**“RECOVER TOGETHER, RECOVER STRONGER: CHALLENGES AND OPPORTUNITIES TOWARD SUSTAINABLE DIGITAL ECONOMY”**

Economic growth is expected to slow down in various developed and developing countries as the Covid-19 epidemic spreads, owing to the decline of globalization and the rise of digitalization and financial risk. To deal with the global economic slowdown and to address different economic issues, the government of Indonesia implemented an economic transformation agenda. At the same time, the business sector must be able to develop a long-term competitive edge. Companies must seek a long-term competitive edge by synergizing management capabilities, technological competence, and innovation strategies to respond to external trends and events.

Sustainable Collaboration in Business, Information and Innovation (SCBTII) 2022 is an international conference that brings together academics, professionals, entrepreneurs, researchers, learners, and other associated groups from all over the world that is interested in theories, as well as practices in the field of the digital economy for global competitiveness.

With the Theme: “Recover Together, Recover Stronger: Challenges and Opportunities Toward Sustainable Digital Economy”, we are pleased to announce that His Excellency Erick Thohir (Minister of State-Owned Enterprises Republic of Indonesia) and distinguished colleagues Prof. Hussain Rammal (The University of Adelaide – Australia), Prof. Hitoshi Mitomo (Waseda University – Japan), Dr. Tan Cheng Ling (Universiti Sains Malaysia ), Dr. Krishnadas Nanath (Middlesex University – Dubai) and Dr. Andry Alamsyah (Telkom University, Indonesia) will be speaking at the conference as keynote speakers.

This conference provides opportunities for both presenters and participants to exchange new ideas and experiences, build research relationships, and find global partners for future collaboration in order to successfully and effectively respond to social and technological development challenges.

## **PREFACE**

Economic growth is expected to slow down in various developed and developing countries as the Covid-19 epidemic spreads, owing to the decline of globalization and the rise of digitalization and financial risk. To deal with the global economic slowdown and to address different economic issues, the government of Indonesia implemented an economic transformation agenda. At the same time, the business sector must be able to develop a long-term competitive edge. In other words, companies must seek a long-term competitive edge by synergizing management capabilities, technological competence, and innovation strategies to respond to external trends and events.

Sustainable Collaboration in Business, Information and Innovation (SCBTII) 2022 is an international conference that brings together academics, professionals, entrepreneurs, researchers, learners, and other associated groups from all over the world interested in theories, as well as practices in the field of the digital economy for global competitiveness.

The theme of SCBTII 2022 is: "Recover Together, Recover Stronger: Challenges and Opportunities Toward Sustainable Digital Economy", which was attended by Mrs. Loto Srinaita Ginting, Special Advisor on Finance and SME Development, Ministry of State-Owned Enterprises of the Republic of Indonesia and distinguished colleagues as the speakers.

This conference has provided opportunities for presenters and participants to exchange new ideas and experiences, build research relationships, and find global partners for future collaboration successfully and effectively respond to social and technological development challenges. Thank you very much to the respected presenters and all the participants of SCBTII 2022. Please participate again in SCBTII next year.

Yuhana Astuti, S.Si.,S.E., M.T., M.Agr., Ph.D

The 13<sup>th</sup> SCBTII 2022 Chairperson

## Analysis Of The Impact Index Of Human Development In The Province Of East Kalimantan And Factors Influencing It

Luqyana Widy Indria Husna<sup>1</sup> and Dr. Daryono Soebagiyo, M.Ec<sup>2</sup>,  
<sup>1,2</sup>Muhammadiyah Surakarta University, Economic Development, Faculty of Economics and Business Muhammadiyah Surakarta, Sukoharjo, Central Java, Indonesia.

### Abstract

*Human Development Index (HDI) is one of the most important indicators for measuring success in building human quality of life. The research aims to analyze the magnitude of some variables in the model's impact on human development index in east kalimantan in 2017-2020. Human development index in the eastern Kalimantan province of 2010 to 2021 tended to increase by an average growth of 0.69% each year. By 2020, the east kalimantan fall by 0.48%, as the covid19 pandemic has affected people's restraint and the impact on poor economies. In 2017-2020, Balikpapan, Samarinda, Bontang, had a highly elevated human development index, causing progress to be driven by improved education dimensions and improved standards of living and school friendly expectations. The study uses a quantitative method with the data panel regression model. In the regression data panel model there are some test models (cem, fem, rem), test chow, hausman test, test t, test F, R-square. In uji F of probabilitas 0,0000, there was a chance that the country's minimum wage, poverty, unemployment, and education together could affect the number of human development index in east kalimantan. Based on the results of the R-square of 99.65% was affected by the variables in the model and the rest of the 0.35% were affected by those outside the model. Research has concluded that only the district's minimum wage variables affected the human development index in the eastern Kalimantan province of 2017-2020.*

*Keywords— human development index; district minimum wage; poverty; unemployment; education*

### I. INTRODUCTION

The economic development of a region is affected by human development processes. Such achievements are not without measure the human quality of a region. An indicator of the quality of people in the region is the human development index (HDI). The ipm is an indicator of how it measures one important aspect of the quality of economic development, the degree of human development.

The human development index is one of the indicators for measuring the level of physical and non-physical quality of the population (andaiyani,2012). The human construction index is a composite index that includes three presumed basic areas of human development that are viewed by the physical and non-physical qualities of the population. These are also the three indicators: health indicator, education level and economics. While physical quality is polluted from life expectancy, non-physical quality is reflected in its average length - the average population in school, literacy and considering its economic capability of real capital expenditure.

The difference in public welfare levels can lead to inequality and inequality between areas. To measure the extent of human development development, it is aimed at analyzing how much the minimum wage of districts/cities is affected by the human development index (HDI) in the eastern provinces of 2017-2020.

Table 1. Index For East Kalimantan Development Man Province

Year	HDI
2017	75,12
2018	75,83
2019	76,61
2020	76,24
2021	76,88

Sources: data from east kalimantan province

Poverty, Human Development Index and economic growth in several regions in Indonesia and make it as a reference to understand the relationship of economic growth and Human Development Index with poverty in Indonesia.

## II. LITERATURE REVIEW

The problem of poverty is generally related to several factors such as the quality of human resources and economic growth. Where the decline in the quality of human resources and economic growth in a region will have a negative impact on the level of poverty, and vice versa. Introduction covers the background of the issue or problem and the urgency and rationalization of activities (research or service). The objectives of the activities and problem solving plan are presented in this section. Relevant literature reviews also included in this section.

### A. Human Development Index Theory

The United Development Program (UNDP) defines human development as a process of expanding people's choices. The most important choice is to live a healthy long life, get adequate education and enjoy a decent standard of living (Hakim, 2002). UNDP compiles an alternative measure of well-being by using the Human Development Index. Human Development Index (HDI) is a composition index based on three indicators, namely health, education and standard of living (Arsyad, 2010)

### B. Quantity Theory Of Money (Irving Fisher)

According to (Kuncoro, 2009), the components seen in measuring HDI are based on the basic components of quality of life consisting of life expectancy, literacy rate and average length of schooling and decent living standards. The determination of the HDI category is based on a scale of 0.0-0.10 consisting of: 1. Low category: HDI value 0-0.05 2. Middle category: HDI value between 0.51-0.79 3. High category: HDI 0.8-1 Cambridge Marshall Pigou theory. Components of the Human Development Index a. Longevity as a measure of Health and nutrition. Longevity is measured by the average life expectancy (in years) of the 31st birth rate, calculated by assuming that a baby born in a given year will experience the instantaneous mortality rate of each age group throughout his life (Hakim, 2002).

### C. Poverty Theory

Poverty is a condition when a person cannot meet his basic needs for life. Or a limitation to meet their needs for food, health, education and welfare in social conditions. Where in the social life of the male and female population have limitations to get a more decent life such as clean water, habitable housing, jobs that can improve the quality of life of 18 people, and higher education that can be achieved. In fact, it is not only the limitations that are experienced by the poor because in other conditions the poor are not uncommon to experience the threat of living conditions such as malnutrition experienced due to Nutritional Insufficiency obtained which poor nutrition can cause death. So that poverty eradication is needed to cut all these limitations with various policies or approaches undertaken by the government (Bappenas: 2004). Transaction motives and precautions.

Precautionary motive: people will benefit from holding money to deal with unforeseen circumstances, because of the liquid nature of money, which is easily exchanged for other goods. According to Keynes, the demand for money for precautionary purposes is influenced by the same factors that affect the demand for money for transactions, that is, it is mainly influenced also by the level of income of the person, and may also be influenced also by the interest rate (although it is not strong influence).

### D. Factors Causing Poverty

Poverty is a problem that always exists in a country or region where these problems are related to productivity, production and consumption in the development of society or individuals as a manifestation of government policies contained in national development. This poverty grows not only naturally without cause and effect but can occur because there is no change from generation to generation that causes poverty to continue to exist. Poverty sometimes makes its inhabitants feel discriminated by social inequalities that cannot be avoided by the poor.

Various kinds of poverty according to Arsyad Lincoln (1997) these kinds of poverty include:

- a. Absolute poverty someone who belongs to the absolute poor if someone is unable to meet their basic needs to achieve survival, someone can be called a poor population.
- b. Relative poverty a person belongs to the relative poor if he has been able to meet the basic needs of his life, but still much lower than the surrounding community conditions.

*E. Relationship Between Poverty Index And Development*

The relationship between poverty and Human Development Index level of Health and education can affect poverty. Improvements in health made by the government can improve public health, and school-age children can attend school and receive lessons well. The level of Education makes workers have skills and knowledge which in turn causes productivity to increase and income also increases. This causes economic growth to increase which will then cause the level of poverty to decrease. There is an important relationship between HDI and earning capacity. Income is the main determinant and result of capital shortage low productivity low income low savings low investment 22 of human development. Poor people use their labor to participate in economic growth, but poverty due to lack of education, as well as poor nutrition and health reduces their capacity for work. Thus, the result of low HDI is that the poor cannot take advantage of productive income opportunities due to economic growth. Therefore, the provision of basic social services is an important element in poverty management (Kanbur and Squire,1999).

*F. Unemployment*

Unemployment is a condition found in developed and developing countries which means a state of the population which is the labor force but has not found a job but is still said to be actively looking for work (Nanga, 2001:253). A resident who is not working but is looking for work cannot be categorized as unemployed and a resident can be said to be unemployed when the resident is included in the labor force but has not obtained a job (Sukirno, 2000:472).

*G. Unemployment*

Unemployment is a condition found in developed and developing countries which means a state of the population which is the labor force but has not found a job but is still said to be actively looking for work (Nanga, 2001:253). A resident who is not working but is looking for work cannot be categorized as unemployed and the population can be said to be unemployed when the population is included in the labor force but has not obtained a job (Sukirno, 2000:47) magam-macam unemployment according to Case and Fair (2004:54), unemployment can be divided into several kinds, as follows:

- a. Frictional unemployment (frictional unemployment) frictional unemployment is a type of unemployment that arises as a result of changes in working conditions, which occur along with economic developments or dynamics that occur.
- b. Seasonal unemployment refers to the fluctuating state of the economy. in general, this unemployment only lasts a certain time in one year. 24
- c. Cyclical unemployment is a condition in which economic activity is slow and results in production restrictions in a company or a reduction in employee working hours or even the threat of employee reduction, this condition causes an increase in unemployment.
- d. Structural unemployment structural unemployment occurs because economic conditions are growing rapidly with increasing production or technology in a company that causes high qualification requirements by a company for job applicants. From the qualifications set by the company make job applicants unable to meet the qualifications set by the company.

The relationship between unemployment and Human Development Index Todaro (2000) suggested that human development is the goal of development itself. Where human development has a role to shape the success of a country in an effort to absorb increasingly modern technologies as a goal for individual capacity development in improving the quality of work and reducing unemployment to achieve sustainable human development. Based on the overcoming of unemployment and the impact on increasing the income of 25 a population that will have an impact on improving human development with various improvements in the quality of life that has been achieved such as nutritional needs, household consumption and education, the reduction of unemployment can experience changes in the Human Development Index is increasing.

Unemployment is a reality faced not only by developing countries, but also by developed countries. In general, unemployment is defined as a situation where a person belonging to the category of labor force (labor force) does not have a job and is actively looking for work. A person who does not work, but is actively looking for work cannot be classified as unemployed. To measure unemployment in a country is usually used what is called the unemployment rate (unemployment rate) is the number of unemployed expressed as a percentage of the total labor force (labor force). While the labor force itself is the number of people who work and do not work, who are in certain age groups in Indonesia for example, included in the labor force are those aged 10 years and over; while in the USA are those aged between 15 64 years).

To determine the size of the unemployment rate can be observed through two approaches, among others, as follows :

- a. Labor force approach the size of the unemployment rate is calculated based on the percentage of the ratio between the number of unemployed people and the number of labor force.
- b. Labor utilization approach to determine the size of the unemployment rate based on the labor utilization approach, among others:
  1. Fully employed: people who work full time or work 35 hours per week.
  2. Underemployed are those who work, but have not been fully utilized, meaning that their working hours in a week are less than 35 hours

### III. RESEARCH METHODOLOGY

#### A. Methods Of Analysis

##### a. Data Types And Data Sources

The method of data collection in this study is the secondary data obtained from the Central Statistics Agency (BPS). Data on all variables to be studied starting from 2017 to 2020.

##### b. Analysis Tools

Regression analysis of Panel data with econometric models (estimators) as follows:

$$IPM_{it} = \beta_0 + \beta_1UMK_{it} + \beta_2JPM_{it} + \beta_3TPT_{it} + \beta_4IHK_{it} + \varepsilon_{it}$$

IPM	= Human development index
UMK	= Minimum wage
KEMIS	= Number of Poor Population
TPT	= Open unemployment
IHK	= Education
$\beta_0$	= Intercept or Konstanta
$\beta_1\beta_2\beta_3\beta_4$	= Shows the regression coefficient of the independent variable
$i$	= Shows Regency or City cross section data
$t$	= Shows time series data for 2017-2020
$\varepsilon$	= Error term (Error factor)

Research methodology, The research method describes the design of activities, scope or object, main materials and tools, place, data collection techniques, operational definitions of research variables, and analytical techniques. [Times New Roman, 10, normal].

#### IV. RESULT / FINDING

The results of panel data regression estimation with Pooled Ordinary Least Square (PLS), Fixed Effect Model (FEM), and Random Effect Model (REM) approach can be seen in Table 1.

Table 1. Panel Data Regression Estimation Results

Variabel	Koefisien Regresi		
	CEM	FEM	REM
C	5.089.214	6.509.214	5.457.987
UMK	-5,36E-07	8,81E-07	1,06E-07
JPM	-0,389138	-0,218508	-0,594891
TPT	-0,062979	-0,063163	-0,010935
IHK	3.050.742	0,961344	2.559.348
R-squared	0,970193	0,996518	0,902434
Adj,R-squared	0,966468	0,99455	0,890238

Prob F-statistik	0,00000	0,00000	0,00000

A. *Uji Chow*

Table 2. Hasil Uji Chow

Effects Test	Statistic	d.f.	Prob.
Cross-section F	19.321043	(9,23)	0.0000
Cross-section Chi-square	79.444471	9	0.0000

Source: Eviews Regression Data

The conclusion of the Chow Test is that the conclusion is H<sub>0</sub> is rejected because the p value for F and Chi Square (0.0000 and 0.0000) ≤ 0.05. So the best model to use is the Fixed Effect Model (FEM).

B. *Hausman Test*

Table 3. Hausman Test Results

Test Summary	Chi-Sq. Statistic	Chi-Sq. d.f.	Prob.
Cross-section random	14.027630	4	0.0072

Source: Eviews Regression Data

The conclusion H<sub>0</sub> is drawn because the p-value for Chi-squared (0.0072) < 0.05. The best Model to use is the fixed effects model (Fem).

Based on the model selection test published above, the best model used is the Fixed Effect Model (FEM). The estimated results of the fixed effects model (fem) are shown in Table 4.

Table 4. Hasil Estimasi Fixed Effect Model

$IPM_{it} = 65,09214\beta_0 + 8,81E - 07UMK_{it} - 0,218508 JPM_{it} - 0,063163TPT_{it} + 0,961344IHK_{it}$

*** Signifikan pada $\alpha = 0,10$		

Result section presents the results of the study. Research results can be supplemented with tables, graphs (pictures), and / or charts.

## V. DISCUSSION

A. *Test The Goodness Of The Model*

Based on Table 4, it is known that the empirical statistical significance of F in the FEM estimate has a value of 0.0000 (<0.01) so that H<sub>0</sub> is rejected. The conclusion is the model used in this study excision. Based on Table 4 The coefficient of determination (R<sup>2</sup>) shows the predictive power of the estimated model. Based on Table 4.4 known value (R<sup>2</sup>) for Fixed Effect Model (FEM) of 0.99455, meaning that 99.45% variation of Human Development Index variable (HDI) can be explained by the district minimum wage variable, the number of poor people, open unemployment rate and CPI. The remaining 0.55% is influenced by variables or other factors that are not included in the research model.

B. *Influence Validation Test*

Table 5. Effect Validation Test Results

Variabel	t-statistik	Prob,t	Criteria	Conclusion
UMK	2.610.122	0,0157	<0,05	Signifikan $\alpha = 10\%$
JPM	-0,718758	0,4795	>0,10	no Signifikan
TPT	-0,922053	0,3661	>0,10	no Signifikan
IHK	1.482.428	0,1518	>0,01	no Signifikan

Source: Eviews Regression Data

Based on the effect Validation Test (t test) that has been described above, there is one independent variable that has a significant effect and three independent variables that do not have a significant effect on the Fixed Effect Model (FEM). Variables that affect the Human Development Index is the district minimum wage, while the number of poor people, open unemployment rate, and RLS has no significant effect.

District minimum wage variable has a regression coefficient of  $-8.81 \text{ E-}07$ . The pattern of the relationship between the district minimum wage and the Human Development Index is linear so that if the district minimum wage increases by 1%, The Human Development Index will increase by  $8.81 \text{ E-}07$  index numbers. Conversely, if the amount of economic growth decreased by 1%, The Human Development Index will decrease by  $8.81 \text{ E-}07$  index Figs. These results are in accordance with research conducted Moh. Faizin (2019). The results of partial hypothesis Test (t test) on the minimum wage states that the independent variable has a significant influence on the HDI, because the probability value obtained is smaller than  $(0.000 < 0.05)$ . Thus, the results of this analysis states the first hypothesis raised in this study is that the minimum wage prevailing in a region positively and significantly affect the value of HDI in the area can be proven empirically.

Variable number of poor people has a regression coefficient of  $-0.218508$ . The pattern of the relationship between the number of poor people with Human Development Index is linear so that if the number of poor people has increased by 1%, The Human Development Index will decrease by  $0.218508$  index numbers. Conversely, if the number of poor people decreased by 1%, The Human Development Index will increase by  $0.218508$  index Figs. This is in line with research conducted by Siti Nur Fatimah (2018) with the results of provincial poverty having a coefficient value of  $1.507112$ , with a t count of  $0.600007$  and a probability of  $0.5522$ . Where the probability is more than  $\alpha = 10\%$ , which means it is not significant to the Human Development Index.

Variable number of open unemployment rate has a regression coefficient of  $-0.063163$ . The pattern of the relationship between the open unemployment rate with the Human Development Index is linear so that if the open unemployment rate increases by 1%, The Human Development Index will decrease by  $0.063163$ , the index Fig. Conversely, if the open unemployment rate decreased by 1%, The Human Development Index will increase by  $0.063163$  index Figs. This result is in line with the research conducted with the results that show based on the results of hypothesis testing shows that unemployment does not affect the HDI. This can be seen from the significant value of  $0.370 > 0.05$ . The theory carried out by Wahyuni (2005) says that the unemployment rate is the state of a person who does not work or is looking for work in order to earn income. When the unemployment rate increases then the decent living index of a society increases then the companies will employ more labor so that the decent living index level of the workers will increase so that it will reduce the Human Development Index.

CPI variable has a regression coefficient of  $0.961344$ . The pattern of the relationship between the CPI with the Human Development Index is linear so that if the CPI has increased by 1%, The Human Development Index will increase by  $0.961344$ , the index number. Conversely, if the CPI decreased by 1%, The Human Development Index will decrease by  $0.961344$  index Figs. These results are in line with research conducted Rivo M, et al. (2022). The results obtained based on the test conducted obtained the result that the value of the CPI table 2013-2107 is  $-1.11$  then  $t_{hitung} < t_{table}$ , means there is no influence between the CPI to the HDI 2013-2017.  $T_{hitung}$  value of GDP 2013-2107 is  $0.256$ , then  $t_{hitung} < t_{table}$ , means there is no full between GDP against HDI 2013-2107. Of the two variables economic conditions there is no significant influence on the Human Development Index in Central Java Province in 2013-2017.

The discussion section describes the results of data processing, interpreting the findings logically, linking them with relevant reference sources. [Times New Roman, 10, normal].

## VI. CONCLUSION AND RECOMMENDATION

The best panel data model selection test results prove that the Fixed Effect Model (FEM) is the selected model. Based on the goodness model test on the Fixed Effect model (FEM) approach model, it is proven that the exsist estimated model with detrminant coefficient (R<sup>2</sup>) of 0.996518, meaning that 99.45 percent of the variation in the Human Development Index is influenced by variations in the district minimum wage, the number of poor people, the open unemployment rate, education. Based on the effect Validation Test (t test), it can be seen that partially the minimum wage variable has a positive and significant effect on the Human Development Index (HDI) in East Kalimantan province, while the number of poor, Open unemployment, CPI variables have no significant effect on the Human Development Index (HDI) in East Kalimantan province. In the F test of 0.0000 so that it can be seen that the district minimum wage, the number of poor, Open unemployment rate, CPI jointly affect the Open Development Index.

