) and Domestic Investment (PMDN) entering Central Java Province. Because investment has the potential to create and absorb industrial sector workers in Central Java Province. Meanwhile, the determination of wages will be a consideration for employers so that in determining wages, the government needs to pay attention to economic conditions and the labor market. The wage setting policy is one of the government's policies to intervene in the labor market with the aim of creating a labor market. So it is hoped that the Central Java provincial government can take into account the increase in the minimum wage every year without harming entrepreneurs which will have an impact on decreasing employment.

## ACKNOWLEDGEMENT

Praise be to Allah SWT who has bestowed His grace and guidance so that this research can be carried out so that the author can complete the writing of a scientific journal according to the planned time. The writing of this scientific journal cannot be separated from the support and encouragement and cooperation of various parties. So the author would like to thank my Supervisor, Mrs. Sitti Retno Faridatussalam S.E., M.M, and Mrs. Eni Setyowati S.E., M.Si as academic supervisors. Thanks also to my parents, my younger brother, and also my friends and various parties that I cannot mention one by one, who have helped so that this article can be completed.

The author realizes that there are still shortcomings in the preparation of this scientific paper. Therefore, the authors expect constructive suggestions for the improvement of this scientific work. Hopefully, this scientific work can be useful for all parties.

## Analysis Of Urban Waste Collection System Planning At Zero Waste Management Company In Jadetabek Using Shortest Route Method

Kennard Jonathan Layman<sup>1</sup>, Ratih Dyah Kusumastuti<sup>2</sup>

<sup>1</sup>Department of Management, Faculty of Economics and Business, Universitas Indonesia, Jakarta, Indonesia

<sup>2</sup>Department of Management, Faculty of Economics and Business, Universitas Indonesia, Jakarta, Indonesia

### Abstract

*This paper looks at a vehicle routing issue primarily related to waste collection in Greater Jakarta. The primary goal of this problem is to determine the routes of waste collector vehicles using the shortest route method to minimize the total operational costs. The total waste production in 2020 in Indonesia reached 67.8 million tons. It was recorded that 69 percent of the waste ended up in final disposal sites without any recycling process. Product recovery activities, such as recycling, can reduce the disposal of wastes at landfills. However, it needs reverse logistics activities, such as collecting and sorting waste. Urban waste collection is one of the most expensive occupations, with several practical challenges and a low-profit margin. Due to high operational expenses (fuel, maintenance, recycling, manpower, and so on), waste collection and disposal are expensive chores, and even little improvements in this area can save company a lot of money. However, there are limited studies of the urban waste collection routes in the application of a reverse logistics system carried out in Indonesia. In this situation, the urban waste is retained at the stations showing the demand nodes, and each node is connected by a branch, which represents the roadways that connect the demand nodes. The results of this study indicate that determining the route using the shortest route method can shorten the trip by 7,55%. The finding of this study helps minimize the operational cost of the company and improve the efficiency of its operation.*

Keywords— Vehicle Routing Problem; Urban Waste Collection; Shortest-Route Method; Reverse Logistics; Sustainability

Manuscript should consists of 3,000 to 7,000 words (exclude abstract, reference, and acknowledgement)

---

### I. INTRODUCTION

According to the Ministry of Environment and Forestry of Indonesia (KLHK), the total waste production in 2020 in Indonesia will reach 67.8 million tons. Which means there are around 185,753 tons of waste every day produced by 270 million people (Setiawan, 2021). It was recorded that 69 percent of the waste ended up in a final disposal site (TPA) without any recycling process (Setiawan, 2021). According to The Global E-Waste Monitor 2020, Indonesia is included in the 10 largest e-waste producing countries in the world by occupying 7th place with 1.61 million metric tons in 2019 (Annur, 2021). And according to research by the University of Georgia, Indonesia occupies the 2nd position as the country with the largest plastic waste production in the world after China with an estimated 3.22 million metric tons per year (The ASEAN Post Team, 2018).

Head of Sub-Directorate of Goods and Packaging, Directorate of Waste Management KLHK, Ujang Solihin said that the average waste management capacity in Indonesia is still below 50 percent with a pattern that is still fixed on the old pattern of collect-transport-dispose, which is a linear pattern with the majority of waste The waste will be collected in a final disposal site (TPA) without any recycling process (Setiawan, 2021). The Bantar Gebang Integrated Waste Management Site, Bekasi, West Java is said to be the largest waste disposal site in Indonesia, even in the world. Thousands of garbage trucks from all over Jakarta are queuing up to unload their cargo every day. Having an area of more than 110 hectares which is divided into five zones, the volume of waste that enters Bantar Gebang per day reaches more than 7,000 tons. By adopting a linear system, namely collection-transport-disposal alias open-dumping, Bantar Gebang is assessed to exceed the capacity load in 2021. The height of the accumulated waste pile is more than 40 meters (Renaldi, 2020).

The latest waste management pattern should adopt a circular system, which is to maximize the economic value of waste by implementing reduce, reuse, recycle (3R). According to data from the Ministry of Environment and Forestry

(KLHK), in 2019, Indonesia only managed to reduce, reuse, and recycle (3R) 14.58% of its waste in 2019, while 34.60% was managed in traditional ways, such as being disposed of in landfills or burned, bringing the national waste management to 49.18%. In 2020, the 3R waste treatment process has increased to 16.23% and 34.60% in waste management with a total of 54.15%. Indonesia wants at least 30% of all trash to be reduced, reused, and recycled by 2025, with the remaining 70% managed traditionally (EKONID, 2021).

However, there are challenges in the recycling sector in Indonesia. According to the Secretary General of Indonesian Plastics Recyclers (IPR) Wilson Pandhika, limited investment in technology for recycling is still an obstacle. In addition, because waste is not segregated from the source, the costs of sorting and managing waste are expensive, and depend on the informal sector which is less efficient. The long supply chain from waste sources to recyclers also makes transportation costs high and involves intermediaries (Syahni, 2019). Since waste collection and transportation account for between 60 and 80 percent of the costs associated with solid waste management, evaluating and improving this system will be crucial in resolving and minimizing issues with the management of municipal services (Tirkolaee et al., 2018a). Therefore, many variations of the vehicle routing problem can be used to define the problem of urban waste collection (VRP). Many common problems, including transportation, supply chain management, production planning, and communications, have been researched to be represented using VRP (Karadimas et al., 2007; Mirmohammadi et al., 2017; Tirkolaee et al., 2017). Waste management system requires reverse logistics activities to collect and dispose of wastes. Reverse logistics is the process of planning, implementing, and controlling the efficient flow of raw materials, process inventory, and final products at the lowest possible cost then involves the movement of data from a point of consumption to a point of origin in order to recapture value or dispose of it properly. (Rogers & Tibben-Lembke, 1999).

One of the zero waste management companies operating in the Jadetabek area is Rekosistem by PT Khazanah Hijau Indonesia. They implement a reverse supply chain in collecting and disposing of waste, especially in urban areas, before it is finally collected and reprocessed. Municipal solid waste collection is one of the most expensive operations, with numerous practical challenges. To put it another way, waste collection and disposal is a costly task due to high running costs (fuel, maintenance, recycling, personnel, and so on) that are unusually high in their operating expenses. (Brandao, 2021). However, there are limited studies of the urban waste collection routes in the application of a reverse logistics system carried out in Indonesia. Hence, this paper aims to determine the routing of waste collector vehicles at Rekosistem by applying the shortest-route problem of the network flow model. The result of the study provides insights on the implementation of reverse supply chain for wastes management and help the company to have a more efficient operations.

## II. LITERATURE REVIEW

### A. Sustainable Supply Chain

Sustainable supply chain (SSC) practices have been defined in a variety of ways in the literature; for example, according to Pagell and Wu (2009), certain supply chain management activities strive to make the chain really sustainable. Many other authors, on the other hand, consider SSC to be supply chain management, which focuses on preserving stability in terms of environmental, economic, and social activities in order to achieve long-term sustainable growth (Ahi & Searcy, 2013; Ciccullo et al., 2018; Fahimnia et al., 2018). al., 2015; Seuring & Müller, 2008).

SSC practice can provide a larger viewpoint, incorporating the need to research social, environmental, and economic values (Kähkönen et al., 2018). According to Giunipero et al. (2012), integrating such principles aids firms in achieving their overall objectives in a sustainable and lucrative manner. As a result, focusing on SSC practices is a good place to start when it comes to attaining corporate sustainability.

### B. Reverse Logistics

Reverse logistics is defined as a branch of research that focuses on recovering goods that are no longer wanted (end-of-use products, EoU) or can no longer be used (end-of-life products) by customers in order to extract economic value. (Rubio & Parra, 2014).

According to De Britto & Dekker (2004), there are several reasons for implementing a reverse logistics system, namely (a) Economics: direct reasons (reduction in raw material use, disposal costs, and production of added value for end-use products) and indirect reasons (demonstrations of environmentally responsible behavior, increased

relationship customers), (b) Legal: companies are responsible for the proper recovery or disposal of trash generated by the items they manufacture or distribute in many jurisdictions (for example, within the European Union), (c) Social: rising public awareness of the need of environmental protection has resulted in increased demands for ecologically responsible business practices, particularly in terms of carbon emissions and trash generation.

The research group of the European Working Group, REVLOG, defines reverse logistics as 'the process of planning, implementing and controlling the backward flow of raw materials, work-in-process, packaging and finished goods, from the point of manufacture, distribution or use, to the point of recovery or point of disposal (De Britto & Dekker, 2004).

A reverse logistics network's successful deployment necessitates numerous decisions at various hierarchical levels: strategic, tactical, and operational. RL networks are classified according to the recovery options provided to EoU products: 1) direct use and resale, 2) repair, remanufacture, repair, cannibalization and recycling, and 3) disposal (Thierry et al, 1995)

Reverse logistics network configuration is a complex problem that requires determining the optimal location and capacity of collection centers, sorting centers, remanufacturing facilities and/or recycling plants (Alumur et al, 2012). The design of the RL network is based on three basic activities (Aras et al, 2010): (1) collection of EoU products, (2) inspection and classification, (3) recovery process.

Reverse logistics is the best technique for achieving long-term solid waste management (SSWM). However, it is necessary to identify the characteristics of the context to confirm the relationship between reverse logistics and SSWM and to propose strategies directed at the integral benefits of SMEs and the environment (Khalili-Damghani et al., 2015).

### *C. Vehicle Routing Problem (VRP)*

Vehicle Routing Problem (VRP) is the general name for a method used to solve the problem of determining the route traversed by a fleet of vehicles from one or several origin points to serve a geographically dispersed set of customers (Diaz, 2002).

Waste management is currently gaining popularity. The management of hazardous waste demands increased attention due to the significant risks to human health and the impact on the environment. VRPTW (vehicle routing problem with time windows) is a frequent VRP problem with limited capacity in which each client must be supplied at specific intervals of time (this interval is known as time window) (Tirkolee et al., 2017).

VRPTW and municipal waste collection were investigated by Buhrkal et al. (2012). They're attempting to determine the best method for calculating the optimal route cost for carrying waste collecting vehicles from their starting point at the base to their final destination at the dump.

One of the methods that can be used to solve vehicle routing problem is the shortest route problem of the network flow model, which is used to determine the path that has the shortest distance between the origin and several destination points. The steps for the shortest route solution method are as follows (Taylor, 2019): (1) Select the node that has the shortest route to the origin; (2) the route connecting the originating step with the node selected in the first step is set as the permanent set; (3) set all nodes that are directly connected to the node in the permanent set; (4) determine the node that has the shortest route from a number of nodes that have been directly connected to the permanent set of nodes; (5) repeat steps 3 and 4 until all permanent sets connect all nodes. The shortest route problem was chosen as the method used for problem analysis because the constraints in the shortest route problem are taken into account the direction of the truck's entry and exit routes so that it can be determined where the starting and ending points of the vehicle journey are. So this method is more suitable than other methods in network flow models. Rather than the minimal spanning tree problem, although it can connect all points in the network, this method has one drawback so it cannot be used in this study. At least the spanning tree problem has no direction so that if we use this method we cannot determine the direction of entering and leaving the vehicle truck.

## III. RESEARCH METHODOLOGY

This research has a research framework, which is depicted in Figure 1. This study aims to determine the optimal route in the operational activities of waste collection in Rekosistem. For this, it is necessary to review the literature to

study the scientific concepts that will be used to achieve the objectives of the research. After determining the appropriate method, the model is formulated. The waste collection route will be determined using the shortest route method. Location data is needed to be used as a node and the road that will be traversed by the truck to be used as a branch. By applying the data to the formulated model, the solution will be found by finding the shortest distance between the customer nodes and the central node. The customer nodes are then sorted from the shortest route in multi-trips, so that the garbage collection sequence is obtained.

Fig. 1. Research Framework

#### A. Data Collection

Rekosistem is an end-to-end zero waste management Start-Up company that strives for a sustainable ecosystem. In running its business, Rekosistem has its head office located at Jl. Pondok Jaya III No. 8B Pela Mampang, Mampang Prapatan, South Jakarta 12720. Waste collection activities are carried out using the central office as a depot point as the starting and ending point for collection. The waste collection fleet is divided into 4 service areas spread across Jakarta, Tangerang and Bekasi areas. Each fleet is required to complete waste collection according to the customer's request schedule and to avoid delays in garbage collection which can result in additional fleets to complete deliveries and customer dissatisfaction.

In this study, the population data used is the collection of House Repickup garbage by one of the trucks owned by Rekosistem which operates in South Jakarta and South Tangerang. The form of the data is in the form of the address of the customer who is the target for picking up the waste, currently used route and duration of the waste collection trip. Data validation used is type checking. This method is a way of data validation where the researcher will confirm that there is the correct data type and can be entered. In this case the type of data entered is address data which must state the name of the street, the name of the city, and the postal code

#### B. Research Model

The method used in this research is to use the shortest route problem. In this study, computers were used to formulate the shortest route modeling solution using the Excel Solver program.

Solving the shortest route problem with Excel These can be achieved by rewriting and solving the shortest route network problem as a 0-1 integer linear programming problem. We define the decision variables for each branch in the network to construct a linear programming model, as follows:

$$x_{ij} = 0 \text{ if branch } i\text{-}j \text{ is not selected as part of the shortest route and } 1 \text{ if branch } i\text{-}j \text{ is selected} \quad (1)$$

Here, it is assumed that there are 7 nodes which are named nodes 1 to 7 which have 11 branches that connect nodes. We assume that commodities can only be transported from a lower node number to a higher node number to limit the complexity and size of the model formulation (eg, 3 to 4 but not from 4 to 3). The number of variables and branches to examine is considerably reduced as a result. By minimizing the multiplication of each branch value and the distance traveled for each branch, the objective function is formed:

$$\text{Minimize } Z = z_{12}x_{12} + z_{13}x_{13} + z_{14}x_{14} + z_{24}x_{24} + z_{25}x_{25} + z_{34}x_{34} + z_{36}x_{36} + z_{45}x_{45} + z_{46}x_{46} + z_{47}x_{47} + z_{57}x_{57} + z_{67}x_{67} \quad (2)$$

Where:  $Z$  = total distance

$x_{ij} = \{0,1\}$ , indicating if branch from location  $i$  to location  $j$  is chosen

$z_{ij}$  = branch distance from location  $i$  to location  $j$

Each node has a constraint that states that whatever enters the node must also depart the node. This indicates that one truck departs from node 1 via branch 1-2, branch 1-3, or branch 1-4. The following is the constraint for node 1:

$$x_{12} + x_{13} + x_{14} = 1 \quad (3)$$

Trucks will pass through node 2 from branch 1-2 to the following branch, such as branch 2-4 or 2-5, as seen below.

$$x_{12} = x_{24} + x_{25} \quad (4)$$

Constraints on the next node will be built like the example above and produce a complete linear programming model. After then, using "Solver" in Excel, the specified model can be solved in the same way as other linear programming problems (Taylor, 2019).

#### IV. RESULT / FINDING

##### A. Data Processing

To determine the optimal waste collection route using the shortest route method, it is necessary to process the data obtained from the company which was originally in the form of an address table into a network that provides location and distance information between locations. The work was carried out with the help of the MyMaps application to visualize the depot location points and stopping points for waste collection. From 1 depot and 37 stopping points, the results of the visualization of waste collection points are as follows.

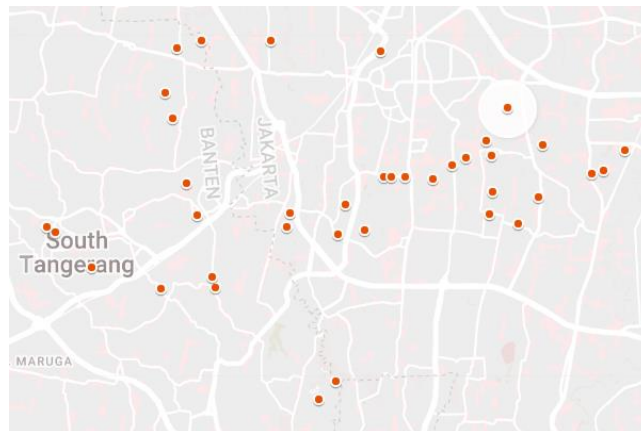

Fig. 2. Waste Collection Point

From the 37 stopping points above, according to the data we obtained from the Rekosistem, the route is determined in the following order. The route reaches a total distance of 106 km.

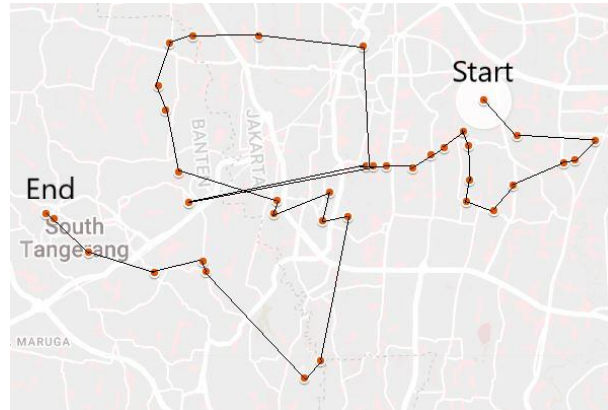

Fig. 3 Waste Collection Route

From the location of the 38 nodes above, it can be seen that there are many nodes that are located close to each other and are in the same path so that in the network creation process, simplification is carried out where each branch will go through several nodes that are in a straight line and will stop at the node which is the intersection between two separate nodes before finally forming a new branch by providing the value of the branch that passes through many stopping points obtained by adding up the total distance between the nodes traversed in the branch. As the explanation in the literature explains that nodes represent intersection points, for example, the intersection of several roads (Taylor, 2019). With this simplification, a network is formed as follows.

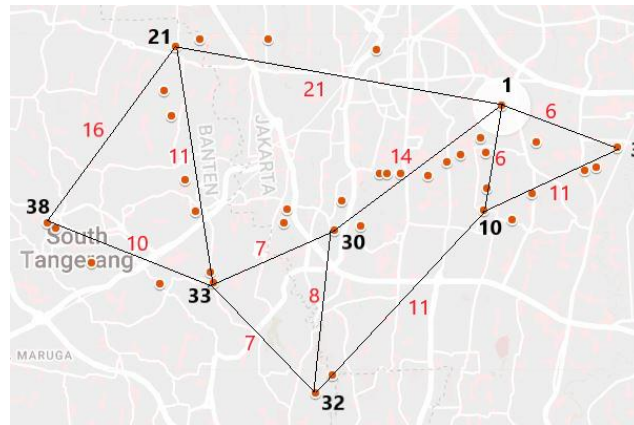

Fig. 4 Network Simplification

From the picture above, the black number shows the name of the point that is used as a node and the red number shows the distance that must be traversed from one node to another in km unit.

*B. Modelling and Solution*

Modelling in an Excel spreadsheet can be done by determining the decision variables for each branch in the network. Where the value of the decision variable is 0 if the branch is not selected as the shortest route and 1 if the branch is selected as the shortest route.

Table 1. Network Formulation For Shortest Route Calculation

Selected Branch	Node (Start)	Node (Goal)	Distance (km)
1	1	3	6
0	1	10	6
0	1	21	21
0	1	30	14
1	3	10	11
1	10	32	11
0	21	33	11
0	21	38	16
0	30	32	8
0	30	33	7
1	32	33	7
1	33	38	10
Total Distance			45

In addition, each node has a constraint indicating that every truck arriving at that node must exit. For example, a truck leaving node 1 must exit via branch 1-3, branch 1-10, branch 1-21, or branch 1-30. Constraints on each node are formulated as follows:

$$\text{Node 1: } x_{1-3} + x_{1-10} + x_{1-21} + x_{1-30} = 1 \quad (5)$$

$$\text{Node 3: } x_{1-3} - x_{3-10} = 0 \quad (6)$$

$$\text{Node 10: } x_{1-3} + x_{3-10} - x_{10-32} = 0 \quad (7)$$

$$\text{Node 21: } x_{1-21} - x_{21-33} - x_{21-38} = 0 \quad (8)$$

$$\text{Node 30: } x_{1-30} - x_{30-32} - x_{30-33} = 0 \quad (9)$$

$$\text{Node 32: } x_{10-32} + x_{30-32} - x_{32-33} = 0 \quad (10)$$

$$\text{Node 33: } x_{21-33} + x_{30-33} + x_{32-33} - x_{33-38} = 0 \quad (11)$$

$$\text{Node 38: } x_{21-38} + x_{33-38} = 1 \quad (12)$$

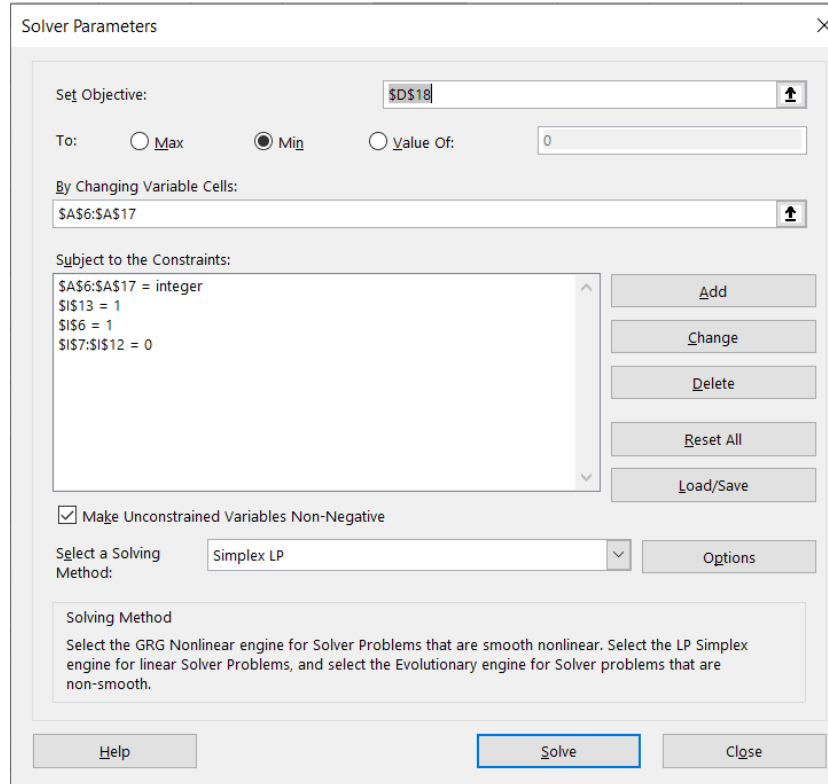

Fig. 5 Excel Solver Constraint

## V. DISCUSSION

The calculation results from Excel Solver show that cells A6, A10, A11, A16, A17 have a value of 1, so it is indicated that branch 1-3-10-32-33-38 is the shortest route with a total distance of 45 km. To be able to go through all nodes, then to go through points 21-33 and 30 with the shortest distance is through branches 1-21-33 and 1-30-33 so that the total distance traveled is  $45 + 32 + 21 = 98$  km.