## Analysis of Determinants of Indonesian Coffee Exports to the United States Period 2001-2020

Mei Sopiani<sup>1</sup> and Eni Setyowati<sup>2</sup>

<sup>1</sup>Development Economic, Muhammadiyah Surakarta University, Sukoharjo, Indonesia

### Abstract

*The era of economic openness allows international trade or buying and selling between countries such as exports to be carried out. The United States is the destination country with Indonesia's largest coffee export value, considering the country's high coffee consumption. This study aims to examine the effect of the variables Gross Domestic Product, Exchange Rate, International Coffee Prices, and Domestic Coffee Production on Indonesian Coffee Exports to the United States. The analytical method used in this research is Ordinary Least Square (OLS) regression analysis. This research was conducted in Indonesia. This research is a quantitative study using secondary data obtained from the Central Statistics Agency (BPS) and the World Bank. The results showed that Gross Domestic Product and Domestic Coffee Production had a significant effect on Indonesian Coffee Exports to the United States for the period 2001 to 2020.*

*Keywords— Export, Gross Domestic Product, Exchange Rate, International Coffee Prices, Domestic Coffee Production*

---

### I. INTRODUCTION

Globalization has made countries dependent on one another, and they can no longer separate themselves from other countries. Because the country cannot meet all of the country's domestic demands. Furthermore, countries are interconnected due to variations in resource ownership and a country's limited ability to create commodities or services independently. As a result, international trade is required to address this situation. According to Setiawan & Lestari (2011), international trade is a purchasing and selling transaction between countries that is carried out on the basis of a mutual agreement. Export activities are one type of international trade. The act of exporting things abroad in order to increase a country's foreign exchange earnings is known as export. If domestic output surpasses domestic demand and meets the standards for sale on the global market, exports are carried out.

Indonesia is a subtropical country with the potential to develop resources other than oil and gas, including plantation commodities. Plantation items continue to dominate some of Indonesia's top products. Coffee is one of the most important plantation products. Coffee is Indonesia's most valuable commodity, serving as a source of foreign exchange, employment, and income for farmers and other economic actors involved in the cultivation, processing, and marketing of coffee beans, particularly in the country's largest coffee-producing regions, such as South Sumatra, Lampung, Sumatra, North, and East Java (Turnip, 2002). After palm oil, rubber, and coconut, coffee was Indonesia's fourth major agricultural commodity (particularly plantations) in 2019. Coffee exports totaled 0.36 million tons, with an export value of US\$ 0.88 billion.

Despite the fact that the plantation sub-sector is the most important, the coffee commodity still need improvement in terms of governance and marketing. Not only that, but there are other factors to consider as well, such as competitiveness, because commodity competitiveness can influence export performance (Kartini, 2018). As a result, the state of the commodity products, the amount of these commodities, and how these commodities contribute at the global level influence the formulation of plans to enhance exports in the plantation sector. After Brazil, Vietnam, and Columbia, Indonesia is the world's largest coffee producer. Brazil will be the world's leading coffee producer between 2016 and 2020, with an average production of 3.19 million tons. Second, Vietnam produced 2.01 million tons on average, followed by Columbia, which produced 840.37 thousand tons on average. With an average production of 725.68 thousand tons per year, Indonesia is the world's fourth largest producer.

Robusta coffee is produced primarily in Vietnam and Indonesia, while arabica coffee is produced primarily in Brazil and Columbia (ICO, 2018). Coffee is a high-value global commodity and one of the most widely consumed beverage components on the planet. According to the International Coffee Organization (ICO), global coffee consumption in 2020-2021 is expected to reach 167.58 million bags, up 1.9 percent from the previous year's Fig of 164.43 million sacks (Dera, 2021). Millennials and parents are adopting the trend (Wibowo, 2019).

Fig 1. Coffee Production in Indonesia from 2016 to 2020

The production of coffee in Indonesia varies, as seen in Fig 1. Extreme weather fluctuations and high rainfall lead coffee production to surge and decline. In 2016, coffee production was 449,536 tons, which climbed to 503,385 tons in 2017, 530,305 tons in 2018, 531,558 tons in 2019, and 541,569 tons in 2020. As a result, coffee production is expected to rise from 2016 to 2020. In order for Indonesia's coffee commodity to compete in the international market, it must maintain its quality by employing superior and high-quality seeds, ensuring that Indonesian coffee output remains constant and grows year after year. Between 2001 and 2020, the majority of coffee plantations in Indonesia grew 80.36 percent robusta coffee, covering an average area of 979.20 thousand hectares, while Arabica coffee covered only 239.39 thousand hectares, accounting for 19.63 percent of the total area of Indonesian people's coffee plantations. As one of the world's largest coffee producers, Indonesia's purpose in supplying coffee goods is to increase exports.

Fig 2. The Value of Coffee Exports by Major Destination Countries  
(Thousand US\$) 2016-2020

Fig 2 shows that the United States has been the main destination for Indonesian coffee exports for the past five years, with a total export value of around US\$ 1.24 million, followed by Japan with a total export value of US\$ 377.6 thousand, Germany with a total export value of around US\$ 331.5 thousand, Malaysia with a total export value of US\$ 327.4 thousand, and finally Italy with a total export value of around US\$ 304.7 thousand. 68 percent of adults in the United States claim they have a cup of coffee every day (VOA, 2018). Starbucks is a coffee franchise in the United States that uses coffee from Indonesia. As a result, the United States becomes a prospective market for Indonesia's coffee exports.

Based on the foregoing context, this research will look at the impact of the GDP, the rupiah exchange rate versus the dollar, international coffee pricing, and domestic coffee production on Indonesian coffee exports to the United States from 2001 to 2020.

## II. LITERATURE REVIEW

### A. *International Trade*

International trade is a type of economic cooperation in which a country trades commodities or services with other countries in order for the countries involved to benefit economically. It is also based on numerous requests and offers of goods or services in each country, in addition to advantages such as the economic benefits of international trade (Jamilah, 2021).

Export is the process of selling goods or services outside of the customs region in compliance with government regulations and legislation. All national areas of a country are considered customs areas (Purnawati, Astuti & Fatmawati, 2013). The export purpose of foreign trade is to generate profits for the country, resulting in an increase in national revenue or foreign exchange, which can lead to an increase in output and the pace of economic growth. The flow of trade of an item from another country into the country is known as import (Winarno & Ismaya, 2003). Imports are the costs of buying or using goods or services from other countries.

### B. *Gross Domestic Product (GDP)*

The market value of all final goods and services generated in the economy during a given time period is known as Gross Domestic Product (Mankiw, 2006). The worth of goods and services measured using current prices is known as nominal GDP. The worth of goods and services assessed at constant prices is referred to as real GDP.

A relationship of GDP and exports is positive. When it comes to international trade, a high GDP can boost people's purchasing power (Risma et al., 2018). According to Desnky et al 2018. research, Indonesia's coffee exports are influenced by GDP. The GDP variable has a considerable effect on the value of Indonesian coffee exports, according to Maulani & Wahyuningsih, 2021. According to Lillah (2016), the United States' GDP has a substantial impact on Indonesian coffee exports to the United States.

### C. *Exchange rate*

The exchange rate is the price of one country's currency versus the price of another country's currency. The nominal exchange rate is the price of a currency when it is exchanged between two countries. The real exchange rate, on the other hand, is the relative cost of commodities between two countries.

Foreign items are relatively inexpensive when the actual exchange rate is high, whereas domestic goods are substantially more expensive. Foreign goods are more expensive when the real exchange rate is low, whereas domestic items are less expensive (Mankiw, 2006). Maulani & Wahyuningsih's research from 2021 found that the exchange rate had no substantial impact on the value of Indonesian coffee exports. According to Afriamah et al., 2021, the currency rate has no bearing on the volume of Gayo coffee exported to the United States.

### D. *International Coffee Prices*

Price is a unit of value assigned to a commodity by commodity producers as counter-performance information. According to economic theory, the high and low prices of an item or service with a competitive market are determined by market supply and demand. When the price of international coffee rises, demand decreases; on the other hand, when the price of coffee lowers, demand increases. Wijayanti et al., 2021 found that global coffee prices had little effect on demand for Indonesian coffee exports to the United States.

### E. *Domestic Coffee Production*

Production is an economic activity that transforms inputs into outputs by changing shape (form utility), moving places (place utility), and storing (store utility) to maximize opportunities (Suhardi, 2016).

According to Heckscher and Ohlin's (Hamdy, 2001) production theory, a country has a proclivity to export products with low production costs and abundant supply. Meanwhile, things that are relatively expensive to produce and are only available in restricted numbers will be heavily imported. Increased demand for exports may emerge from increased worldwide market demand, resulting in increased output. According to Maulani and Wahyuningsih (2021), Indonesian coffee output has a substantial impact on the value of Indonesian coffee exports. Putri et al., 2018 found that Indonesian coffee production variables had a substantial impact on the value of Indonesian coffee exports in a previous study.

### F. *Previous research*

Ordinary Least Square (OLS) regression analysis was used by Wijayanti et al., (2021). With a significant empirical t of 0.0591 ( $< 0.05$ ), 0.0002 ( $< 0.01$ ), 0.0057 ( $< 0.5$ ), 0.0001 ( $< 0.01$ ), the t-test concludes that the real effective exchange rate, Indonesian inflation, world tea prices, and the population of the United States have a significant effect on the demand for Indonesian coffee exports to the United States, while real GDP per capita and world coffee prices have no significant effect on the demand for Indonesian coffee exports to the United States.

Elisha, (2015), using the Error Correction Model's regression analysis (ECM). Coffee production has an empirically significant t of 0.0451 ( $< 0.05$ ), while world coffee prices and exchange rates have empirically significant ts of 0.1582 ( $> 0.10$ ) and 0.1501 ( $> 0.10$ ), respectively.

Ordinary Least Square (OLS) regression technique was used by Desnky et al., (2018). With empirical significance of 0.0011 ( $< 0.05$ ) and 0.0488 ( $< 0.05$ ), the t-test revealed that GDP and exchange rate had a significant effect on

Indonesia's coffee exports. With significant empirical  $t$  of 0.9636 ( $> 0.10$ ) and 0.8183 ( $> 0.10$ ), the variables of coffee output and international coffee prices had no significant effect on Indonesian coffee exports.

Ordinary Least Square (OLS) regression analysis was used by Novariani et al., (2021). According to the regression results, the variables of Indonesian coffee bean production, exchange rates, and international coffee prices all have a substantial impact on the volume of Indonesian coffee bean exports to Japan. The volume of Indonesian coffee bean exports to Japan is influenced in part by worldwide coffee price and exchange rate variables. Meanwhile, Indonesian coffee bean production has little impact on the volume of Indonesian coffee beans exported to Japan.

In the period 1993-2011, Komaling (2013) investigates the factors that influence Indonesian coffee shipments to Germany. analysis of regression Least Squares in the Real World (OLS) The findings of this study show that German per capita income, global coffee prices, and German coffee consumption all have a considerable impact on the volume of Indonesian coffee exports to Germany, whereas world tea prices had no impact.

The Error Correction Model (ECM) approach is used in this study by Haryadi and Nopriyandi (2017). The findings of the estimation show that the volume of coffee exports is related to the price of coffee, Indonesia's Gross Domestic Product (GDP), and the exchange rate in both the short and long term. Coffee exports are influenced by coffee prices, GDP, and exchange rates in the short term.

The Error Correction Model (ECM) was utilized in this study by Putri et al., (2018) The  $t$ -test revealed that the Indonesian coffee production variable had a significant effect on the value of Indonesian coffee exports in the short run, but not in the long term. In the short term, the US consumption variable has no influence, but in the long run, US consumption has a considerable impact on the value of Indonesian coffee exports. While the coffee area variable has little bearing on the value of Indonesian coffee exports to the US.

Maulani & Wahyuningsih, (2021) examines Indonesian coffee exports to foreign markets. This study used panel data regression analysis with the Fixed Effect Model as the chosen regression model (FEM). The  $t$ -test found that GDP, international coffee prices, and Indonesian coffee production all had a significant effect on the value of Indonesian coffee exports, with significant empirical  $t$ s of 0.000 ( $< 0.01$ ), 0.000 ( $< 0.01$ ), and 0.002 ( $< 0.01$ ), respectively, while the exchange rate variable had no significant effect, with a significant empirical  $t$  of 0.942 ( $> 0.10$ ).

Tahani et al., (2021) investigates the factors that influence coffee exports from Indonesia to the United States. Ordinary Least Square (OLS) analysis is used in this study. The study's findings show that the United States GDP, exchange rate, and production all have a significant impact on Indonesian coffee exports to the United States, with significant empirical  $t$ s of 0.000 ( $< 0.05$ ), 0.005 ( $< 0.05$ ), and 0.006 ( $< 0.006$ ), respectively, while the inflation variable has no impact, with a significant empirical  $t$  of 0.828 ( $> 0.10$ ).

Explanatory Research utilizing a quantitative technique was used by Jamilah, (2021) in her research. With a significant empirical  $t$  of 0.024 ( $< 0.05$ ), 0.061 ( $< 0.05$ ), and 0.001 ( $< 0.05$ ), the  $t$ -test reveals that the rupiah exchange rate, international coffee pricing, and domestic output all have a substantial impact on the volume of Indonesian coffee exports. The rupiah exchange rate, international prices, and domestic output all have a substantial effect on the volume of Indonesian coffee exports, according to the F test.

### III. RESEARCH METHODOLOGY

#### A. *The Scope*

For the period 2001-2020, this study examines the impact of the Gross Domestic Product, Exchange Rate, International Coffee Prices, and Domestic Coffee Production on Indonesian Coffee Exports to the United States. This is a quantitative study that relies on secondary data from the Central Statistics Agency (BPS) and the World Bank.

#### B. *Operational Definition Variable*

##### *Export (EXP)*

The value of a set of products exported/imported (across Indonesian borders) without the use of non-PEB/PIB documentation, expressed in millions of US dollars.

##### *Gross Domestic Product (Gdp)*

GDP at buyer prices is the sum of gross value added by all resident producers in the economy, plus product taxes, minus non-product value subsidies. The data in this study is based on current GDP prices in trillions of dollars.

##### *Exchange Rate*

The Rupiah as for the Dollar exchange rate is an agreement known as the exchange rate of currency against present or future payments between two currencies.

##### *International Coffee Prices*

The International Coffee Organization (ICO), which is an organization or group of coffee exporting countries, is used to determine the price of international coffee. The data in this study is based on the annual average price of robust coffee in US\$/kg.

#### Domestic Coffee Product

Wet coffee beans and dry coffee beans are the two types of coffee beans produced. The coffee used in this study is robust, and the units are thousand US dollars per ton.

#### C. Techniques of Analysis

The Eviews 10 program is used in this study to perform Ordinary Least Square (OLS) regression analysis. The relationship and influence between the independent and dependent variables will be shown in this model. model Ordinary Least Square includes classical assumption tests such as multicollinearity test, normality test, autocorrelation test, heteroscedasticity test, and linearity test (t-test). Model goodness test includes model existence test (F test), interpretation of the coefficient of determination (R square test), and test the validity of the effect. The accompanying is the econometric model:

$$EXP_t = \beta_0 + \beta_1 \text{LogGDP}_t + \beta_2 \text{KURS}_t + \beta_3 \text{PRICE}_t + \beta_4 \text{PRODUCT}_t + \varepsilon_t$$

Where :

<i>EXP</i>	= Export (million US\$)
<i>GDP</i>	= <i>Gross Domestic Product</i> (trillion US\$)
<i>KURS</i>	= Exchange Rate(Rupiah/US\$)
<i>PRICE</i>	= International Coffee Prices (US\$/Kg)
<i>PRODUCT</i>	= Domestic Coffee Product (Thousand/Ton)
<i>Log</i>	= Operator Logaritma berbasis <i>e</i>
$\varepsilon$	= <i>Error Term</i>
$\beta_0$	= Constant
$\beta_1 \dots \beta_4$	= Coefficient of Regression Independent Variables
<i>t</i>	= the year <i>t</i>

#### IV. RESULT / FINDING

Table 1. Results of Regression

Variable	Coefficient	Std. Error	t-Statistic	Prob.
C	-8243038.	2598482.	-3.172252	0.0063
LOG(GDP)	290090.2	89903.86	3.226672	0.0056
KURS	-11.37872	7.388980	-1.539959	0.1444
PRICE	34433.85	25151.38	1.369064	0.1911
PROD	-0.588404	0.220463	-2.668941	0.0175
R-squared	0.911155	Mean dependent var		191154.9
Adjusted R-squared	0.887463	S.D. dependent var		86943.14
S.E. of regression	29166.39	Akaike info criterion		23.61174
Sum squared resid	1.28E+10	Schwarz criterion		23.86067
Log likelihood	-231.1174	Hannan-Quinn criter.		23.66033
F-statistic	38.45841	Durbin-Watson stat		2.004707
Prob(F-statistic)	0.000000			

Source: Authors' data was processed with Eviews in 2022

Model Existence Test (F Test) is used to see whether all independent variables in the model have the same effect on the dependent variable (simultaneous effect). The existence of the model is verified by comparing the statistical results with alpha. If the probability F-statistic  $< \alpha$ , this indicates that the independent variables affect the independent variables together. Table 1 demonstrates that the regression results have an empirical probability value of 0.0000 ( $< 0.01$ ), indicating that the independent variables of GDP, exchange rates, international coffee prices, and domestic coffee production have a significant impact on Indonesia's coffee exports to the United States.

Table 1 demonstrates that the coefficient of determination ( $R^2$ ) is 0.9112, meaning that independent factors including GDP, exchange rate, international coffee prices, and domestic coffee production can explain 91.12% of the variation in Indonesian coffee exports. Other factors not included in the model influenced the remaining 8.88 percent.

The effect validity test (t test) was used to determine the significance of each independent variable's influence (partial). The probability value of each variable is compared with alpha in this t-test. The independent variable has a significant effect if the probability is less than alpha. The GDP and domestic coffee production variables have a significant impact on Indonesian coffee exports, as shown in Table 1, with empirical probability t of 0.0065 ( $< 0.01$ ) and 0.0175 ( $< 0.05$ ) respectively. Because exchange rates and international coffee prices have empirical probability of 0.1444 ( $> 0.10$ ) and 0.1911 ( $> 0.10$ ), they have no significant effect on Indonesian coffee exports.

#### A. Results of a Classic Assumption Test

##### Multicollinearity Test

Table 2.

Variable	VIF	Criteria	Conclusion
<i>LOG(GDP)</i>	8,4425	$< 10$	Causes no multicollinearity
<i>KURS</i>	5,6256	$< 10$	Causes no multicollinearity
<i>PRICE</i>	4,7321	$< 10$	Causes no multicollinearity
<i>PROD</i>	2,7118	$< 10$	Causes no multicollinearity

The VIF test is the multicollinearity test that is applied. Multicollinearity in the VIF test happens when the independent variable's VIF value is more than 10.

##### Test of Residual Normality

A Jarque Bera (JB) test will be used to rate residual normality. If the probability value or empirical statistical significance of the JB test is greater than alpha, the residual distribution is normal. The residual distribution is normal since the probability or empirical significance JB is 0.3761  $> 0.10$ .

##### Test for Autocorrelation

The Breusch Godfrey (BG) test will be used to examine autocorrelation. The BG states that if the probability value or the empirical significance of the BG  $> \alpha$ , then the model does not have an autocorrelation problem. Since the empirical significance BG, or probability value, is 0.9107  $> 0.10$ , the model has no autocorrelation issues.

Table 3.

##### Breusch-Godfrey Serial Correlation LM Test:

F-statistic	0.110401	Prob. F(3,12)	0.9524
Obs*R-squared	0.537178	Prob. Chi-Square(3)	0.9107

##### Heteroscedasticity Test

Heteroscedasticity will be tested using White's test. If the probability value or empirical significance of the White test statistic is smaller than alpha, there is a heteroscedasticity issue in the model. As can be observed, there is no concern with heteroscedasticity in the model because the probability value, or statistical significance of the White test, is 0.7035  $> 0.10$ .

Table 4

##### Heteroskedasticity Test: White

F-statistic	0.450826	Prob. F(13,6)	0.8923
Obs*R-squared	9.882580	Prob. Chi-Square(13)	0.7035

##### Test of model specifications

The Ramsey Reset test will be used to assess the linearity of the model specification. In cases where the probability value or empirical statistical significance is  $F > \alpha$ , the Ramsey Reset test is a linear model or the specific model specification. Considering that the empirical significance or probability value  $F$  is 0.0212 less than 0.10, the model specification is inconsistent or imprecise.

Table 5

	Value	df	Probability
F-statistic	5.255668	(2, 13)	0.0212
Likelihood ratio	11.85067	2	0.0027

#### *The connection between the coffee GDP of the United States and the coffee exports of Indonesia.*

Indonesian coffee exports to the United States are influenced by the GDP variable in a positive and significant way. The regression coefficient for the GDP variable is 290090.2. The link between GDP and Indonesian coffee exports is linear-logarithmic (lin-log), which means that if GDP rises by 1%, Indonesian coffee exports rise by  $290090.2/100 = \text{US\$ } 0.2900902$  trillion, or 29,009 dollars. However, if GDP declines by 1%, Indonesia's coffee exports will drop by  $290090.2/100 = \text{US\$ } 0.2900902$  trillion, or US\$ 29,009.

#### *The exchange rate's association with Indonesia's coffee exports*

In Indonesian coffee exports to the United States, the exchange rate variable has a negative and small influence. The exchange rate variable has a coefficient of -11.3787. The exchange rate and Indonesian coffee exports have a linear connection, meaning that if the exchange rate rises by one rupiah, Indonesian coffee exports fall by US\$ 1.3787 million. If the exchange rate falls by one rupiah, however, Indonesian coffee exports will rise by US\$ 1.3787 million.

#### *The connection between international coffee prices and coffee exports from Indonesia*

In Indonesian coffee exports to the United States, the international coffee price variable has a positive but not significant effect. If the international coffee price increases by one US\$/kg, coffee exports will increase by US\$ 34433.85 million, according to the coefficient value of the international coffee price variable. If the international coffee price falls by one US dollar per kilogram, Indonesian coffee exports will fall by US\$ 34433.85 million.

#### *The correlation between Indonesian coffee exports and domestic coffee production*

Variables in domestic coffee production have a negative and significant effect on Indonesian coffee exports to the US. The regression coefficient for the Indonesian coffee production variable is -0.5884. The relation between domestic coffee output and Indonesian coffee exports is linear, which means that if domestic coffee production rises by 1,000 tons, Indonesian coffee exports fall by US\$ 0.5884 million, or \$5884,000. On the other hand, if local coffee production declines by 1,000 tons, Indonesia's coffee exports will rise by US\$ 5884,000 million.

## V. DISCUSSION

During the period 2001-2020, Indonesian coffee exports were influenced by GDP and domestic coffee production, but the exchange rate and international coffee prices had no significant impact.

The Gross Domestic Product (GDP) has a significant and positive effect. indicates that as Indonesia's GDP rises, so will its coffee exports. GDP is one of the key indicators of a country's economy and well-being. When the US GDP rises, so does people's spending power and demand for coffee, resulting in an increase in coffee consumption in the US.

Coffee production in the United States has a negative and significant effect. Indonesia's coffee exports decrease as domestic coffee production rises. Increased coffee production in the United States is not usually accompanied by an increase in exports. Because the outcomes of domestic coffee production are more important in meeting domestic demand. The quality of coffee has a significant impact on importers' willingness to buy coffee from Indonesia.

The currency rate has a negative impact on Indonesian coffee exports, but it is not significant. According to (Sukirno, 2008), export transactions from one country to another necessitate the use of a foreign exchange market, which is a market where one currency is exchanged for another. As a result, the foreign exchange market is essential. Importers consider domestic coffee prices costly when the rupiah exchange rate rises against the US dollar. Likewise, as the rupiah's exchange rate versus the dollar falls, its price of coffee falls for importers. Coffee exports are unaffected by exchange rate variations since coffee has become one of the most sought-after commodities on the worldwide market, despite the fact that its price has risen.

International coffee prices have a positive influence on Indonesian coffee exports, but the effect is not significant. According to (Soekartawi, 2005), if the price of coffee in the international market is higher than in the domestic

market, the number of coffee commodities exported will grow, resulting in an increase in the value and volume of coffee commodities exported. Domestic coffee growers, on the other hand, will choose to sell their coffee domestically if international coffee prices fall.

## VI. CONCLUSION AND RECOMMENDATION

### A. Results

The findings of this study show that the GDP variable in the United States has a significant positive effect on Indonesian coffee exports, whereas the domestic coffee output variable has a significant negative effect. In the meanwhile, the fluctuating currency rate and international coffee prices had no impact on Indonesian coffee exports. GDP, exchange rate, international coffee prices, and domestic coffee production all have an impact on Indonesian coffee exports, whether in independently or together.

### B. Suggestion

To increase the quality of coffee production, there is a need for collaboration between the government, the business sector, and farmers, such as repairing and reviving coffee plant seeds, utilizing technology, and teaching farmers. Apart from focusing on coffee bean exports, stakeholders are hoped to support downstream production so that coffee exports will have added value in the future.

## ACKNOWLEDGEMENT

Thank you to Allah SWT for His goodness and guidance in allowing this research to be completed. The support, encouragement, and participation of numerous parties were essential in the creation of this scholarly paper. The author would like to express his gratitude to my supervisor, Mrs. Eni Setyowati, SE, M.Sc., and academic adviser, Mr. Dr. Daryono Soebagiyo, M.Ec. Thanks also to my parents, brother, and friends, as well as Telkom University's Sustainable Collaboration in Business, Technology, Information, and Innovation for allowing me to attend this international conference.

## Poverty and Population: Evidence Using Panel Data Approach in Gorontalo

Yusnia Solikah<sup>1</sup> and Salma Audiena Alfaizah<sup>2</sup>

<sup>1,2</sup>Muhammadiyah Surakarta University. Economic Development, Faculty of Economics and Business  
Muhammadiyah Surakarta, Sukoharjo, Central Java, Indonesia

### Abstract

Poverty is one of the complex and fundamental problems in the Indonesian economy. It is necessary to find a *solution to overcome or at least reduce the poverty rate*. The *HDI in the Gorontalo from 2016 to 2021 has increased because the Gorontalo provincial government has implemented various policies and programs to improve human quality, it increase occurred in all dimensions in 2021*. This research was conducted to determine the effect of the variable level of education, and analysis the influence of the human development index, and population on poverty in Gorontalo. The method used to analyse is panel data method. The selected model is Fixed Effect Model (FEM). The results show that only population has significant effect on poverty in Gorontalo, while the human development index and the average length of schooling have no significant effect on poverty in Gorontalo from 2016 to 2021.

*Keywords: Poverty, Human Development Index, Average Years of Schooling, Population, Panel Data*

---

### I. INTRODUCTION

Poverty is a problem faced by all countries in the world, especially developing countries, such as Indonesia. The problem of poverty is still the subject matter that must get extra attention. In the current conditions, the level of poverty is not only viewed from the low quality of the economy, but has been viewed from different angles and depends on the views used, the poverty limit has also shifted. According to the World Bank (in Whisnu Adhi Saputra, 2011), one of the causes of poverty is due to lack of income and assets to meet basic needs such as food, clothing, housing and acceptable health and education levels (acceptable).

The strategic problems in Gorontalo Province are not much different from the problems at the national level, namely the problem of poverty which is still relatively high, because it is the responsibility of the government, both local and central government, as a buffer in the process of improving the lives of the poor. The government has the responsibility of finding a way out and formulating measures to overcome poverty.

As explained before, poverty may impose as a problem in economic development. Poverty may become a benchmark that needs to be reduced for developing countries in order to redistribute the economic growth to all population. Therefore, poverty alleviation strategies is really important for developing countries. Overcoming poverty is essential in developing countries. Poverty reduction policies need to focus on the empowerment of the poor to be independent, in economic, socio-cultural, and political aspects. Hence, poverty alleviation strategies need to satisfy all aspects that is associated with poverty itself. Therefore, this research will further investigate the factors that is associated with poverty to create poverty alleviation strategies.

This research would specifically analyse the issue of poverty in Gorontalo Province, because poverty rate in Gorontalo is relatively high compared to other provinces in Indonesia. According to BPS (2017), poverty is included as one of the fundamental problems in economic development in Gorontalo Province.

### II. LITERATURE REVIEW

Subandi (2012) stated that poverty alleviation strategies need to address the quality of human resources due to poverty trap. Huraerah (2012) also stated that poverty alleviation strategies need to prioritize structural, cultural, and political aspects into consideration. Meriyanti (2015) further validates that human development index has significant impact on poverty alleviation strategies, while Satriani (2014) found that unemployment and human development index has insignificant impact on reducing poverty rate.

Poverty is more than just simply financial distress as it inevitably part of lacking empowerment, knowledge, chance as well as to income and capital (Gounder & Xing, 2012). Moreover, poverty has important role that influence macroeconomic policies that the governments endorse, as it generates a series of effects upon the fund distribution mechanism, affecting both the source and destination of public financial policies (Paraschiv, 2017).

The relationship between poverty and education is not simple. However, education brings people a healthier life and gives them smarter decisions about their life; for their children, their livelihoods, and the way they live. Education has a significant role for children, it provides chances to develop mentally, physically, and social awareness in them (ChildFund, 2019). The Unesco report claims that, if all adults completed secondary education, more people could be lifted out of poverty, global poverty rate would be reduced to more than halved.

This report shows that education is so crucial to be the center to the achievement of the SDGs. Education can play a transformative role to bring people out from their poverty, but access and inclusion need to be improved by education policies (Unesco, 2003). With education, people can improve their health and productivity. People with good education will have basic knowledge and skills, they will have a choice to have a job, starting from increasing productivity and raising income. Then education can break the vicious circle of poverty and social marginalization to improve the quality of life and social welfare (Ustama, 2009).

### III. RESEARCH METHODOLOGY

This study is quantitative research. In this study, the independent variables consist of HDI, education and population, while the dependent variable is poverty. The population in this study were all regencies/cities in the Gorontalo Province. Type of data in this study is secondary data. Secondary data is source of research data obtained by researchers indirectly through intermediary media. Data sourced from the Central Statistics Agency and journals, this data is obtained through direct access from the BPS website (bps.go.id).

Data analysis technique used in this study is panel data regression analysis. The data model used in this study is panel data. Panel data is combination of time series data and cross section data, the cross section can be in the form of characteristics of a company or region or country. So, by using panel data regression models it is possible to capture characteristics between individuals and between times which can be different.

Data analysis in this study begins with testing the best model to choose the right model. According to Winarno (2015) there are three panel data regression models, there are Common Effect Model (CEM), Fixed Effect Model (FEM) and Random Effect Model (REM). In determining the most appropriate and best model, it is necessary to test first based on the Chow Test and Hausman Test. Then, hypothesis test was conducted to determine the effect of independent variable on dependent variable in the study of R<sup>2</sup> test, F test and t test. In this research, poverty is This research uses panel data regression model with fixed effect model (FEM). We develop panel data model in estimating the effect of variable independent on poverty. Panel data model used in this research is written in Equation 1 as follows:

$$POVi,t = \beta_0 + \beta_1 HDIi,t + \beta_2 EDUi,t + \beta_3 POPI,t + \epsilon_{i,t}$$

where

$POVi,t$  is poverty rate of regencies  $i$  during period  $t$ ;

$HDIi,t$  is human development index of regencies  $i$  during period  $t$ ;

$EDUi,t$  is education level of regencies  $i$  during period  $t$ ;

$POPI,t$  is population of regencies  $i$  during period  $t$ ;

$\epsilon_{i,t}$  is error term of regencies  $i$  during period  $t$ .

### IV. RESULT / FINDING

The results of the regression reported in Table 1 show that the Fixed Effect Model (FEM) is the right model to use.

## Effects Specification

Cross-section fixed (dummy variables)			
R-squared	0.994730	Mean dependent var	32.34528
Adjusted R-squared	0.993168	S.D. dependent var	19.35995
S.E. of regression	1.600189	Akaike info criterion	3.990439
Sum squared resid	69.13635	Schwarz criterion	4.386318
Log likelihood	-62.82790	Hannan-Quinn criter.	4.128611
F-statistic	637.0139	Durbin-Watson stat	1.176882
Prob(F-statistic)	0.000000		

From the results of Chow test and Hausman test, it's known that probability value of both is  $< 0.05$ . This means that regression analysis in this research uses the Fixed Effect Model. Based on the FEM results above, the regression model can be formulated as follows:

$$POV = 132.2072 - 0.890144HDI - 2.538579 EDU + 0.000104POP + \varepsilon$$

From the regression model, it's known that HDI, education and population have positive relationship towards poverty. According results of the F test, all independent variables have joint effect on the dependent variable. From results of the t test, it's known that only population has a significant effect on poverty.

## V. DISCUSSION

Based on quantitative analysis with Chow test and Hausman test, the probability value  $< 0.05$ . And it is determined that the selected test is the Fixed Effect Method (FEM). Based on the estimation results, the HDI coefficient value is  $- 0.890144$  with a 95% confidence level. This means that every 1 percent increase in HDI will decrease the poverty rate by 0.890144. This indicates that an increase in HDI has a negative effect on poverty. And this is in accordance with several studies that have proven that HDI affects poverty levels, including research by Sofilda et al (2013) which shows that HDI has a negative and significant effect on poverty levels in districts/cities of Papua Province (Sofilda, 2016). Likewise with Silswanto's research that HDI plays a very important role in tackling poverty levels in Indonesia. Although there are several studies which state that HDI does not have a significant effect on poverty and it is stated that there is no causal relationship between HDI and poverty in Indonesia in the period 1990-2013 (Susilowati and Wahyudi, 2015).

After that, the JP coefficient value is 0.000104 with a 95% confidence level. This means that every 1 percent increase in JP will decrease the poverty rate by 0.000104, this shows that an increase in JP has a positive effect on poverty. This is in accordance with what Siregar and Wahuniarti (2008) stated that if the number of people increases, it will increase the number of poor people. Residents in question are people who settle and reside in a certain area. The increase in population is influenced by fertility, mortality, and migration.

And also the RLS coefficient value is  $-2.538579$  with a 95% confidence level. This means that every 1 percent increase in RLS will decrease the poverty rate by 2.538579. The level of education has a significant effect on the level of individual income, where the higher the level of education, the level of income will also increase, and the poverty will decrease.

## CONCLUSION AND RECOMMENDATION

This study aims to investigate impact of education level, human development index and population to poverty in Gorontalo Province. Based on the explanation above, it can be concluded that the level of education positive but not significant impact on poverty in Gorontalo Province. And also the population positive impact but on poverty in Gorontalo Province. As well as human development index (HDI) has positive and significant impact on poverty rates in Gorontalo Province.

Based on the conclusion, this Further research recommends that each the government needs to provide training or workshops to further alleviate poverty, the government also needs to evaluate policies about education, health, and the economy dimensions for overcoming poverty. Moreover, this study also recommends that the government need to integrate or coordinate poverty alleviation strategies at the national level or local level.

ACKNOWLEDGEMENT

Thank you to all those who have helped the author to complete this paper, including the supervisors, BPS Gorontalo and other parties who cannot be mentioned one by one. There is no ivory that is not cracked, therefore the author also apologizes if there are errors in writing this scientific paper.

## **Analysis of the Effect of Minimum Wage, Investment, and Human Development Index on Labor Absorption in the Semarang Karesidenan Region in 2017-2020**

A.Mira Putrinisih<sup>1</sup> and B.Eni Setyowati<sup>2</sup>

<sup>1,2</sup> Development Economic, Muhammadiyah University of Surakarta ,Sukoharjo,Indonesia

### **Abstract**

*Population growth in Indonesian will continue to increase, as well as population growth in the Karesidenan area of Semarang. The increase in the number of people certainly results in an increase in the number of workers which will be a problem in the world of labor if the number of workers is not proportional to the amount of labor demand. The study aims to analyze the effect of the minimum wage, investment, and human development index on labor absorption. The dependent variables used are labor while the independent variables used are the minimum wage, investment, and human development index. The data used is panel data using 6 districts/cities in the Semarang Karesidenan area in 2017-2020. The model chosen in this study is the Fixed Effect Model (FEM), from the model it is known that the minimum wage and investment variables have a significant effect on the absorption of labor in the Semarang Karesidenan area, while the human development index variable has no significant effect on labor absorption in the Semarang Karesidenan area in 2017-2020.*

*Keywords— Minimum Wage; Investment; Human Development Inde; Labor*

---

### **I. INTRODUCTION**

The economic development of a region or a country is basically the interaction of various variable groups, including human resources, natural resources, capital, technology and others. Therefore, economic development cannot be separated from the role of humans in managing it. Man is labor, development input, also a consumer of the development itself. Employment is a very basic aspect of human life because it includes social and economic dimensions. One of the important goals in economic development is the provision of sufficient employment to pursue the growth of the labor force, which is faster than the growth of employment opportunities (Pangastuti, 2015: 6).

Indonesia is a country with a large population, but the number of workers who have not found high jobs. This is a problem that has not been resolved because the quality of human resources is still low and the number of jobs that are not balanced with the number of available labor force. With this problem, the role of the government is needed in improving the quality of its human resources through training and education. The training and education aims to increase people's expertise and creativity in working in order to be able to compete with foreign workers. The higher the expertise and creativity you have, it will increase work productivity. Therefore, human resources who have good skills and expertise will be the main capital to get a job while people who are not able to compete will be eliminated and become unemployed (Ministry of Industry, 2017: 19).

Economic growth is also one of the most important indicators for the absorption of labor. This is because the demand from labor is a derivative of the output demand. So logically there is the same movement between economic growth due to the growth of output demand and the absorption of labor. A rapidly growing economy is not a guarantee that a country is said to prosper if it is not followed by the expansion of employment opportunities to accommodate new workers who enter the workforce every year.

### **II. LITERATURE REVIEW**

According to Sukirno (2011) investment is investors, expenditures and companies to buy equipment for the production of goods and services available in the economy. Ilhamdi, et al (2015) explained that investment is investment spending such as production equipment to increase the production capacity of goods and services. An increase in investment will have an impact on increasing output if the value of the investment is more than its depreciation. The increase in output will increase some production inputs, one of which is labor demand.

According to Ilhamdi, et al (2015) labor demand is a relationship between the level of wages and the number of workers employed by the company at a certain period of time. If in the economy there is an increase in labor supply then there will be a decrease in the level of wages, then the amount of labor demand will increase. If the labor force or with a high unemployment rate, it will cause high wage levels.

Wages that apply in one region can have a positive and negative impact. According to Gilarso (2002) the positive impact of wage determination is seen from the labor supply where wage increases will cause labor supply to increase and the number of unemployed will decrease. While the negative impact of wage fixing is when workers' wages rise it will result in a decrease in the number of people working because the company will reduce the number of workers so that the number of unemployed will increase.

Table 1. Jumlah Tenaga Kerja di Wilayah Karesidenan Semarang Tahun 2017-2020

Kabupaten/Kota	2017	2018	2019	2020
Kota Semarang	899.796	883.396	919.003	925.963
Kabupaten Semarang	596.297	575.925	600.787	600.322
Kota Salatiga	100.834	105.114	99.041	102.053
Kabupaten Kendal	460.967	462.260	476.852	493.062
Kabupaten Demak	549.295	571.560	561.895	574.602
Kabupaten Grobogan	724.515	727.216	707.352	710.909

Sumber : Badan Pusat Statistik, JawaTengah 2017-2020

Table 1 shows that the number of workers in the six districts and/or cities in the Semarang karesidenan area during 2017-2020 has fluctuated except in the Kendal Regency area from 2017-2020 experienced a steady increase. One of the areas with the number of workers experiencing fluctuations occurred in the Salatiga City area, where in 2017 a total of 100,834 people increased to 105,114 people in 2018. Furthermore, in 2019 it decreased to 99,041 people and an increase of 102,053 people in 2020. Of the six districts and/or cities in the Semarang karesidenan area, the area with the highest population occurs in Semarang City.

Economic growth is also a very important indicator for employment. This is because the demand for labor is a derivative of the demand for output. So that logically the same movement occurs between economic growth due to growth in output demand and employment. An economy that is developing rapidly is not a guarantee for a country to be said to be prosperous if it is not followed by the expansion of job opportunities to accommodate new workers who enter the workforce every year.

Economic development is a series of efforts and policies aimed at improving people's living standards, expanding employment opportunities, equitable distribution of people's income, and improving regional economic relations.

### III. RESEARCH METHODOLOGY

#### *Research Method*

Data analysis methods used in this study are:

#### Research Tools and Models

This study uses a panel data regression tool. Panel data analysis was performed using three models, namely, Common Effect Model (CEM), Fixed Effect Model (FEM), and Random Effect Model (REM). Selection of the right panel data can be done by using the Chow test and Hausman test. After determining the right model, the next step is to test the existence of the model (F test), the coefficient of determination ( $R^2$ ), and the effect validation test (t-test).

The model in this study was modified from the journal (Biamrillah, 2018) and Sulistiawati, 2012) with the title about employment.

The following is the regression model:

The calculation of the regression model has 3 approaches to analyze panel data, including:

$$\log TK_{it} = \beta_0 + \beta_1 \log UMK_{it} + \beta_2 \log INV_{it} + \beta_3 \log IPM_{it} + \varepsilon_{it}$$

Where :

- Kindergarten = Labor Absorption
- UMK = District Minimum Wage
- INV = Investment
- HDI = Human Development Index
- e = Error Term (Error Factor)
- $\beta_0$  = Constant
- $\beta_1, \beta_2, \beta_3, \beta_4$  = Independent variable regression coefficient
- Logarithmic operator based on e
- i = Observation to i
- t = Year t

*Common-Constant Method*

The Common-Constant method or can be called Pooled Least Square (PLS) is a model obtained by combining or collecting all cross section data and time series data. This data model is then estimated using ordinary least squares (OLS) (Pangestika, 2015). According to Gujarati et al., (2012) the big problem with this PLS model is that it does not differentiate between various airlines or the response of the explanatory variable to the total cost is the same for each airline at all times. The panel data regression model can be formulated as follows:

$$CM_{it} = \beta_0 + \beta_1 PQ_{1it} + \beta_2 UMP_{2it} + \beta_3 TPEN_{3it} + \beta_4 PDRB_{4it} + \varepsilon_{it} \quad (2)$$

- Where: CM = Public Consumption Rate (Million)
- PQ = Total Population (Soul)
- UMP = Minimum Wage (Million)
- TPEN = Education Level
- PDRB = PDRB (billion rupiah)
- $\beta_0$  = Constant
- $\beta_1, \beta_2, \beta_3, \beta_4$  = Regression coefficient of independent variables
- e = Error term
- i = County or city
- t = Year

#### Effects Specification

Cross-section fixed (dummy variables)

R-squared	0.999003	Mean dependent var	559542.3
Adjusted R-squared	0.998471	S.D. dependent var	251810.8
S.E. of regression	9847.600	Akaike info criterion	21.50784
Sum squared resid	1.45E+09	Schwarz criterion	21.94961
Log likelihood	-249.0941	Hannan-Quinn criter	21.62504
F-statistic	1877.986	Durbin-Watson stat	1.782056
Prob(F-statistic)	0.000000		

To determine the most appropriate model for estimating the panel data regression parameters, there are three tests that can be carried out, namely:

#### Chow Test (Likelihood Test Ratio)

The Chow test is a test used to find out whether the FEM model is better than the PLS model by looking at the significance of the FEM model which can be done with the F statistical test. For the formulation of the hypothesis,  $H_0$ , the model chosen is Polled Least Square (PLS), and  $H_A$ , the model that is used. Selected Fixed Effect Model (FEM). The test criteria are  $H_0$  accepted if p-value  $>$  and  $H_0$  is rejected if p-value  $.$  In conclusion, if the p-value  $>$

0.05, then  $H_0$  is accepted so that the selected model is pooled least square. While the p-value 0.05, then  $H_0$  is rejected so that the model chosen is Fixed Effect Model.