When compared with the initial route of waste collection which was carried out to cover all customer home addresses which reached 91 km, then by using the Shortest Route method the company could shorten the journey by 7,55%. With the use of the 190 PS Engkel Truck as a garbage truck carried out by the ecosystem, according to the fuel ratio reference (Antonius, 2020) this type of truck has a fuel ratio of 1 liter of diesel and can cover a distance of 3.5 km. With the price of diesel in Jakarta which reaches Rp. 12,950 in 2022 (Pertamina, 2022). So the company can save IDR 28,571.43 in one trip or IDR 857,142.85 in 30 trips from fuel costs.

Calculations using the excel solver with the address data obtained still have limitations in terms of travel time because the distance traveled is not necessarily directly proportional to the distance traveled. In addition, this research still has limitations in terms of direct implementation in the field which has many factors of uncertainty.

## VI. CONCLUSION AND RECOMMENDATION

Urban waste collection is a high-cost activity with a small revenue margin, so small improvements and improvements in optimizing collection routes can result in tremendous reductions in operating expenses. In this study, determining the route of waste collection using the shortest route method with the help of an excel solver in terms of

route calculation is proposed to overcome the selection of the optimal route for waste collection because it can shorten the travel distance by 7,55% and save on travel fuel costs by IDR 857,142.85 in 30 trips.

Based on the results showed that the use of the shortest route method was able to shorten the distance traveled by 7.55%. Therefore, it is necessary to conduct a review to be taken into consideration to provide direction to the waste collection team to study the new route. So that the company can immediately feel the advantages and disadvantages in choosing the proposed route so that the company can improve and develop it.

For further research, it is recommended to add the parameters of the collection travel time or to examine the operational process of the collection as a whole, not only in the logistics and transportation section. It would be better if the proposed waste collection system is also integrated with other systems, such as the capacity of transport trucks, vehicle fuel costs, waste collection systems on site, monitoring and control of travel routes which will further help the company to optimize the collection process. trash done. It can also increase the use of other VRP methods or by using a programming language that is better than the current one.

#### ACKNOWLEDGEMENT

In connection with the completion of the research that we have made, on this occasion for all the efforts and assistance that has been given to us. Your help enabled us to finish this research and to meet the scheduled time for the conference. Professional support and assistance from all respected parties have made this research eligible for publication.

### Abstract

*This study explores consumer behavior regarding out-of-home fish consumption, using occasion-based as a segmentation approach. This study also seeks to determine the relationship between the experience of eating fish meals outside the home and the adoption of fish consumption at home, as well as how the perceptions differ between whole-fish products and processed fish. Indonesia's fish consumption per capita is one of the highest in the world. However, if we examine this situation further, we see that most of this consumption is at the industrial level, while at the household level, fish consumption is not as high as consumption levels for other protein sources. The existence of a food delivery application makes it easier for consumers to buy fish meals outside the home. Identifying the factors related to fish consumption outside the home is necessary to determine the influence of food delivery applications on fish consumption at home. Many studies have discussed consumer behavior regarding food delivery applications (FDAs), but few have explicitly discussed fish meals. Furthermore, research on food-away-from-home has not contrasted FDA, dine-in, and take-away options. Another important goal is to determine the extent to which eating fish outside the home, both whole and processed fish, influences the intention to cook fish at home.: This study adopted a qualitative method to explore occasion-based segmentation issues in out-of-home consumption via FDA. The data collection techniques consist of netnography and a series of in-depth interviews in three large cities. This study found that, although consumption of fish in the home has increased, this is only true for processed-fish products, not whole-fish consumption. This study also found four segmentation types in terms of fish consumption outside the home. It is necessary to increase whole-fish consumption because eating the whole fish is a healthier option for children's growth, and it is closer to the experience at home in the context of 'eating fish.'*

Keywords— Food-away-from-home, Food-delivery application (FDA), fish meal, fish consumption

---

### I. INTRODUCTION

The statistics show that, even though fish is a familiar product for Indonesian consumers, for daily consumption at the household level, fish is still not the primary choice for families. Although fish consumption in Indonesia has begun to increase, most such consumption still industrial (58%). In comparison, household consumption represents only 33% of total consumption, while restaurants and services represent 9% of total consumption (Statistic Indonesia, 2019).

The development of types of businesses that provide services for purchasing ready-to-eat food online has led to increased food consumption outside the home in Indonesia. There has been a significant increase in fish consumption outside the home; from 2017, when consumption was 16.7 kg per capita, to 2019, consumption doubled to 36.5 kg per capita (Statistic Indonesia, 2019). However, this increase in out-of-home consumption was not followed by a significant increase in home fish consumption, which only increased by 1.5 kg per capita, from 15.7 kg per capita in 2017 to 17.3 kg per capita in 2019.

Increasing in-home fish consumption is important because the results of the study by Maulana et al. (2019) show that the experience of eating fish at home from a young age is a factor that has a significant influence on a person's willingness to eat fish as an adult. So that efforts to increase in-home fish consumption are not only efforts to increase consumption levels at this time but also for the future.

Consumers can distinguish between different forms of fish on the market, most importantly between whole and processed fish (Goossens et al., 2020, Agustini & Swastawati, 2003). Whole fish is original fish that has not undergone any processing or alteration, while processed fish has undergone some action or processing to provide added value. Moreover, whole fish involves no cuts, and in fish fillets, some part of the fish has been removed and cut off. Fish fillets are widely used in processed fish.

In a previous study, Maulana et al. (2019) found that fish have more complex consumption barriers than other protein sources, such as meat and eggs. This study indicated a tier-based adoption barrier. Furthermore, empirical studies in the area of fish consumption still focus on demographic variables, such as socio-economic class (Nicolae et al., 2016), ethnicity, marital status (Tan et al., 2015), type of occupation, income (Trondsen et al., 2003), age, education level, and gender to investigate the adoption of food delivery service applications (Keeble et al., 2020; Dominici et al., 2021).

In the previous literature, the discussion of food consumption can occur in terms of the location where the food is consumed, that is, food at home (FAH) or food away from home (FAFH) (Richards & Mancino, 2013; Saksena et al., 2018). Furthermore, Maulana et al. (2021) suggest two essential variables to distinguish between various fish consumption situations, namely cooking point and consumption point. These two variables remind us that fish consumption is not only a question of the location the food is consumed but also where it is cooked. In home and away from home are still used as location settings, but they must be linked to one another to provide context. It is also necessary to consider the purchasing channel or point of purchase, including whether these are online or offline/physically located at the food outlet.

This study focused on fish consumption prepared away-from-home (PA) and enjoyed at home (EH), abbreviated PA-EH. In this PA-EH consumption type, there are two ways of ordering food. The first is the purchase of take-away or eat-out fish dishes, which consumers must collect physically from the food outlet. The second type is purchasing fish dishes through mobile apps. Consumers interact with food outlets using food delivery apps, or food delivery app (FDA) services. The present study addresses the need to understand and elaborate on the complexities of fish consumption adoption barriers in the PA-EH category, particularly those involving the FDA channel. Technological developments have given rise to the FDA service, in which consumers do not need to cook own their food and enjoy it at home. With the broader penetration of information technology, consumers have come to rely heavily on digitalization in every aspect of their lives, including purchasing a meal.

Past research has examined many factors that influence fish consumption from various perspectives. These factors include time-saving orientation, information quality, design, convenience, the online purchase experience, and the ease of ordering food from users' favorite restaurants (e.g., Allah Pitcay et al., 2021; Kang and Namkung, 2019; Gunden et al., 2020, Cho et al., 2019).

The accumulated findings are comprehensive and offer deep insights into various aspects of FDA usage and adoption. However, a review of this literature reveals that specific research gaps persist. Many studies have discussed consumer behavior regarding food delivery applications (FDAs), but few have explicitly discussed fish meals. Furthermore, research on food-away-from-home has not contrasted FDA, dine-in, and take-away options. The mapping of issues regarding this type of consumption is essential because this FDA channel represents a fast-growing segment of the PA-EH sector, which is already considered a key distribution channel for fish consumption in society. Even more critically, FDAs have become a prominent way of ordering food during the COVID-19 pandemic.

The research questions in this study include the following: what distinguishes consumer behavior in terms of choosing fish menus for purchases outside the home, especially in terms of occasion-based segmentation? To what extent does eating fish outside the home, especially via the FDA channel, influence the intention to cook fish at home. Is there a difference between consuming whole and processed fish (fillets) outside the home in terms of their effects on the motivation to prepare fish at home?

## II. LITERATURE REVIEW

### *Factors affecting the decision-making process in purchase behavior*

A previous study by Maulana et al. (2019) regarding the adoption of barriers to in-home consumption explains two individual factors in purchase behavior, cooking skills and childhood fish experience, and one situational factor, the

point of the customer journey. This study created an interactive consumer typology that combines these three factors to contextually explain what obstacles are faced regarding fish consumption. In this way, the design of educational programs can be made compelling. For example, a housewife who used to eat fish as a child and has no cooking skills has resistance to processing various fish dishes. Mothers and their families often provide fish on the daily menu to provide easy recipes using fish in the form of fillets.

There are three main types of factors related to PA-EH type: individual, situational, and social. Individual factors include the characteristics of the actors involved in the consumer adoption process. Situational factors are all those factors particular to a time and place of observation that do not follow from a knowledge of personal (intra-individual) or stimulus (choice alternative) attributes (Ali et al., (2021). Situational factors have long been discussed in the decision-making process by Belk (1975). They consist of physical surroundings, social surroundings, temporal perspectives, task definitions, and antecedent states. Social factors involve cultural issues and the influence of others.

Previous studies have discussed many barriers to the consumption of food delivered via this FDA channel, as summarised in Table 1, in which they are divided by type of stakeholder. Problems are described related to three main stakeholders, namely (1) individual ordering and food connoisseurs at home, (2) FDA application companies, and (3) dining outlets that prepare ordered fish meals. For example, in general, barriers to ordering food via the FDA have been discussed related to individual factors, including socio-demographic factors, digital literacy, social influence, technological insights, environmental issues, insecurity, discomfort, time-saving, price orientation, and a reduction in waiting time (Allah Pitcay et al., 2021; Ali et al., 2021; Dominici et al., 2021; Keeble et al., 2020; Ray et al., 2019; Supartini et al., 2018). However, researchers have not investigated barriers to food ordering specifically for fish meals.

In the literature, the barriers to and complaints against FDAs related to performance have been widely discussed (see Table 1). As with individual factors, the discussion only focuses on ordering food in general, not on fish meal ordering issues. Past studies have found that the inhibiting factors for the FDA channel include the assumption that the fee for this channel is expensive; the idea that navigation is not easy/not easy to use; and concerns related to incomplete information, delivery experience, quality control, product availability, and convenience (Gunden et al., 2020; Pal et al., 2021; Ray et al., 2019; Verma., 2020). Specific studies on the adoption of ordering and consuming fish meals via FDAs are still limited in the literature. Therefore, the current study explores the inhibiting factors that specifically discuss the adoption barrier to fish meal FDA ordering and consumption/enjoyment.

Table 1. Research studies on food consumption via FDA's channel

Barrier types	Research method	Country	Authors
<i>FDA-channel-related factors</i>			
Perceptions regarding expensive fees and FDA information not being detailed enough	Online Survey – 256 respondents	Malaysia	<u>Allah Pitcay et al. (2021)</u>
Issues regarding ease-of-use, usability, convenience factors, and bad prior delivery experience	Mixed method: open-ended essays (125) and an online survey (395)	India	<u>Ray et al. (2019)</u>
<i>Individual factors</i>			
Insecurity and discomfort with technology	Online survey – 439 respondents	Pakistan	<u>Ali et al. (2020)</u>
Lack of knowledge about how to use FDAs properly	Online survey – 440 respondents	India	<u>Sharma et al. (2021)</u>
Socio-demographics: age, gender, education,	Survey – 18,504	Italy	<u>Dominici et al.</u>

and digital literacy	Households		(2021)

*Integrative Typology of Fish Consumption*

Maulana (2021) proposed an integrative fish consumption typology by using occasion-based segmentation to replace the dichotomy of in-home versus out-of-home consumption. The benefit of having this new integrative typology is that it improves the effectiveness of the social behavior change communication (SBCC) community education program. This SBCC framework suggested targeting the community with homogeneous problems to better internalise education messages. This conceptual study suggests adding two important variable, which is preparing food at home and the location where the food is enjoyed. Because the barriers to fish consumption are broad and complex, each consumption context has its own adoption problems.

Maulana et al. (2021) introduced a new integrative typology in which it is not only the location of consumption or enjoyment that is important but also the point of preparation. In this typology, two variables are combined in a matrix: the preparing/cooking point (P) and the enjoying/consumption point (E), which is either at-home (H) and away-from-home (A), as shown in Figure 1.

The new integrative typology of fish consumption will be helpful for anyone considering solving problems related to adoption barriers in specific communities. This research uses this typology, focusing on type 3, namely PA-EH. With an integrative typology of fish consumption, mapping adoption barrier issues becomes more relevant and contextual. Knowing each consumption type barrier will help in designing a more relevant and contextual community education SBCC program. Furthermore, the effectiveness of such a program would be measurable.

**Enjoying point**

		<b>Enjoying point</b>	
		At-home	Away from home
<b>Preparing Point</b>	At-home	<b>Type 1</b> Preparing and enjoying at home (PH-EH)	<b>Type 2</b> Preparing at home but enjoying away from home (PH-EA)

Fig. 1. Typology of fish consumption behavior based on preparing and enjoying point (Maulana et al., 2021)

#### *Consumer behavior in the PA-EH consumption type*

This paper will specifically discuss the barriers to adopting fish consumption in PA-EH type 3, when fish is prepared away from home but enjoyed at home. Especially for this type of PA-EH, this paper also considers the purchase channel for offline (directly at food outlets) and online purchases through FDAs. There are two types of consumer behavior in this type of PA-EH. The first is the takeaway purchase of fish meals, in which consumers are directly at the outlet and buy fish dishes in a ready-to-eat form and then take them home to consume. In the second, the food is prepared by a dining outlet promoted via the FDA, selected for delivery, and enjoyed at home.

Few studies discuss the adoption barriers to this type of PA-EH consumption. Ramlawati et al. (2019), in their study of 'cultural behavior of feeding migration', found that one of the barriers to eating fish outside the home is accessibility. Currently, the interaction of individuals with online systems is increasing, which will help overcome this accessibility issue.

### III. RESEARCH METHODOLOGY

#### *Data Collection*

This study adopts a qualitative approach because it aims to explore the buying behavior of consumers buying fish menus outside the home via the FDA channel, which is still scarcely explored in the literature. Data collection in the field begins with conducting netnographic studies. According to Kozinets (2020), netnography is a further observation activity on various interactions that occur in the online space, specifically via an online community or forum. Researchers conducted a netnography by tracing (1) conversations about opinions regarding the experience of buying fish-based food at restaurants for pick-up orders or buying via FDA channels on social media, such as Twitter, Facebook, and Instagram; (2) discussions in the online community forums that allude to various experiences and problems in fish consumption for the segment in question; and (3) various online platforms to obtain an initial picture of the diversity of merchants who sell fish menus with various attributes. This will be done to understand the current consumer experience with ordering online. The selection of different techniques for use in this study was intended to ensure the triangulation of the data, increasing the credibility of the findings (Brewer & Hunter, 1989).

After gaining insights from the netnography, the researcher also conducted in-depth interviews with 30 informants from across three large cities in Indonesia with high fish consumption, namely Jakarta (ten informants), Bandung (ten informants), and Surabaya (ten informants). The informants were selected based on the following criteria: they were housewives who have children; were accustomed to cooking; and were accustomed to buying fish food meals through either dine-in, take away, or using the FDA channel.

Informants were obtained using the convenience method, followed by the snowball technique, wherein the informants who had been interviewed were asked again whether they had acquaintances with characteristics that were in accordance with this study. Interview were conducted in a semi-structured fashion and conducted online through the Zoom platform.

#### *Data Analysis*

The data were analyzed using the grounded theory approach (Strauss & Corbin, 1998). All interview recordings and screenshots of conversations on social media were transcribed in text form. The transcription data are used as material for analysis using the coding method (Creswell & Poth, 2018). Data coding was conducted to explore the theme of obstacles to adopting fish cooking and enjoying away from home, based on the research question. Repeated coding was carried out in three stages, namely open coding, axial coding, and selective coding so that the research data can be relied upon. In the open coding stage, the researcher revealed a multi-dimensional theme (Strauss & Corbin, 1998; Carpenter, 1999). Then, each theme, was transformed into a broader sub-category of themes in a multi-step fashion through the axial coding process (Strauss & Corbin, 1998). After that, the researchers triangulated the data via a selective process to obtain valid and reliable insights (Patton, 1999; Charmaz, 2000).

#### IV. FINDINGS

Research findings and analysis are compiled to answer the research questions. This section will begin by discussing the behavior related to consuming fish through the FDA channel, as well as the barriers encountered. Then, the discussion will continue with an explanation of how the relationship between the experience of consuming fish through the FDA channel and the increased desire to provide fish as a meal at home will be discussed.

##### *Consumption behavior of whole fish dan processed fish products*

Currently, consuming fish is easy; the form of fish is making cooking simpler, for example, the availability of fish fillets that can be eaten directly by consumers. The benefits of eating fish are well known, but on the other hand, some groups, particularly children, do not understand the shape of whole fish in general.

Thus far, consumers can obtain information about the shape of whole fish that have not been cooked, and examples of whole-fish dishes can be seen in pictures or videos. However, this is still incomplete knowledge because consumers, especially children, have not had the experience of eating a whole fish.

*“My kids don’t know what a whole fish looks like. I feel too lazy to cook it. When I buy fish, I prefer to choose fish that has a simple appearance, for example, fish fillets. My kids eat fish in the processed form” (In-Depth interview- DE, Jakarta).*

*“Since I was born, I have lived in Cirebon, so I am very used to eating whole fish. Even when I moved to another city, I carried on this habit, and the experience was very different when I was eating the whole fish. I felt like I was eating fish for real.” (In-Depth interview- IN, Surabaya)*

In addition to their different tastes, the experiences of eating fish fillets and eating whole fish are very different. For consumer groups living in coastal areas, the experience of eating whole fish has become a habit, so they are familiar with all of whole fish’s organoleptic characteristics, such as taste, texture, and smell. Children in urban areas feel they have eaten fish only via eating fish fillets. However, this statement may not be accepted by children living in coastal areas. For coastal children, eating fish means eating the whole fish.

*“I think the taste can also differentiate, it is more delicious to consume whole fish, s the taste is sweeter. The taste of fish fillet is also delicious, but it's not like eating fish” (In-Depth interview- VI, Bandung)*

*“I don't think fillets are fish, I think fillets are just pieces of fish. It feels strange to eat fish, but there are no spines, skin, or heads. As far as I know a lot of vitamins are also from the eyes, skin, or other parts” (In Depth interview- SA, Jakarta)*

For groups on the coast, eating fish is common. Providing fish at home is a habit; it would be strange if no fish were on the dinner table. Fish has never been replaced in terms of its role as the primary source of protein at home. However, the fish menu will usually also be supplemented with other protein dishes, such as eggs and chicken.

*“Because they are used to eating fish, some of my friends who live in coastal areas are used to providing fish menus at home; they are used to using fish as their main protein source.” (In-Depth interview- LI, Jakarta)*

#### *Situational factors that influence the decision to consume fish out of home*

Based on the results of the research, there are several things that influence consumers in determining the choice of fish meals at PA-EH, namely time and what experience they want. Time is one of the most important factors in determining PA-EH fish choices. Consumers have little time to cook fish at home, making them increasingly likely to engage in PA-EH activities. The many choices of outlets to buy ready-to-eat meals from make it easy for such consumers to prepare family meals.

*“I find it easy when buying fish menus at street vendors because they provide many menu choices; the taste is also delicious and varied” (In-Depth interview- NI, Bandung)*

Consumers have a different buying experience when buying fish meals through FDA channels. Based on the in-depth interviews. Usually, consumers make purchases during peak hours, when they do not have time to cook at home but still want to be able to enjoy fish. Consumers find this approach practical and economical. One interesting finding is that, during each stage of the buying process, consumers have many variables to consider, such as whether to choose the FDA channel, which offers processed fish meals delivered to one's home for consumption.

First, they will interact with the FDA channel with several considerations, for example, choosing a channel that provides more promos, is user-friendly, or is familiar to them. After that, consumers will decide which fish meal to buy first, the restaurant to buy it from, or how to cook the fish, for example, grilled, fried, or steamed. Instead of factoring in the tastes of the moment, based on the results obtained from the diaries, decisions are made based on the roles of family members when ordering online. Most purchasers are mothers, fathers are only influencers, and children are deciders and influencers. When choosing a restaurant and fish meal, the ratings of FDA channels are important.

Difficulties arise when consumers become confused regarding the available fish meals because they are exposed to too much information about meal and restaurant choices. Although they are considered practical and economical, consumers generally require a long time to scroll through FDA channels. In addition, when the fish meal does not meet expectations, in addition to complaints, there is also a desire to make the meal by oneself at home. This is because Mom feels she can make better food than what she ordered. This is also in line with the NN informant from Bandung, who said that her family ultimately wanted to make their own food at home when the food they ordered did not meet expectations. This is also in line with the CK informant from Jakarta, who told of his experience when he wanted to order fish via FDA channels; he often felt confused and scrolled for quite a while.