#### *Hausman Test*

To find out whether the fixed effect model is better than the random effect model, the Hausman test is used. The Hausman test statistic follows a chi-square statistical distribution with as many degrees of freedom as the number of independent variables ( $p$ ). Formulation of the hypothesis,  $H_0$  then the model selected Random Effect Model (REM), and  $H_A$  then the model selected Fixed Effect Model (FEM). The test criteria are  $H_0$  accepted if p-value  $>$  and  $H_0$  is rejected if p-value  $\leq$ . In conclusion, if the p-value  $> 0.05$ , then  $H_0$  is accepted so that the model chosen is the Random Effect Model. While the p-value 0.05, then  $H_0$  is rejected so that the model chosen is Fixed Effect Model. To see an accurate value estimate in the panel data regression function, it is necessary to carry out a goodness of fit test including the F statistic test, R2 determinant test, and t test.

#### *F Statistic Test*

According to Kuncoro, (2013) the F statistical test basically shows whether all the independent variables included in the model have a joint effect on the dependent variable. F test is used to test the existence of a model. The formulation of the hypothesis,  $H_0 : \beta_1 = \beta_2 = \beta_3 = \beta_4 = 0$ ; the model does not exist and  $H_A : 0$ ; existing models. The test criteria  $H_0$  is rejected if the statistical significance is  $F$  and  $H_0$  is accepted if the statistical significance is  $F >$ . In conclusion, if the significance of  $F$  0.05 then  $H_0$  is rejected which means the model does not exist, and  $H_0$  is accepted if the significance of  $F > 0.05$  then  $H_0$  is accepted which means the model exists.

#### *Determination of Adjusted R-Square (R2)*

According to Kuncoro, (2013) the coefficient of determination ( $R^2$ ) is to measure how far the model's ability to explain variations in the dependent variable is. In general, the coefficient of determination for cross-site data is relatively low because of the large variation between each observation, while for time series data it usually has a high coefficient of determination. The coefficient of determination test aims to see the percentage of variation (diversity) of the dependent variable that can be explained by the variation of the independent variables in the model. The value of the coefficient of determination is used to measure the contribution or contribution of the independent variables to the dependent variable. The value of the coefficient of determination ranges from zero to one. The closer to one the model is said to be better because it shows the more precise or suitable a regression line and the greater the variation of the independent variable can explain the variation of the dependent variable.

#### *T Test*

Test the validity of the effect of the selected model using the t test. The partial regression coefficient test (t test) was conducted to determine whether or not the influence of the independent variables in the model was significant or not. The formulation of the hypothesis,  $H_0 : \beta_1 = \beta_2 = \beta_3 = \beta_4 = 0$ , the i-th independent variable has no significant effect and  $H_A : \beta_2 \neq \beta_4 \neq 0$ , the i-th independent variable has a significant effect. The test criteria  $H_0$  is rejected if the statistical significance of  $t_i$  and  $H_0$  is accepted if the statistical significance of  $t_i >$ . In conclusion, if the statistical significance of  $t_i$  0.10 then  $H_0$  is rejected, which means the i-th independent variable has a significant effect. And  $H_0$  is accepted if the statistical significance  $t_i > 0.10$  then  $H_0$  is accepted, which means the i-th independent variable has no significant effect.

#### *Operational Definitions Of Research Variables*

Consumption is expenditure activities carried out by consumers to fulfill their needs of goods and services in order to fulfill the needs or satisfaction of consumers themselves. The unit of the Consumption Level variable is in rupiah. According to the Central Statistics Agency (BPS) population is all people who live in the geographical area of the Special Region of Yogyakarta for 6 months or more and or those who live less than 6 months but aim to settle down. The data used is the population in 2015 – 2019 (in soul units).

Education is a form of investment in human resources in the life of the nation and state in order to create quality human resources. Education must be prioritized in balance with physical capital investment because education is the basic capital to create quality children of the nation so that education is categorized as a long-term investment. The data used in this study is the average length of school for 2015 – 2019 (in years).

According to the Central Statistics Agency (BPS) Wage/salary is a reward in the form of money received from employers to workers for work that has been or will be carried out and determined according to an agreement, or legislation. Compensation will be paid on the basis of an employment agreement between the employer and the worker, including allowances for both the worker himself and his family. While the minimum wage is the lowest wage (excluding overtime pay) paid to employees by type of work or position. The data used in this study is the minimum wage for the Special Region of Yogyakarta in 2015-2019 (in rupiah).

## IV. RESULT / FINDING

Based on the results of the Chow test and Hausman test, the estimated accuracy of the model can be seen in the following table:

Table 1. Chow Test Results And Hausman Test

Model Testing	Prob.	P-value (5%)	Selected Model
Chow Test	0,000000	0.05	FEM
Hausman Test	0,000000	0,05	FEM

Source: Data processed by the author with Eviews, 2022

Based on the results of the Chow test from table 1 that the probability value is  $0.000000 < 0.05$ , then  $H_0$  is rejected and  $H_1$  is accepted so that the model chosen is Fixed Effect Model. Furthermore, according to the results of the Hausman test from table 1, it shows that the probability value is  $0.000000 < 0.05$ , so  $H_0$  is rejected so that the model chosen is the Fixed Effect Model.

Hypothesis testing can be seen based on the results of the t test, F test, and  $R^2$  test, the results of the test can be seen in the following tables:

Table 2. t Test Results

Variable	Prob.	P-value (Significance 10%)	Description
PQ	0,1545	$P > 0,10$	Not Significant
UMP	0,0613	$P < 0,10$	Significant
TPEN	0,0015	$P < 0,10$	Significant
PDRB	0,0858	$P < 0,10$	Significant

Source: Data processed by the author with Eviews, 2022

Based on the results of the t-test from table 2, it shows that if the statistical significance is 0.10 then  $H_0$  is rejected, which means the to-i independent variable has a significant effect. And  $H_0$  is accepted if the statistical significance of  $t_i > 0.10$  which means the to-i independent variable has no significant effect. From the table it can be seen that the population variable has no significant effect, while the minimum wage, education, and GRDP variables have a significant effect.

Table 3. F Test Results

Variable	Prob (F-Statistic)	Criteria	Conclusion
PQ, UMP, TPEN, PDRB	0,000000	$P < 0,10$	Take effect

Source: Data processed by the author with Eviews, 2022

Based on the results of the F test from table 3, it shows that the probability value (F-Statistic) is  $0.000000 < 0.10$ , it means that all variables such as population, minimum wage, education, and GRDP together have an effect on public consumption level.

Table 4. Coefficient of Determination Test Results ( $R^2$ )

R-square	Adjusted R-square	S.E. of Regression
0,991463	0,987194	43973,13

Source: Data processed by the author with Eviews, 2022

Based on the results of the coefficient of determination test ( $R^2$ ), it shows that the variables of population, minimum wage, education, and GRDP affect the level of consumption by 99.14%, while the remaining 0.86% is influenced by variables outside the model.

## V. DISCUSSION

The estimated Public Consumption Rate can be influenced by total population, minimum wage, education level, and PDRB. Based on the results of panel data regression analysis assisted by the Eviews version 9 analysis tool, hypothesis testing has been carried out. The following are the results of the research with the proposed hypothesis:

*The Effect Of Total Population To Public Consumption*

Based on the results of research on the total population variable in testing, the value of Prob is obtained. of 0,1545 more than 0,10 ( $P > 0,10$ ). This shows that  $H_1$  is rejected, where the total population variable has no significant effect on public consumption. The high value of the total population variable is not a measure of the size of public consumption rate. In other words, the increase in population is not only a factor causing the increase in the level of public consumption but is also found in other variables.

*The Effect of minimum wage to public consumption*

Based on the results of research on the minimum wage variable in testing, the value of Prob is obtained. of 0,0613 less than 0,10 ( $P < 0,10$ ). This shows that  $H_2$  is accepted, where the minimum wage variable has a significant effect on public consumption. Therefore, minimum wage can affect the value of the public consumption. This means that the greater the value of the minimum wage, the greater the influence on the public consumption.

*The Effect of education level to public consumption*

Based on the results of research on the education level variable in testing, the value of Prob is obtained. of 0,0015 less than 0,10 ( $P < 0,10$ ). This shows that  $H_3$  is accepted, where the education level variable has a significant effect on public consumption. Therefore, education level can affect the value of the public consumption. This means that the greater the value of the education level, the greater the influence on the public consumption.

*The Effect of PDRB to public consumption*

Based on the results of research on the PDRB variable in testing, the value of Prob is obtained. of 0,0858 less than 0,10 ( $P < 0,10$ ). This shows that  $H_4$  is accepted, where the PDRB variable has a significant effect on public consumption. Therefore, PDRB can affect the value of the public consumption. This means that the greater the value of the PDRB, the greater the influence on the public consumption.

VI. CONCLUSION AND RECOMMENDATION

- a. Based on the results of data analysis and discussions that have been carried out, some conclusions can be drawn as follows:
- b. Based on the results of the cross section panel data estimation, the best model was chosen, namely the Random Random Effect Model (REM).
- c. The validity test of the effect (t test) shows that the significance level of the district/city minimum wage (UMK), Gross Regional Domestic Product (GRDP) and Inflation (INF) has a positive and significant effect on employment.

*Suggestion*

- a. Based on the conclusions and limitations above, the researcher gives some suggestions as follows:
- b. The government should formulate a wage policy in such a way as to increase labor productivity and production growth as well as increase the income and welfare of workers. So that the wage policy will be oriented to the interests of all parties.
- c. The government should encourage employment in Central Java Province to be maximized, one of which is increasing the rate of GRDP growth in every economic sector. So that it can improve the quality of human resources so that later they form a creative and ready-to-use person.

ACKNOWLEDGMENT

We would like to thank Sustainable Collaboration in Business of Telkom University in Indonesia, who gave me the opportunity to attend this international conference.

## Analysis of the Effect of Inflation, Minimum Wage, TPT, HDI on the Number of Poor People in East Java Province 2018-2021r

Trisnika Alfina Putri<sup>1</sup> and Dr.Daryono Soebagiyo,M.Ec<sup>2</sup>

<sup>1</sup>Muhammadiyah Surakarta University. Economic Development, Faculty of Economics and Business Muhammadiyah Surakarta, Sukoharjo, Central Java, Indonesia

### Abstract

Poverty is one of the complex and multidimensional economic problems that must be solved. This study aims to analyze the effect of inflation, Minimum Wage, TPT, and HDI on the number of poor people in East Java province from 2018-to 2021. The type of data uses secondary data which obtained from BPS East Java province and also journals as supporting research. This research uses panel data and uses a Eviews 9. The model chosen from this research is the Fixed Effect Model (FEM). From the model, it is known that the Open Unemployment Rate (TPT) has a significant effect on the poor in East Java province in 2018-2019. From the results of the F test, it is known that the GRDP, ME, TPT and HDI variables simultaneously affect the PM variable. It is evidenced by the probability value of  $0.00 < 0.05$ . According to the results of the t-test, partially the TPT variable has a positive and significant effect, while the GRDP, ME and HDI variables have no significant effect to the PM variable..

**Keywords**— number of poor people, inflation, minimum wage, TPT, HDI

### I. INTRODUCTION

Poverty is a problem that faces by a country. Poverty reflects a condition which shows about an inability on fulfilling basic needs such as foods, clothes and houses. Poverty uses for measuring of the success on region's development. Poverty data can be used to evaluate government policies on poverty, compare poverty across times and regions, and determine targets for the poor by the aim of improving their life quality. According to the data from Central Statistics Agency (CSA), Indonesia's poverty statistics began to decline from March 2015 to September 2019, but in September 2019 to 2020 the number of poverty rate increased due to COVID-19 pandemic. The following data on the number of Indonesia's poor people from 2013 to 2020 as follow:

Fig 1. The Number of Poor People in Indonesia

Java Island is a national economy center; economic activity on the java island has a significant contribution to the Indonesian economic growth. East Java has the largest area on Java Island. From 2019, the number of poor people in East Java Province has increased. It is also influenced by out breaking of pandemic which causing community activities are disrupted. The following data on the poor population in East Java Province in 2019 to 2021 as follow:

Fig 2. The Number of Poor People in East Java Province

Poverty is a long-term problem that has never been solved until this time. This problem is likened to a vicious circle that never finds its ending and beginning. The cycle of poverty is influenced by many interrelated factors. One of the goals of national development is to improve economic performance in order to create jobs and organize a decent life for all people which in turn will realize the welfare of the Indonesian citizen. One of the national development targets is to reduce poverty. Poverty is a disease in the economical field, it must be cured or at least reduced. Poverty problem is a complex and multidimensional problem. Therefore, poverty alleviation efforts must be carried out comprehensively, covering various aspects of people's lives, and implemented in an integrated manner.

Inflation is believed to affect the number of poor people. According to Ramadhana and Jayawarsa (2018) inflation is an increase in the value of commodities that applies to all economic sectors. When the price of goods rises, the purchasing on goods will decrease. The decrease on people's purchasing can increase the number of poor people. The minimum wage can also affect the number of poor people. The minimum wage is a monthly (lowest) income as a reward from the employer to the employee for a job for services. It have been or will be performed as stated or valued in a set amount of money based on an agreement or statutory regulation agreement between the entrepreneur and the employee which include of benefits, both for the employees themselves and for their families (Julianto and Suparno, 2016). The effect of the minimum wage toward poverty is influenced by high social costs and made fatal poorer.

Minimum wages, TPT is also believed on giving affect to the number of poor people beside inflation. According to BPS (2022) the Open Unemployment Rate (TPT) is the percentage of the number of unemployed to the total workforce. When the number of unemployed increases, people will difficult on fulfilling their needs and the number of poor people will increase significantly. The last factor that affects the number of poor people is the Community Development Index (IPM). According to Saputra in Palindangan and Bakar (2021) the Human Development Index (IPM) is a number to measure the achievement of human development based on a number of basic components of quality life that can give real affect the level of productivity of person. The higher of HDI level, it will make poor people will decrease.

Poverty is a social problem that should be solved. Therefore, it is important to conduct a study on kind factors that affecting the number of poor people, then government and related parties can determine steps to reduce poverty. Based on this, the researcher was motivated to conduct a research entitled "Analysis of the Effect of Inflation, Minimum Wage, TPT, HDI on the Number of Poor People in East Java Province in 2018-2021".

## II. LITERATURE REVIEW

### A. Poverty

Solikatur et al., (2018), argue that poverty is a low condition of living standard, which a low living material standard in a number of people or class compared to the generally accepted in the community concerned. Lower living standard affects to the health, moral life and self-esteem level for the people who classified on poor people directly. Sulistiyani (2017) defines poverty as a limited condition where the community has low accessibility to production factors, business opportunities, education, other living facilities, causing every activity in limited condition.

### B. Inflation

Inflation is an increasing the price of goods generally and occur continuously within a certain period (Ambarini, 2017). According to Ramadhana and Jayawarsa (2018), inflation is an increase in the value of commodities that applies to all economic sectors. An increasing in one or two goods not called as inflation, unless the increasing is widespread and affects most of the prices of other goods. If inflation fluctuates, then economic activity will tend

to adjust to the conditions that occur. The impact of rising inflation causes a decrease in people's purchasing power. This is because the real value of the currency has decreased (Ningsih and Andiny, 2018).

#### C. Minimum wage

Wages are given as a result after giving service or doing work which given to workers for their services in achieving organizational goals. Wages are paid to workers based on operational hours, number of production or the number of services provided (Rivai in Setiawan, 2017). The minimum wage is a monthly lowest income as a reward from the employer to the employee for a job or service that have been or will be performed and is stated or valued in a set amount of money based on an agreement or statutory regulation and paid on the basis of a work agreement between the entrepreneur and the employee which including allowances, both for the employees themselves and for their families (Julianto and Suparno, 2016). The minimum wage is a minimum standard which used by entrepreneurs or industry players to provide wages to workers in the business or work environment. The main purpose of setting minimum wages is to meet minimum living standards such as for health, efficiency, and worker welfare (Kaufman in Anggriawan, 2016).

#### D. Open Unemployment Rate

Unemployment defines as a condition whom a person belonging to the labor force category does not have a job and actively looking for job (Nanga in Anshori, 2018). According to BPS (2022) the Open Unemployment Rate (TPT) is the number of percentage about unemployed to the total workforce. Putro and Setiawan (2013) argue that unemployment can be occurred as a result of the high rate on changing in the workforce that is not matched by large job opportunity and low job demand percentage. It was caused the low growth rate of job creation to accommodate workers who are ready to work. In other words, labor market, the supply of labor is higher than the quantity supplied labor demand.

#### E. Human Development Index

According to Saputra in Palindangan and Bakar (2021) the Human Development Index (HDI) is a number to measure the achievement of human development based on a number of basic components of quality of life that can be affected to the level of productivity of people. In the context of region economic development, HDI defines as one of the main measurement included in the basic pattern of regional development. This indicates that HDI occupies an important position in regional development management. HDI function and human development indicators will be the key for implementation of targeted planning and development. HDI is a benchmark for the development of a region should have a positive correlation with poverty conditions in the region because it is expected that an area that has a high HDI, ideally the quality of life of the community is also high or it can be said that if the HDI value is high, then the poverty level of the community should be low. Lismawati in Syaifullah and Gandasari, 2016)

Fig 3. Research Framework

#### F. Hypothesis

##### 1. The Effect of Inflation on the Number of Poor People

Inflation is the tendency of rising price generally and continuously. Increasing one or two price of commodity cannot called as inflation, it can be called as inflation if almost all commodity have high price. Bad result of inflation is the decline in real income received by the community. The workers salary does not change easily to adjust by inflation conditions but it also give direct affect to the salary in general. Thus inflation will reduce the real income of fixed income. In addition, inflation can cause various bad effects on economic activities which will ultimately leading to instability, creating slow growth and increasing unemployment (Sukirno in Mahendra, 2017). Research conducted by Hamzah et al. (2019) provides evidence that inflation has a positive and significant effect on the number of poor people.

H1 = Inflation has a positive effect on the number of poor people

2. The Effect of the Minimum Wage on the Number of Poor People

The minimum wage is the number of people income, if the income decreases or remains, then welfare also decreases or remains and that will also certainly affect the poverty level. The effect of the minimum wage toward poverty was influenced by the social costs which will cause the number of poor people. Complaints about inflation are common problem. We know that increasing of purchase of labor comes from capital accumulation and technological progress. Wages do not depend on how much money which determined to spend in society by government. Government can push inflation by creating policy on slowing the growth rate of money. Workers will not get their wages rising fast. In other word, when inflation is slower, companies or slightly increase the prices of their products every year and as a result will give workers a smaller minimum wage increase (Waluyo in Aggriawan 2016). Research conducted by Ningrum (2017) and Aggriawan (2016) states that the minimum wage has a positive and significant effect on the number of poor people.

H2 = Minimum wage has a positive effect on the number of poor people.

3. The Effect of TPT on the Number of Poor People

There is a very close relationship between the high number of unemployed and the number of poor people. Most of the people do not have permanent job or just take part time includes very poor groups of people. Human needs are much and varied, therefore they try to fulfill their needs, the usual thing is to work to earn an income. If they do not work or unemployed, the consequence is that they cannot fulfill their needs properly, this condition has an impact on the creation and swelling of the existing poor population. According to Octaviani in Redha (2018), the number of unemployed is closely related to poverty in Indonesia, where the population has a very large dependence on current salary or wages. Research conducted by Ningrum (2017) provides evidence that TPT has a positive and significant effect on the number of poor people.

H3 = TPT has a positive effect on the number of poor people.

4. The Effect of HDI on the Number of Poor People

Napitupulu in Redha (2018) said that the Human Development Index has an influence in reducing the number of poor people. Human Development Index has composite indicators in its calculation, including life expectancy, literacy rates, and per capita consumption. Improvements in the health and education sectors as well as income per capita contribute to human development, so that higher quality of people in an area will reduce the number of poor people. Human development is a development goal, where it plays a key role on shaping a country's ability to absorb modern technology and to develop its capacity to create sustainable growth and development. In the research, which conducted by Redha (2018) and Ningrum (2017) stated that HDI has a negative and significant influence on the number of poor people.

H4 = HDI has a negative effect on the number of poor people.

### III. RESEARCH METHODOLOGY

#### A. *Research Design*

The research is a quantitative research, which include of associative research. Associative research is research that has the aim of knowing how the relationship between two or more variables, looking for roles, influences and causal relationships, namely between independent variables and dependent variables. In this study, the independent variables consist of inflation, minimum wage, TPT and HDI, while the dependent variable is the number of poor people.

#### B. *Population and Sample*

The population in this study were all regencies/cities in East Java Province. In this study, Process of takes sampling by using saturated sampling technique. Saturated sampling is a sampling technique when all members of the population are used as samples (Sugiyono, 2018). In other words, saturated sampling can be called a census, where all members of the population are used as samples.

#### C. *Data and Data Collecting Technique*

The type of data in this study is secondary data. Data sourced from the Central Bureau of Statistics of East Java Province and journals. The data was obtained through direct access from the BPS website for the Province

of East Java (jatim.bps.go.id). Data collection in this study was carried out using the documentation method, namely analyzing data on inflation, minimum wages, TPT, HDI and the number of poor people in East Java Province in 2018-2020.

#### D. Analysis Tools

To measure accuracy of the calculation and to reduce human error, this study did not use manual calculations but using a computer program for statistical data processing.

#### E. Analysis Technique

The data analysis technique in this research is panel data regression analysis. The data model was used is panel data, which panel data is a combination of cross section data and time series data, namely observations on several companies that are observed within a certain period of time. The use of panel data in this study is expected to provide more complete information and be able to show the effect due to more observations. Data analysis in this study begins with testing the best model to choose the right model. The Best Model Selection Test was conducted to select the right model in the research by using panel data. There are three panel data regression models, namely, Common Effect Model (CEM), Fixed Effect Model (FEM) and Random Effect Model (REM) (Winarno, 2015). On determining the most appropriate and best model, it needs to test first based on the Chow Test and Hausman Test. Then, a test hypothesis was conducted to determine the effect of the independent variable on the dependent variable in the study in the form of the R2 test, F test and t test. In this study, the number of poor people tested was, so the panel data regression equation in this study was as follows:

$$NPP = \alpha + \beta_1 INF + \beta_2 MW + \beta_3 OUL + \beta_4 HDI + e \quad (1)$$

Description:

- NPP = Number of Poor People  
 INF = Inflation  
 MW = Minimum Wage  
 OUL = Open Unemployment Level  
 HDI = Human Development Index

## IV. RESULT / FINDING

Table 1. The Result of Chow Test

Effects Test	Prob.
Cross-section F	0.0000
Cross-section Chi-square	0.0000

Source: Processed data, 2022

Table 2. The Result of Hausman Test

Test Summary	Prob.
Cross-section random	0.0000

Source: Processed data, 2022

Based on the results of the Chow test and Hausman test that have been carried out previously, it can be seen that the probability value is <0.05, the test will be carried out using the Fixed Effect Model (FEM).

Table 3. The Result of Fixed Effect Model

Variable	Coefficient	Std. Error	t-Statistic	Prob.	F. Statistic	Prob(F-statistic)	R-squared
C	463.3446	117.0561	3.958314	0.0002	571.4987	0,0000	0,9969
LOG(PDRB)	-11.97025	7.980792	-1.499882	0.1380			
LOG(UM)	-12.20636	8.494934	-1.436898	0.1551			
TPT	2.022484	0.490401	4.124144	0.0001			
IPM	-0.846076	1.580638	-0.535275	0.5941			

Source: Processed data, 2022

From table 3 above, the regression model can be formulated as follows:

$$NPP = 463,34 - 11,97 INF - 12,21 MW + 2,02 OUL - 0,85 HDI + e \quad (2)$$

From the regression model above, it can be seen that inflation, minimum wage and HDI are negatively related to the number of poor people, while TPT has a positive relationship. According to the t-test, only TPT has an effect on the number of poor people, while the variables of inflation, minimum wage and HDI have no significant effect to the main variable.

## V. DISCUSSION

Based on the model selection test conducted with the Chow test and the Hausman test, the panel data regression model was selected, namely the Fixed Effect Model, because the probability value of the Chow test and Hausman test are  $<0.05$ . In testing using FEM, it is known that the R-Squared value is 0.9969, which means that the ability of the independent variable to explain the dependent variable is 99.69% while the remaining 0.31% is explained by other variables not examined to this study. According to the results of the F-test probability  $0.00 < 0.05$ , this proves that the regression model used in this study is fit and the independent variables together can affect the dependent variable.

According to the results of the t test, the GRDP variable has no effect on the PM variable. These results are similar with the research which conducted by Kolibu et al. (2017) where inflation has no effect on the poverty level. Inflation is a macroeconomic determinant for changes in poverty conditions in a country. The poor will not be affected by the inflation rate because basically the poor do not have purchasing demand, even though inflation occurs they still have no purchasing demand.

From the results of the t test, it is known that the ME variable has no effect on the PM variable. Research conducted by Fatimah (2017) also proves that the minimum wage has no effect on the number of poor people. It can be seen to the fact that minimum wage in each region has been determined by the government, in the real practice not all companies provide salaries according to the minimum wage. In addition, some people have odd jobs then their income different with minimum wage.

Based on the t test, TPT variable proved that there is a positive and significant effect on PM. These results are similar with the research which conducted by Ningrum (2017) states that TPT has a positive and significant influence on the number of poor people. Work is one way to earn income so that people can fulfill their needs. Therefore, lower of unemployment rate in an area will causing the rate of poor people in certain area.

According to the results of the t test, HDI does not have a significant effect on PM. These results are in accordance with Edfrida's research (2019) which states that HDI has a negative and insignificant effect on poverty levels. This is probably caused by uneven human development in East Java Province. Therefore, the Human Development Index in East Java Province has not been able to provide a significant influence on the number of poor people.

## VI. CONCLUSION AND RECOMMENDATION

### A. Conclusion

Independent variable in this study was able to explain the dependent variable namely 99.69% while the remaining 0.31% was explained by other variables not examined in this study. From the results of the F test, it is known that the GRDP, ME, TPT and HDI variables simultaneously affect the PM variable. It is evidenced by the probability value of  $0.00 < 0.05$ . According to the results of the t-test, partially the TPT variable has a positive and significant effect, while the GRDP, ME and HDI variables have no significant effect to the PM variable.

### B. Recommendation

The independent variable in this study has a high enough ability to explain the dependent variable, but further research can add or replace the independent variable with other variables. For the subjects studied in this study only focused on data from the East Java Province, further research could conduct research with other provincial subjects as well as on a national scale in order to obtain more reliable data. Based on the results of the study, it is known that TPT has an influence on the number of poor people, therefore the East Java Province government can design steps to reduce unemployment by opening job opportunities and providing job training.

## ACKNOWLEDGEMENT

The authors would like to thank the supervisors who have guided in the preparation of this journal and to various parties who have contributed to this research.

## Analysis Of Real, Export, And Import Exchange Value Impact On Indonesia's 1994-2019 Trading Sheet

Rachmat Subiyantoro<sup>1</sup> and Dr. Daryono Soebagyo, M.Ec<sup>2</sup>

<sup>1,2</sup>Muhammadiyah Surakarta University, Economic Development, Faculty of Economic and Business, Muhammadiyah Surakarta University, Sukoharjo, Indonesia

### Abstract

The trade balance is one of the instruments in the balance of payments to indicate the state's export and import condition. The country's economic balance sheet is often a poor indicator. As one of the countries that support such an open economic system today, a country will not abandon its current economic activities. The economic condition of a country, especially in regard to international trade, can be noted by the balance sheet of that trade. The trade balance sheet in Indonesia during the 2009-2018 period experienced fairly dynamic fluctuations. The economic growth rate was expected to reach 6.3 percent in 2008, he said. Then, in 2009 to 2011, there were positive trends of 19,680, 22,115, and 26,061 million us dollars. The study aims to know the impact of kurs, imports, exports on trade scales. The research is expected to provide information for the relevant parties. Research research: the study USES regression analysis tools with the ordinary least square approach of ols. The method of ols presents several tests: multicollinearity, vif tests, normality tests, autocorrelation tests, heterosticizing tests, model specs. After processing data obtained value coefficient is decrypted (squared) in the model which is 1.0000. Of known prob. F statistics by 0.0000. At the t test it was stated that variable exchange, import, export affected the trade balance sheet the study has concluded that kurs variables, imports, exports affect Indonesia's 1994-2019 balance sheet.

*Keywords— trade balance; Curs; Import; export*

### 1. INTRODUCTION

The condition of the deficit trade balance is often used as an indicator of the poor economy of a country. This is not entirely true because the trade balance does not have such an ideal condition. To be able to declare the condition of the trade balance deficit as bad or good is very relative to the economic conditions both domestic and international. As one of the countries that adopt an open economic system like Indonesia today, a country will not be separated from international economic activities. The economic condition of a country, especially in terms of international trade, can be known by looking at the trade balance. The trade balance is one of the instruments in the balance of payments that shows the conditions of exports and imports of a country. The data present in the trade balance can show not only the condition but the performance of exports and imports of a country (Salvatore, 2004).

However, if the condition of the trade balance deficit occurs continuously, it needs to be considered because it can indicate poor economic conditions, especially in terms of export performance. The condition of the trade balance in Indonesia in the period 2009-2018 can be seen in Graph I.

Fig. 1 Trade Balance in Million USD

*Source: BPS Indonesia 2018*

From the i-1 chart, it can be seen that the level of trade balance in Indonesia during the 2009-2018 period experienced quite dynamic fluctuations. The highest trade balance occurred in 2018 at -4.161 million USD, while the lowest deficit occurred in 2012 at -1.669 million USD. Then in 2009 to 2011 had a positive trend of 19,680, 22,115, and 26,061 million USD. In the graph I - 1 shows the development of the value of Indonesian exports is greater than imports. However, this development did not last long since the end of 2012 until in 2014 there was a negative trade balance trend of -1,669, -4,076, and -2,198 million USD, an increase in the amount of Indonesian export value since that year is lower than the increase in the amount of import value, causing the trade balance, in 2015-2017 Indonesia can restore Indonesian trade in a surplus position of 7,671, 9,533 and 11,842 million USD.

The trade balance has been researched quite often. Aniyati Ika (2017) found that the variable exchange rate, Export Import simultaneously or simultaneously significant effect on the trade balance. This is because the increase in the exchange rate will greatly affect the formation of export and import, where the exchange rate is too high will disrupt price stability. So in the short or long term if imports are greater than exports, the instability of the combination will cause a decline in the trade balance.

Chaisrisawatsuk in Ginting Ari Mulianta (2015) said that the inflow of Foreign Direct Investment becomes one of the important factors to stimulate the increase in exports of a country and increase the capacity of production capabilities of these countries and the increase in production capacity can increase exports.

Asnawi and Hasniati (2018) there is a relationship between interest rates and the trade balance that the policy of granting interest rates can have an impact on economic activity because high interest rates result in expensive deposits of money. This will weaken the competitiveness of exports in the world market. Based on the background in advance this study will observe the effect of exchange rate, inflation, foreign exchange reserves and birate period 1994-2019

## II. LITERATURE REVIEW

### A. *Trade Balance*

The trade balance is one part of the current account balance, the trade balance records the difference between exports and imports of goods traded in international trade (Ekananda, 2014). The export of goods is a credit transaction because the transaction gives rise to the right to receive payment (causing the flow of money or funds into the country). The import of goods is a debit transaction because it creates an obligation to make payments to other countries (causing the flow of money or funds abroad). In recording transactions in the trade balance is based on the value of free on board (fob) and is not taken into account the costs of transportation including Transactions Services. If the value of imports is higher than the value of exports, then what happens is the trade balance deficit, otherwise if the value of exports is higher than the value of imports, then there is a trade balance surplus, Madura (1997) in Marpaung (2013).

### B. *Curs*

The currency exchange rate or often referred to as the exchange rate is the price of one unit of foreign currency in domestic currency, or it can also be said the price of domestic currency against foreign currency. For example, the value of the Rupiah exchange rate against the US dollar (USD) is the price of one US dollar (USD) in Rupiah (Rp), or vice versa (Arsyad, 2015). In this case, if the exchange rate increases, it means that the Rupiah depreciates, while if the exchange rate decreases, the Rupiah experiences appreciation.

The exchange rate is a fundamental macroeconomic variable that spurs investors on how best to strike a balance between trading partners. Exchange rate refers to the price of a currency (domestic currency) in another (foreign currency). Exchange rates and balance of payments are interconnected because there cannot be international trade if one country's currency has no price in another country (Kuswanto, 2017). The weakening of the rupiah exchange rate will make foreigners buy Indonesian goods because of the low price, the situation resulted in the number of exports in Indonesia increased. If the number of exports is greater than imports indicates that the country has a lot of foreign exchange reserves. Setyowati & Soepatini (2004) stated that the real exchange rate in the short term is influenced by interest rates and GDP, while in the long term it is influenced by the money supply and relative prices.

### C. Export

The definition of export according to the Directorate General of Customs & Excise is quite simple, namely the activity of removing goods from the customs area. Meanwhile, the meaning of the Customs Area is the territory of the Republic of Indonesia which includes land, water and airspace above it, as well as certain places in the Exclusive Economic Zone and the Continental Shelf in which Law No. 10 of 1995 on customs applies. While from the general sense of export in economics, is the expenditure of goods from circulation in the Society of a country, and sending out of the country according to government regulations and expect payment in foreign currency (Gentari & Sunaryo, 2019).

Export is the process of transporting goods or commodities from one country to another (Fauziah, 2018). Export is an activity or effort to deliver goods from a country or region to other countries or regions either in a series of moral trade or as a personal action (Sherly et al., 2020).

### D. Import

Import is the process of transporting goods or commodities from one country to another legally, generally in trade. The import process is generally the act of introducing goods or commodities from other countries into the country. The import of goods generally requires the intervention of Customs (customs) in the sending and receiving countries. The involvement of this institution is generally for the purpose of recording goods that are transferred from one country to another (Yoesoef, 2013).

Import can be defined as the purchase of goods and services from abroad into the country with a cooperation agreement between two or more countries. Import can also be said to be a trade by entering goods from abroad into the territory of Indonesia by fulfilling the applicable provisions (Benny, 2013).

## II. RESEARCH METHODOLOGY

This study will observe the effect of real exchange rates, exports, and imports on the trade balance (trade balance) Indonesia, using multiple regression analysis with OLS (Ordinary Least Square) method approach with the estimator model: Ordinary Least Square (OLS) with econometric model as follows :

$$TB_t = \beta_0 + \beta_1 KURS_t + \beta_2 Eks_t + \beta_3 Imp_t + \varepsilon_t$$

Di mana :

$TB_t$  = Neraca Perdagangan Indonesia (Juta USD)

$KURS_t$  = Nilai tukar rupiah terhadap USD (Rupiah)

$EKS_t$  = Ekspor di Indonesia (Juta USD)

$iMP_t$  = Impor di Indonesia (Juta USD)

$\varepsilon_t$  = *Error term* (faktor kesalahan)

$\beta_0$  = Konstanta

$\beta_1 \dots \beta_3$  = Koefisien regresi variabel independen

$t$  = tahun ke  $t$

## III. RESULT / FINDING

This study uses multiple linear regression method. Multiple linear regression test is done to determine how much influence the independent variable to the dependent variable. This test uses the Ordinary Least Square (OLS) method with the E Views 10 application.

1. The results of multiple linear regression of the relationship between the variables of foreign exchange reserves and trade balance against the exchange rate of the rupiah against the US dollar obtained the following results:

Table 1. Multiple Linear Regression Test Results

Variable	Coefficient	Std. Error	t-Statistic	Prob.
C	-1.36E+08	92652679	-1.464258	0.1573
LOG(KURS)	18023212	12318438	1.463109	0.1576

LOG(IMPOR)	-52843.96	8841.588	-5.976750	0.0000
LOG(EKSPOR)	66265.47	10741.30	6.169224	0.0000
R-Squared	0.758406			
F-Statistic	0.000001			

Source: Result Output E Views

Based on the results of the regression test in the table above, the equation can be written as follows: Trade Balance =  $-1.36 \text{ E} + 08 + 18023212 \text{ Exchange Rate} - 52843.96 \text{ Imports} + 66265.47 \text{ Exports}$ . The value of the exchange coefficient of 18023212 which means that the exchange rate increases every 1 unit it will increase the trade balance of 18023212 units, the value of the import coefficient of 52843.96 which means that imports increase every 1 unit it will decrease the trade balance of 52843.96 units, and the value of the export coefficient of 66265.47 which means that exports increase every 1 unit it will increase the trade balance of 66265.47 units.

#### A. Classical Assumption Test

##### Normality Test

Table 2. Normality Test Results

Jarque Bera	1,3338280
Probability	0,512149

Source: Result Output E Views

Based on the test results in the table above, it is known that the probability value of  $0.512149 > 0.05$  (UTC) and the value of Jarque Bera of  $1.3338280 < 2$  which means that the data in this study is normally distributed.

##### Autocorrelation Test

Table 3. Autocorrelation Test Results

Prob. F(2,20)	0,0983
Prob. Chi-Square (2)	0,0678

Source: Result Output E Views

Autocorrelation test Based on the test results in the table above, it is known that the probability value of chi-square is  $0.0678 > 0.05$  (UTC) which means that there is no autocorrelation problem in this research data

Table 4. Multicollinearity Test Results

Variable	Value VIF
C	NA
LOG(KURS)	3.735290
LOG(IMPOR)	21.64275
LOG(EKSPOR)	17.52646

Source: Result Output E Views

Based on the test results in the table above, it is known that the value of VIF for the exchange rate variable is  $3.735290 < 10$  which means that there is no multicollienarity problem in this research data. While the import and export variables there is a multicollienarity problem in this research data.

##### Heteroscedasticity Test

Table 5. Heteroscedasticity Test Results

Prob. F(6,19)	0,0370
Prob. Chi-Square(6)	0,6672

Source: Result Output E Views

Based on the test results in the table above, it is known that the probability value of chi-square is  $0.6672 > 0.05$  (UTC) which means that there is no problem of Heteroscedasticity in this research data.

##### t-statistic Test

Table 6. Heteroscedasticity Test Results

Variable	t-Statistic	Prob.
----------	-------------	-------

C	-1.464258	0.1573
LOG(KURS)	1.463109	0.1576
LOG(IMPOR)	-5.976750	0.0000
LOG(EKSPOR)	6.169224	0.0000

Source: Result Output E Views

Based on the results of testing the probability of the exchange rate variable of  $0.1576 > 0.10$  (UTC) which means that the exchange rate has a significant effect on the trade balance. The test results are known that the value of import probability of  $0.0000 < 0.05$  (UTC) which means that imports have a significant effect on the trade balance. The results of the test are known that the export probability value of  $0.0000 < 0.05$  (UTC) which means that exports have a significant effect on the trade balance.

#### *F-statistical test*

Based on the results of the test, it is known that the probability value of F is  $0.000001 < 0.05$  (UTC) which means that exchange rates, imports, exports together affect the trade balance.

#### *Coefficient Of Determination (R-Squared)*

The test results obtained R-squared value of 0.758406 which means the variable exchange rate, imports and exports can affect the trade balance variable of 75.84% and the rest of 24.16% explained by other factors that are not contained in this study.

#### IV. DISCUSSION

Variable	Coefficient	Std. Error	t-Statistic	Prob.
C	-1.36E+08	92652679	-1.464258	0.1573
LOG(KURS)	18023212	12318438	1.463109	0.1576
LOG(IMPOR)	-52843.96	8841.588	-5.976750	0.0000
LOG(EKSPOR)	66265.47	10741.30	6.169224	0.0000
R-Squared	0.758406			
F-Statistic	0.000001			

Based on OLS regression states that:

From Table 1, the results of the above estimates can be explained the influence of independent variables, namely exchange rates, imports, exports to Indonesia's trade balance as follows :

- The exchange rate coefficient has a positive and insignificant effect on the trade balance. This shows the result where, the exchange rate has a coefficient of 18023212. Every exchange rate increase of 1%, the trade balance will rise by 18023212 percent. Which means if the rupiah exchange rate against the dollar depreciates and the price of goods that will.
- The import coefficient has a negative and significant effect on the trade balance. Where, imports have a coefficient of -52843.96. this means that every increase in imports by 1%, the trade balance will fall by -52843.96 percent.
- The export coefficient has a positive and significant effect on the trade balance. Where, exports have a coefficient of 66265.47. Every increase in exports entering Indonesia by 1%, the trade balance will increase by 66265.47 percent.
- Normality test, based on the test results in the table above, it is known that the probability value of  $0.512149 > 0.05$  (UTC) and the value of Jarque Bera of  $1.3338280 < 2$  which means that the data in this study is normally distributed.
- Autocorrelation test, based on the test results in the table above, it is known that the chi-square probability value is  $0.0678 > 0.05$  (ironic) which means that there is no autocorrelation problem in this research data.

- f. Multicollinearity test, based on the test results in the table above, it is known that the value of VIF for the exchange rate variable is  $3.735290 < 10$  which means that there is no multicollienarity problem in this research data. While the import and export variables there is a multicollienarity problem in this research data.
- g. Heteroskedasticity test, based on the test results in the table above, it is known that the chi-square probability value is  $0.6672 > 0.05$  (ironic) which means that there is no problem of heteroskedasticity in this research data.

## V. CONCLUSION AND RECOMMENDATION

- a. The exchange rate has a positive and not statistically significant effect on Indonesia's trade balance.
- b. Imports negatively and significantly affect Indonesia's trade balance.
- c. Exports have a positive and significant effect on Indonesia's trade balance.
- d. Test F, the probability value of F is  $0.000001 < 0.05$  (UTC) which means that exchange rates, imports, exports together affect the trade balance
- e. the R-squared value of 0.758406 which means that the exchange rate, import and export variables can affect the trade balance variable of 75.84% and the remaining 24.16% is explained by other factors that are not contained in this study.

## Analysis of the Effect of Economic Growth, Education and Unemployment on Poverty in Semarang Residency in 2017-2019

Claurita Nur Khasana<sup>1</sup> and Salma Audiena Alfaizah, S.E., M.E<sup>2</sup>

<sup>1,2</sup>Muhammadiyah Surakarta University. Economic Development, Faculty of Economics and Business

### Abstract

*Poverty is a state of inability to meet basic needs such as food, clothing, shelter, education, and health. This study aims to determine the effect of economic growth, education and unemployment on poverty in Semarang Residency during the period 2017-2019. The type of data using secondary data obtained from the BPS residency of Semarang. This study uses panel data method and the model chosen is the Fixed Effect Model (FEM). The result show that RLS has significant effect, economy growth and unemployment variables have no significant effect. The F test show that PE, RLS, PG simultaneously has significant effect on poverty.*

*Keywords— poverty; economic growth; education level; unemployment*

### I. INTRODUCTION

Poverty is problem experienced by all countries. Poverty can cause various other problems such as hunger, health problems, crime, and sanitation. Poverty is generally characterized by low levels of education, work productivity, income, health, nutrition, and population welfare. This caused by limited human resources owned and utilized, especially the level of formal and non-formal education. Poverty is seen as an economic inability to meet basic food and non-food needs measured from the expenditure side (Badan Pusat Statistik, 2016). A population is categorized poor if it has an average monthly per capita expenditure below the poverty line.