*“One of the advantages of buying wrapped fish menus is that you can get inspiration for the fish meal at that time because you can immediately see the available meals” (In Depth interview - FF, Jakarta)*

*“I need more time just scrolling because I feel confused about choosing the meal. Purchasing online actually has more meal variations, and I am tempted by the visual menus” (In Depth interview-CK, Jakarta)*

#### *Food Delivery Application (FDA) Experiences*

The results of this study found that, with the development of the FDA, it is becoming easier for consumers to access fish meals, making them consume fish meals more often than before. Two things affect this; firstly, fish meals are one type of meal that requires a higher level of cooking skill than meals with other food ingredients, such as chicken. This becomes an obstacle for some consumer segments who do not have sufficient cooking skills. This

finding is also mentioned in Maulana et al. (2019) as complicating household fish consumption. However, it is easy to buy ready-made fish meals; thus, fish meals are still included on the menus of housewives who cannot cook.

The second factor that makes fish consumption in households increase with the existence of the FDA channel is the availability of fish meals on the menu. When consumers are in an Urgent Order and Fast Enjoyment (UO-FE) situation, a fish meal can be an option because restaurants provide a choice of fish meals that can still be enjoyed even though consumers have little time to enjoy them. In addition, the fish meals provided by restaurants are typically easy to eat.

*"I am a mother who really can't cook, so I rarely eat fish, because it's complicated. But now I often eat fish because it's easy. You can just order online" (In-depth interview -TN, Surabaya).*

This study also found that, with increasing consumer awareness of existing fish menus, consumers also attempted to cook the meals that they had tried. This shows that fish consumption through the FDA channel can help consumers become more willing to cook fish meals at home for their family members. Even so, this study also found that this phenomenon was specific to food meals that used processed fish. In contrast, in terms of meals that used whole fish, consumers still experienced obstacles to adoption in the household.

*"I used to only know fried fish, grilled fish, simpler dishes. Now, since I know online purchases through the application, click and scroll, there are many types of fish meals. There is a fish fillet meal with many variants of chili sauce; there is also fish soup" (In-Depth interview -DR, Jakarta)*

This study also found that, with increasing consumer awareness of existing fish menus, consumers also attempted to cook the meals that they had tried. This shows that fish consumption through the FDA channel can help consumers become more willing to cook fish meals at home for their family members. Even so, this study also found that this phenomenon was specific to food meals that used processed fish. In contrast, in terms of meals that used whole fish, consumers still experienced obstacles to adoption in the household.

*"I feel I get new knowledge from the menus in the online application. I often order the fish meal, making me want to try it at home, but I still choose meals that I don't think are complicated, for example, catfish fillets with chili." (In-Depth interview -SR, Bandung)*

Meals that use whole fish tend to have higher complexity and require higher levels of cooking skill than meals that use processed fish. However, this is not an obstacle for consumers who have cooking skills and like to cook. For consumers of this type, looking for meals via the FDA is fun because it can become their reference for meals they can cook for their families.

Although this study found that consumers are becoming more aware of processed fish products, many consumers still do not have complete knowledge about processed fish products. There are still perceptions that processed fish products have less nutritional content than whole fish products because they have been processed into other product forms. This is still an obstacle for consumers in terms of buying processed fish products to cook themselves

## DISCUSSION

This study's results have revealed the factors influencing consumer decisions regarding which fish meals to buy. To better understand customer behavior in buying fish menus. Below, we segment behavior based on the occasion or

situational factors, where two factors are considered: time availability and urgency of purchase. There are four types of behavior that can be identified in this way.

		<b>Consuming/Enjoying time availability</b>	
		<i>Fast Enjoyment</i>	<i>Relaxing Enjoyment</i>
<b>Urgency of Purchase (Order)</b>	<i>Urgent</i>	<b>Type 1</b> Urgent Order and Fast Enjoyment (UO-FE)	<b>Type 2</b> Urgent order and Relaxing Enjoyment (UO-RE)
	<i>Not Urgent</i>	<b>Type 3</b> Not Urgent Order and Fast Enjoyment (NUO-FE)	<b>Type 4</b> Not Urgent Order and Relaxing Enjoyment (UO-RE)

Fig 2. Four situations in PA-EH segment (Derived from this study)

**Type 1. Urgent Order and Fast Enjoyment (UO-FE)**

The consumer group in this segment only has a limited amount of time to place an order and enjoy the fish consumed. In addition, consumers in this segment tend to realise that they do not have time to cook and then decide to place an order online. This happens to mothers who also have a dual role in terms of working. When work requires mothers to work from home while at lunch, they must meet both personal and family dining needs; mothers only have a short time ordering and enjoying the food. Mothers will have only short work breaks, so it will be best for them to consider the time between making the order and when the order arrives. This is usually done so that one does not have to wait until the work break is over, leading to there being no time for lunch.

**Type 2. Urgent order and relax time to enjoy (UO-RE)**

Groups in this segment tend to have free time to enjoy the fish meal that is being consumed. This condition is usually experienced by respondents who have many activities or work projects. In this type of segment, consumers enjoy a full-fish experience because they have a relaxing time.

Urgent orders relate to having limited time to prepare dinner but not having time to cook, and travel from work to home takes time as well. Alternatively, there may be no time to prepare a meal, because of an urgent event. Thus, the choice is made to order quickly through the FDA channel. Because the time for ordering food is limited, the selection of fish dishes must be made based on preparation time. Time constraints mean that the fish dishes must also be quick to make, but not necessarily fish fillets. Whole-fish ordering is still possible because the food can be enjoyed slowly. A relaxing time to enjoy food is common for dinner or on the weekend, when there is more free time. Cooking the whole fish can be a fun experience when the time is right.

### Type 3. Not Urgent Order and Fast Enjoyment (NUO-FE)

Groups in this segment tend to have free time to think seriously about the selected fish meal when ordering and experience a short moment of enjoyment when considering the menu.

Not Urgent in ordering is related to situations in which the time for ordering lunch or dinner is still quite long. It could also be that the order has been thought out the day before so that the selection process is not too long when ordering.

Fast Enjoyment is related to having a limited time to enjoy the food served. For example, lunch time is shorter than dinner time. Even during dinner, other jobs may be waiting; for example, some children may be taking exams, or the husband may have additional office work. Another example of this situation occurs during events with the community or family, given that the event is not simply eating combined with other activities.

### Type 4. Not Urgent Order and relax time to enjoy (UO-RE)

Consumers in this segment have plenty of time to consider the fish menu as an option when ordering, combined with the free time to enjoy the meal. Housewives experience this condition when they have good cooking skills but are too lazy to cook. When the holidays arrive and they want to enjoy dinner with family, consumers in this segment tend to order food through the FDA channel. Housewives, in this context, had much time to think about fish menu choices and had much time to enjoy the food because they were relaxing with their families during dinner at home. One respondent reported that he would think carefully about the fish menu to be ordered when in such a situation because he wanted to have the complete experience of eating fish, even though he was at home. In this case, respondents will consider the fish's size, type, and condition, noting that the fish must be kept warm when served at home. When the fish meal arrived at their home, respondents and their families had the free time to enjoy the fish meal. Also, on this occasion, the distance from the restaurant and the time spent waiting for orders are not considered. What families want to enjoy is the time to eat fish together, so ordering fish in its intact form becomes exciting.

## VI. CONCLUSION AND RECOMMENDATION

This study confirmed the previous research highlighting the importance of extending the dichotomy of in-home versus away-from-home fish consumption. Understanding the contextual issues and finding each segment's homogeneous barrier problems is critical before offering solutions to reduce the barriers involved (Maulana, 2021). This current study focuses on one consumption segment, the prepared-away-from-home, enjoyed at home (PA-EH) segment, completing a study of the barriers to fish consumption.

This study confirms that consumer behavior in terms of buying fish meals is a complex issue, so it cannot be discussed generically. This study provides field evidence about contextual problems in order to reduce the adoption barrier; we must investigate consumer segmentation and situational factors to solve this problem.

Two occasion-based variables were found in the prepared-away-from-home, enjoyed-at-home (PA-EH) consumer segment: enjoying time availability (E) and urgency of purchase (U). Enjoying time availability consists of relaxing or fast, while urgency of purchase consists of urgent and not urgent. The combination of the variables proposed by this study has not been discussed or found in previous studies. The existence of four situations, namely UO-EF, UO-ER, NUO-EF, and NUO-ER, illustrates the consumer needs that food outlets and FDA providers must consider if they want to provide the best experience to consumers. Success in creating a moment of truth in consuming fish of each type shows the fit between the needs of each occasion-based segment and its value proposition.

Furthermore, this study also found that the experience of consuming fish meals away from home did not significantly affect the consumer's desire to attempt to adopt the meal as a home-cooked food meal. The ability to cook and the perception of the complexity of cooking fish meals are the primary reasons why the out-of-home experience does not affect in-home consumption. Although meals that use processed fish are easier to adopt as part of in-home consumption, introducing whole-fish products into in-home consumption remains to be accomplished. Whole-fish products are more commonly associated with products with significant health benefits, which must be included in fish consumption campaigns.

## ACKNOWLEDGEMENT

This work was supported by the Ministry of Research, Technology, and Higher Education, the Republic of Indonesia as a part of a Research Grant to BINUS University entitled “Mapping the Adoption Barrier of Fish Consumption in the Out-of-Home Context, in Indonesian Urban Consumers,” with contract number 069/E5/PG.02.00.PT/2022.

## **The Role Of Social Capital As Mediator Of Financial Literacy And Financial Inclusion On Productive Age In Purwakarta Regency**

Haura Dyna<sup>1</sup>, Astrie Krisnawati<sup>2</sup>

<sup>1</sup>Faculty of Economics and Business, Telkom University, Bandung, Indonesia

<sup>2</sup>Faculty of Economics and Business, Telkom University, Bandung, Indonesia

### **Abstract**

*The main topic of this research is about financial literacy and financial inclusion on productive age community in Purwakarta Regency. Purwakarta Regency is a part of West Java Province that has more than 900,000 people on its population, and about 80,170 people are still below the poverty rate. In order to cut off poverty, the productive age community as social capital has to be utilized to spread awareness about financial literacy and financial inclusion. This study aims to determine how significant the role of social capital in mediating the relationship between financial literacy and financial inclusion, especially in the productive age community in Purwakarta Regency. This study uses quantitative methods by distributing questionnaires with 400 respondents of productive age in Purwakarta Regency as samples of this study. This study uses the Sobel Test and the Baron and Kenny method to analyze mediation. The results of this study found that financial literacy, social capital, and financial inclusion of productive age community in Purwakarta were classified as good. In addition, the researcher also found that social capital was proven to partially mediate the relationship between financial literacy and financial inclusion at productive age community in Purwakarta Regency. This research is expected to be used as a reference for local communities in Purwakarta, local governments, the Financial Services Authority or regulatory agencies, as well as further researchers to provide more effective programs and innovations to increase financial literacy and financial inclusion among the productive age community in Purwakarta in order to reduce poverty.*

Keywords— Financial Inclusion; Financial Literacy; Social Capital

### **I. INTRODUCTION**

Even though Indonesia has a large population of up to 271.3 million people which means Indonesia has more abilities to advance the level of the economy, but in reality, the majority of Indonesians still continue to experience financial difficulties such as poverty. The community empowerment program emphasizing the significance of financial literacy and inclusion is one of the government's surefire measures for reducing poverty.

Financial literacy is the ability to manage one's financial assets for a more secure future. Meanwhile, financial inclusion was defined as the process of providing financial services and loans that can be accessible promptly, have enough facilities, and have low access costs.

In Survei Nasional Literasi dan Inklusi Keuangan (SNLIK) in 2019, In 2019, the average financial literacy score in Indonesia is 38.03 %, whereas the average financial inclusion index is 76.19 %. According to Atkinson and Messy (2013), if the financial literacy score is low, the financial inclusion index will likewise be low, and vice versa. This is because financial education tends to play a significant role in facilitating individuals' access to and utilization of formal and suitable financial products.

Indonesia's Financial Services Authority (OJK)'s 2015-2016 Financial Services Sector Master Plan explains that the following data pertains to community actions in accessing formal financial services in a number of sample ASEAN countries (MPSJKI):

**Figure 1. 2017 Financial Exclusion Index Chart**

*Source: Data processed, Global Findex 2017 (2018)*

The percentage of financial exclusion across all ASEAN region is depicted in Figure 1, financial exclusion is a circumstance in which public access to formal financial services and financial institution is limited. In Figure 1, Indonesia's level of financial exclusion is ranked fifth out of a total of ten ASEAN region, indicating that 51 percent of Indonesians continue to have difficulty gaining access to formal financial services. According to Naidoo and Loots (2020), unequal access to formal financial institutions in rural areas is the main source of financial exclusion among most Indonesians.

According to SNLIK (OJK, 2019), the degree of financial literacy in the province of West Java is 37.43 percent, while the level of financial inclusion is 88.48 percent. The Master Plan for the Indonesian Financial Services Sector (MPSJKI) 2021-2025, published by the OJK (2020), explains the strategies for expanding financial access to promote an increase in the financial literacy and inclusion in Indonesia, specifically through the KEJAR program, a savings product for young children available via digital channels.

According to Fukuyama (2000), social capital is an unwritten value or norm that community members who collaborate to achieve a common goal believe in. If every member of society cultivates the principles of financial literacy and inclusion in their daily lives, social capital in the form of productive age communities will play a vital role in increasing financial literacy and inclusion.

Bongomin et al. (2016) found that social capital was able to mediate the effect of financial literacy and financial inclusion, especially in accessing financial services in rural Ugandan communities. From the study of the phenomena that have been defined earlier, authors are therefore interested in conducting further research related to **“The Role of Social Capital as a Mediator of Financial Literacy and Financial Inclusion at Productive Age in Purwakarta Regency”**.

## II. LITERATURE REVIEW

### Financial Behavior

According to Wicaksono (2015), Behavioral finance is the study of how humans behave in the real world while making financial decisions, particularly how psychological factors can influence individuals, groups, and groups when making financial decisions for individuals, companies, and financial markets.

The relationship between financial behavior and this research is that the field of financial behavioral science in general has several sub-theories, some of it are used as variables for this research, which is financial literacy and financial inclusion. As the theory explained, financial behavior is related to the psychology of individuals, companies, and financial markets, where in this study, the object studied is the financial psychology of a group of individuals, which is the people of productive age of Purwakarta Regency.

### Financial Literacy

Chen and Volpe (1998) argues that financial literacy is an individual skill regarding the management of financial assets for the sake of ensuring a life in the future. Dimensions of financial literacy according to Bongomin et al. (2016) are behavior, attitude, ability or skills, and knowledge.

The relationship between financial literacy theory and this research is, it is one of the research variables that will be studied. In this study, the authors examine how is the level of financial literacy in the productive age community in Purwakarta regency. This variable will be measured from the results of questionnaires that will be filled out by respondents who meet the research criterias. The measurement of this variable is expected to provide an overview and be used as a benchmark for elaborating suggestions to improve the distribution of financial education to improve financial literacy in communities of Purwakarta district.

**Financial Inclusion**

Financial inclusion can be defined as a method of developing financial services and loans that vulnerable groups, such as those with low-to-middle incomes, can access on time and with enough facilities, if needed, at affordable access costs (Marimuthu et al., 2015). Dimensions of social capital according to Bongomin et al. (2016) are welfare, quality, usage, access.

The relationship between the theory of financial inclusion and this research is that, it is one of the research variables to be examined. In this study, the authors examine how far the level of financial inclusion in the productive age community in Purwakarta regency, which will be measured from the results of questionnaires filled out by respondents who meet the research criterias. The measurement of this variable is expected to provide an overview and be used as a benchmark for elaborating suggestions to improve financial inclusion and financial services facilities in Purwakarta district.

**Social Capital**

According to Prusak dan Cohen (2001), social capital is a relationship between individuals who are intertwined and have an attachment in the form of trust, mutual understanding, and shared values and upheld by each group member in order to take an action to achieve a common goal. equally effectively and efficiently. Dimensions of social capital according to Bongomin et al. (2016) are collective action, bridging, bonding, and trust.

The relationship between social capital and this research is, it is one of the research variables to be defined. In this study, the authors examine how is the role of social capital in the form of relationships between individuals in the productive age community of Purwakarta district, on the level of financial literacy and inclusion. The role of social capital will be measured from the results of questionnaires filled out by respondents who meet the research criterias, then the data obtained will be processed to draw research conclusions and to be used as a reference of the local community utilizations on spreading awareness of financial literacy and financial inclusions.

**Framework for Thinking**

The data of this research was collected through a questionnaire adopted from the research of Bongomin et.al (2016) which was then processed into information. The framework for thinking in this research is as follows:

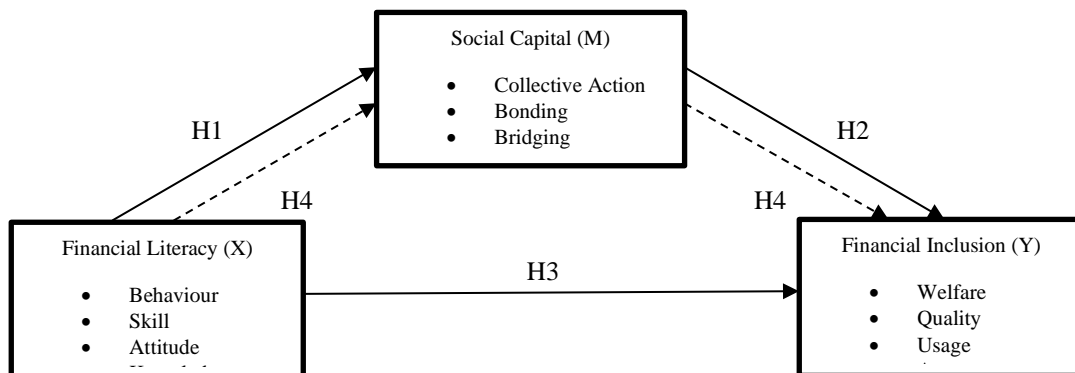

Figure 2. Framework for Thinking

Source: Bongomin et al. (2016)

From figure 2, it can be seen that there are straight lines and dotted lines. The straight line shows that in hypothesis 1 to hypothesis 3, it symbolizes a partial relationship between 2 variables which consist of X to M, M to Y, and X to Y. While the dotted line describes hypothesis 4, which shows a mediating relationship between variables X to Y through M. From the theoretical basis and framework for thinking above, the following research hypotheses are proposed:

- H<sub>1</sub>: Financial literacy has a significant effect on social capital in productive age at Purwakarta district.  
 H<sub>2</sub>: Social capital has a significant effect on financial inclusion in productive age at Purwakarta district.  
 H<sub>3</sub>: Financial literacy has a significant effect on financial inclusion in the productive age at Purwakarta district.  
 H<sub>4</sub>: Social capital mediates the relationship between financial literacy and financial inclusion among individuals of productive age at Purwakarta district.

### III. RESEARCH METHODOLOGY

This research uses quantitative methods, with causal and correlational objectives included. Based on the duration of implementation, this study is categorized as cross-sectional study. This study focuses on the people of productive age (15-55 years) in Purwakarta Regency, which has a total population of 614,805. This study uses non probability sampling, utilizing the Slovin formula. With a level of significance of 5%, the research sample consists of 400,26 ≈ 400 respondents. The primary source of data for this study was a questionnaire issued to 400 respondents of productive age in Purwakarta Regency. The researcher received secondary data from the Central Bureau of Statistics of Purwakarta regency, especially to gain information on the number of people of productive age in Purwakarta regency and other pertinent data.

#### Data Analysis Method

Descriptive analysis, Pearson correlation analysis, classical assumption tests in the form of normality test, multicollinearity test, and heteroscedasticity test were utilized to analyze the data. Baron and Kenny (1986) indicated that the Sobel test was undertaken to assess the value of the indirect influence of the independent variable on the dependent variable via the mediator variable. To determine the effect of mediation, the Baron and Kenny method with three regression estimates, the Sobel test, and the bootstrapping method (process) proposed by Hayes are used to generate an indirect effect output ( $ab$ ), a confidence interval, and an effect size (Preacher and Hayes, 2004). To determine the mediation effect on this study, apply the following formula:

$$Sab = \sqrt{b^2Sa^2 + a^2Sb^2 + Sa^2Sb^2} \quad (1)$$

where:

$a$  = regression path value  $X - M$

$b$  = regression path value  $M - Y$

$Sa$  = standard error  $a$  coefficient

$Sb$  = standard error  $b$  coefficient

For the Sobel Z test, you can use the formula:

$$Z = \frac{ab}{Sab} \quad (2)$$

Notes:

$a$  = independent variable

$b$  = dependent variable

$S_{ab}$  = Standard Error Indirect Effect

According to Suhardi and Isfarudi (2009), the Z value is significant if the Sobel Z value is greater than the minimum statistical value for the mediation effect, which is 1.96 at the 5% confidence level and 1.64 at the 10% confidence level, or if p is less than the confidence level. According to Baron and Kenny (1986), mediation occurs if the value of direct effect of the independent variable (X) on the dependent variable (Y) is not greater than its indirect effect via the mediating variable (M).

## IV. RESULT / FINDING

**Respondents Characteristics**

Respondents for this study are individuals of productive age in Purwakarta Regency, West Java Province. The distribution of questionnaires was conducted online via social media. As many as 400 individuals participated in this study. The distributed questionnaire has three sections: screening questions, respondent profiles, and research statements. The following are the respondent's data in this study, depending on the respondent's characteristics:

**Table 1. Respondents Characteristics**

No	Characteristics	Classification	Amount of Respondents	%
1	Gender	Male	121	30,25%
		Female	279	69,75%
2	Age	15-19	93	23,25%
		20-24	289	72,25%
		25-29	9	2,25%
		30-34	4	1%
		35-39	0	0%
		40-44	2	0,5%
		45-49	0	0%
		50-54	3	0,75%
		55-59	0	0%
		60-64	0	0%
3	Education	Elementary School	0	0%
		Junior High School	2	0,5%
		High School	260	65%
		Diploma	23	5,75%
		Bachelor Degree/D4	114	28,5%
		Post-graduate Degree	1	0,25%
		Doctoral Degree	0	0%
4	Monthly Income	< IDR 1,000,000	238	59,5%
		IDR 1,000,000 – IDR 2,500,000	84	21%
		IDR 2,500,000 – IDR 4,000,000	33	8,25%
		IDR 4,000,000 – IDR 5,500,000	19	4,75%
		IDR 5,500,000 – IDR 7,000,000	10	2,5%

		> IDR 7,000,000	16	4%
5	Occupation	Students	324	81%
		Civil organizations employees	3	0,75%
		Private organizations employees	44	11%
		Self-employed	14	3,5%
		Others	15	3,75%

Source: Data processed (2022)

Based on Table 1, female respondents have a higher percentage, namely 69.75%. Ages 20-24 years dominated filling out the questionnaire, which was 72.25%. The education level of High School is the largest level of education with a percentage of 65%. Monthly income < IDR 1,000,000 has the largest percentage of 59.5%. For the occupation of the respondents, most of them are students, as much as 81%.