Rate of the poverty can measure using level of income, level of expenditure, also combination of both. To measure poverty, BPS uses the concept of ability to meet basic needs (basic needs approach). This concept refers to Handbook on Poverty and Inequality published by the Worldbank. Good poverty data can be used to evaluate government policies on poverty, compare poverty across time and regions, and determine targets for the poor with the aims improving their quality of life. The poverty data obtained from BPS presented in Fig 1:

Fig 1. Poverty Graph in Indonesia 2012-2021

From the data in table 1, it's known that from 2015 to 2019 the poverty rate in Indonesia tends to decrease but in 2020 the poverty rate increases again. Based on BPS, Indonesia included in the list of 15 countries that able to reduce extreme poverty which is an average of -2,1 percentage point per year. Compared to other countries, Indonesia is country that is slow in reducing poverty rates compared to Tanzania, Tajikistan, Chad and the Republic of Kongo which able to reduce poverty rates by 30 percent (Hill, 2021). One of the causes of the increasing number of poverty in Indonesia today is influenced by COVID-19 pandemic which weakens community's economy. Semarang City is one of the areas that is considered successful in maximizing the use of technology to accelerate handling of COVID-19. Semarang city also one of the areas in Central Java with the

lowest poverty rate. Semarang Residency as one of the main residencies in the Dutch East Indies, has strategic position because it's an agribusiness development area and the main gateway for import-export activities in the Central Java region. Based on the analysis of CORE economists, the potential for increasing the number of poor people is greater in urban areas with a scenario prediction that the number of poor people in cities is 9.7 million while in rural areas it is 3 million. The risk of a massive increase in the number of poor people cannot be separated from the wave of layoffs or layoffs and work stoppages that are currently rolling. The number of unemployed has crept up rapidly in the two months the social restrictions were imposed.

Poverty is national problem that must be handled properly. it's needed research about what the factors can affect the poverty rate. One of the factors believed to able influence poverty rate is economic growth. Economic growth means the development of activities in economy which causes the goods and services produced in the community and prosperity community increase (Sukirno, 2015). When economic growth in the area increases, poverty rate will decrease.

Education is also believed have effect on poverty. According to Illahi (2012) education is effort to foster and develop human person, both concerning the spiritual and physical aspects. When people get high level of education, the quality will increase. This will also have effect on reducing poverty. Currently, the level of education is one of the requirements in applying job. High level of education and adequate skills are competencies that must be possessed by every job seeker.

Beside economic growth and education, unemployment rate can also affect poverty. Unemployment is defined a condition where a person belonging the labor force category does not have job and is actively looking for work (Nanga dalam Anshori, 2018). Poverty is condition where a person is not able to meet basic needs, people who work will earn income, so their needs can be met. When the unemployment rate in area is low, the poverty rate will also be low.

Poverty occurs because ability of the community as economic actors is not same, so there are people who cannot participate in the development process or enjoy the results of development. It is necessary to study the factors that influence poverty so national development can be enjoyed by all levels of society. Therefore, researchers are motivated to conduct research on "Analysis of the Effect of Economic Growth, Education and Unemployment on Poverty in Semarang Residency in 2017-2019".

## II. LITERATURE REVIEW

### A. *Poverty*

Poverty can define as condition faced by an individual where they do not have the availability of resources to meet their comfortable daily needs, both in terms of economic, social, psychological, and spiritual dimensions (Shirazi dan Pramanik in Dinata et al., 2020). Meanwhile, according to Badan Pusat Statistik (2016) poverty is seen as an inability from economic perspective to meet basic food and non-food needs measured from the expenditure side. According to BPS, there are three poverty indicators, namely head count index, poverty gap index and poverty severity index. Head count index is percentage of population below the poverty line. Poverty gap index is measure of the average expenditure gap of each poor person against the poverty line. While poverty severity index is description of distribution expenditure among the poor. According to Todaro dan Smith inc Fadila & Marwan (2020) the factors caused poverty are low income levels, limited employment opportunities, slow economic growth, income inequality, health and education service facilities are still inadequate. Poverty is disease category in the economy, so the number of its must be cured or minimized. Therefore, poverty reduction efforts must be carried out comprehensively, covering various aspects of life in society, and carried out in integrated manner.

### B. *Economic Growth*

Economic growth means the development of activities in economy which causes goods and services produced in the community increase and the community's prosperity also increase (Sukirno, 2015). According Boediono in Utomo (2020) economic growth is process of increasing output per capita in the long term. The emphasis is on three aspects, there are process, output per capita and long term. So, economic growth measured the achievement of development in economy. Meanwhile, according to Hasyim (2016) economic growth can be interpreted as process of changing the economic conditions a country ongoing basis towards a better state during certain period. From one period to another the ability a country to produce goods and services will increase. This increased ability is caused by the addition of production factors both in quantity and quality. Investment will increase capital goods and the technology used is also growing. Economic growth in a region influenced by economic factors. Economic factors that affect economic growth include natural resources, human resources, capital and technology.

### C. Education

According to Illahi (2012) education is an effort to foster and develop human person, both concerning the spiritual and physical aspects. According to Djumali (2014) education prepare humans to solve life problems in the present and future. Education is process where the nation prepares their young generation to live and fulfill life goals effectively and efficiently. Education is more than just teaching, because reality education is process where the nation or state fosters or develops self-awareness among individuals, with that awareness, nation or state can pass down cultural wealth or ideas to next generation, so it becomes an inspiration for them in every aspect of life. Education level is a long-term process uses systematic and organized procedure, which the managerial workforce learns conceptual and theoretical knowledge for general purposes (Sikula dalam Toyyibatussalamah, 2017). Education is very important for everyone with the aims to educate and develop the potential within themselves. By growing and developing, every individual can have creativity, wider knowledge, good personality and become responsible person. Education indicators in calculating the HDI of new method can be measured through the literacy rate and the average length of schooling.

### D. Unemployment

Unemployment defined as a condition where person belonging to the labor force category does not have a job and is actively looking for work (Nanga dalam Anshori, 2018). Unemployment is condition where someone who is included in the workforce wants to get a job but hasn't got it (Sukirno, 2015). A person who is not working but not actively looking for work is not classified as unemployed. Unemployment is macroeconomic problem that directly affects human survival. For most people losing a job is drop the standard of living. Unemployment can occur as result the high rate of change in workforce that is not matched by existence fairly the wide job field and the absorption of labor which tends to be small in percentage. This is due the low growth rate of job creation to accommodate workers who are ready to work. Or in other words, in the labor market the supply of labor is higher than the demand for labor (Setiawan dalam Anshori, 2018). Unemployment causes people to be unable achieve theirs maximize the welfare. Unemployment causes the actual achieved national income to be lower than the potential national income. This situation means that the level of community prosperity achieved is lower than the level that is possible to achieve.

Fig 2. Research Framework

### E. Hypothesis

#### *The Effect of Economic Growth on Poverty*

Economic growth is one of the important factors in assessing the performance of economy, especially in analyzing the results of economic development. It is said to experience growth if there is an increase in the production of goods and services from previous year so give provide increase in income. Economic growth is very significant in improving people's welfare through the creation and expansion job opportunities and business opportunities. In other words, economic growth able to create a trickle-down effect through the creation and absorption of labor which in turn is expected to be followed by more and more people who earn income which will ultimately increase economic growth and reduce poverty. Research conducted by Alwi et al. (2021) and Faritz & Soejoto (2020) proves that there is a negative and significant effect between economic growth and poverty.

$H_1$  = Economic growth has a negative effect on poverty

#### *The Effect of Education on Poverty*

Education is one of the important things in the development of nation so that it cannot be underestimated. Highly educated people will lead to higher economic growth, making it easier for the government to overcome poverty, education and economic growth have relationship that can be explained through human capital theory. According

to the theory of human capital in the field of education will produce graduates who have high productivity, where more the quality higher, it's more be better. Education has negative effect on the level of poverty, when the more person's education increases, the productivity will increase. Research conducted by Azis et al. (2021) and Faritz & Soejoto (2020) show that education has significant negative effect on poverty.

H<sub>2</sub> = Education has a negative effect on poverty.

#### *The Effect of Unemployment on Poverty*

Unemployment is believed to be one of the factors that can affect poverty. The high number of unemployed will result in reduced people's prosperity, this will have impact on low income levels, so people's purchasing power is also low so productivity will also be low. One of the important factors in determining the level of prosperity society is the level of income. The community's income will reach its maximum if the full employment rate can be realized. By being unemployed, resources are wasted. The bad effect of unemployment is decrease in people's income which will ultimately have influence on person's level of prosperity. The decreasing level welfare or prosperity of person due to unemployment will make person trapped in poverty because of their declining income. Research conducted by Prasetyoningrum (2018) proves that there is a positive and significant influence between unemployment and poverty.

H<sub>3</sub> = Education has a positive effect on poverty.

### III. RESEARCH METHODOLOGY

#### *A. Types of Research*

This study is quantitative research with associative nature. The quantitative research method is scientific method because it has fulfilled scientific rules, there are concrete, objective, measurable, rational and systematic (Sugiyono, 2018). The purpose of associative research is to find out how the relationship between two or more variables, looking for roles, influences and causal relationships, there are between independent variables and dependent variables. In this study, the independent variables consist of economic growth, education and unemployment, while the dependent variable is poverty.

#### *B. Population and Sample*

The population in this study were all regencies/cities in the residency of Semarang. In this study, sampling using saturated sampling technique. According to Sugiyono (2018) the saturated sampling technique is sampling technique when all members of the population are used as samples. This is often done when the population is relatively small, less than 30 people. Saturated sample is also known as census, where all members of the population are sampled.

#### *C. Data and Data Collection Techniques*

Type of data in this study is secondary data. Secondary data is source of research data obtained by researchers indirectly through intermediary media. Data sourced from the Central Statistics Agency and journals, this data is obtained through direct access from the BPS website (bps.go.id). Data collection in this study was carried out using the documentation method, there are analyzing the GRDP data to measure economic growth, the average length of schooling (RLS) as instrument to measure the education variable, the number of unemployed and the number of poor people.

#### *D. Analysis Tools*

In this study analytical tools in the form of Eviews 9 and Microsoft Excel are used. Eviews is Windows-based computer program that is widely used for statistical analysis and computational tool for time series econometrics. The purpose of using computer programs in analyzing statistical data is to reduce human error and ensure the accuracy of calculations.

#### *E. Analysis Techniques*

Data analysis technique used in this study is panel data regression analysis. The data model used in this study is panel data. Panel data is combination of time series data and cross section data, the cross section can be in the form of characteristics of a company or region or country. So, by using panel data regression models it is possible to capture characteristics between individuals and between times which can be different. Data analysis in this study begins with testing the best model to choose the right model. According to Winarno (2015) there are three panel data regression models, there are Common Effect Model (CEM), Fixed Effect Model (FEM) and Random Effect Model (REM). In determining the most appropriate and best model, it is necessary to test first based on the

Chow Test and Hausman Test. Then, hypothesis test was conducted to determine the effect of independent variable on dependent variable in the study of R2 test, F test and t test. In this research, poverty is tested, so the panel data regression equation in this research is follows:

$$KMS = \alpha + \beta_1PE + \beta_2RLS + \beta_3PG + e \quad (1)$$

Description:

KMS = Poverty

PE = Economic Growth

RLS = Education

PG = Unemployment

e = error

#### IV. RESULT/FINDING

Before performing regression analysis, testing is needed to select the best model. The best model testing is carried out using the Chow test and Hausman test, here are the test results:

Table 1. Results of Chow Test

PG	9635.943	6311.747	1.526668	0.1612

Effects Specification

Cross-section fixed (dummy variables)

R-squared	0.875775	Mean dependent var	376451.4
Adjusted R-squared	0.765352	S.D. dependent var	31673.92
S.E. of regression	15343.00	Akaike info criterion	22.42156
Sum squared resid	2.12E+09	Schwarz criterion	22.86675
Log likelihood	-192.7940	Hannan-Quinn criter.	22.48294
F-statistic	7.931115	Durbin-Watson stat	1.961002
Prob(F-statistic)	0.002723		

From the results of Chow test and Hausman test, it's known that probability value of both is  $< 0.05$ . This means that regression analysis in this research uses the Fixed Effect Model. FEM is technique for estimating panel data using dummy variables to capture differences in intercepts. Definition of Fixed Effect is based on difference in the intercept between individuals, but the intercept is same across time (time invariant). In addition, this model also assumes that the regression coefficient (slope) remains between individuals and over time. The following are results of multiple panel regression analysis using the FEM technique:

Table 3. Results of Fixed Effect Model Test

Dependent Variable: KMS

Method: Panel Least Squares

Date: 04/08/22 Time: 21:30

Sample: 2017 2019

Periods included: 3

Cross-sections included: 6

Total panel (balanced) observations: 18

Variable	Coefficient	Std. Error	t-Statistic	Prob.
C	-777808.3	427617.0	-1.818937	0.1023
PE	2545.273	28271.43	0.090030	0.9302
RLS	65944.40	19528.93	3.376755	0.0082
PG	9635.943	6311.747	1.526668	0.1612

## Effects Specification

Cross-section fixed (dummy variables)

R-squared	0.875775	Mean dependent var	376451.4
Adjusted R-squared	0.765352	S.D. dependent var	31673.92
S.E. of regression	15343.00	Akaike info criterion	22.42156
Sum squared resid	2.12E+09	Schwarz criterion	22.86675
Log likelihood	-192.7940	Hannan-Quinn criter.	22.48294
F-statistic	7.931115	Durbin-Watson stat	1.961002
Prob(F-statistic)	0.002723		

Based on the FEM results above, the regression model can be formulated as follows:

$$\text{KMS} = -777.808 + \beta_1 2.545 + \beta_2 65.944 + \beta_3 9.635 + e \quad (2)$$

From the regression model, it's known that economic growth, education and unemployment have positive relationship towards poverty. According results of the F test, all independent variables have joint effect on the dependent variable. From results of the t test, it's known that only education has an effect, while economic growth and unemployment have no effect on poverty.

## V. DISCUSSION

Based on best model testing using Chow and Hausman test, the probability value is  $<0.05$ . Therefore, the panel data regression test that was selected in this study was Fixed Effect Model. From the results of the analysis, it's known that R Squared value is 0.8758, meaning that ability of variance economic growth, education and unemployment in explaining the poverty variable is 87.58% while the remaining 12.42% is explained by other variables not examined in this study. From results of the F test, it is known that regression model used in this study is fit and there is a simultaneous influence between economic growth, education and unemployment on poverty, this is evidenced by the probability value of  $0.002 < 0.05$ .

According to results of the t test, it's known that economic growth has no significant effect on poverty because probability value of PE obtained is  $0.93 > 0.05$ . These results are in line with research by Prasetyoningrum & Sukmawati (2018) which proves that economic growth cannot have a significant effect on poverty. Siregar in Fadila & Marwan (2020) said that economic growth is necessary condition for poverty reduction. While the conditions for adequacy where growth must be effective in reducing poverty. This means that poverty alleviation must be carried out through systematic and programmed policies of economic development, so that economic growth can really be enjoyed by all sections of society. It's hoped that good economic growth will be able to reduce economic inequality in the community.

Based on the t-test, it is known that the RLS probability is  $0.00 < 0.05$  and the t-count is positive, meaning that education has positive and significant effect on poverty. These results are in line with research conducted by Agustina et al. (2019). The level of education is able to affect poverty, this because low level of education is one of the components that cause poverty. The development of education sector is an important aspect that the government needs to do reduce poverty. Although it has significant effect, results of this study are not in accordance with hypothesis which states that education has negative effect on poverty. This can be due to the fact, that employment in the residency area of Semarang is not determined by individual's educational level and lack of certain abilities and skills to compete in finding better jobs.

From results of the t test, it's known that probability value of PG is  $0.16 > 0.05$ , meaning that unemployment does not have significant effect on poverty. The results of this study are in accordance with the results of research conducted by Dinata et al. (2020) where unemployment has no significant effect on poverty. The results of this study are also supported by theory proposed by Nanga in Dinata et al. (2020) which states that workforce includes both working and non-working adults. A person said to be unemployed if the workforce is willing and ready to work and must have made effort to find work in last four weeks. It's likely that most of unemployment occurs in the residency of Semarang is those who are classified as frictional unemployment. Unemployment in this category is the power of newcomers who are looking for their first job and temporary workers, because the emergence of these workers moving to new location or job where workers will feel more productive.

Results of this study can be information for the government be able to further evaluate education which is the main factor in influencing the increase in poverty that occurs in Indonesia. Education is widely recognized as having an important role in the instrument of economic growth. This is because education can improve welfare and reduce poverty. In the field of education, the illiteracy rate can be used to measure the poverty line. In dealing with this problem, the government should improve the policy system on poverty that is influenced by the education sector. The policy can be formulated based on a population-weighted aggregation of national targets referring to "quality education for all" as stated in SDG 4 (UNICEF, 2022).

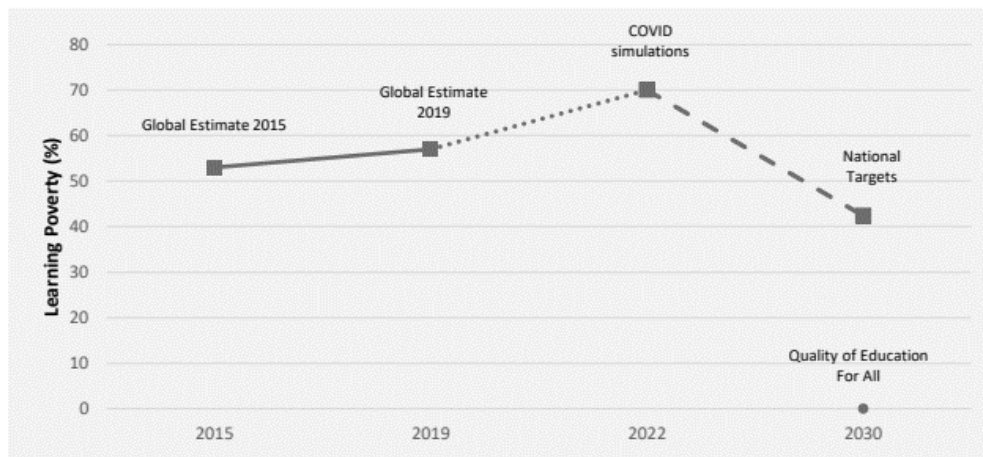

Fig 3. Learning Poverty – history, simulation results, and targets

## VI. CONCLUSION AND RECOMMENDATION

### A. Conclusion

Based on testing using Fixed Effect Model, it's known that the ability of variables of economic growth, education and unemployment in explaining poverty variable is 87.58% while the remaining 12.42% is explained by other variables not examined in this study. According to results of F test, simultaneously variables of economic growth, education and unemployment have effect on poverty. However, partially the variables of economic growth and unemployment have no effect on poverty, only education variable has positive and significant effect on poverty.

### B. Recommendation

In this study, ability of independent variable to explain dependent variable was only 87.58%, although the Fig is quite high, further research can replace or add independent variables such as HDI, minimum wages and inflation. Subjects in this study only covered the residency area of Semarang, further research could expand the subject to provincial or national level in order to obtain more reliable and relevant results. From the results of this study, it's known that education has effect on poverty, therefore the government must strive to ensure equal opportunities for all levels of society to get education.

## 2. ACKNOWLEDGEMENT

3. The author would like thanks to Mrs. Salma Audiena Alfaizah, S.E., M.E as the supervisor and all parties who have helped in this study so this study can be completed properly.

### Abstract

*HDI (Human Development Index) is one of the important discussion topics in the development of a country. The increasing and also decreasing of human development index will cause significantly on the development of the country. It can be overcome by created quality of human being, which can make life level in society will increase. This research aims to analyse GRDP (Gross Regional Domestic Product), education, population and poor people toward human development index in West Sulawesi during 2017-2021. The independent variable in the research is GRDP (Gross Regional Domestic Product), education, population, and poverty. The dependent variable in this research is human development index. This research uses panel data and chooses fixed effect model (FEM). The result shows that GRDP (Gross Regional Domestic Product), education, total population, and the number of poor people simultaneously have a significant effect toward human development index.*

*Keywords— HDI, GRDP, Education, Population, The Number of Poor people*

---

## VII. INTRODUCTION

National development is not only focus on infrastructure building but also on developing human. Human development index (HDI) is an indicator to measure how far the successful on developing human life quality. HDI is a measurement of comparing from life hope, knowing words, education and life standard. HDI explains how citizen can access the result of development on reaching income, healthy, education etc. Based on data from BPS, Indonesia's HDI was suffered incline from 2019 to 2021. The inclining from 2019 to 2020 was low but it was significant from 2020 to 2021 . Here is HDI data in Indonesia:

Fig 1. Human Development Index in Indonesia 2019-2021

Based on graphic above, HDI level in Indonesia was 71,92 in 2019, then it suffers increasing 0,02 in 2020 became 71,94 and in 2021 it increased 0,35 became 72,29 The achievement of economic development in certain area was influenced on human development process. The achievement cannot be separated from the level of human resources in certain area. West Sulawesi includes a province by smallest number of citizens, but HDI level in West Sulawesi always increase every year. Here is HDI data in West Sulawesi from 2019-2021:

Fig 2. Human Development Index in West Sulawesi Province 2019-2021

The increasing of HDI in West Sulawesi Province increases consistently year by year. According to, HDI grouping guidance status from BPS, HDI score of West Sulawesi includes medium category. HDI become IPM measurement on the successful of area development. By that argumentation, HDI is in important position on region development management. Government should determine all steps on increasing human development index in West Sulawesi. There are many factors which can influence higher or lower HDI level in certain region such as PDRB, education, the number of society, and the number of poor people.