### Descriptive Analysis

In descriptive analysis, the categorization distance for the percentage value of respondents' responses must be calculated. 400 respondents participated in this survey, with the following percentages of response scores:

**Table 2. Descriptive Analysis Results**

Variable	Percentage Average Score	Category
Financial Literacy	78,73%	Good
Social Capital	75,65%	Good
Financial Inclusion	79,95%	Good

Source: Data processed (2022)

Based on Table 2, all the variables in this study are categorized as good since they are in the range of values obtained from 68% - 84%. This explains that the value of financial literacy, financial inclusion and social capital at productive age in Purwakarta Regency may be deemed to be good.

### Pearson Correlation Analysis

Pearson correlation analysis measures the relationship of two variables which were normally distributed. The output of the correlation analysis using SPSS Ver. 25 is:

**Table 3. Pearson Correlation Analysis**

		Correlations		
		X	M	Y
X	Pearson Correlation	1	.514**	.586**
	Sig. (2-tailed)		.000	.000
	N	400	400	400
M	Pearson Correlation	.514**	1	.542**
	Sig. (2-tailed)	.000		.000

	N	400	400	400
Y	Pearson Correlation	.586**	.542**	1
	Sig. (2-tailed)	.000	.000	
	N	400	400	400
**. Correlation is significant at the 0.01 level (2-tailed).				

Source: Data processed (2022)

Based on Table 3, the Pearson correlation results are obtained where the correlation value of X and M is 0.514 with sig < 0.05, the correlation r value of X and Y is 0.586 with sig < 0.05, and the correlation r value of M and Y is 0.542 with sig < 0.05, so that the two variables of each correlation models have a positive correlation with moderate correlation level.

**Classical Assumption Test**

**Normality test**

**Figure 3. Normality Test Results (Data processed, 2022)**

The fact that the points in the image above form a straight line demonstrates that the data genuinely follows the diagonal line. This regression model satisfies the assumption of normality since the data is distributed uniformly about the line. The findings of the Kolmogorov Smirnov test are as follows:

**Table 4. Kolmogorov Smirnov Test Results**

One-Sample Kolmogorov-Smirnov Test		
		Unstandardized Residual
N		400
Normal Parameters <sup>a,b</sup>	Mean	.0000000
	Std. Deviation	5.24400305
Most Extreme Differences	Absolute	.043
	Positive	.029

	Negative	-.043
Test Statistic	.043	
Asymp. Sig. (2-tailed)	.079 <sup>c</sup>	
a. Test distribution is Normal.		
b. Calculated from data.		
c. Lilliefors Significance Correction.		

Source: Data processed (2022)

Based on the table above, the results of Asymp. Sig. (2-tailed) is 0.079 and sig > 0.05. So based on statistical tests, the existing data are normally distributed.

### Mediation Analysis

The mediation analysis in this study was carried out by calculating 3 stages, namely regression. The following are the results of mediation analysis:

**Table 5. Mediation Analysis Results**

Predictor	Social Capital				Financial Inclusion							
	Model 1				Model 2				Model 3			
	Coef	SE	Sig	R sq	Coef	SE	Sig	R Sq	Coef	SE	Sig	R sq
Financial Literacy	0,624	0,052	0,000	0,264	0,313	0,042	0,000	0,422	0,483	0,052	0,000	0,422
Social Capital									0,313	0,042	0,000	0,422
Financial Literacy and Social Capital									0,678	0,047	0,000	0,343

Source: Data processed (2022)

Considering the calculation above, with 95% of confidence level, the relationship between variables becomes as follows:

1. There is a significant effect on financial literacy and social capital, as demonstrated by the coefficient value is 0.624 and the p-value < 0.05.
2. There is a significant effect on social capital and financial inclusion, as evidenced by the coefficient value is 0.313 and the p-value < 0.05.
3. In the second model, the regression coefficient for financial literacy on financial inclusion is 0.678 and the p-value is < 0.05. Meanwhile, the coefficient value in the third model is 0.483 and the p-value < 0.05. As a result, the coefficient of the second model is bigger than in the third model, but both models have a significant effect, therefore mediation has been established.

The next step is to do the Sobel test. The Sobel test is used to test the dominance of the indirect effect of the independent variable on the dependent variable through the mediator variable. The Sobel test formula is as follows:

$$Sab = \sqrt{0,313^2 \cdot 0,052^2 + 0,624^2 \cdot 0,042^2 + 0,052^2 \cdot 0,042^2}$$

$$Sab = 0,03093$$

the t count is:

$$Z = \frac{(0,624)(0,313)}{0,03093}$$

$$Z = 6,315$$

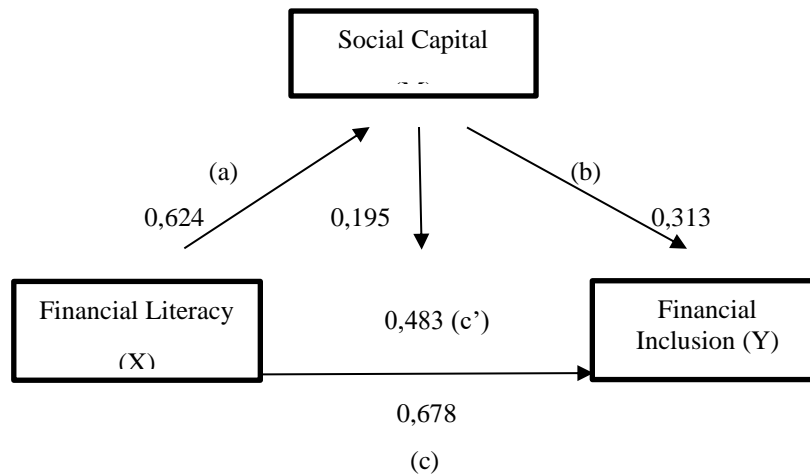

To see the effect size and effect values on the indirect effect or the indirect effect of the mediation model, a Sobel test was carried out with SPSS which resulted in:

**Table 6. Sobel Test Result**

<i>Indirect Effect</i>			
<i>Effect</i>	<i>Se</i>	<i>Z</i>	<i>Effect Size</i>
0,195	0,037	6,315	0,169

*Source: Data processed (2022)*

If described, then the relationship between direct and indirect influence in the mediation model of this research is as follows:

**Figure 4. Mediation Model Calculation Results (Data processed (2022))**

Calculations in Table 6 indicate that the indirect effect of financial literacy (X) on financial inclusion (Y) through social capital (M) is 0.195. The effect size reveals the value of the mediator variable, which is 0.169. According to Cohen (1988), an impact size of 0.2 falls into the category of being weak. The Sobel test value yielded a result of 6.315. With a significance level of 5%, (Z) or t count (6,315) > t table (1,96), which is the point of effectiveness of the mediation effect, indicating that the indirect effect of X on Y via a mediator is significant. Therefore, it can be argued that social capital partially mediated the relationship between financial literacy and financial inclusion among

people of productive age in Purwakarta regency. After incorporating the M variable into the regression model, the significant effect of X on the Y remained significant, indicating partial mediation. This differs from perfect mediation, in which the influence of X on Y, which was previously significant, becomes insignificant after including variable M in the regression model (Suliyanto, 2011).

To evaluate the established hypotheses, the Sobel test was conducted to obtain the Z value that would be utilized to build the decision rules. In accordance with the rules of the hypothesis testing in this study, H<sub>0</sub> is accepted if Z equals 1.96. Therefore, the independent variable has no effect or does not significantly mediate the effect of the dependent variable and the mediator on the productive age in the Purwakarta district. In the meantime, if Z is 1.96, H<sub>0</sub> is rejected. In other words, the independent variable significantly influences or mediates the effect of the dependent variable and the mediator on the productive age in the Purwakarta district. Since the Z value found in this study was 6.315, which is greater than 1.96, H<sub>0</sub> was rejected and H<sub>1</sub>, H<sub>2</sub>, H<sub>3</sub>, and H<sub>4</sub> were accepted.

## V. DISCUSSION

In this study, the targeted respondents are the productive age communities in Purwakarta district. The results of the descriptive analysis indicated the state of financial literacy, social capital and financial inclusion of the people of productive age in Purwakarta Regency. In the financial literacy variable, the results of the descriptive analysis of the respondents' answers are categorized as good, which in Table 2 shows the percentage of 78.73%. These results concluded that the people of Purwakarta Regency already have a good awareness of the importance of having insight and understanding of financial products so that people are able to independently evaluate what financial products fit their financial capabilities and needs. Although overall respondents' answer items on the financial literacy variable can be categorized as good, there are some whose percentages are lower than others, namely statements about interest in accessing financial news. From these results, it can be seen that plenty of the respondents still have low interest in accessing financial news.

Dissemination of education regarding financial literacy is still very much needed to increase the knowledge and ability of the people of Purwakarta in managing their finances. Several activities have been carried out by financial institutions in Purwakarta, for example BJB Bank which has provided financial literacy education to novice entrepreneurs at Islamic boarding schools in Purwakarta district. BJB Bank has a mission to provide comprehensive education on financial topics to business actors in order to encourage the interest of entrepreneurs to take advantage of financial infrastructure facilities that have been facilitated by banking institutions in order to boost the growth of micro business sector actors (Bogor.ayoindonesia.com, 2020).

If viewed based on the latest education level, people who took their last education at the middle school level tend to get a fairly low financial literacy score among those with higher education levels, which is 60.91%. To address the gap in the distribution of financial literacy education, OJK has released a learning book that has many basic themes regarding finance, including the introduction of the concept of money, the use of money, the culture of saving, and the concept of sharing. This book is published for elementary school to university level which contains material related to the entire financial services sector and an introduction to OJK (OJK, 2020). With the existence of literacy books for primary and secondary school levels, OJK expected that it would facilitate the dissemination of financial literacy education, and it would be even better if this financial education was also part of the education curriculum to produce more of the well-literate young people.

Descriptive analysis of the social capital variable got a good category with a percentage of 75.65%. From these results, the conclusion is that the people of Purwakarta Regency have good social habits and uphold the common welfare. The regression results above also conclude that the social capital variable has a significant effect on financial literacy and financial inclusion. This means that the social capital owned by the people of Purwakarta Regency tends to be good and can support the community effort to spread financial literacy and inclusion.

However, some social capital indicators have results that are not good enough. In the first indicator of community participation in social activities to serve the surrounding community, the average respondent

chose to be neutral, resulting in a percentage of 65.15% with a fairly good category. So it could be said that most of the people of Purwakarta district tend not to have the awareness to participate in social activities in the form of community services. One of the reasons that the existence of an attitude of individualism and a tendency not to want to go into serving the community can occur is because of the impact of globalization which makes all members of the community feel more comfortable to interact using digital media. The emergence of individualism that causes indifference to fellow community members is one of the impacts of globalization that is often encountered in Indonesia (Wahyudi and Sukmasari, 2014). According to Bongomin et al. (2016), if social capital is not channeled properly, the literacy rate and financial inclusion in the community will also be hampered.

Next is a descriptive analysis for the financial inclusion variable which also gets good results, which is 79.95%. The interpretation of these results is that the people of Purwakarta regency already have access to products and services facilitated by financial institutions. This is in accordance with the phenomenon in the background where the financial inclusion level in Indonesia, particularly in the West Java province is already quite high, reaching 76.19% per year 2019. OJK is also working with the government to conduct periodic socialization to the public to introduce the functions of financial service institutions, which aims to accelerate the use of financial services in order to improve the welfare of people's lives (OJK, 2020).

In Purwakarta district itself, Bank of Indonesia has collaborated with local governments and BJB Bank in the launch of QRIS technology to access transportation and culinary facilities in Purwakarta Regency. This effort is carried out to create the digitalization of inclusive finance and also become a stepping stone to develop the local trade and tourism sector, especially driven by the MSME sector in Purwakarta district (Jabarprov.go.id, 2021).

From the analysis above, it can be seen that there is a significant influence of all the models as shown in the results of the Pearson correlation test that has been done previously. These results emphasize the findings of Bongomin et al. (2016), which states that there is a significant influence between financial literacy and social capital, financial literacy and financial inclusion, and also social capital on financial inclusion.

To answer the established hypotheses, the Sobel test was carried out to find the calculated Z value that would be used to determine the decision rules taken. The provisions of the hypothesis testing in this study are, if  $Z \leq 1.96$ , then  $H_0$  is accepted. So that means, the independent variable has no effect or does not mediate the influence between the dependent variable and the mediator on productive age in Purwakarta district significantly. Meanwhile, if  $Z \geq 1.96$ , then  $H_0$  is rejected. So the conclusion is the independent variable significantly influences or mediates the effect of the dependent variable and mediator on productive age in Purwakarta district. In this study, the Z value that was found is 6.315, which means more than 1.96, so the decision taken was that  $H_0$  was rejected and  $H_1$ ,  $H_2$ ,  $H_3$ , and  $H_4$  in this study were accepted.

To prove that  $H_1$  is accepted, it can be seen in Table 5 which shows the regression coefficient value between X and M is 0.624 and p-value  $<0.05$ . So the conclusion is  $H_1$  is accepted. This means that, if there is an increase in the financial literacy of the Purwakarta regency's people, then the social capital role among community members will be higher. These results support the findings of Budiyo and Krisnawati (2020), which found financial literacy significantly affects social capital.

To answer the hypothesis  $H_2$ , it also can be seen in Table 5 which shows the regression coefficient value between M and Y is 0.313 and p-value  $<0.05$ . The conclusion obtained is that  $H_2$  is accepted, which means that social capital has a significant effect on financial inclusion in the productive age in Purwakarta regency. This means that the role of social capital in Purwakarta district can support the spread of financial inclusion implementation in Purwakarta district.

According to the results of the regression tests, the regression coefficient of X on Y for the third model (c) is 0.678 with p-value <0.05, and the regression coefficient in the fourth model (c') of 0.483 with p-value <0.05. In conclusion, H3 is accepted, that means financial literacy has a positive and significant effect on financial inclusion, meaning that when the financial literacy of the people of Purwakarta increases, their financial inclusion also increases. This conclusion also supports the findings of Dewi and Iimalhaq (2020) where it is found that financial literacy significantly affects financial inclusion.

The regression coefficient of X on Y in the third model (c') is higher than the second model (b) and there is a significant effect on both models or the value of sig < 0.05. Therefore, H4 is accepted, and it is proven that social capital partially mediates or affects directly or indirectly between financial literacy on financial inclusion at productive age in Purwakarta regency. These results also strengthen the research findings of Safira and Dewi (2019) that social capital partially mediates financial literacy on financial access in a country.

From the results of the discussion, there are findings where the results of the descriptive analysis of all three variables tends to be good. This means that the relationship between communities in Purwakarta Regency, which is referred to as social capital, has the potential to help the government to disseminate educational programs on financial literacy and financial inclusion in Purwakarta district. The results presented by Bongomin et al. (2016) explain that the literacy program has not fully increased financial inclusion in the community, so that the involvement of the community's social life is needed so that financial education can be better accepted by the community itself. One of the programs that have been carried out in Purwakarta Regency is the financial literacy socialization program for entrepreneurs by BJB Bank.

## VI. CONCLUSION AND RECOMMENDATION

### Conclusion

From the results and analysis which has been elaborated by the author, these are the conclusions:

1. The average response percentages for financial literacy, social capital, and financial inclusion in the Purwakarta district are 78.73% for financial literacy, 75.65% for social capital, and 79.95 % for financial inclusion, and all of the results were categorized as good.
2. Financial literacy has been proven to have a significant effect on social capital among the productive age in Purwakarta regency.
3. Social capital has been proven to have a significant effect on financial inclusion in the productive age in the Purwakarta regency.
4. Financial literacy has been proven to have a significant effect on financial inclusion in the productive age in the Purwakarta regency.
5. Social capital has been proven to have a significant effect on mediating the relationship between financial literacy and financial inclusion among the productive age in Purwakarta district.

### Suggestion

Suggestions that has been elaborated by the writer based on the results of this research:

1. The local community leaders, government, financial service regulators and other stakeholders, such as firms, financial practitioners, political leaders, and influencers, can hold a collaborative actions and programs to aim on financial literacy and financial inclusion increase. One of the example of the collaborative actions is to have an open forum that can be offline or online to have discussions and exchange informations about financial goods and services, investment, the hazards of disinformation, fraud, and hoaxes, thereby protecting more individuals from the negative effects created by irresponsible parties in the financial industries.
2. Currently, many corporations are establishing factories in the Purwakarta region, which normally, corporations will engage in Corporate Social Responsibility (CSR) activities. Local community leaders can

commence cooperation with these companies to carry out CSR by hosting financial discussion forums to establish relationships between local communities and company personnel by exchanging information about financial education and financial services.

3. From the descriptive analysis of financial literacy, it can be determined that 68.75 % of the public's interest in accessing financial news is still inadequate. To overcome this issue, the community can collaborate with influencers or develop their own content that discusses the most recent valid and reputable news about finance with simple, relevant, and easy-to-understand explanations so that more people are interested in viewing the news material.
4. Local governments and regional financial institutions need to accommodate the aspirations of the community to create innovative financial products and services with terms and conditions adapted to the financial condition of the people of Purwakarta Regency, so that the products and services offered can be used by all financial levels of the society.
5. Regional governments and also The Indonesian Financial Services Authority (OJK) needs to improve the optimization of the implementation of programs that have been implemented, such as MSME transactions using digital payments, which is the Regional Financial Access Acceleration Team (TPAKD) program to realize the digitalization of the regional economy. The other programs that needs to be improved is the socialization of KEJAR or digital student savings programs, sharia financial inclusion programs, and several OJK programs. The socialization of this program is beneficial so that all programs have public exposure and more individuals utilizes OJK programs for saving, investing, and transacting activities, as well as funding and credit activities.
6. The Indonesian Financial Services Authority (OJK) must develop cooperation in order to utilize the social capital of communities of productive age in Purwakarta Regency and Indonesia in general. The ministry of education and culture, which governs school learning curricula throughout Indonesia from elementary schools to universities, may participate in the collaboration of the distribution of financial literacy through financial education. The actions that can be taken is providing socialisation by financial practitioners discussing financial literacy, implementing the digitization of financial services to facilitate access for all levels of age group in the society, develop socialization program regarding saving and investing, as well as make an easier access for the public to open savings and stock accounts to encourage people to invest in the stock market and other investment instruments,
7. Due to the abundance of alternative media, the government and regulators can engage in online collaborations with financial sector influencers to create podcasts and educational videos on social media to socialize financial regulations, banking products, and savings and investment instruments.
8. In this study, the researchers examined the productive age in Purwakarta Regency. For future research, the author advises to expand the object of study to include not only individuals of productive age but also those of other age groups, and for the extent of the area under study future researchers can try collecting samples from different areas in Indonesia. The indicators used in the future study object might be more specific, such as selecting objects from among universities students, private organization employees and entrepreneurs, individuals with monthly salaries below the regional minimum salary level, etc. Future researchers can also investigate the penetration rate of financial products such as crowdfunding, peer-to-peer lending, etc. to identify the level of financial product distribution among the general society. Further research can also investigate various variables within the field of financial behavior, including financial self-efficacy and many others. This study employs quantitative methods, the next researcher is expected to employ qualitative methods by conducting direct interviews with respondents. This is a cross-sectional study, thus it is recommended that future researchers would be able to use the longitudinal research.

#### Abstract

*This research was made with the aim of knowing the service quality and satisfaction of the Tukang Sayur.co App. Tukang Sayur.co it has the advantage of a high rating and its already wide sales reach to various cities compared to other applications. However, behind these advantages there are still many problems and complaints related to the application Tukang Sayur.co from consumers. As for the average consumer complaints due to delays in delivery that do not comply with the specified estimated schedule, lack of service response from the management Tukang Sayur.co, the use of the application is less qualified'E-Service Quality Analysis (SERVQUAL) and Importance Performance Analysis (IPA) are research methods used by App Tukang Sayur.co users. The method used is a non-probability sampling technique, and sampling is by using the method of determining special characteristics, especially the users of the application, and using a sample of 100 people.The results of this study indicate that the service quality of the Tukang Sayur.co App is good, although there are still some indicators that the service is sufficient. Dimensions included in the sufficient category are: Access, Reliability, and Assurance. Meanwhile, the dimensions included in the good category are: Ease of Navigation, Security/privacy, Responsiveness, Site aesthetics, Price knowledge, Efficiency, Flexibility and Personalization. As for satisfaction, it shows that overall there is a gap between the results of reality and consumer expectations of -15.24. From the final result of attribute mapping, there are 3 attributes.*

*Keywords- Service Quality, SERVQUAL, Importance Performance Analysis, Tukang Sayur.co*

#### I. INTRODUCTION

Technological developments, especially in the digital era as it is today, help entrepreneurs improve their business. Technology is the foundation of the company in innovating, not only as a complement to the business, but also the main key of a business that continues to grow and is able to continue to compete. For this reason, the existence of technology is the foundation of innovation in the company. The role of technology is not only engaged in telecommunications but has developed in the fields of health, education, communication and services (Noor, 2016). An example of the rapid development of information technology is the development of mobile apps which have a major impact on the habits of using these devices.

With the mobile app people are easier to carry out activities such as buying and selling. With the mobile app makes people more happy to make transactions online without having to go directly to the store. Because in the mobile app there are already features that manufacturers can offer consumers to make purchases. Indonesia is one of the fastest growing E-commerce in the world, where the growth reached 78% in 2020, and there are 100 million internet users in Indonesia. That way, there are various types of startups that make applications in agriculture.

Vegetables are one of the food ingredients needed by the body because it provides many benefits and many vitamins. Vegetables can be accepted to consumers because there are steps that start from farmers, sellers, and then come to us as consumers. However, the problem often faced by us as consumers is that the vegetables obtained are not always fresh, and producers also do not always provide and sell fresh vegetables. So, to overcome this, an application is made that can solve that problem, the problem faced by farmers, producers, and consumers. With the

application, it makes it easier for consumers to find fresh vegetables. Currently there are many applications that appear, one of which is the application Tukang Sayur.co.

Based on the ratings and reviews written by previous consumers about the application that they give negative reviews about service complaints Tukang Sayur.co, such as the quality of products that are not Fresh, delivery of goods that do not match the promised estimate, transaction failure, and responsivity in the application Tukang Sayur.co. from these reviews, it should be application Tukang Sayur.co investigate the factors that affect the problem, so as to improve the quality of products and service quality of the application.

The customer complaints Tukang Sayur.co, namely they say " after 3 years of subscription I finally moved to the application next door. Because of Service tukang sayur.co it's getting worse. Packaged products of finished origin. I bought kale 1 kg, fitting came at all not in the tie and the roots are still grounded. Buy salted fish of very poor quality, full of mites and smelly. Moreover, the price of the product does not follow the market and is increasingly expensive. Comparison of curly chillies in other stalls 20rb / kg in this application 40rb / kg.", "Has been a message since yesterday (tgl. 30/3/2020) paid via transfer. Promised to come today (tgl. 31/3/2020) before the clock 19.00. Since 15.00 still on the road, in application mobile chat not read. Until 20.00 did not come either, no news. Can not be traced the whereabouts of The Courier. Although materials are needed immediately. The application is detrimental, the admin is unprofessional, and is not responsible It can be reported to the police, right."The goods sent are not fresh instead tend to be damaged because they are sent already in the afternoon."Those are some of the complaints said by consumers.

Of these complaints, it is necessary for the application Tukang Sayur.co to review the quality of its services. Customer expectations of the application Tukang Sayur.co and hope for the application Tukang Sayur.co, following the results of interviews conducted by researchers:

**Table 1.1**

Interview Results

No	Statement	Results
1	How information about the product in the application Tukang Sayur.co ?	Based on the results of the mini survey 16 of 20 respondents answered Good and 4 of them answered product information in the application Tukang Sayur.co not compatible with available products.
2	Whether when opening the application Tukang Sayur.co often have errors?	Based on the survey results 18 out of 20 answered Never and 2 others answered never experienced an error.
3	Are the products categorized by Category ?	Based on the survey results, all respondents answered the appropriate category.
4	Is the product ordered in accordance with the order ?	Based on the results of the mini survey 15 of 20 respondents answered not appropriate, such as: the condition of the product is not fresh, there are less products, the presence of product errors. And the other 5 answered according to the order.
5	Is the delivery of the product in accordance with the promised estimate ?	Based on the results of the mini survey 18 out of 20 respondents answered not appropriate, often the

		occurrence of delays in delivery. While 2 answer according to estimate or right.
6	How to respond application Tukang Sayur.co in response to consumer problems ?	Based on the results of the mini survey 16 of 20 respondents answered the response of the Tukang Sayur.co not good and the other 4 answered Good.

Source : research survey

Based on Table 1.1 it is known that respondents stated the quality of Service application Tukang Sayur.co not good because of some errors and lack of response from the management Tukang Sayur.co. not a few consumers are moving to other similar applications.

Customers' expectations of the Tukang Sayur.co App and their expectations of the Tukang Sayur.co App can be measured using Importance Performance Analysis (IPA). This study intends to adopt IPA to determine the service quality analysis of the Tukang Sayur.co App.

Tukang Sayur.co it has the advantage of a high rating and its already wide sales reach to various cities compared to other applications. However, behind these advantages there are still many problems and complaints related to the application Tukang Sayur.co from consumers. As for the average consumer complaints due to delays in delivery that do not comply with the specified estimated schedule, lack of service response from the management Tukang Sayur.co, the use of the application is less qualified because there are still consumers who have difficulty contacting and discrepancies Courier number that has been listed in the application and the quality of the product is not fresh.

## II. LITERATURE REVIEW

### 2.1 Marketing Management

According to Kotler and Armstrong (2017), Marketing Management is a way carried out by a company from starting to plan, coordinate to carry out marketing activities to achieve the desired goals.

### 2.2 E-Business

According to Ahmadi and Hermawan (2013: 7), E-Business is an interconnected system that provides information desired by its users, which focuses on strategy and function with technological capabilities.

### 2.3 E-Commerce

E-Commerce is one of the emerging technologies today where transactions are made through online without having to meet producers and consumers, and payments are made by transfer, and others

### 2.4 Service Quality

Service quality is an effort made by a person or a company in providing quality or good services to consumers where if consumers are satisfied with the services provided, then consumers will also trust the company, so that the impact occurs consumer loyalty to the manufacturer.

### III. RESEARCH METHODOLOGY

The method used in this study is the qualitative method, which is the technique of collecting data by using triangulation or the combination of observation, finding information directly to the object, and documentation. In addition, the method also describes the results of research that has been done by the author, and this study uses Confirmatory factor analysis. Based on the unit of analysis, researchers use individual units of analysis. Population and samples used in this study is the user of artisan applications Sayur.co, and the sample used using non probability sampling by using special characteristics, characteristics in particular are people who have used the Artisan application Sayur.co. analysis conducted by gap Analysis, Performance & Importance and mapping using IPA.

### IV. RESULT / FINDING

#### 4.1 Characteristics Of Respondents

The data search procedure carried out by researchers is by distributing questionnaires to 100 respondents, and the distribution of questionnaires is done using google form. Respondents who became a sample in this study should have characteristics such as domicile of Tangerang area which amounted to 26 people with a percentage of 26% it is because of the many enthusiasm of the Tangerang community towards the use of applications Tukang Sayur.co. most who make purchases are women aged 21-25 who are mostly young mothers, with private employee work.

#### 4.2 Descriptive Analysis

The following is a recapitulation of the overall E-Service Quality Score:

**Tabel 4.1**  
Overall E-Service Score Recapitulation

No	Dimensions	% Total Score	% Ideal Score	Category
1	<i>ACCESS</i>	66,3	100	<b>Enough</b>
2	<i>EASE OF NAVIGATION</i>	74,1	100	<b>Good</b>
3	<i>RELIABILITY</i>	65,5	100	<b>Enough</b>

## V. DISCUSSION

**5.1 Discussion Importance Performance Analysis (IPA)****5.1.1 SERVQUAL analysis by item by item**

SERVQUAL analysis can not only show the quality of service, but also can show customer satisfaction. The following is a table of GAP values based on item by item studied:

**Table 4.2**  
GAP analysis by item by item

No Attribute	Hope Score (Importance)	Reality Score (Performance)	GAP
1	4,2	3,48	-0,72
2	4,26	3,15	-1,11
3	4,2	3,15	-1,05
4	4,26	4,17	-0,09
5	4,21	2,95	-1,26
6	4,2	3,6	-0,6
7	4,18	3,45	-0,73
8	4,31	3,6	-0,71
9	4,31	3,25	-1,06
10	4,13	4	-0,13
11	4,26	3,47	-0,79
12	4,06	3,06	-1
13	4,19	3,91	-0,28
14	4,15	3,3	-0,85
15	4,34	4,16	-0,18
16	4,2	3	-1,2
17	4,23	3,84	-0,39
18	4,48	4,18	-0,3
19	4,39	3,88	-0,51
20	4,39	3,75	-0,64
21	4,23	3,85	-0,38
22	4,29	3,03	-1,26

Source : research survey

Based on Table 4.2 it is seen that the value of SERVQUAL all attributes are negative meaning that the performance of Mobile Application Services Tukang Sayur.co perceived consumers are still less than the value of expectations, although it can be said that the quality of Mobile Application Services Tukang Sayur.co it has been good or has met consumer expectations because the value of the gap is low.

### 5.1.2 SERVQUAL analysis by Dimension by Dimension

The following is a table of Gap values based on dimension by dimension studied :

**Tabel 4.3**

GAP analysis by Dimension by dimension

No	Dimensions	Hope (Importance)	Reality (Performance)	Gap (GAP)	Ranking
1	<i>Access</i>	8,46	6,63	-1,83	10
2	<i>Ease of Navigation</i>	8,37	7,41	-0,96	2
3	<i>Reliability</i>	8,41	6,55	-1,86	11
4	<i>Security/privacy</i>	8,49	7,05	-1,44	7
5	<i>Responsiveness</i>	8,44	7,25	-1,19	6
6	<i>Assurance</i>	8,32	6,53	-1,79	9
7	<i>Site Aesthetics</i>	8,34	7,21	-1,13	4
8	<i>Price Knowledge</i>	8,36	7,34	-1,02	3
9	<i>Efficiency</i>	8,41	8,32	-0,09	1
10	<i>Flexibility</i>	8,78	7,63	-1,15	5
11	<i>Personalization</i>	8,52	6,88	-1,64	8

Source : research survey

Based on Table 4.3 it can be seen that the performance value is lower than the expectation value, so the gap value is all negative. This could indicate that the quality of Service application Tukang Sayur.co still low. The largest gap value is in the Reliability dimension with a gap value of -1.86. The value of Gap Reliability illustrates that the form of service quality application Tukang Sayur.co as the product according to the order, the speed in the delivery of the product is still less according to consumers. while the smallest gap value contained in the Efficiency dimension with a gap value of -0.09 illustrates that in terms of innovation, payment methods, ease of use is quite good. Although the value of this Gap is the smallest but the value is still negative and indicates that according to consumers is still less than the service should be improved again.

### 5.1.3 Overall SERVQUAL analysis

$$Q (\text{Quality of Service}) = X_i(\text{Reality}) - Y_i(\text{Hope})$$

$$Q = 78,8 - 92,9 = -14,1$$

Gap.the negative shows it..Fun..between performance and expectations. consumers. Performance given Application *Tukang Sayur.co* can not meet consumer expectations. The value of -14.1 gap is not too big because consumers are not satisfied with the performance provided by the application.

**5.1.4 Performance Difference Test**

The results of different tests that have been done can be seen as follows :

**Table 4.4**  
Performance & Importance Difference Test Requirements

		Paired Samples Test					t	df	Sig. (2-tailed)
		Paired Differences			95% Confidence Interval of the				
Pair 1	Importance - Performance	Mean	Std. Deviation	Std. Error Mean	Lower	Upper			
		69,818	171,872	36,643	-6,386	146,022	1,905	21	.071

Source : research survey

Based on Table 4.2 obtained results of the calculation of performance and importance difference test shows that the mean or average value of expectations and reality shows positive results, meaning that there is a difference between expectations and the reality of the quality of Service application *tukang Sayur.co*.

**5.1.5 Analysis Importance Performance Analysis (IPA)**

The following is the data distribution score Importance and consumer Performance, that is:

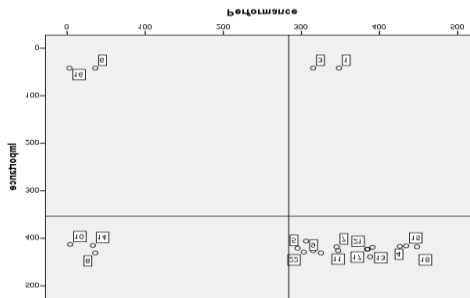

**Table 4.5**  
Importance and Performance score and suitability level

Dimensions	No Atrribute	Reality Score (Xi)	Hope Score (Xi)	Degree Of Conformity (Tki)%
<i>Access</i>	1	348	420	82,9
	2	315	426	73,9
<i>Ease of Navigation</i>	3	315	420	75,0
	4	426	417	102
<i>Reliability</i>	5	295	421	70,1
	6	360	420	85,7
<i>Security/Privacy</i>	7	345	418	82,5
	8	360	431	83,5
<i>Responsiveness</i>	9	325	431	75,4
	10	400	431	96,9
<i>Assurance</i>	11	347	426	81,5
	12	306	406	75,4

Dimensions	No Atrribute	Reality Score (Xi)	Hope Score (Xi)	Degree Of Conformity (Tki)%
<i>Site Aesthetics</i>	13	391	419	93,3
	14	330	415	79,5
<i>Price Knowledge</i>	15	434	416	104
	16	300	420	71,4
<i>Efficiency</i>	17	384	423	90,8
	18	448	418	107
<i>Flexibility</i>	19	388	439	88,4
	20	375	439	85,4

Source : research survey

1. Quadrant a Concentrate Here (concentration/top priority), where customers as respondents feel these attributes are very important and have high expectations but have not felt the maximum performance. The attributes are as follows:

**Table 4.7**

Result Attribute In Quadrant A

<b>Attribute In Quadrant A</b>	
<b>No Attribute</b>	<b>Statement</b>
8	In my opinion, the transactions made in the application <i>Tukang Sayur.co</i> safe and trustworthy.
10	<i>Application Tukang Sayur.co</i> provide notification to consumers if the product has been delivered.

14	application system Tukang Sayur.co provides a stable display on all smartphones.
----	--

Source : research survey

2. The table above shows that the attributes are considered important but the performance given has not been able to satisfy the consumer. The results of asnalysis attribute quadrant B can be seen as follows :

**Table 4.8**  
Result Attribute In Quadrant B

<b>Attribute In Quadrant B</b>	
<b>No Attribute</b>	<b>Statement</b>
2	Page on the application Tukang Sayur.co never error
4	The location of the search field is easy to find in the application Tukang Sayur.co
5	Products are delivered quickly and on time
7	I believe my personal data and contacts are protected by the application tukang Sayur.co
9	Application Tukang Sayur.co always be responsive in serving orders
11	Application tukang Sayur.co provide a guarantee if the product does not match the order
12	Application Tukang Sayur.co handle returns well.
13	application display Tukang Sayur.co easy to understand
15	Application Tukang Sayur.co provide products accompanied by the price
17	In my opinion, the application Tukang Sayur.co has good innovation so easy to use
18	application Tukang Sayur.co provide a wide range of payment methods in transactions
19	Features in the application Tukang Sayur.co very easy to understand
20	Products in the application Tukang Sayur.co grouped by Category
21	In my opinion, the quality of the application system Tukang Sayur.co very good because of the availability of service features that can meet the needs.
22	Artisan application Tukang Sayur.co have the ability to always serve quickly

Source : research survey

3. Quadrant C Low Priority (low priority), this quadrant shows about this attribute is less satisfactory, because the influence given less important according to consumers, as for those included in this quadrant are the following attributes :

**Table 4.9**

Result Attribute In Quadrant C

<b>Attribute In Quadrant C</b>	
<b>No Attribute</b>	<b>Statement</b>
6	Products ordered in accordance with existing in the application TukangSayur.co
16	In my opinion, the products in the application Tukang Sayur.co cheaper compared to other applications.

Source : research survey

4. Quadrant d Possible Overkill( excessive), this quadrant shows attributes that according to consumers are less important but in the realization of the service is considered too excessive. So that this attribute is considered less important but satisfactory in its implementation. The attributes included in this quadrant are:

**Table 4.10**

Result Attribute In Quadrant D

<b>Attribute In Quadrant D</b>	
<b>No Attribute</b>	<b>Statement</b>
1	Network systems are used For Applications Tukang Sayur.co for hugely accurate and accurate transactions
3	Application System Tukang Sayur.co it is believed to have been more than one of his accounts.

Source : research survey

## VI. CONCLUSION AND RECOMMENDATION

### Conclusion

After the results that have been presented by the author, it can be taken conclusions as follows :

1. The total score of the Gap between the desired reality and consumer expectations of the service is negative. Negative score indicates the reality of artisan app services Sayur.co can not meet the consumer. This is because the 5th attribute is “the product is delivered quickly and on time” is still low, so there are still many consumers complain because the delivery speed is often late or not in accordance with the promised estimate. Consumer perception of the quality of application services provided is still not good, can be seen with the resulting score is negative. This is because the application has not met the wishes of consumers.
2. Based on the results of the test the difference between kenyatan and expectations. It is known that the mean value is based on reality and positive expectation. This means that there is a difference to the reality and expectations of the quality of Service applications Tukang Sayur.co. which is where consumer expectations are higher compared to the reality of the services provided.

3. By using the method of IPA as a whole obtained results that berpengaruh be in Quadrant A, because it is considered very important but the performance has not been maximized. It can be seen that consumers are still complaining about the services provided by The application Tukang Sayur.co.
4. Attributes that must be improved that is about the service application Tukang Sayur.co still low related to the stability of applications in various types of smarthphone, often experience errors including the presence and absence of notifications to users. In addition, the application Tukang Sayur.co also a very important attribute but in fact that consumer confidence in transactions in the application Tukang Sayur.co still low. For attributes that exist in this quadrant should be a top priority to be improved so that satisfaction can be higher than expectations.

### Recomendation

1. For applications Tukng Sayur.co should improve the quality of services provided to consumers, can be responsive in providing services, and features in the application is further improved so that consumers are satisfied with the services provided by The application Tukang Sayur.co so that consumers will be loyal and trust in the application.
2. To increase repeat purchases on consumers, this application should provide the right price and affordable with good quality so that consumers will still choose this application and will not choose other applications.

## Poverty Factors in Grobogan Regency 2010-2020 Period

Agus Purnomo<sup>1</sup>

<sup>1</sup>Faculty of Economics and Business, University of Muhammadiyah Surakarta, Indonesia

### Abstract

*Poverty is often a problem that occurs in Indonesia, Grobogan Regency is included in an area with poverty which shows that the percentage of poor people is still quite large. This study aims to determine the effect of the Human Development Index and Economic Growth on the Poverty Level by using the multiple linear analysis method during the 2010-2020 period. The results showed that the Human Development Index and Economic Growth had a significant effect on the Poverty Level with a negative correlation. The human development index has an effect on the level of poverty, this can be seen through the data on the percentage of HDI which increases every year. Economic growth affects the Poverty Level,*

*Keywords—Human Development Index (HDI); Economic growth; Poverty level*

---

### VII. INTRODUCTION

Poverty is a problem related to the economic aspects faced by almost every country, both in developing and developed countries. In general, a person's poverty in meeting the basic needs of his life. Only this ability is not measured materially but psychologically in someone who fails to meet the requirements if he cannot fulfill his basic needs, namely food, clothing and shelter (Sriyani, 2021). The Central Bureau of Statistics defines poverty as an inability that can be measured from an economic, material and physical point of view in meeting basic food and non-food needs by measuring expenditure. The problem of poverty itself is a very complex social problem, this is caused by the factors that influence it and usually each region has different aspects as the cause of poverty. Factors that influence poverty are education level, minimum wage and movement (Putut N, 2021). According to Zuhdiyati & Kaluge (2017) the factors that influence poverty are the Human Development Index and Economic Growth. Meanwhile, according to Rachman et al (2019), economic growth is one of the factors that most influence poverty. Kaluge (2017) factors that influence poverty are the Human Development Index and Economic Growth. Meanwhile, according to Rachman et al (2019), economic growth is one of the factors that most influence poverty. Kaluge (2017) factors that influence poverty are the Human Development Index and Economic Growth. Meanwhile, according to Rachman et al (2019), economic growth is one of the factors that most influence poverty.

Economic growth and poverty as indicators that can be used to measure success in the development of a country. Therefore, every country always strives to achieve economic growth, these efforts are made to reduce poverty. So the way that the government can do to increase economic growth in an area is to improve the quality of human resources (HR) and natural resources (SDA). From the Poverty Circle theory put forward by Nurkse that poverty is caused by underdevelopment of human resources and natural resources, because the management of natural resources depends on human competence itself (Jhingan, 2016). If an area has quality human resources that are competent and able to manage natural resources properly and optimally, then development in an area will be carried out. The implementation of economic development properly will increase the standard of living of the community which will also reduce the number of poor people in the area (Kurniawati, 2017). The HR index includes three dimensions, namely education, decent living per capita income and health, where these three dimensions greatly affect the quality of human resources (Prasetyo and Sukmawati, 2018).

Grobogan Regency is one of the areas in Central Java that cannot be separated from poverty. In 2020 Grobogan ranks 12th out of 35 districts/cities that present poverty levels in Central Java Province.

Fig 1. Poverty Level Data in Grobogan Regency

From these data, that from 2010-2020 shows that there is a decrease in the percentage of poverty in Grobogan Regency every year. Although the data shows a downward trend, until 2020 the number of poor people in Grobogan Regency is still relatively large, namely 172.26 thousand people. Based on the Central Statistics Agency, the percentage of poverty in Grobogan Regency is still relatively large compared to other regencies or cities in Central Java, where in 2020 the percentage of Grobogan Regency's poverty rate is 12.46% which is ranked 12th out of 35 cities. /province in Central Java.

From this description, the formulation of the research problem is whether Economic Growth and Human Development Index affect the Poverty Level in Grobogan Regency during the 2010-2020 period. The aim to be achieved is to determine and also analyze the effect of Economic Growth and HDI on the Poverty Level in Grobogan Regency for the 2010-2020 period.

## VIII. LITERATURE REVIEW

### A. Poverty

An area will be called poor if its population with an average per capita expenditure reaches the basic poverty line (Shafa and Niniek, 2022). Poverty that occurs in society is not because someone wants this situation, but it is difficult to avoid (Bayu et al., 2018). According to Jhingan in (Ari and U. Sulia, 2018), the cause of poverty that occurs is due to the lack of human resources and natural resources, where the natural resources of an area will depend on human productivity. The management of these resources must be encouraged by people who have high quality, if the population has low education then activities, knowledge, and technical skills will result in neglected and undeveloped resources. Measurement of poverty can be done by looking for a comparison between the level of public consumption and the poverty line, namely expenditure for consumption in a month. The poor can be said to be people whose monthly per capita expenditure is below the average.

The causes of poverty are structural poverty and cultural poverty. Structural poverty is poverty caused by socially and culturally, economically, and politically dominating community groups, which consequently does not realize equality in all levels of society and the quality of self-development does not develop. Cultural poverty is poverty caused by culture. The culture in question is a poor culture, where people feel lazy to try to be better (Farathika, 2020).

### B. Human Development Index

The Human Development Index aims to encourage human development with a better quality of life (Nurul and Lilies, 2021). According to Farathika (2020) the Human Development Index (IPM) contains three scopes in the field of human development, namely age, knowledge possessed, and a decent standard of living. The Central Bureau of Statistics states that the Human Development Index (HDI) indicator is measured by life expectancy, school expectations, and per capita expenditure. The higher the number of indicators that make up the Human Development Index (HDI) it will reduce poverty, in other words it will affect the welfare of the community to live decently.

### *C. Economic Growth*

Economic growth is an indicator used to find out how the prospects for success in development are directed at reducing poverty (Imade, 2020). Economic growth is an activity in the economic field that can increase the cost of products and services in order to improve people's welfare (Hugo et al., 2022). Economic activities carried out by the community are expected to increase the income of the owners of production factors.

The problem of economic growth that arises is a long-term macroeconomic problem. Changes in each period result in the production of goods and services continuing to increase, where the quality and quantity of production also increases. The workforce will also continue to grow due to the increasing population density, people who are experts in their fields, educated people, and work experience. (Hugo et al., 2022) This economic activity aims to review the growth rate of Gross Domestic Product (GDP) with the addition of the amount generated by production activities in the economy (Heppy, 2018).

### *D. Hypothesis*

H1: The Human Development Index (HDI) has a significant positive effect on poverty in Grobogan Regency in 2010-2020 with a negative correlation.

H2: Economic growth has a significant positive effect on poverty in Grobogan Regency from 2010 to 2020 with a negative correlation.

### *E. The Effect of Human Development Index (HDI) on Poverty*

The Human Development Index (HDI) adheres to three basic scopes of life, namely education, age of life, and a decent standard of living for humans with the aim of increasing human development to overcome poverty into shared prosperity. According to Yani Mulyaningsih (2008), the human development index consists of three dimensions of development, namely the fulfillment of long life needs, healthy living to gain knowledge, and access to resources to meet the needs of life. these three dimensions have an important influence on poverty.

Based on the new growth theory which states the important role of government in increasing HDI and encouraging research and development in order to increase human productivity. What can be done is to improve the quality of human resources through education. The output to be obtained is an increase in one's ideas and knowledge. The higher the level of education, knowledge and skills of a person can increase one's work productivity. This knowledge and expertise will provide benefits in various sectors, for example in the formal sector in a company if someone has high knowledge and expertise, it can encourage work productivity in the company so that in return the company will also provide higher wages. So it can be said that if someone has a high level of productivity then he will get a better level of welfare which can be seen through income and consumption. according to research (Nadya et al., 2019) states that HDI has a positive and significant effect on poverty levels. This is reinforced by research from Dia (2020) which states that HDI has a significant and positive influence on poverty levels in Riau Province.