One of the factor that influence HDI (Human Development Index) is GRDP (Gross Regional Domestic Product). Gross Regional Domestic Product is a measurement of increasing value which produce by all units in certain region or measurement of the end goods value and services value (net) which produce by all economical units (BPS dalam Hidayat & Woyanti 2021). The highest GRDP (Gross Regional Domestic Product ) ever in certain region, it will make HDI level in certain region will increase. Education is one of factors which influence HDI. Education is a teaching learning process on knowledge, skill, and habitual action a group of people which taught in one generation to the next generation by using teaching learning process, research, and also training. Good education will produce qualified human resources. Qualified human resources will give contribution on the advancement of technology than product efficiency will increase and give impact on increasing HDI.

Beside GRDP and education, the number of society also gives influence toward HDI. Population is an important element in economic activity as an effort to build an economy power because the population provides labor, experts and business leaders in creating economic activities. The high number of population in certain area, the economic activity will increase. The last factor that can affect the HDI is the number of poor people. Poverty can prevent a person from getting a decent level of education and health and causes no improvement in human resources. The high number of poor people will cause a decrease in human development. This statement was supported by Sastraningsih et al (2020) in their research which said that human development index has a significant negative effect on poverty. It is important to overcome the problem because it has high contribution on economic level in certain area.

HDI is one of indicators on measurement of successful development in certain region. It needs more research about factors that can influence the highest and lower HDI. Based on the background of the study, this research aims to analyse GRDP (Gross Regional Domestic Product) variable, education, population and poor people toward human development index in West Sulawesi during 2017-2021. Besides, the researcher wants to prove that GRDP (Gross Regional Domestic Product), education, total population, and the number of poor people simultaneously have a significant effect toward human development index.

## VIII. LITERATURE REVIEW

According to UNDP (United Nations Development Programed) in Siswati & Hermawati (2018), Human development is a process of enlarging choices for humans. The concept or definition of human development basically includes a very broad dimension of development. In the concept of human development, development should be analyzed and understood from the human point of view, not only from economic growth. The Human Development Index (HDI) is a number that measures the achievement of human development based on a number of basic components of quality of life that can affect the level of productivity produced by a person (Saputra dalam Palindangan & Bakar, 2021). The HDI Fig is a geometric mean of three main components, namely life expectancy,

education (average length of schooling and expected length of schooling), and a decent standard of living. The Human Development Index is an important indicator in measuring success in developing the quality of life of the community in an area which is used to determine the level of development in that region. HDI provides a more comprehensive measure of development achievement because it does not only measure economic achievement, but also includes the basic essence of human happiness regarding a healthy, long life, smart life, and the opportunity to gain knowledge.

According to BPS (Central Bureau of Statistics) in Hidayat & Woyanti (2021) Gross Regional Domestic Product (GRDP) is the amount of added produced value by all business units in a certain area, or it is total value of final goods and services (net) which is produced by all economic units. GRDP is one of the important indicators to determine the economic development in an area within a certain period, both on the basis of current prices and on the basis of constant prices (Muliza et al., 2017). GRDP on the basis of current prices describes the added value of goods and services which is calculated using the prevailing prices in each year, while GRDP on the basis of constant prices shows the added value of these goods and services which is calculated using prices prevailing in one particular year as a basis. PRDB on the basis of current prices can be used to see the shift and structure of the economy, while constant prices are used to determine economic growth from year to year.

Education is every effort, influence, protection and assistance given to a child aimed at the maturation of the child, or more accurately helping the child to be sufficiently capable of carrying out his own life duties. (Longeveled in Kusuma & Sumianto, 2022). Education is learning of knowledge, skill, and habit on a group of people which doing continuity from one generation to the next generation through teaching, research and training. Education is something that has a role as a foundation in human life. Therefore, the implementation of education must be carried out as well as possible and oriented to the future. Education gives big contribution to the progress of a nation, and is a vehicle for translating constitutional messages as well as a means of developing nation's character. The purpose of education is to educate the nation's life and also to develop a complete human being.

Population is the number of people who living in an area at a certain time and as result of demographic processes, such as fertility, mortality, and migration (Said in Didu & Fauzi, 2016). Population are all people who are domiciled in certain geographical area of the Republic of Indonesia for six months or more and or those who are domiciled for less than 6 months but aim to settle down (Kuncoro, 2013). Population is an important element in economic activity as an effort to develop an economy because of population provides labor, experts, business leaders and manpower companies in creating economic activities. The large number of populations will increase production activities, consumption from the population can lead to aggregate demand. Then, increasing in aggregate consumption allows productive enterprises to develop whole economic factors

According to Alhudhori (2017) poverty is the condition where someone unable on buying basic needs such as foods, clothes, house, and medicine. BPS in Hidayat & Woyanti (2021) explains that poverty as individual inability on fulfilling basic needs such good life. In the whole meaning, poverty is economy inability not only on fulfilling basic needs but also inability on fulfilling some needs such clothes, foods, and house. Poverty cannot be seen from sex appearance or gender but whoever individual always has same needs on fulfilling life needs such as food, beverage, and other needs. Poverty is a condition which people in limited condition in all factors such as production, job opportunity, education, other life facilities in every activity or an effort become limited (Sulistiyani, 2017).

One indicator to see the distribution of development is to look at the Gross Regional Domestic Product. Domestic refers to the local area which not as large as country area. Domestic product refers to the product which is producing by the people in certain local area. Equitable development will be followed by increased income, both goods and services produced. It is because GRDP is an indicator that describes the ability of a region to generate income or remuneration for production factors in certain area. The high GRDP growth will cause consumption patterns in the community to increase and in this case will increase the level of purchasing demand. The high level of purchasing demand in the community will affect the increase in the human development index, because people's purchasing power is one of the composite indicators in the formation of HDI in terms of income. Research conducted by Muliza et al. (2017) stated that GRDP has a positive and significant effect on HDI. This result related to the research conducted by Hidayat & Woyanti (2021) which proves that there is a positive and significant influence between GRDP and HDI.

Indonesian education system consists of several levels of education. The level of education is a long-term process that uses a systematical and organizational procedure, which is the managerial workforce, learns conceptual and theoretical knowledge for general purposes. The basic measure of education level is the previous year. The development is always showed in the form of a percentage change in national income that it always compares every year to the previous year. Community welfare can be realized by fulfilling basic needs such as health, education, and infrastructure. Fulfillment of basic needs will improve the quality of human resources.

Quality resources will be able to contribute to the advancement of more advanced technology so as to increase production efficiency. Human resource development can be done by improving the quality of human capital. The Research conducted by Pamungkas (2020) states that education has a positive and significant effect on HDI.

Population is a supporting of development, because larger populations are potential market that becomes a source of demand for various kinds of goods and services which will support various kinds of economic activities. From this activity, it will create economies of scale in production that will give benefit to all parties, reduce production costs and create a source of supply or supply of cheap labor in sufficient quantities so that it can stimulate an increase in people's welfare which means poverty will decrease. With a large population, production activities, consumption of the population will increase and lead to aggregate demand. This increase in aggregate consumption will develop productive businesses which will affect the growth of the national economy. Research conducted by Zakaria (2018) and Jasasila (2020) states that there is a positive and significant relationship between the number of residents and the HDI.

Poverty is thought to be a disparity in increasing the Human Development Index. Poverty can prevent a person from getting a decent level of education, and health. Both of impact can cause decreasing in human resources and unemployment. Poverty causes a person have no the capability on doing something, it is because they have no ability on doing something. The level of a person's ability to access resources greatly affects the level of well-being. The high number of poor people will cause a decrease in human development. In this case, poverty and human development index has correlate each other. The lower number of human development index will cause poverty range in the certain area. Research conducted by Ningrum et al. (2020) stated that poverty has an effect on HDI. These results are related to the research conducted by Zakaria (2018) which proves that poverty has a negative and significant effect on HDI.

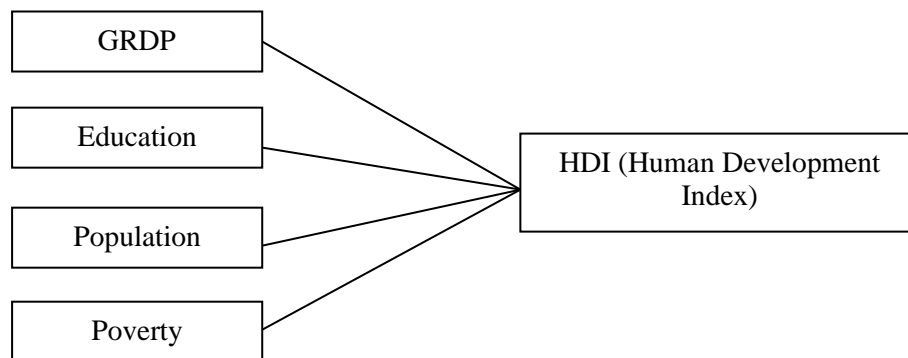

Fig 3. Conceptual Framework

The result shows that GRDP (Gross Regional Domestic Product), education, total population, and the number of poor people simultaneously have a significant effect toward human development index.

## IX. RESEARCH METHODOLOGY

This research is a type of quantitative research by associative nature. The purpose of associative research is to find out the relationship between two or more variables, which is looking for roles, influences and causal relationships, such as between independent variables and dependent variables. In this study, the independent variables consist of GRDP, Education, Total Population and Poor Population, while the dependent variable is HDI.

The populations in this study were all regencies/cities in the West Sulawesi Province. In this study, sampling collection technique is by using saturated sampling technique. According to Sugiyono (2018) the saturated sampling technique is a sampling technique when all members of the population are used as samples. This is done when the population is relatively small, less than 30, or the research wants to make generalizations with very small errors.

The type of data in this study is secondary data. Data sourced from the Central Statistics Agency of West Sulawesi Province and journals. The data was obtained through direct access from the website of the BPS of West Sulawesi Province ([sulbar.bps.go.id](http://sulbar.bps.go.id)). Data collection in this study was carried out using the documentation

method, namely analyzing data on GRDP, education, population, number of poor people and HDI in West Sulawesi Province in 2017-2021.

The data analysis technique used in this research is panel data regression analysis. The data model used is panel data, where this panel data is a combination of cross section data and time series data, namely observations on several individuals who are observed within a certain period of time. The purpose of panel data analysis is to see the economic impact that is inseparable between each individual in several periods, and this cannot be obtained from the use of cross section data or time series data separately. Data analysis in this study begins with testing the best model to choose the right model. According to Winarno (2015) there are three panel data regression models, namely, Common Effect Model (CEM), Fixed Effect Model (FEM) and Random Effect Model (REM). In determining the most appropriate and best model, it is necessary to test first based on the Chow Test and Hausman Test. Then, a hypothesis test was conducted to determine the effect of the independent variable on the dependent variable in the study in the form of the R2 test, F test and t test. In this study, the HDI was tested, so the panel data regression equation in this study is as follows:

$$\text{HDI} = \alpha + \beta_1\text{GRDP} + \beta_2\text{EDU} + \beta_3\text{TP} + \beta_4\text{NPP} + e$$

where

HDI	= Human Development Index
GRDP	= Gross Regional Domestic Product
EDU	= Education
TP	= Total Population
NPP	= Number of Poor People
e	= error

F-statistic	64.44168	Durbin-Watson stat		1.955299
Prob(F-statistic)	0.000000			

From Table 3 it can be formulated regression model as follow:

$$\text{HDI} = 49,67 - 2,90 \text{ GRDP} + 0,16 \text{ EDU} + 5,54 \text{ TP} - 0,13 \text{ NPP} + e$$

From the regression model above, it can be seen that GRDP is negatively related to HDI, while education, population and the poor have a positive relationship. According to the t-test, only education has a significant effect toward HDI, while GRDP, total population and the poor have no effect toward HDI.

## XI. DISCUSSION

Based on the results of the Chow test and Hausman test, the panel data regression test in this study was carried out using Fixed Effect Model. Testing with Fixed Effect Model was chosen because the probability value in the Chow Test and Hausman Test < 0.05. In the FEM test, it is known that the R-Squared value is 0.9667; it means that the ability of the GRDP, Edu, TP and NPP variables in explaining the HDI variable is 96.67% while the remaining 3.33% is explained by other variables not examined in this study. Based on the results of the F test, it is known that the probability value is 0.00 < 0.05, so the regression model in this study is proven to be fit and the variables GRDP, Edu, TP and NPP simultaneously affect HDI.

The results of the t-test indicate that GRDP variable has no effect on the HDI variable. The results of the study are in accordance with research conducted by Nainggolan et al. (2021). High and low GRDP is not able to give effect to HDI. A high GRDP value does not guarantee the success of human development in certain area will increase. It is because the funds does not use for improving human development but for infrastructure or other purposes.

Based on the results of the t test, it is known that education has a positive and significant influence toward HDI. The results of this study are related to the research conducted by Pamungkas (2020) which states that there is a positive and significant influence between education and HDI. Positive influence means that the higher

education in certain area, it will make HDI in the higher position also. Education is one indicator of economic growth that can increase people's income. When the quality of education increases, the quality of human resources will also increase.

According to the results of the t-test the population has no significant effect on HDI. The results of this study are related to the results of research conducted by Kiha et al. (2021) population is not able to influence the HDI. Human in their roles are subjects and objects of development, which means that human, apart from being actors of development, and also development of targets. In this case, various facilities and infrastructures are needed to encourage the role of developing human. Therefore, investment is needed to be able to create the formation of productive human resources. According to human resource development can be done by improving the quality of human capital.

The results of the t-test show that the poor have no significant effect on HDI. These results are related to the result of research conducted by Kiha et al. (2021) the number of poor people in certain area cannot affect human development. Poor people can access education easily. The government has made various assistance programs to all levels of society and make them can get proper education. Therefore, the high and low poverty rates do not affect human development itself.

## XII. CONCLUSION AND RECOMMENDATION

From the result and discussion above, the independent variable in this study was able to explain the dependent variable of 96.67% while the remaining 3.33% was explained by other variables not examined in this study. From the results of F test, it is known that the GRDP, Edu, TP and NPP variables simultaneously affect the NPP variable. It is proved by the probability value of  $0.00 < 0.05$ . According to the results of the t test, the Edu variable partially has a positive and significant effect, while the GRDP, TP and NPP variables have no significant effect on the PM variable.

The subjects was studied in this research only focused on data from West Sulawesi Province, further research could conduct research with subjects from other provinces as well as on a national scale in order to obtain more reliable data. The independent variable in this study has a high ability to explain the dependent variable, but further research can add or replace the independent variable with other variables. Based on the results of the study, it is known that education variable has a positive and significant effect on HDI. Therefore, government should be able to improve educational facilities and facilitate public access to obtain proper education in order to achieve increased human development.

## ACKNOWLEDGEMENT

The author would like to say thank you to the supervisors and all parties who have helped in this research so that this research can be completed properly. support in participating in this manuscript/research.

## **Micro and Small Enterprises Employee Productivity Analysis in the Post Pandemic Era: The Impact of Motivation and Work Environment**

Intan Tenisia Prawita Sari<sup>1</sup>, Wati Susilawati<sup>1</sup> and Mohamad Iqbal Abdul Rauf<sup>2</sup>

<sup>1,2</sup> Management Department, Economic Faculty, Garut University, Garut, Indonesia

### **Abstract**

*The objective of research is to broaden insight on how the effect of employee motivation and work environment to employee productivity after the pandemic of COVID-19. During Covid-19 outbreak since 2020 has changed work and business behavior as past studies found that Covid-19 has an dramatically effect on workers and workplaces. The greatest effect has caused a crisis on micro and small enterprises (MaSES). Changes in work regimes and rhythms in the post- pandemic will make changes in the organizational environment and employee motivation. The effect of coronavirus on human body is reputable and more research is ongoing but the human motivation and the workforce studies are yet to be unraveled. In this study, 80 MaSES employee in Garut regency were surveyed through questionnaire and the analysis was carried out using the structured Equation Model (SEM). Frequency Distribution was used for descriptive analysis while chi-square (X<sup>2</sup>) was used as the inferential statistical tool. The results revealed that work motivation, work environment and work productivity were not quite good, meaning that they were not maximized. But, there are strong connection between motivation, work environment and productivity. The findings of the study are valuable and have urgent policy implications for MaSES owner to emerging a special strategy for crisis after COVID-19 pandemic and any other case in the future. Although the calamity would be gradually lessened, organizations need to rebuild different alternatives approaches. The urgent need today is to enhance employee responsible and sense of belonging to organization to foster optimum productivity*

*Keywords—Employee; Motivation, Post-pandemic; Productivity; Work Environment*

### **I. INTRODUCTION**

The COVID-19 pandemic has resulted in a global crisis which has made significant changes to the global economy and pace of company activity around the world (Jamal et al., 2021). Lockdowns worldwide are driving irreparable disruptions in many industries, prompting many companies to close their businesses (Donthu & Gustafsson, 2020). Micro and Small Enterprises (MSEs) is the one who fragile to disappear due to COVID-19 effect on economy. Companies that are able to answer challenges and implement the right strategies during the Pandemic will have a greater chance of surviving and growing, while others will be eroded (Chan and Muthuveloo, 2020). The pandemic had already caused massive dislocation among small businesses just several weeks after its onset (Bartik, et al, 2020). Two implications of the economic crisis experienced by Indonesia in the sector employment. First, an increase in the number of unemployed, and second, post-crisis labor market landscape changes (Rizal, 2020). In the worst conditions, termination of employment occurs unilaterally (Sugiri, 2020).

In the other hands, In Indonesia, MSEs are one of the fields businesses that have an important role for economic growth, besides that MSEs also have a in the absorption of labor and distribution of results development. COVID-19 can be a good influence on the Indonesian economy. The COVID-19 pandemic can also be an opportunity so that investment can be stable even though the economy is under pressure (Nasution et al., 2020). Nuari, (2017) stated that during the 1998 economic crisis, SMEs were one of the sectors that were able to survive and develop, while the larger sector was actually uprooted by the crisis. As business have been changed due to the COVID-19 crisis, MSEs need to change the way they conduct their business productivity to meet customers' new preferences. However, Almost all of the employee may have little or no opportunity to work remotely due to highly concentrated among highly skilled, well-educated workers in a handful of industries, occupations, and countries (McKinsey, 2020). According to Onwuegbuna et al (2021), the challenges experienced by human resource managers in MSEs during and after the coronavirus pandemic include employee motivation and the work environment, because before the pandemic work was an impossible task. Workplace conditions are the main risk factor that can spread the corona virus. These changes can have implications for the performance of an economy.

In order to ensure the progress of current business at the national and international level after COVID-19 pandemic. The operational journey of MSEs must always be accompanied by a high level of ability in their field

and coupled with strong capital and good resources. This of course requires employees who run the company in a healthy, productive manner, a good work environment, strong competitiveness and safety, so that the company's output can run and develop smoothly. To get human resources like this, it is necessary to have support from the management of the MSEs itself. A very important problem in human resource management is to understand the factors that affect employee productivity, including knowing the influence of motivation and the work environment.

For individuals, those that affect motivation and the work environment allow employees to put more effort into improving their standard of living and for companies that affect employee motivation and work environment use it as a trigger for increasing productivity and achieving planned targets through improving the character and behavior of employees within the company. The work environment in the company will also support the production level of the employees. If the environment around the workplace gives an uncomfortable impression, employees will feel lazy to work. A good work environment includes several aspects that must be considered, for example a comfortable work space, safe working conditions, a fixed room temperature, adequate lighting, good relations with coworkers. If this can be fulfilled by a company or organization, it will lead to satisfaction for employees and will increase employee work production.. With the complaints from SME employees after COVID-19, in terms of motivation and work environment, of course, it greatly affects the productivity produced by employees, will be declining productivity employees in doing their jobs. Therefore, the authors are interested in taking the title "The Influence of Motivation and Work Environment on Work Productivity of Small and Medium Enterprises Employees in Post Pandemic Era".

5.

## II. LITERATURE REVIEW

### A. *Micro and Small Enterprises (MSEs)*

The characteristics of MSEs are using simple or manual technology so that technology transfer is easy, raw materials are easy to obtain, have basic skills that are generally obtained from generation to generation, market opportunities are wide enough, are labor intensive or absorb a large number of workers, most of their products are marketed in Indonesia. local or domestic market and some other parts have the potential to be exported (Halim, 2020). Sarmigi (2020) said that micro, small and enterprises are the main players in economic activity in Indonesia. The expertise and ability of micro, small and medium enterprises in developing their business independently can make changes in future development.

### B. *Motivation*

Many transcript of literature documented research about human behavior from many perspective such, psychological, economic and behavioural, etc., to understand what motivate people to do the things they do. Some researcher try to propose definition of motivation. According to Hasibuan (2012), motivation is the provision of a driving force that creates a person's enthusiasm so that they want to work together, work effectively or be integrated with all their efforts in order to achieve a result, namely satisfaction. Finally, several universities and technology related institutions have designed, implemented and maintained employee recognition programmes to encourage hard work and productivity in the workplace. There are various factors to consider in motivating employees: some financial like salary and other non-financial like recognition and challenging work (Bawa, 2017). Motivation is often described as human need to regulate, control, or explain human behavior (Shoraj and Llaci, 2015). However, People who have a high motivation on completed task orientation tend to be not take time to socialize. (Hermina and Sari, 2021)

Motivation highlighted in this paper is based on McClelland Theory (1985) which is the needs for achievement, power, and affiliation. Humans who are high in achievement needs will experience feelings of either joy or sadness when getting results in accordance with their efforts (McClelland & Koestner, 1992). Need of power value to be dependent on the organizational context (De Hoogh et al., 2005). However, Humans who have a high need of power prefer to be in competitive situations, have status recognition, and actively want to achieve status (Veroff, 1992). To maintain appropriate interdependent relationships with others, individuals with a high need for power must often refrain their desire (Yamaguchi, 2003). And the last, The need for affiliation describes the willingness to relate closely and friendly other people (Robbins, 2003). McNeese-Smith (1999) suggests those who are higher in need of affiliation to lead others in desired directions and that in doing so, they feel there is an attachment to the same code of ethics as their partners. McClelland's pointof view on personality and its effect on motivation helps explain the meaning of the social context that creates leaders for real organizations, based on the

motives that exist in each person to encourage, direct, and choose their own behavior (Spangler, House, & Palrecha, 2004).