### *F. The Effect of Economic Growth on Poverty*

Economic growth is a factor supporting the success of development to reduce poverty levels through activities in the economic sector. Economic growth is one of the indicators used to determine the success of economic development, besides that economic growth is also a requirement to minimize poverty. If an area experiences an increase in economic growth, the poverty rate will decrease. So that the relationship between the two becomes very important where the government must accelerate economic growth so that poverty can be reduced. According to research conducted by (Ridho et al., 2018), economic growth, especially GRDP, has a significant and positive effect on poverty levels, and is in line with research from Nadya et al.

### *G. Previous Research*

The research conducted by Laga Septian and Wiwin Priana P (2022) entitled Analysis of Factors Affecting Poverty. This study uses the Ordinary Least Square (OLS) method, namely multiple linear regression analysis. The results of the study show that the Provincial Minimum Wage (UPM) and Human Development Index (IPM) have a negative and insignificant effect on poverty, while Economic Growth has a positive and significant effect on poverty in East Java.

Furthermore, research from Ari Kristin P and U. Sulia Sukmawati (2018) entitled Analysis of the Effect of HDI, Economic Growth and Unemployment on Poverty in Indonesia. This research uses path analysis method and panel data. The results show that HDI has a direct and negative effect on the poverty level, while Economic Growth has no

significant effect on the poverty level, then Unemployment has a positive effect on the poverty level of 33 provinces in Indonesia.

Furthermore, the research conducted by Bariyyatin Nafi'ah (2021) entitled Analysis of Factors That Can Affect Poverty Alleviation in Indonesia (2016-2019). This study uses the REM method with panel data regression analysis. The results showed that Zakat, Infaq, Sadaqah had an effect on the poverty level, while HDI and inflation had no effect on the poverty level in Indonesia.

## IX. RESEARCH METHODOLOGY

This research uses a quantitative approach with secondary data as a data collection technique. The research data got from the Central Bureau of Statistics of Grobogan Regency during the period 2010-2022. The analytical method used of research is the Multiple Linear Analysis method, linear analysis aims to determine the changes that occur in the dependent variable (Y) refers to known independent values variable (X). Thus, the use of linear analysis is used to determine changes from the dependent variable (poverty) to the independent variable (HDI and Economic Growth). Multiple linear analysis in this study is formulated using this equation.

$$Y = \alpha + \beta_1 X_1 + \beta_2 X_2 + e$$

Which:

Y = Dependent variable

$\alpha$  = constant

$\beta_1 \beta_2$  = Regression coefficient

X1 X2 = Independent variable

e = Standard error

This method is used to see the effect of HDI and Economic Growth on the poverty rate in Grobogan Regency.

### A. Population and Sample

#### Population

The population of this study is all data index of human development, economic growth and poverty in Grobogan Regency 2010-2020.

#### Sample

The sample of this research is annual data from human development index, economic growth and poverty rate in Grobogan Regency in 2010-2020 so that the total is 10 years.

### B. Variable Operational Definition

The research variables consist of the dependent variable and the independent variable.

#### Human Development Index (HDI)

This variable was taken from the Central Bureau of Statistics of Grobogan in 2010-2020 which was measured through 3 categories, namely health and longevity, knowledge and a decent life, the data obtained in the form of percent.

#### Economic Growth

Economic Growth Variables were obtained from data from the Central Statistics Agency (BPS), especially Grobogan Regency's GRDP in 2010-2020 in percent units.

#### Poverty

Poverty variable is the percentage of the population that has not met the poverty line obtained from the Central Statistics Agency (BPS) of Grobogan Regency in 2010-2020 in percent units.

## X. RESULT/FINDINGS

A. *Regression Test**Coefficient of Determination (R<sup>2</sup>)*

The Coefficient of Determination Test selects a function to measure the model's ability to provide an explanation of the variation in the dependent variable. The value of the coefficient of determination is in the range of zero (0) and one (1). If the value is small, it indicates that the ability of the independent variable to explain the dependent variable is minimal. However, if the value is close to one (1), this indicates that the independent variable is able to provide all the information to predict the variation of the dependent variable. To determine the coefficient of determination in the study can be observed in the following table.

Table 1. Coefficient of Determination Test Results

Model Summary				
Model	R	R Square	Customized R Square	Std. Estimated Error
1	,993a	,986	,983	,26852

a. Predictors: (Constant), HDI, Economic Growth  
 b. Dependent variable: Poverty  
 source : SPSS Output SPSS Secondary Data Processed 2022

The results of the analysis of the coefficient of determination (R<sup>2</sup>) obtained the significance value of Adjusted r square is 0.986,. This shows the ability of the independent variable to explain the dependent variable by 98.6%, and the remaining 1.4% is explained by other variables not used in the study.

B. *Simultaneous Test (F)*

The F test basically functions to determine whether each independent variable thus in the model has a simultaneous effect on the dependent variable. From the F test, it means that all independent variables are explained significantly through the dependent variable simultaneously. here is the result of Simultaneous (F):

Table 2. Simultaneous Test Results (F)

ANOVA					
Model	Number of Squares	df	Square Average	F	Signature.
Regression	41.174	2	20,587	285,529	0.000
Remainder	0.577	8	0.072		
Amount	41,750	10			

- a. dependent variable poverty
  - b. predictor: (constant). HDI, Economic Growth
- source: SPSS output secondary data processed (2022)

From the table of data processing results, it is known that the P Value is  $0.000 < 0.05$ . So it can be said that economic growth and HDI simultaneously affect poverty.

*C. Partial Test (T)*

Partial Test (T) was conducted with the aim of knowing the effect of each independent variable, namely HDI and also Economic Growth. Partially the effect of two independent variables on poverty in Grobogan Regency is shown in the figure below:

Table 3. Partial Test Results (T)

From these results obtained the following regression equation:

$$Y = 93.976 - 1.169(X_2) - 0.093(X_1)$$

Model	Non-standard coefficient	Standard Coefficient	t	Signature.
	B	Std. Error	Beta	
1 (Constant)	93.976	3.365		27,930 ,000
Economic growth	-.093	0.040	-.098	-2,311 0.050
HDI	-1.169	0.049	-1.006	-23.821 ,000

a. Dependent Variable: Poverty  
 source : SPSS secondary data output processed, 2022

Referring to the regression equation, it can be described as follows:

- a. The constant of 93.976 shows the value of the poverty variable if the independent variables, namely economic growth and HDI are considered zero, meaning that it is not influenced by the independent variable, the magnitude of poverty is 93.976.
- b. The economic growth regression coefficient (X1) is -0.093, meaning that if the economic growth variable is added by 1 unit, then poverty will be reduced by 0.093.
- c. The HDI regression coefficient (X2) is -1.169, meaning that if the HDI is added by 1 unit, poverty will decrease by 1.169.
- d. From table 3, it is obtained that the t value of the economic growth variable is 2,311 and the HDI variable is 23,821. the value of t table with n is equal to 11, k = 3 then the value is 2,306. because t count is greater than t table, then HDI and also economic growth partially have a significant effect on poverty with a negative correlation.

*D. The Poor in Grobogan District*

Grobogan Regency is one of the regencies in Central Java Province and the administrative center of Grobogan Regency is in Purwodadi City. Administratively, Grobogan Regency consists of 19 sub-districts and 280 villages/kelurahan. The area owned by Grobogan Regency is 1,975.86 KM<sup>2</sup>. The results of the population census in 2020 noted that the population of Grobogan Regency in 2020 was 1,453,526 people with an average annual population growth rate of 1.02%.

The percentage of poor people in Grobogan Regency although from 2010-2020 tends to show a decline, but the poverty rate of Grobogan Regency still ranks the 12th largest in Central Java Province. When compared to other districts in Central Java Province, the percentage of poverty in Grobogan Regency is 12.46% or around 172,265 people. This figure has increased when compared to the percentage of poverty in 2019 of 11.77 or around 161,921 people (BPS).

Gross Regional Growth (GRDP) in Grobogan Regency fluctuates every year with an average GRDP growth rate of 5.11%. The highest economic growth occurred in 2018 which was 5.83%, while in 2019 economic growth decreased to 5.37%. The structure of the economy in an area is determined by the size of the economic sectors in producing goods and services. The formation of Grobogan Regency's total GRDP is dominated by three main sectors, namely; First, the agricultural sector contributed 28.64%. Second, wholesale and retail trade, car and motorcycle repairs contributed 19.91%. Third, is the manufacturing sector which contributes 13.70%.

The Human Development Index in Grobogan Regency has increased even though in the Covid-19 pandemic situation where in the midst of a limiting situation due to the Covid-19 outbreak, Grobogan Regency's HDI in 2020 grew by 0.01 points from 69.86 points in 2019 which grew to 89.87 in 2020. In the last decade the status of human development in Grobogan Regency is included in the "moderate" category. Although the HDI achievement in Grobogan Regency is generally still below other regencies/cities in Central Java Province, Grobogan Regency's HDI growth still shows a positive trend. HDI growth in 2020 is still much lower than in previous years, especially 2018-2019. This is due to the Covid-19 outbreak which has caused the wheels of the economy to not turn, including Central Java. The economy in Central Java experienced a deep contraction in 2020, resulting in a decrease in the income of most people, including the people of Grobogan Regency. As a result of the decline in income, the average per capita expenditure also decreased.

*E. The Effect of Economic Growth on Poverty*

From the hypothesis test (X1), economic growth has a significant effect on poverty with a negative correlation. This statement implies that economic growth can affect the poverty level, that is, if there is an increase in economic growth, the poverty rate will decrease. Economic growth as measured by Gross Regional Domestic Product (GRDP) can be used as a reference to see the welfare of the population in an area. This can happen if the GRDP in an area increases, this shows that the welfare of residents in that area is increasing. Thus it can be said that economic growth is a prerequisite for minimizing poverty levels.

Economic growth is a factor supporting the success of development to reduce poverty levels through activities in the economic sector. According to research conducted by (Ridho et al., 2018), economic growth, especially GRDP, has a significant and positive effect on poverty levels, in line with research from Nadya et al. (2019) which states that economic growth has a positive and significant effect on poverty levels, which in his research explains that if an area increases economic growth, this will affect the decrease in poverty levels.

*F. The Effect of the Human Development Index on Poverty*

From the hypothesis test (X2), the HDI results have a significant positive effect on poverty. HDI is a variable that describes human development or the quality of human resources, where if it increases, the work productivity of the community also increases. When there is an increase in community work productivity, it will reduce the poverty rate in the area.

The results of Syafifullah and Gandasari's research (2016) explain that HDI has a positive effect on poverty levels. The HDI consists of three important dimensions, which include meeting the needs of a long life, living a healthy life, and gaining knowledge, meaning that these three dimensions contribute to poverty levels. This research is also supported by research from Prasetyoningrum and Sulistyowati (2018) which also explains that if the human development index increases which will then reduce poverty, this means that HDI can increase human productivity and can increase human income to fulfill a decent life. The three dimensions of HDI greatly determine the quality of human life. Education plays an important role in absorbing and developing modern technology that can support

economic growth and development. In addition, the health dimension is also important because health is a prerequisite for increasing productivity. So in this case education and health are components in economic development, especially poverty alleviation. The results of Edfrida's research (2019) also show the same results, namely HDI has a positive effect on poverty levels.

## XI. CONCLUSIONS AND RECOMMENDATIONS

### A. Conclusion

From the discussion above, conclusions can be drawn:

- a. Economic growth (X1) has a significant positive effect on poverty with a path coefficient value of -0.093.
- b. The HDI Human Development Index (X2) has a significant positive effect on poverty with a coefficient value of -1,169.

### B. Recommendation

The suggestions from the research results and conclusions are:

- a. The Grobogan Regency Government should carry out sectoral development that dominates increasing the quality and quantity of production by utilizing existing human and natural resources so as to increase economic growth, especially GRDP.
- b. Increasing the Human Development Index (HDI) is more oriented to easy access to education at every level so that people can gain knowledge so that they become human beings who have potential resources.

## E-Government and Corruption Indonesian Government Studies

Dimas Bayu Putrantio<sup>1</sup> and Maulidyah Indira Hasmarini<sup>2</sup>

<sup>1,2</sup> Economic Development, Muhammadiyah Surakarta University

### Abstract

*The purpose of this article is to assess the impact of introducing e-Government on the likelihood of corruption in Indonesian local governments. As a proxy for the e-Government variable, this study used the Ministry of Communication and Information of the Republic of Indonesia's e-Government rating index of provincial governments in Indonesia. Meanwhile, corruption is investigated using 172 local government samples from 2011 to 2013. The governance characteristics examined in this study include accountability, fairness, decentralization, transparency, professionalism, and responsiveness. The e-government variable is measured by the Indonesia e-Government Ranking. A logistic model is used in the study procedure. This study includes calculating the governance index, which is analyzed using the PCA approach. The findings demonstrate that introducing accountability, professionalism, and e-government reduces the likelihood of corruption. However, decentralization increases the likelihood of corruption. Meanwhile, justice, transparency, and responsiveness have failed to reduce the amount of corruption. Furthermore, the study finds that instituting complete governance can minimize the amount of corruption. This report makes recommendations for the government to prevent corruption, such as improving oversight on follow-up recommendations, raising the professionalism of the apparatus, and implementing e-government, in addition to adopting thorough governance to minimize corruption.*

*Keywords—E-Government, corruption, Local Government, Governance*

---

### I. INTRODUCTION

According to Law No. 20/2001, corruption is defined as violating the law by doing acts to profit oneself or others at the expense of the state or its economy. Not only result in losses In state finances, but corruption also has nonfinancial effects, such as diminishing the integrity of the government's accountability system, diminishing public faith in government, and interrupting public services. Each year, the number of corruption cases reported for investigation in Indonesia grows dramatically. ICW (2020) documents an annual average of 181 corruption instances that can be probed by law enforcement. In the meanwhile, the average number of individuals identified as suspects is 412. Since 2018, a deterioration in law enforcement performance has been seen. Nonetheless, there was a rise the next year, although it was not statistically significant. The same holds true for the element of identifying the culprit. Moreover, there has been a substantial increase in the value of state losses from 2018 to 2020.

In collaboration with the Corruption Eradication Commission (CEK) and the courts, the government has taken action against corruption culprits. Additionally, the government has leveraged information and communication technology (ICT) by constructing an electronic government (e-Government) for public services. Implementing e-Government aims to reduce information asymmetry conditions between agents and principals (Elbahnasawy, 2014) so that opportunities for corruption can be reduced or even (Asorwoe, 2014; Bertot et al., 2010).

Even though the government has adopted e-Government, the number of corruption cases continues to rise, raising the study topic of whether or not e-Government can reduce corruption in Indonesia. Previous research on e-Government and corruption has been conducted (Andersen, 2009; Bhatnagar & Apikul, 2006; Choi, 2014; Emirullah Pemerintahan & Kajian Internasional, 2014); however, the majority of these studies rely on cross-national data. First, UNDP (2006) conducted research on e-Government and corruption in developing and developed countries members of the Organization for Economic Co-operation and Development (OECD) and discovered that e-Government could reduce corruption in developing countries but not in developed countries. Second, Andersen (2009) concluded that the introduction of e-Government was advantageous for reducing corruption in 149 non-OECD nations between 1996 and 2006. Emirullah (2019) discovered empirical evidence that good eGovernment may reduce corruption in 17 Asian nations. Fourthly, Choi (2014) discovered that the deployment of eGovernment in the form of online participation, online services, and improved ICT infrastructure contributed to reducing the country's corruption rate. Fifth, Setyobudi and Setyaningrum (2019) came to different conclusions than UNDP (2006), e.g., e-Government in developed countries

has a practical effect on eradicating corruption since it is already in the transaction and transformation phase compared to its deployment in developing nations.

Intriguingly, despite the fact that the majority of prior research on e-Government and corruption has revealed evidence of a link between e-Government and the elimination of corruption, the indices, and variables employed in this study are derived from a variety of sources. The research results cannot be relied upon (Grönlund & Flygare, 2011) This circumstance inspired Gronlund and Flygare (2011) to analyze the robustness of numerous indices utilized in studies on the influence of e-Government on corruption, including the e-government index, namely the Environmental Data and Governance Initiative (EDGI), Brown university index, Waseda university index, the Economist's e-readiness index, and the International Telecommunication Union's Government Core Indicator (ITU). Indicator for corruption variables utilizes both the Corruption Control Index (CCI) and the Corruption Perception Index (CPI). According to the findings of Gronlund and Flygare (2011), the usage of several e-Government indices resulted in correlation coefficients ranging from 0.49 (less significant) to 0.95. (very significant). In order to achieve accurate study results, Gronlund and Flygare (2011) recommend that future researchers utilize an index or variable that represents reality and not simply perception.

In addition, research on e-Government and corruption in Indonesia has been conducted (Kurnia et al., 2018; Manurung et al., 2019; Nugroho, 2014; Simarmata, 2017). These investigations were undertaken from a legal standpoint. According to research by Nugroho (2014), Kurnia et al. (2018), and Simarmata (2017), the deployment of e-Government in government administration facilitates public services and reduces corruption by enhancing openness and accountability. However, Manurung et al. (2019) reach a different conclusion. The amount of corruption incidents in the purchase of goods and services through the Electronic Procurement Service (LPSE) demonstrates that Indonesia's e-government is not yet trustworthy in combating corrupt activities (Manurung et al., 2019). ICT has no meaningful impact on eliminating corruption and instead creates new chances for it (Heeks, 2020). The findings of Manurung et al. (2019) are consistent with the research completed in 2013 by the Harvard, MIT, and U.Michigan research groups on 20,000 and 14,000 e-procurement-using road building contracts in India and Indonesia, respectively, as mentioned by Holman (2014). The study team discovered that e-procurement did not considerably reduce the manipulation of technical standards in India and Indonesia road building projects. The auditors were unable to quickly discover the manipulation that happened, which contributed to state losses. Indonesian study on e-Government and corruption is extremely intriguing due to the discrepancy of prior research results. Therefore, the purpose of this study is to collect real information regarding e-Government interactions and corruption in Indonesia.

Two contributions are made to this research. Firstly, research has influenced the evolution of public accounting. The research presents empirical evidence that e-government is a crucial aspect considered in the governance planning activities of public-sector organizations in order to decrease corruption chances within organizations. Second, research has aided governments by giving information on the efficiency and utility of e-government implementation for overseeing public service operations in Indonesia.

## II. LITERATURE REVIEW

### *a. Agency Theory and Corruption*

The agency theory outlines the potential for conflict between the agent and the principle (Jenson & Meckling, 1976). There are also agency interactions in public sector organizations. Individuals serve as principals, whereas governmental officials operate as agents. By designating the State Civil Apparatus, public authorities are liable for public service actions (ASN). The reason of the dispute between the principal and the agent is the agent's opportunistic behavior (Jenson & Meckling, 1976; Klitgaard, 2020). For every choice they make, agents prioritize their own or their group's interests over the public's. By engaging in bribery, embezzlement, fraud, nepotism, and extortion, agents pursue their own self-interests (Pirannejad, 2017)

The definition of corruption is currently expanding. According to Klitgaard (2020) and Rose-Ackerman, corruption is not simply motivated by economic factors (1999). However, it is also motivated by other factors, like the desire to preserve political power (Sikka, 2008). According to Hopkin (1997), corruption in the public sector is associated with political leadership. Political corruption happens at the highest levels of power, particularly when designing policies

and laws to reap economic gains for politicians and lawmakers (Bakre, 2008). Corruption incidents involving politicians and lawmakers in Indonesia occur mostly during the budgeting process and result in state financial losses (Maria & Halim, 2020).

According to Tanzi (1998), corruption in emerging nations is more serious than in developed nations. This is because corruption in developing nations is typically carried out at the discretion of influential public officials in the absence of an effective oversight structure. There are several opportunities for corruption there. In addition, legal enforcement is typically poor in developing nations. The law cannot serve as a disincentive for corrupt actors. Hence corruption flourishes in that area. Corruption distorts government expenditures and resource allocation and decreases investor trust in nations with high corruption levels (Elbahnasawy, 2014).

*b. The Concept of E-Government in Indonesia*

E-Government refers to the provision of online government services to the general public and companies, including e-tax, e-transportation, e-procurement, and e-participants (Gupta et al., 2016). In the 1970s, ASEAN began to create electronic government. Brunei Darussalam was the pioneer when it announced a vision in 2035. In the 1980s, Singapore then unveiled the Intelligent Nation programme. In 1997, E-Government was introduced in Malaysia. In 2001, the Indonesian government initiated the use of e-Government in public administration activities.

The ASEAN 2020 strategy plan fosters the development of e-Government services by all member states. Development relies on shared services to promote cross-border movement of people and things. Registration, licensing, and certification, money creation, and social returns are areas where E-Government is being explored. To ensure the success of the program, all ASEAN members must prepare themselves by advancing science, technology, and infrastructural innovation.

E-Government streamlines and integrates data and information management workflows and procedures to enhance the quality of public services. E-Government is used to perform services involving government personnel, people, the business sector, and other government agencies and their employees. The Ministry of Communications and Information in Indonesia has been preparing a blueprint for e-Government application since 2003. The blueprint application is meant to be adaptable since it is independent of organizational structure and policy changes in government agencies and allows each local government to translate and adapt it

Presidential Instruction No. 3/2003 on the National Policy and Strategy for the Development of e-Government regulates the implementation of e-Government in Indonesia. This rule defines four tiers or stages of developing e-Government in Indonesia. The initial phase is the preparatory phase. At this stage, activities include the creation of information sites for each government agency, the preparation of human resources and information technology infrastructure to support the e-Government implementation process, and the internal and external promotion of the information site. The maturation stage is the second phase. Activities at this level involve the creation of an interactive, interconnected public information website. The consolidation stage is the third phase. This phase includes the development of a website for public service transactions, as well as application and data connectivity with other government entities. The fourth phase is known as usage. At this level, Government to Government (G2G), Government to Business (G2B), Government to Citizen (G2C), Government to Employee (G2E), and Government to Employee (G2E).

G2G focuses on enhancing the administrative processes of central and local governments to reduce expenses from an economic and social standpoint. G2B focuses on government and private sector taxation, licensing, certification, and company reporting operations. Utilizing ICT is advantageous for enhancing supply chains and corporate competitiveness. G2C focuses on empowering individuals with the right to seek, produce, receive, and disseminate information on critical problems of government-provided public services. This position can promote the openness of public authorities' exercise of power by monitoring citizen safety, the budgeting process, and the operation of local government. Meanwhile, G2E focuses on payroll transaction assistance, employee happiness, and the labor market to boost employee productivity.

The establishment of the National Information and Communication Technology Council, (DeTIKNas) in 2006 helped the government focus on addressing strategic issues of e-Government. There are 16 main agenda programs that must be realized, such as e-Procurement, Single Identity Number, e-Budgeting, e-Learning, e-Health, Digital TV, Tecno Park, including the preparation of policies and infrastructure to support the e-Government implementation process. Kurnia et al. (2018) stated that Law no. 11/2008 concerning Information and Electronic Transactions is a legal umbrella that dispels public doubts regarding the legitimacy of the use of information technology in public service administration activities. This law offers copyright protection for electronic publications. From 2014 to 2019, E-Government has been a priority area of the Indonesian broadband expansion agenda. Pitalebar is an always-connected, secure, tri-play internet connection with a minimum speed of 2 Mbps for fixed access and 1 Mbps for mobile access. Therefore, it is anticipated that pitalebar will be able to provide, process, and transmit information more rapidly, openly, accountably, effectively, and efficiently. The objective is for the information to maintain or increase its value to the community. This rule demonstrates the government's commitment to establishing e-Government at the national, regional, and municipal levels

*c. Good Government Governance*

Good governance consists of maintaining the mandate of the people, running the government to improve independence, fostering sustainable development, and attaining social justice. Corruption-free government administration means that GGG has been attained (KNKG, 2010).

Bappenas establishes several GGG principles in order to design a sound state administration system (Bappenas, 2007): visionary, openness and transparency, community participation, accountability, law enforcement, democracy, professionalism and competence, responsiveness, efficiency and effectiveness, decentralization, a partnership between the private sector and the community, reducing inequality, commitment to environmental protection, and achieving a fair market. In addition to Bappenas, the KNKG is the organization that creates governance to accomplish GGG. This committee is a group of GGG-interested specialists with the mission of formulating a plan for the implementation of GGG in Indonesia (KNKG, 2010). According to the KNKG, the GGG's guiding principles are accountability, supervision, responsiveness, professionalism, efficiency and effectiveness, transparency, justice and equality, foresight, involvement, and law enforcement. This study employs the GGG concept defined by KNKG to examine GGG. Accountability, fairness, decentralization, openness, professionalism, and responsiveness are some of the factors whose effects on corruption are explored. Due to a lack of data to undertake measurements, the additional components were not investigated.

*d. Hypothesis Development*

E-Government is the government's use of information and communication technology (TIK) to operate more efficiently, share information, and improve public services (UNDP, 2006). This concept relates to disseminating government information and services to individuals and companies via the internet and other digital platforms. UNDP (2006) defines corruption as public officials' misuse of power and authority for private gain. Corruption negatively influences a nation's economic progress (Elbahnasawy, 2014).

Klitgaard (2020) explains government corruption from an agency theory approach. Theoretically, the community serves as the principal, delegating authority to public officials as agents. It was discovered that the interests of the agent and the principal do not always coincide. This state motivates actors to behave strategically (Baiman, 1990; Eisenhardt, 1989; Jenson & Meckling, 1976). Agents are free to carry out their duties due to the high cost of supervision, which creates information asymmetry (Hopkin, 1997). The agent possesses more excellent knowledge than the principal. Informational inequality creates opportunities for corruption (Hopkin, 1997; Klitgaard, 2020). Thus, corruption is an issue of information asymmetry that may be described by the principal and agent models of agency theory

According to Klitgaard (2020), corruption occurs because there is a massive monopoly of authority and discretion in government decision-making, but the level of accountability is inadequate. In public sector organizations, monopoly power dominates policies, regulations, and even resources for the advantage of people or groups. Due to the complex and time-consuming bureaucracy in public sector companies, public officials' enormous discretion might provide the potential for abuse. Meanwhile, accountability is minimal since the community is not participating in decision-making.

The mathematical expression for corruption is  $K = M + D - A$ , where  $K$ =corruption,  $M$ =monopoly,  $D$ =discretion, and  $A$ =accountability (Klitgaard, 2020). In other words, boosting bureaucrats' capacity to manage and act arbitrarily on information will encourage corruption. Moreover, less responsibility and oversight from superiors and the general public can exacerbate corruption. When public officials have a monopoly of power and information, corruption is more likely to arise (Elbahnasawy, 2014; Klitgaard, 2020). Corruption occurs when public officials abuse their positions and authority for personal or group gain. To combat corruption, it is crucial to reform the relationship between principals and agents to remove monopolies of power and information access (Klitgaard, 2020).

According to agency theory, E-Government has the potential to transform the relationship between principals and agents in public sector organizations (Elbahnasawy, 2014; Mahmood, 2004; Pirannejad, 2017). E-Government can reduce the information gap between agents and principals, lowering or eliminating corruption (Elbahnasawy, 2014). The usage of TIK can increase government transparency, access to performance data, and the delivery of public services, hence increasing public trust in their government (Kolstad & Wiig, 2009)

E-Government contributes to increased accountability since the application makes it easier for citizens to monitor the choices and activities of agents. Also, e-Government was discovered to let the public criticize agents' use of arbitrary processes (Pirannejad, 2017). Using e-Government by the government can help streamline procedures and connections between the public and companies with public officials in government agencies, hence reducing corruption, particularly in the form of bribes and gratuities.

Cross-country research on e-Government and corruption revealed that introducing e-Government could reduce corruption (Andersen, 2009; Choi, 2014; Emirullah, 2014; Krishnan et al., 2013; UNDP, 2006; Setyobudi & Setyaningrum, 2019). On the other hand, earlier research undertaken in developing nations has yielded conflicting results (Mahmood, 2004). Holman (2014) and Manurung et al. (2019) discovered that electronic procurement of products and services in India and Indonesia was rife with corruption. This indicates that the deployment of e-Government in these two nations has not decreased corruption. In contrast to Kim et al. (2009), who found evidence that the implementation of online procedures enhancement for civil application (OPEN) in the Seoul Metropolitan Government, South Korea, can reduce corruption, we found that the implementation of online procedures enhancement for civil application (OPEN) does not affect corruption.

From a legal examination, Simarmata (2017) and Kurnia et al. (2018) determined that in Indonesia, current national or central rules and regulations on e-Government may be utilized as a foundation for local governments to manage e-government utilizing e-Government. The application of ICT has yielded positive outcomes and is exhaustive and transparent. In addition to facilitating services and reducing service costs, using ICT can decrease corrupt behaviors (Simarmata, 2017). The study hypothesis so describes the link between e-Government and corruption in local government in Indonesia.

$H_1$ : The level of accountability reduces the probability of corruption.

*e. The Impact of LKPD Fairness Level on Corruption Probability*

Government officials' compliance with applicable norms and laws embodies the notion of fairness (KNKG, 2010). The connection between the fairness of financial statements and governance is that, with information from fair reports serving as a basis for decision making, the quality of decisions made will be enhanced (Heuer et al., 2007). The organization's information serves as a management tool for decision-making and assessment. Therefore, the accuracy of the information transmitted has a significant impact on decision-makers. The level of fairness of local government financial reports in Indonesia is evaluated by the BPK auditor based on the audit's view. It is anticipated that this opinion will serve as a whistleblower on problems in local government for both community and agency officials so that it will not occur again the following year.

Research on local government in Indonesia demonstrates that audit opinion has no substantial impact on corruption levels in Indonesia (Heriningsih, 2013). The contrary conclusion was reached by Masyitoh et al. (2015), whose research found that audit opinion had a substantial effect, namely a reduction in corruption. A favorable audit opinion helps minimize corruption since it offers assurance that the supplied financial information is correct and accounted

for. In addition, the regional government receives a fair judgment if it compiles financial reports in accordance with established accounting standards and the internal control system so as to decrease the likelihood of deviant activities leading to corruption. This study attempts to demonstrate that there is a relationship between the degree of justice and corruption by referencing past studies and existing viewpoints.

$H_2$ : The level of fairness of LKPD reduces the probability of corruption.

*f. The Influence of Decentralization Level on Corruption Probability.*

Decentralization is supposed to improve the functioning of local governments. However, the growth of decentralization and autonomy might weaken oversight, which can encourage public sector corruption (Von Maravic, 2007).

Wu's (2005) research demonstrates that decentralization without accountability increases corruption. The existence of decentralization increases the flexibility of local governments in managing finances, thereby increasing the opportunity for corruption if it is not accompanied by an adequate control system (Klitgaard, 2020), while Saputra (2012) demonstrates that it has a negative effect on corruption levels.

The dispersion of government officials' jurisdiction enhances the level of oversight. Similarly, Fiorino et al. (2015) asserted that fiscal decentralization affects curbing corruption. After three to five years of adopting fiscal decentralization, this reduction is much more pronounced if the quality of governance has improved. Based on the hypothesis and prior research

$H_3$ : The level of fiscal decentralization decreases the likelihood of corruption.

*g. The Influence of Transparency Level on Corruption Probability*

Transparency is the ease with which the public may receive information in a timely and trustworthy way, including information on economic, social, and political concerns pertinent to stakeholders' requirements (Al-Mahayreh, 2015; Kolstad & Wiig, 2009). The expenses that result from the utilization of resources illustrate the direct influence of openness on corruption; without transparency, it cannot be determined whether the apparatus has committed corruption or not (Kolstad & Wiig, 2009). However, information supporting transparency must be pertinent to corruption instances that may be perpetrated by government officials, such as information on government income, expenditures, and contracts, as well as purchases of products by government officials.

According to Lindstedt and Naurin (2005), transparency, exemplified by media freedom, is a tool that may be used to combat corruption. However, openness cannot have a detrimental effect on corruption without proper accountability and publicity. Implementing GGG transparency in Indonesian government agencies is characterized as the disclosure and provision of adequate, stakeholder-relevant, and easily accessible information (Bappenas, 2007).

Setyaningrum et al. (2017) said that transparency aids the implementation of GGG in Indonesia's fight against corruption. In order to conduct impartial oversight of governmental management through openness. Considering the experience and prior studies.

$H_4$ : The level of transparency reduces the probability of corruption.

*h. Professionalism's Impact on the Probability of Corruption*

The realization of GGG, which is characterized by the establishment of a corruption-free state, demands the professionalism and skill of state administrators. Increasing professionalism and skill is one method for preventing corruption (Doig & Riley, 1998). Increased competency influences professionalism to enhance the integrity of state officials (Whitton, 2015). Professionalism is a person's ability to behave in accordance with applicable norms and standards when doing their obligations, whereas competence is a person's education/training/experience-based expertise in performing his duties. The training that is followed to increase their expertise has an effect on their understanding of the norms, values, service standards, sanctions, and rewards in carrying out their duties so that they can be expected to behave professionally by providing better services to the community and generating trustworthy, accountable reports. To decrease the prevalence of corruption.

Training for government personnel is a method for preventing corruption over the long run (Poerting & Vahlenkamp, 1998). Knowledge of acts of corruption will strengthen government officials' ability to determine which behaviors constitute acts of corruption, recognize the existence of acts of manipulation, and recognize the necessary procedures to avoid them. The PP no. 101 of 2000 about education and training for state employees governs the increase in the professionalism of government officials in Indonesia. It is expected that the professional demeanor of government officials in carrying out their responsibilities with the utmost honesty will preclude conduct that might be detrimental to the interests of the community. This study believes that with the skills acquired via education and training. Government officials may run the government and manage resources with a high level of professionalism and honesty. Based on past study and experience.

$H_5$ : Professionalism decreases the likelihood of corruption.

*i. The Impact of Responsiveness on Corruption Probability*

Responsiveness indicates the attitude of state officials who are responsive in providing services to the community, resulting in improved service quality. The relationship between responsive integrated services and corruption is that responsive integrated services allow the administration to be conducted in a single location, simplify procedures, increase transparency, and reduce face-to-face contact between officials and the community, reducing the likelihood of corruption. Investors who need to take care of licensing come to a centralized location to take care of different permissions and non-licensing, complain about business-related issues, and receive resolutions to these issues (Bappenas, 2014). Based on past studies and experience

$H_6$ : Responsiveness decreases the likelihood of corruption.

*j. The Impact of E-Government on Corruption Probability*

Reduce the direct link between government officials and the general people to combat corruption (Klitgaard, 2020). Information and communication technology is the ideal instrument for this strategy. Transparency enhances and decreases inconsistencies through increasing information sharing, simplifying operations, and facilitating data retrieval. E-government decreases the information gap between the local administration and the community (Klitgaard, 1998). This knowledge imbalance can be minimized by the use of information and communication technologies (Elbahnasawy, 2014; Pirannejad, 2017). Elbahnasawy (2014), Lio et al. (2017), Bertot et al. (2010), and Andersen (2009) have demonstrated that e-government has a detrimental impact on the impression of corruption. Conclusion: the usage of information and communication technologies has an effect on eliminating corruption in Indonesian local governments. Based on past study and experience.

$H_7$ : The use of e-government in local governments reduces the probability of corruption.

### III. RESEARCH METHODOLOGY

*k. Research Model*

This study's model is divided into two parts.

Model 1:

$$\begin{aligned} \text{logit } kor_{it} = & \beta_0 + \beta_1 ACCT_{it} + \beta_2 FAIR_{it} + \beta_3 DEC_{it} + \beta_4 TRANS_{it} + \beta_5 PROF_{it} \\ & + \beta_6 RESP_{it} + \beta_7 EGOV_{it} + \beta_8 IPM_{it} + \beta_9 Wage_{it} \\ & + \beta_{10} COMPLEX_{it} + \varepsilon \end{aligned}$$

*l. Data Analysis*

The gathered samples consisted of 172 samples representing 172 local governments for three years, including 59 local governments in 2011, 45 local governments in 2012, and 68 local governments in 2013. The research population consisted of all Indonesian local governments. Local governments polled by the Ministry of Communication and Information (Kemenkominfo) so that e-government index data is accessible or known as the Indonesian E-

Government Ranking comprised the sample for this study. This local government prepares LKPD and seeks an opinion from the BPK about the auditing outcomes of financial accounts. According to Andersen's research, the data in this study are imbalanced panels since they consist of time series elements and cross-sectional characteristics (2009). The estimate method utilized in this study is ordinary least square (OLS).

*m. Variable Operational Definition*

*n. Dependent Variable*

The researcher's aims dictate the choice of measuring application. Because this study aims to estimate the likelihood of corruption in local governments, the probability is measured using a dummy variable, with a value of 1 if corruption cases are being investigated by the KPK and the Attorney General's Office and a value of 0 otherwise. The statistics collected pertain to instances of corruption from 2011 to 2013. Salih (2013) implemented the technique of measuring corruption with probability, which assesses the likelihood of corruption by splitting the sample into two categories: the sample of nations thought to have corruption and the sample of countries seen to be free of corruption. The categorization is based on Transparency International's Corruption Perceptions Index (CPI). The CPI value is turned into a dummy variable with a value of 0 if the CPI value of a nation is low, suggesting a low amount of corruption and a value of 1 otherwise. This study calculates the values 0 and 1 using the approach of maximum likelihood.

*o. Accountability Independent Variables (ACCT)*

The level of accountability is defined by the proportion of suggestions that were followed up on plus those that could not be followed up on, divided by the total number of recommendations (TLRHP) (Liu & Lin, 2012). The greater the TLRHP level, the more eager the local government is to improve the management of state funds to establish a GGG implementation that represents a government free of corruption.

*p. Fairness (FAIR)*

Heriningsih and Merita (2013) utilized an ordinal variable, such that if the WTP or WTP opinion were gained, the DPP would receive 1 point. However, if the WDP, TW, and TMP received points, the DPP would receive 0 points. This assessment provides the basis for determining whether the local government has implemented good governance from the perspective of creating a government that is clean and devoid of corruption and collusion

*q. Decentralization Level (DEC)*

The level of fiscal decentralization is an indicator of the efficiency and effectiveness of local governments (Goel & Nelson, 2011; Treisman, 1999). This research used the ratio of Regional Original Income (PAD) to overall Regional Income to measure fiscal decentralization, citing Saputra's work (2012). The greater the decentralization value produced from comparing PAD to total regional revenue, the greater the financial autonomy of the local government (Saputra, 2012).

*r. Transparency (TRANS)*

Disclosure in financial statements is an indicator of openness, according to a study by Djasuli et al. (2013). CALK refers to the Guidelines for Government Accounting Standards (PSAP), which gauges the amount of compulsory disclosure based on PP no. 71 of 2010 Appendix II. Disclosure is measured via LKPD content analysis, specifically by comparing disclosures in LKPD to PSAP (Heriningsih, 2013). To improve the impact of openness on the degree of corruption, the only relevant information is disclosed, including information on income levels, expenditure levels, contracts held by local governments, and information on purchases of commodities by local governments.

*s. Professionalism (PROF)*

This study implies that professional growth results from education and training that enhances competence. As a result of their education and training, government employees are better able to apply values and standards to their jobs, increasing their professionalism. The indicator is whether or not local government expenditures are

allocated for education, training, and scholarships for local government officials in a particular year.

t. *Responsiveness (RESP)*

Bappenas measures the responsiveness level of local government personnel based on the existence or absence of the one-stop integrated service (PTSP) (2014). The local government's PTSP services include services for different permissions required by the community to be more responsive to community demands. The provision of many permits at a single location minimizes the frequency of encounters between authorities and the community, limiting corruption potential.

u. *E-Government (EGOV)*

Using the Indonesian e-Government Rating, the Ministry of Communication and Information assesses e-government in Indonesia (PeGI). The index assesses the deployment of technology and information in central and regional government organizations. The PeGI index value issued to each local government is utilized in this study. Based on the PeGI index, the following is a measurement of the implementation of e-government in Indonesia: (Kominfo, 2015)

$3,60 \leq \text{Very Good} < 4,00$

$2.60 \leq \text{Good} < 3.60$

$1.60 \leq \text{less} < 2.60$

$1.00 \leq \text{very less} < 1.6$

v. *Variable Control*

1. *Human Development Index*

Rajasa (2014) uses the human development index (HDI) to estimate the province's level of education. The Human Development Index (HDI) has demonstrated that it helps reduce corruption in Indonesia (Rajasa, 2014). Community ownership of adequate education will boost government implementation oversight, hence reducing the likelihood of corruption. Education is crucial to combating corruption (Lin and Liu, 2012). It is intended that a high level of knowledge for residents will strengthen citizen oversight of local government operations. This research uses the BPS-published Human Development Index proxy.

w. *Wage Rate (WAGE)*

The degree of salary is utilized by Treisman (2000), Liu and Lin (2012), and Dong and Torgler (2013) as a controlling variable that can influence the level of corruption. Government officials' degree of compensation influences their desire to engage in corrupt behavior. With a large wage, it is believed that the desire to commit acts of corruption will decrease. In addition, there is the GONE hypothesis, of which Greed is one component (Bologna, 1993). The hypothesis asserts that officers' avarice is the root of corruption, such that they continue to perform corrupt crimes despite their high pay.

x. *Level of Complexity*

Government agency complexity is one of the variables that contribute to corruption. According to Prud'homme (1995), operating complexities and elaborate regulations without oversight might contribute to the spread of corruption. According to Nurhasanah's (2016) research, the complexity of ministries/agencies is assessed by the number of work units. This study employs the number of local government work units (SKPD) as a measure of complexity based on prior research.

IV. RESULT / FINDING

a. *Research Result*

Table 1. Descriptive Statistical Results

## Sustainable Collaboration in Business, Information and Innovation 13<sup>th</sup> 2022

Variabel	Obs	Mean	Std. Dev	Min	Max
ACCT	172	0,61	0,263	0,16	1
DEC	172	0,08	0,07	0,02	0,53
TRANS	172	0,70	0,05	0,61	0,82
EGOV	172	1,7	0,49	1,01	3,49
IPM	172	70,69	4,51	57,43	79
WAGE	172	533,7	322,58	168,31	2,049
COMPLEX	172	48,67	18,42	22	170

ACCT is determined by comparing the number of suggestions that have been implemented and those that cannot be implemented to the total number of recommendations made by the BPK examiner during the previous year. DEC is a measure of fiscal decentralization determined by dividing the total local revenue by the overall income. TRANS number of income, spending, contract, and purchase-related disclosures per total disclosure. EGOV for the e-government category, HDI for the human development index, WAGE for local government salary expenditures, and COMPLEX for the number of SKPD in local governments.

Table 2. Frequency Table

Variabel		2011	2012	2013
KOR	0 - no corruption cases	90	87	85,3
	1 - corruption case	10	13	14,7
	Total	100	100	100
FAIR	0 - other than the opinion of WTP and WTP DPP	88,14	77,78	54,41
	1 - opinion of WTP and WTP DPP	11,86	22,22	45,59
	Total	100	100	100
PROF	0 - no disclosure of local government apparatus training	8,5	13,33	10,29
	1 - there is disclosure of training for local government officials	91,5	86,67	89,71
	Total	100	100	100
RESP	0 - no PTSP	8,47	11,11	8,82
	1 - PTSP	91,53	88,89	91,18
	Total	100	100	100

KOR whether there are examples of corruption. FAIR is the view of LKPD in the previous year acquired by the local government, measured by WTP and WTPDPP is 1 and 0 if not. PROF represents the existence or lack of education and training offered by the local government, assessed by a dummy, 1 if there is and 0 if there is no training education. RESP represents the existence or absence of One Stop Services (PTSP) in the local government, assessed by a dummy of 1 if there is and 0 if there is no PTSP in the study year

Table 1 contains descriptive statistical information about study data. The findings of descriptive data indicate that the average degree of accountability of local governments in Indonesia is 61%, showing that local governments are willing to handle finances more responsibly by implementing audit suggestions from prior years. Comparatively, the amount of decentralization, as measured by the ratio of original revenue to total local government revenue, was, on average, 8%, ranging from 2% to 53.3%. This demonstrates that, on average, local governments in Indonesia have lower local income than overall revenues, which contributes to their lack of autonomy in handling regional budgets. As evaluated by obligatory disclosures, the average degree of openness in CALK regarding corruption is 70%, with

the lowest transparency value being 61% and the highest being 82%. The high degree of local government transparency in Indonesia suggests that local governments in Indonesia comply with disclosure requirements in their financial reports. The average e-government implementation in Indonesia has attained a score of 1.7, with the highest implementation scoring 3.49 and the lowest implementation scoring 1.01. Based on the Kominfo reference, the PeGI index indicates that the average implementation of e-government in Indonesia is still deemed inadequate and must be enhanced in quantity and quality. The controlling variable indicates that the average degree of human development in Indonesia is 70.69 percent, while the average local government wage spending is 533.7 billion. The number of task units per local government showed a moderate complexity of 48.67 percent. In the three years of the survey, there was an increase in the number of local government corruption cases, while the proportion of local governments with WTP and WTP DPP attitudes climbed from 11.86 percent to 45.59 percent. These data imply that the financial management of local governments in Indonesia has improved. As indicated by the disclosure of local government officials' training status, the professional variable declined from 91.5 percent to 89.71 percent. Comparatively, the responsiveness determined by the presence or absence of PTSP decreased from 91.59 percent to 91.18 percent.

*b. Regression Results*

Table 3. Model 1 Regression Results

***Signifikansi pada level 1% **Signifikan pada level 5% *signifikan pada level 10%						

The regression results in model 1 show that hypothesis 1, namely the level of accountability affects reducing the probability of corruption, hypothesis 4, namely the effect of professionalism on decreasing the probability of corruption, and hypothesis 7 that e-government plays a role in reducing the probability of corruption, is proven to be supported by data, while hypothesis 3 is the level of fiscal decentralization has an effect on increasing the probability of corruption significantly

The three primary factors in this study, fairness, transparency, and responsiveness, were not demonstrated to impact the amount of corruption. In contrast, the regression findings of the control variables in model 1 revealed that the HDI level variable influenced the chance of corruption. In contrast, the income level (WAGE) and complexity (COMPLEX) affect rising corruption chances.

c. *Additional test Results*

Model 2

$$\text{logit } kor_{it} = \beta_0 + \beta_1 GGG_{it} + \beta_2 EGOV_{it} + \beta_3 IPM_{it} + \beta_4 Wage_{it} + \beta_5 COMPLEX_{it} + \varepsilon$$

According to the research of Setyaningrum et al. (2013) and Zou et al., the GGG index was constructed using the principal component analysis (PCA) technique (2006). Eliminating the connection between independent variables into new, unrelated variables is the technique's objective. A linear combination of components is created without PCA, which is difficult to comprehend. Table 4 below displays the regression with model 2 as an additional test:

Table 4. Model 2 Regression Results

KOR if there are instances of corruption Results of the GGG government governance index PCA EGOV category e-gov  
 HDI human development index WAGE expenditures on local government wages COMPLEX the number of SKPD inside  
 local governments.

The regression results of model 2 indicate that the implementation of comprehensive governance, which is comprised of accountability, fairness, decentralization, professionalism, transparency, and responsiveness, significantly reduces the likelihood of corruption. In contrast, the regression results of model 2's control variables yield the same results as model 1: the HDI level reduces the likelihood of corruption, whereas the salary level (WAGE) has no effect.

## V. DISCUSSION

The results of the research on hypothesis 1, which demonstrate that the level of accountability influences the likelihood of corruption, are consistent with the findings of Liu and Lin (2012), who found that the local government's willingness to implement the examiner's recommendations influences the likelihood of corruption. In conjunction with the number of findings recorded by the examiner, the number and kind of irregularities committed by government personnel serve as a proxy for accountability. The supervision of compliance with the implementation of local government management with the control system and law encourages local governments to effectively manage their resources to promote accountability and decrease authority abuse and embezzlement. These results are consistent with Klitgaard's (1998) assertion that accountability can be a strategy for reducing corruption when there is a great deal of discretion in managing the apparatus's resources.

This study could not demonstrate the relationship between the assessed degree of local government opinion fairness and the likelihood of eliminating corruption. These results concur with Heriningsih and Merita (2013) but contradict Masyitoh et al. findings (2015). This is because the BPK's opinion is not based on the presence or absence of deviant activities or actions that lead to corrupt behavior but on the adequacy of the regional government's records and accounting standards.

Following Wu's (2005) findings, fiscal decentralization has a strongly favorable effect on the potential of corruption. Due to the transfer of responsibility from the central government to local governments, fiscal decentralization favors corruption. However, this effect is not accompanied by enhanced accountability and effective oversight. This study confirms Klitgaard's (1998) assertion that the delegation of authority without adequate oversight encourages local governments to engage in deviant behavior that leads to corruption.

The results indicate that the method for providing information on local governments' earnings, expenditures, contracts, and purchases has not been able to lower the likelihood of corruption. These findings contradict Kolstad and Wiig's (2009) research on natural resource-rich nations. The application of CALK LKPD as a proxy for transparency in local government cannot be a factor that reduces the likelihood of corruption. The low level of punishments received if caught in the act of corruption, the low likelihood of corruption being exposed, the high degree of information asymmetry, and the low amount of public oversight are all factors that do not influence the level of corruption transparency.

The study findings on the relationship between professionalism and the likelihood of corruption indicate that professionalism can minimize the likelihood of corruption. This conclusion confirms the opinion of Doig and Riley (1998) that education and training will increase the apparatus's understanding of appropriate local government administration, strengthen monitoring, and inform government employees about the repercussions of engaging in deviant behavior. It is anticipated that a rise in professionalism will raise the proficiency of government officials in doing their duties correctly, making the process of reviewing the performance of the apparatus more efficient. A well-functioning performance evaluation permits the provision of incentives to motivate government employees to carry out their responsibilities correctly by increasing the incentives they get rather than by raising their income through dishonest conduct. This study did not demonstrate that responsiveness reduces the likelihood of local government corruption. This is because the responsiveness evaluated by the One-Stop Integrated Service (PTSP) has not been standardized, and there are regional disparities in service quality (Bappenas, 2014). In addition, the still-complicated service processes prevent PTSP from impacting the government's attempts to lower the likelihood of corruption. Improving the functionality of PTSP requires the seriousness of the local government in developing public services policy.

The eighth research hypothesis asserts that e-government has been shown to reduce the likelihood of corruption. This finding corroborates the findings of Lio et al. (2017), Bertot et al. (2010), and Elbahsanawy (2014), who evaluated the detrimental influence of e-government on the international level of corruption. According to Elbahsanawy (2014), technology deployment in local governments reduced corruption. Technology makes information readily accessible and data retrieval facilitated, hence reducing acts that violate rules. The greater availability of information has led to increased internal and external oversight. The research findings on the HDI variable show that a greater level of public education will raise the monitoring capability of the community, hence decreasing the likelihood that local government officials will engage in deviant behavior. The public's oversight is vital to preventing corruption, although wage level

has a role in raising the likelihood of corruption. This confirms the GONE hypothesis (Bologna, 1993) that corruption is fueled by greed, therefore, despite a high pay, the motivation to increase revenue through corruption remains. The research findings on the complexity variable indicate that the degree of local government complexity positively influences the corruption likelihood. The results of this study concur with those of research (2016) and Lin and Liu (2012), which indicate that the more complex an organization is, the more corruption will emerge.

In this study, further test findings demonstrate that the influence of governance on lowering the likelihood of corruption is powerfully demonstrated. These findings provide empirical evidence that the governance components developed by Bappenas (2007) and KNKG (2010) can minimize the likelihood of corruption when applied concurrently. In addition, the findings are consistent with Klitgaard's (1998) assertion that government control can provide the desired outcome, namely a decrease in the rate of corruption.

## VI. CONCLUSION AND RECOMMENDATION

Accountability, professionalism, and e-government, which may be derived through research analysis, have an empirically negative influence on corruption. Meanwhile, data do not support the degree of fairness, transparency, and responsiveness in lowering the likelihood of corruption. The study's test level of fiscal decentralization results indicates that fiscal decentralization influences the likelihood of corruption incidents. Delegating authority from the center to the regions for decentralization is intended to strengthen oversight. In practice, however, it improves the freedom of local government officials in managing resources, which motivates them to engage in corrupt behavior.

Suggestions for further study are the development of a professionalism measure. This study's measure of professionalism is based solely on the presence or absence of training held by the local government, not on the type/subject of training held; therefore, it is unable to capture the types and topics of training that are most relevant to efforts to reduce the likelihood of corruption. Future study is anticipated to enhance analysis based on additional measures, such as grouping by kind of training, such as whether or not anti-corruption training is provided. The weakness of this research is that it only investigates corruption based on the existence or absence of local government corruption; thus, it is recommended that future research validate these findings by conducting surveys and interviews to provide a more comprehensive analysis. This study believes that competence influences enhancing the apparatus's professionalism, but in actuality, competence has a different meaning. Competence can be determined based on the equipment's degree or type of education. In contrast, government employees' professionalism is judged by their adherence to appropriate norms, principles, and standards. Therefore, the next study should include a metric that differentiates the degree of competence and professionalism.

## ACKNOWLEDGEMENT

First of all, the writer gives praises and thankfulness to Allah SWT for all the blessing and grace to enable the writer to complete this paper entitle "E-Government and Corruption Indonesian Government Studies".

The writer also want to express her sincere thanks to all individual who has given the contribution, help, and guidance for the writer so that this final project report can be finished. The writer wants to extends her thank to:

- a. Prof. Dr. Sofyan Anis, M.Si., the director of Muhammadiyah University of Surakarta
- b. Dr. Syamsudin, MM., the Head of Economic and Business department
- c. Ir. Maulidyah Indira Hasmarini, MS., The Head of Economic Development Program
- d. Beloved parents who always pray, encourage, motivate and sincere loves during the writing of this paper

The writer also realizes that this report may still has weaknesses. Therefore criticism and suggestion from the reader will be accepted by pleasure.

## Affecting Factor Analysis On Earning Management Of LQ45 Manufacture Company

Desi Qoriah<sup>1</sup>, Reni Dany Merliyana<sup>2</sup>, Irma Rosmayanti<sup>3</sup>

<sup>1,2,3</sup>Universitas Garut, Economic Faculty, Accounting, Garut West Java

### Abstract

*The main objective of this research is analyzing the factors affecting earning management which consists of institutional ownership, size of enterprise, and financial leverage. Analyzing factors that effect to Earning Management can help the manufacture company gain strong factors to be developed. The method is associative population of manufacturing companies registered in LQ45 during 2014-2021. Research sample determining by certain criteria till gain five samples of manufacture company. The data analysis used is descriptive statistics and hypothesis testing using the IBM SPSS Statistics Version 23 program. The result using multiple linear analysis method, indicates that institutional ownership has a significant negative effect on earning management, size of enterprise has no effect on earning management, and financial leverage has no effect on earning management.*

*Keywords-* factor analysis, earning management, manufacturing company

---

### I. INTRODUCTION

Profit is a benchmark to measure whether the performance of a company good or bad. Profit is a value remaining after manufacture company expenses have been paid. Profits are also used as the basis for making economic decisions by investors and other interested parties. Companies usually use the basis of accrual accounting calculations because it is considered more rational and reflects actual state of the company. However, this basic calculation is not always best way, sometimes it has a weakness that is easy to be manipulated by the company's management. Some factors analysis, still have to be found to improve some effective ways to improve profit. Then earning management can be upgraded year to year. Some factors that affect earning management can derive a simple way of estimating the profit efficiency measure. As researcher Fare and Zelenyuk 2020 state on their research entitled “profit efficiency: generalization, business accounting and the role of convexity”, found that factors measurement on earning management is needed to adapt economic situation.

Accrual accounting which allows companies to recognize revenues and expenses regardless of cash receiving and issue, gives willing for management to choose and use certain accounting methods as long as they do not violate generally accepted principles (Sulistyanto, 2018).. That risk is taken for the profit of the regional energy service providers (RESP). This researcher firstly defines conditional robust profits (CRP) based conditional value-at-risk and uses it constructs a risk-averse model. He found some factors to analyze the impact to the profit (Zhang and Yang, 2022). It is necessary for company especially manufacture firm to analyze some factors affected and influence to earning management.

Institutional ownership is sharing ownership owned by an external company which is considered to be able control the company's management. It is indicated preventing management from carrying out earning management. Another factor is the size of enterprise which is considered based on company volume, larger company means higher practice activities of earnings management. Large companies usually have higher political costs. In this condition, they tend to defer current period income to the future so that profits can be minimized and tax payments are smaller. Small and medium-sized manufacturing enterprises (SMMEs) have been facing the financing contradiction of “strong demand” and “weak trust” for a long time almost in many countries. It needs to find the problem solving that related to the production efficiency of manufacturing enterprises. It is related with the research that has been done by Jiang, Duan, Sun and Liu, 2021.

The next factor is financial leverage which is used as a measuring tool for the size of the company's assets obtained from debt. Companies with high financial leverage will make any trigger management to do earnings management. Company tries to make it looks fine by increasing the earning profit even with high debt levels. In this study, we take the manufacturing sector as the object because of the discovery of earnings management cases

consisting of PT. Indofarma Tbk, PT. Kimia Farma Tbk, and PT. Ades Alfindo Tbk prove to practice earnings manipulation. The phenomenon of earnings management itself becomes very interesting to study because it describes the behavior of company management, and by looking at the results of previous studies which still have different results (Murni et al., 2016) showing that size of enterprise affects to earning management, while research conducted by (Pratama, 2016) does not show the effect between firm size and earning management.

The urgency on this research is finding some factors which are strong effect to earning management especially in this situation where the pandemic happen in the world. By knowing those factors, some companies can learn and find solving problem to earn profit even in hard situation. The objective of activities on this research is analyzing and finding empirical evidence on the effect of institutional ownership, size of enterprise, and profit leverage on earning management with the object of research being manufacturing companies listed on the 2014-2021 on accessing LQ45 index.

## II. LITERATURE REVIEW

### A. *Earning management*

Earning management is the impact of the company manager freedom in using and choosing certain accounting methods compiling the information contained in the financial statements. Managers can easily choose to increase or to decrease company profits as long as they do not violate applicable accounting principles. . Earning management includes managerial fraud, because it is consciously carried out by management to achieve personal goals. Earning management in this study is chosen by discretionary accruals obtained using the modified Jones model.

Earning management will show how much profit can be earned by firm. Analyzing some factors that related to this management is needed, other that company can prepare some strategies to earn big profit every period. Such Koke and Moehler resume on their journal that ensuring benefit realization, a project or program control must extend beyond program end. For gaining an effective profit, the company should make evaluation and analyze some factors which are having a big impact on gaining profit and influence management.

### B. *Institutional ownership*

Institutional ownership is sharing ownership owned by external parties (investors) in a corporate institution that can supervise internal parties (management) in carrying out their performance. The percentage of institutional ownership, can be determined by comparing the number of shares owned by institutional investors to the number of shares outstanding in the company. According to the research of Dang and Hoang (2021), they state that the relation between institutional ownership and commonality in liquidity and whether this relation differs across country-level institutional and information environments. Institutional company relate to other aspect on firm.

### C. *Size of enterprise*

Size of enterprise is the size of the company indicates from the total value of assets owned by the company. Firm size also represents profits generated by the company calculating logarithmic value of total assets. Size of enterprise can relate strongly to earning management. As Hadid and Hamdan said on their research that focusing on firm size, as the most examined and confusing variable in this contingency literature, they develop and test more complex relations than in prior studies to provide more insights into its role.

### D. *Financial leverage*

Financial Leverage is a measurement used to determine the amount of assets owned by company. It is resulting from debt. So higher level of Financial Leverage in a company, it reflects the high debt owned by the company, and vice versa. It states if the company has high debt, it is feared that it will not be able to pay off all its debts. Management will do all possible things to keep investors willing to invest. One of possibility way is by practicing earnings management. Financial leverage in this study is calculated using the debt to asset ratio by comparing the total debt owned by the company, to the total assets owned by company. In line with another research that investigates whether financial leverage is affected by financial reporting quality. Financial reporting quality is measured by employing the outcome of the Vietnam Annual Report Awards and earnings quality (Tran, 2021).

### III. RESEARCH METHODOLOGY

This research uses an associative approach with quantitative research. The design of activities is finding secondary data source carried out by downloading data from the financial statements of manufacturing companies from the official website of the Indonesian Stock Exchange (IDX), namely [www.idi.co.id](http://www.idi.co.id). The purposes of this study are to know the impact of three indicators: institutional company, size of enterprise and financial leverage to earning management. This research analyzes the impact especially during seven years which is the latest three years are pandemic era. From this research we will find the impact, the impact on managing the benefit of manufactured company.

The populations of this study are manufacturing companies listed on the Indonesia Stock Exchange (IDX) from 2013 to 2020 and meet the following criteria:

1. Manufacturing companies in LQ45 from 2013 to 2020 and have always been consistently registered during the observation period.
2. Complete financial reports for 2013 to 2020 are available in rupiah.
3. There is institutional ownership above 10% in its share ownership structure.

Based on the standard of 10 manufacturing companies listed in LQ45, 5 manufacturing companies met the standard of this research sample. The data processing technique uses descriptive analysis techniques and multiple linear analysis for hypothesis testing which is processed using SPSS version 23.

### IV. RESULT/FINDING

#### A. *Statistic Descriptive*

Here are the data of three indicators: Institutional ownership, Size of enterprise and financial leverage as we can see from the table.

Table 1. Research Sample

	N	Minimum	Maximum	Mean	Std. Deviation
Kepemilikan Institusional	40	.10	.69	.4613	.19653
Ukuran Perusahaan	40	30.06	33.49	31.7266	1.02286
Leverage	40	.13	.53	.3361	.14655
Manajemen Laba	40	.00	.01	.0017	.00192
Valid N (listwise)	40				

Sumber: Output SPSS 23

Based on table 4.1 the total number of research samples is 40. From the results of the descriptive analysis, it can be seen that this institutional property has a minimum value of 0.10 and a maximum value of 0.69 with an average value of 0.4613, which means that institutional ownership in the manufacturing companies sampled survey average of 43.16%. Firm size, measured by log total assets, has a minimum value of 30.06 and a maximum value of 33.39 with an average of 31.722, which means that all firms in the study sample own more than 30%. The leverage variable has a minimum value of 0.13 and a maximum of 0.53 while the mean is 0.3361. The mean value lower than 1 indicates the company has not too high debt. Earnings management has a minimum of 0.00 and a maximum of 0.01 with an average of 0.0017 because a positive average means the company follows more earnings management practices reporting higher earnings than it should.

*B. Double linier analysis*

Table 2. Hypothesis Test Result

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate	Durbin-Watson
1	.465 <sup>a</sup>	.216	.151	.00177	2.170

From Table 4.8, the corrected number of R Square (R2) is 0.216. This shows that the percentage contribution of institutional property. Company size. The leverage for managing profits is 21.6%. While the remaining 78.4% is influenced by factors other than the regression model.

*C. F test (Fitting Test)*

Stimulant effect testing is basically to determine whether the explanatory variable affects the dependent variable simultaneously or simultaneously, so that the model built can be continued to test the partial hypothesis (T-Test).

Model		Sum of Squares	Df	Mean Square	F	Sig.
1	Regression	.000	3	.000	3.310	.031 <sup>b</sup>
	Residual	.000	36	.000		
	Total	.000	39			

It is known from the SPSS processed table above, the calculated F value is 3.310, and the F table value for level = 5 is 2.86, so F-count > F TABLE (3.310 > 2.86), it is also known that the probability value of the test The above F is 0.031, lower than the 0.05 level of significance. T test.

*D. T test (Parsial test)*

The t-test shows that it has a high influence on the independent variable on the dependent variable. The t-test in this study can be seen in Table 4.8, namely:

Model	Unstandardized Coefficients		Standardized Coefficients	T	Sig.
	B	Std. Error	Beta		
1 (Constant)	.006	.016		.385	.702
Kepemilikan Institusional	-.005	.002	-.489	-2.763	.009
Ukuran Perusahaan	.000	.001	-.064	-.224	.824
Leverage	.005	.003	.374	1.401	.170

The explanation of the table above is as follows:

- The calculated t variable of institutional ownership is 4,444 2,763, and the value of t table is  $\alpha = 5\%$  ( $\alpha / 2$ ; nk1).  $df = 0.025;26$  is 2.056, then  $T \text{ Count} > T \text{ table}$  ( $2.763 > 2.056$ ), Sig is  $0.009 < 0.05$  (reject  $H_0$ , accept  $H_1$ ), indicating that institutional stock ownership has a significant negative effect on earnings managements.
- The firm's scale variable is T Count 0.224, and the value of T table and  $\alpha = 5\%$  ( $\alpha/2$ ; nk1).  $df = 0.025;26$  is 2.056, then  $T \text{ Count} < T \text{ table} > 0.05$  ( $H_0$  is accepted,  $H_2$  is rejected), indicating that the firm's scale variable has no effect on the company's management performance. So,  $H_2$  (firm size affects earnings management) is rejected.
- The value of T Calculate the financial leverage variable is 1.041, and the value of t table is  $\alpha = 5\%$  ( $\alpha/2$ ; nk1).  $df = 0.025;26$  is 2.056, then  $T \text{ Count} < T \text{ table} > 0.05$  ( $H_0$  is accepted.  $H_3$  is rejected) This means that there is no influence between financial leverage and earnings management, so the third hypothesis is rejected.

## V. DISCUSSION

### a. The Effect of Institutional Ownership on Earnings Management.

The test results show that organizational ownership partially has a significant and negative effect on earnings management. This means that the higher the ratio of organizational ownership, the lower the possibility of earnings management practices. With additional oversight from institutional investors such as outsiders, companies can prevent management from acting opportunistically in financial statements, and management will be more likely to choose policies to achieve their goals, profits that investors want.

### b. The Effect of Firm Size on Earnings management.

Partly, there is no effect of firm size and profitability management. Therefore, firm size has no effect on managing results. According to (Paramitha & Firnanti, 2018), there is no incentive to practice yield management because large companies are more interested in shareholders and foreigners, but not necessarily small companies practice performance management. Since small businesses want better growth opportunities and require considerable external capital, they need to improve good corporate governance.

### c. Effect of Financial Leverage on Earnings management.

Some test results lack leverage and yield management. This means that the higher or lower the debt does not affect the practice of earnings management. Indeed, the companies studied are companies with a leverage value of less than 1 or 100%, so they are always classified as safe companies.

## VI. CONCLUSION AND RECOMMENDATION

### A. Conclusion

The results of research and discussion of data analyzing show the impact of organizational ownership, company scale and financial leverage on profitability management in manufacturing companies listed in LQ45 for the 2013-2020 period, in this study conclusions can be drawn as we can see below:

The results of the model fit test (F-test) show that institutional ownership, firm size and leverage all affect earnings management in manufacturing companies listed in LQ45.

1. The higher the institutional share ownership, the lower the company's earnings management practice because of the tight supervision of institutional investors, so there is an unfavorable effect on management's earnings management.
2. In part, company scale does not affect earnings management. Company size, which is calculated as the log of total assets, is not a yardstick for earnings management companies as there are many other factors that investors take more into account.
3. Partially, financial leverage does not affect earnings management. This means that high and low leverage ratios Represented by the debt-to-asset ratio (DAR), the company will not be forced to manage earnings, because if the company's leverage level is high, the company may not be able to pay all of its guaranteed debt and guaranteed assets, if that happens. , the company will not choose Earnings Management because there will be strict supervision by lenders.

### B. Recommendation

The recommendations from the researcher for the next researcher who will study with the same topic, we consider:

1. By looking at the results of the coefficient of determination in this study which is still quite low, namely 21.6%, the researcher suggests to any party who wants to re-examine that other variables are added.
2. It is hoped that for further researchers the number of research samples will increase not only by utilizing the manufacturing sector but also other sectors so that the results can be compared