C. *Work Environment*

According to Sedarmayanti (2015) the definition of the work environment is a condition that exists around the workplace that can affect employees both physically and non-physically. The work environment is one of the causes of success in carrying out a job, but can also cause a failure in the implementation of a job, because the work environment can affect workers, especially the psychological work environment. A study had shown that prime condition of physical work environment can minimize absenteeism of worker, and improve employee performance (Chandrasekar, 2011). Haynes (2008) argues that the work environment is one of the real elements that determine the ability of employees to connect with work roles.

While, Oyetunji (2014) revealed the quality of the work environment has an effect on worker behavior and their mental, physical and emotional state. Pailhe (2002) pointed out that the important factors in calculating the work environment of an organization include non-physical, such as communication networks, working hours, employee empowerment, and work speed. Hours of work connect to programs, policies and practices initiated by worker to scheduling their work hours and compromising their working hours to get their want (Golden, 2012).

D. *Work Productivity*

According to Sunyoto (2015) Work productivity is the comparison between the results achieved and the overall resources used, taking into account the quality of employee work, time, initiative and employee abilities as a benchmark for work results. Hasibuan (2012) defined that productivity is a comparison owned either individually or in a group within the company. Rollison and Broadfield (2002), explained productivity is the quantity of output obtained from a given level of input, and which is influenced by various skills, characteristics and attitudes, including formal training and qualifications, level of motivation, initiative, team skills, attention to detail, multi-tasking ability, communication skills, general attitude and work ethic. Indicators of work productivity put forward by Simamora (2004), namely: Quantity of work, Quality of work, Punctuality work completion and cooperative attitude. According to (Sedarmayanti, 2011) that employee productivity can be influenced by several factors including motivation and work environment. Swandono Sinaga (2016) concluded that the work environment has a positive effect on employee work productivity. The results of Purnama's research (2008) conclude that there is a strong relationship between work motivation and work productivity.

E. *Conceptual Framework*

Based on the review of the theoretical basis above, the research framework describes the influence of motivation and work environment on employee productivity at UKM worker in Kabupaten Garut is depicted in the following Fig.

Fig 1. Framework Of Thinking

- Information :
- X1 = Variabel Independent (Motivation)
  - X2 = Variabel Independent (Work Environment)
  - Y = Variabel Dependent (Productivity)
  - H1, H2 = hypothesis 1 dan hypothesis 2 (Partially test)
  - H3 = hypothesis 3 (Simultaneously test)
  - = the partially effect of variable
  - = the simultaneously effect of variable

The hypothesis is a temporary answer compiled by the researcher, which will then be tested for truth through the research conducted. Meanwhile, the hypothesis of the research is: "The Effect of Motivation and Work Environment both Simultaneously and partially on Work Productivity".

### III. RESEARCH METHODOLOGY

In this study, the method used by the author is descriptive and associative methods of causal relationships. According to Nazir (2013), descriptive method is a method in which it examines the status of a human group, an object, a system of thought, or a class of events in the present. The aim is to provide a systematic, factual and accurate description of the facts, characteristics and relationships between the phenomena studied. In the descriptive method, the problem solving procedure is researched by developing the state of the subject or object of research when the research is carried out by collecting data, processing and analyzing then drawing conclusions. While the causal relationship associative method, according to Sugiyono (2012) is a study that aims to determine the effect or relationship between two or more variables. This research has the highest level compared to descriptive and comparative because this research can build a theory that functions to explain, predict and control a symptom.

According to Sugiyono (2016) a variable is everything in any form that is determined by the researcher to be studied and then drawn conclusions. Then the variabel is divided into 3, namely:

- a. Motivation  
Motivation is the provision of a driving force that creates a person's enthusiasm so that they want to work together, work effectively or be integrated with all their efforts in order to achieve a result, namely satisfaction such as need of achievement, affiliation and power (Hasibuan, 2012).
- b. Work Environment  
The work environment is a condition that exists around the workplace that can affect employees both physically and non-physically (Sedarmayanti, 2015)
- c. Work Productivity  
Work productivity is the comparison between the results achieved and the overall resources used, taking into account the quality of work of employees, time, initiative and employee abilities as a benchmark for work results (Sunyoto, 2015)

The population in this study were employees of leather craft SMEs in Garut Regency. The sample taken is part of the population, selected using Nonprobability Sampling using purposive sampling techniques and quota sampling . According to Sugiyono (2013) purposive sampling is a sampling method based on certain criteria. In this case, the criteria used are worker of small and medium enterprises (SMEs) and are engaged in the leather work industry sector.

The analytical tool used in this study is Path Analysis which can explain the causal relationship between cause variables and effect variables. Therefore hypothesis as follows.

H0: There is no relationship between rows and columns or between motivation and work environment to productivity

H1: There is a relationship between rows and columns or between motivation and work environment to productivity

### IV. RESULT / FINDING

#### A. Characteristics Respondents

Questionnaire is distributed to 80 Leather SMEs workers in Kabupaten Garut in December 2021. The characteristics of the respondents who were sampled in the study were grouped into 3 aspects namely; gender, age and education level. The results is shown in Fig 2.

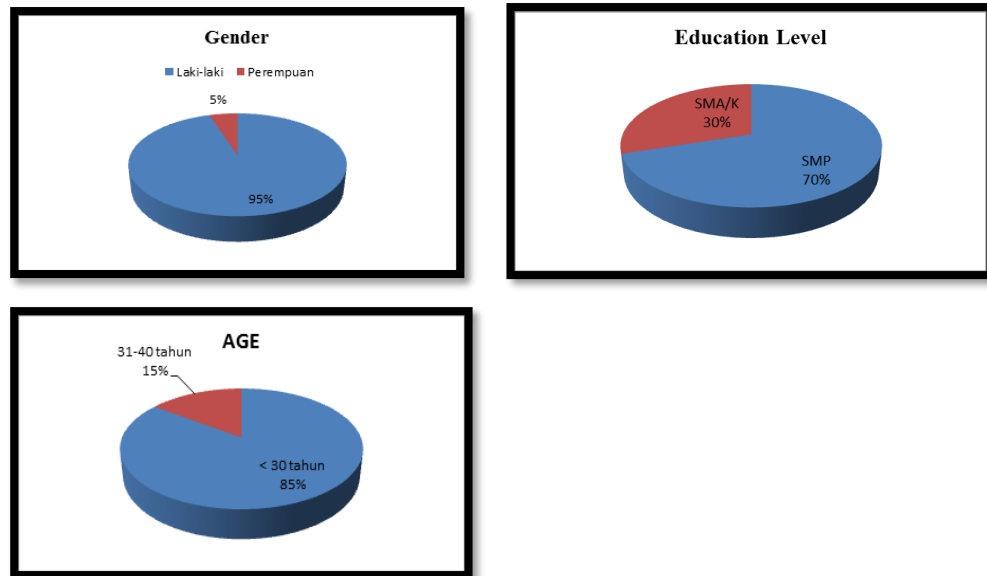

Fig 2. Respondent Characteristics (Source: data Processing, 2022)

Of the 80 employees in the leather craft sector who became respondents in this study, it showed that the number of male employees was 95% while the number of female employees was 5%. Furthermore, the Fig also shows that the majority of employees at this sector are under 30 years old, 85%, while the remaining 15% are aged 31-40 years. And finally, the grouping of education levels is divided into 2 parts, namely SMP and SMA/K which shows that employees with a junior high education (SMP) level have a percentage of 70% and employees with a high school (SMA/K) education level of 30%.

To find out the respondents' responses to the motivation variable at Leathers SMEs in Garut, namely by measuring the results of the questionnaire responses that have been carried out consisting of 10 statement items connected in 3 dimensions, namely: the need for achievement, the need for affiliation and the need for power. While, the work environment variable, consisted of 12 statement items connected in 2 dimensions, namely: physical work environment and non-physical work environment. To find out the respondents' responses regarding the work productivity variable, measured 8 statement items connected in 4 dimensions, namely: quality of work, punctuality, initiative, and ability.

Table 1. Respondent Response in Motivation

No	Dimension		Statement	Score	Criteria
1	Motivation	Achievement	1	101	Quite Good
			2	106	Good
			3	102	Quite Good
			4	103	Quite Good
	Affiliation		5	103	Quite Good
			6	105	Good
			7	103	Quite Good
	Power		8	107	Good
			9	101	Quite Good
			10	104	Quite Good
OVERALL MOTIVATION				104	QUITE GOOD

2	Workforce	Physical	1	103	Quite Good
			2	105	Good
			3	101	Quite Good
			4	101	Quite Good
			5	105	Good
			6	106	Good
			7	106	Good
			8	107	Good
			9	102	Quite Good
		Non-Physical	10	104	Quite Good
			11	102	Quite Good
			12	105	Good
OVERALL WORK ENVIRONMENT				105	GOOD
			1	105	Good
			2	106	Good
			3	103	Quite Good
			4	104	Quite Good
			5	102	Quite Good
			6	104	Quite Good
			7	102	Quite Good
			8	103	Quite Good
OVERALL PRODUCTIVITY				104	QUITE GOOD

Source: data Processing(2022)

Based on Table 1, the summary of the responses of respondents as a whole, with an average score of 104 meaning that all criteria is quite good. The highest score is dimension Motivation in affiliation statement 8 “I’m always included when the company has a big event” and work environment dimension in physical statement 8 ”work can guarantee security” with score 107. While, the least is 101 score in Achievement dimension statement 1” In my work I always develop creativity”, Power dimension statement 9 “The company provides opportunities for promotion to outstanding employees”, and physical dimension statement 3 “There is still noise that can interfere at work”, and 4 “The color arrangement in the workplace is good”.

#### B. The Impact Of Motivation And Workforce To Productivity

To find out the influence of motivation and work environment to the work productivity of Leather Craft Worker in Garut, then an analysis is carried out using several statistical data analysis methods including the data from the questionnaire distribution (Validity Test, Reliability Test, Classical Assumption Test and Multiple Regression Test).

To test the validity of data, several statements were made from each variable, to be able to find out the correlation value based on the statement items, the Cronbach Alpha data processing method was used. The processing of the validity test of Motivation (X1), Work Environment (X2) and Work Productivity (Y) variables using the SPSS application program can be seen as follows:

Table 2. Validity Test (X1)

MOTIVATION	WORKFORCE	PRODUCTIVITY

Item	R count	r Table	Conclusion	Item	R count	r Table	conclusion	Item	R count	r Table	conclusion
Item 1	0.560	0.332	VALID	Item 1	0.676	0.332	VALID	Item 1	0.730	0.332	VALID
Item 2	0.696	0.332	VALID	Item 2	0.619	0.332	VALID	Item 2	0.597	0.332	VALID
Item 3	0.767	0.332	VALID	Item 3	0.765	0.332	VALID	Item 3	0.712	0.332	VALID
Item 4	0.430	0.332	VALID	Item 4	0.428	0.332	VALID	Item 4	0.550	0.332	VALID
Item 5	0.741	0.332	VALID	Item 5	0.772	0.332	VALID	Item 5	0.661	0.332	VALID
Item 6	0.576	0.332	VALID	Item 6	0.594	0.332	VALID	Item 6	0.757	0.332	VALID
Item 7	0.671	0.332	VALID	Item 7	0.714	0.332	VALID	Item 7	0.661	0.332	VALID
Item 8	0.575	0.332	VALID	Item 8	0.559	0.332	VALID	Item 8	0.730	0.332	VALID
Item 9	0.576	0.332	VALID	Item 9	0.627	0.332	VALID				
Item 10	0.730	0.332	VALID	Item 10	0.576	0.332	VALID				
				Item 11	0.698	0.332	VALID				
				Item 12	0.770	0.332	VALID				

Source: data Processing(2022)

Based on Table 2 above, overall it is declared valid. Because the overall value of r-count > the value of r-table (0.332). While, the results of the data processing of the reliability test variables of Motivation (X1), Work Environment (X2) and Work Productivity (Y) using the SPSS application are as follows:

Table 3. Reability Test

<i>Reliability Statistics</i>		
<i>Variabel</i>	<i>Cronbach's Alpha</i>	<i>N of Items</i>
Motivation	,890	10
Work Environment	,914	12
Work Productivity	,894	8

Source: data Processing(2022)

Based on Table 3 above, it is known that the variables of Motivation (X1), Work Environment (X2) and Productivity (Y) in reliability testing have Cronbach's alpha values more than alpha values (0.05). Thus the measuring instrument used in the form of a questionnaire is declared reliable and can be used in data collection in the research process.

Then, Classical assumption test is used to ensure that the data used is normally distributed. The classical assumption test used is as follows normality test and multicoreality test. Based on observations using normal probability plot graph analysis as shown in Fig 3, it can be seen that the histogram graph forms a pattern such as peaking in the middle and with the normal probability plot graph it can be seen that the data spreads around the diagonal line and follows the direction of the diagonal line. According to Ghozali (2012) states that if the data spreads around the diagonal line and follows the direction of the diagonal line or the histogram graph shows a normally distributed pattern, it can be concluded that the regression model meets the assumption of normality. Thus, the conclusion is that the regression model in the study is normally distributed because it has met the assumption of normality.

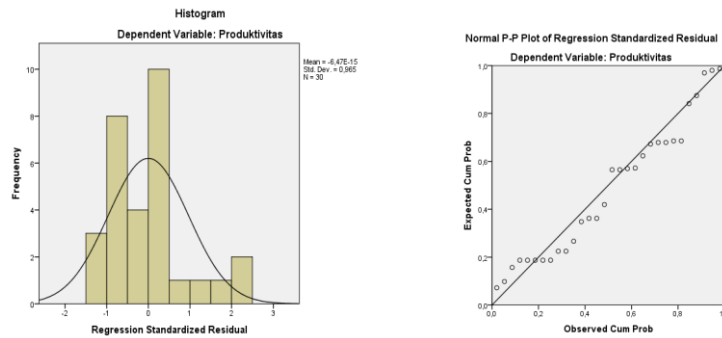

Fig 3. Grafik Normal Probability Plot (Source: data Processing, 2022)

According to Ghozali (2012) the normality test with a line can be misleading if you are not careful, visually it looks normal, but statistically the opposite. Therefore, another test is through the Non Parametric Kolmogorov Smirnov (KS) statistical test. The results of the test can be seen as follows:

Table 4. One-Sample Kolmogorov-Smirnov Test

		Standarized Residual
N		80

	Std. Deviation	,96490128
Most Extreme Differences	Absolute	,142
	Positive	,142
	Negative	-,082
Test Statistic		,142
Asymp. Sig. (2-tailed)		,128 <sup>c</sup>
a. Test distribution is Normal.		
b. Calculated from data.		
c. Lilliefors Significance Correction.		

Source: data Processing(2022)

From the table above, it can be seen that the One-Sample Kolmogorov-Smirnov Test shows that the data used is normally distributed. This can be seen in the significant value which is greater than the alpha value ( $0.128 > 0.05$ ). Thus the results of statistical analysis are consistent with the results of graphic analysis.

Then, Multicollinearity test was conducted to test whether the regression model found regression between independent variables. Multicollinearity test can be done by looking at the TOL (Tolerance) and VIF (Variance Inflation Factor) of each independent variable on the dependent variable.

Table 5. Coefficients Multikolinearitas

Model	Unstandardized Coefficients		Standardized Coefficients	T	Sig.	Collinearity Statistics	
	B	Std. Error	Beta			Tolerance	VIF
1 (Constant)	,940	1,183		,795	,434		
Motivation	1,262	,395	1,550	3,193	,004	,007	1,470
Work Env.	1,700	,329	2,512	5,174	,000	,007	1,470

Dependent Variable: Productivity  
 Source : data processing(2022)

Based on Table 5, it can be seen that the TOL (Tolerance) value of the Motivation variable (X1) and Work Environment (X2) is 0.007, while the VIF (Varian Inflation Factor) value is 1.470, then the VIF value is  $1.470 < 10$ , so the regression model that is formed does not contain any multicollinear symptoms. This means that each independent variable is not related to each other so that the regression model is good to use.

The next test is heteroscedasticity test. This test aims to test whether in the regression model there is an inequality of variance from the residuals of one observation to another observation.

Fig 4. Scatterplot Heteroscedasticity Test (Source : data processing, 2022)

Based on the appearance of Fig 3 the scatterplot graph shows that the plot spreads randomly, above or below zero on the Studentized Residual Regression axis. Therefore, based on the heteroscedasticity test using graphic analysis, the regression model formed states that there is no heteroscedasticity. So that the regression model is declared good. Then, statistical analysis of heteroscedasticity testing was carried out using the Glejser method. Based on Table 6. Heteroscedasticity Coefficients, it is known that the significance value of the Motivation variable (X1) is 0.296, the Work Environment variable (X2) is 0.306 as a whole is greater than the alpha value (0.05), meaning that there is no heteroscedasticity in all variables, so the regression model is stated good.

Table 6. Coefficients Heteroscedasticity

Model	Unstandardized Coefficients		Standardized Coefficients	T	Sig.
	B	Std. Error	Beta		
1 (Constant)	,426	,667		,638	,529
Motivation	,237	,223	2,353	1,065	,296
Work Env.	,193	,185	2,304	1,043	,306

a. Dependent Variable: ABRESID

Source : Data Processing(2022)

The autocorrelation test is used to determine whether in a linear regression model there is a strong positive or negative relationship between the data on the research variables. In this study, researchers used the Run Test method. This test is conducted to test whether the residual value has a high correlation. The following are the results of the autocorrelation test using the Run Test method:

Table 7. Runs Autocorrelation Test

	Unstandardized Residual
Test Value <sup>a</sup>	,01610
Cases < Test Value	15
Cases >= Test Value	15
Total Cases	30
Number of Runs	17
Z	,186
Asymp. Sig. (2-tailed)	,853

a. Median

Source : Data Processing(2022)

Based on the Autocorrelation Test in Table 7, it can be seen that the significant value is 0.853 > alpha value (0.05), meaning that the residual value spreads randomly. Thus, it can be concluded that there is no autocorrelation in the regression equation. Next, Multiple linear regression analysis was used to predict the magnitude of the relationship between the dependent variable, namely Work Productivity (Y) and the independent variable, namely Motivation (X1) and Work Environment (X2). The results of calculations using SPSS are as follows:

Table 8. Coefficients Multiple linear regression

Model		Unstandardized Coefficients		Standardized Coefficients	T	Sig.
		B	Std. Error	Beta		
1	(Constant)	,940	1,183		,795	,434
	Motivation	1,262	,395	1,550	3,193	,004
	Work Env.	1,700	,329	2,512	5,174	,000

a. Dependent Variable: Produktiviti

Source : Data Processing(2022)

Based on the results of data processing in Table 8 that has been carried out, the following regression equation is obtained:

$$Y = 0,940 + 1,262 X1 + 1,700 X2 \quad (1)$$

The equation states that the intercept or constant is 0.940, meaning that without the motivation variable (X1) and the work environment (X2), the magnitude of the work productivity variable (Y) is 94.00%. Thus the interpretation of the regression equation is as follows: Motivation variable (X1) of 1.262 has a positive value, indicating that if motivation has increased, then work productivity (Y) has increased by 12.62%. The Work Environment (X2) of 1,700 has a positive value, indicating that if the Work Environment (X2) has increased, then Work Productivity (Y) has increased by 17.00%.

Next step, the determination coefficient test was conducted to find out how much the endogenous variables were simultaneously able to explain the exogenous variables. Based on the results of data processing using the SPSS application, the results of the determination calculation are as follows:

Table 9. Model Summary Determination Coefficient

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	,977 <sup>a</sup>	,954	,950	,819
a. Predictors: (Constant), Work Env., Motivation				
b. Dependent Variable: Produktivty				

Source : Data Processing(2022)

Based on Table 9, the correlation result is 0.977, which means that the correlation between the X variable and the Y variable is very strong. This means that the ability of the independent variables in explaining the variation of the dependent variable is high. A value close to one means that the independent variables provide almost all the information needed to predict the variation of the dependent variable.

### C. Hypothetical Test

Hypothesis testing is done by using the feasibility test to find out whether the model is feasible or not. To find out how much influence motivation and work environment have on productivity, a hypothesis test is carried out with F-test statistics to obtain the F-table obtained from the F distribution. In this study the significance level used was 5%, following the test results. Then the value of F is 3.3541. Furthermore, comparing the value of the F-count with the F-table by using the decision rule, it can be proven if the sub-hypothesis is accepted or rejected. For the calculated F value, it can be seen from the output results in the F description, the results are 277.977 and the F-table is 3.3541.

Table 10. ANOVA

	Sum of Squares	Df	Mean Square	F	Sig.
Regression	373,336	2	186,668	277,977	,000 <sup>b</sup>
Residual	18,131	27	,672		
Total	391,467	29			
a. Dependent Variable: Produktivty					
b. Predictors: (Constant), Work Env, Motivation					

Source : Data processing (2022)

Based on the results of simultaneous calculations for the effect of the variable Motivation (X1) and Work Environment (X2) on Work Productivity (Y) obtained F-count > F-table (277.977 > 3.3541) then the decision taken is H<sub>0</sub> is rejected, meaning that there is an influence of Motivation and work environment simultaneously on work productivity.

To determine the effect of motivation and work environment on work productivity partially, hypothesis testing was carried out using t-test statistics, to obtain a t-table using a distribution table with a level of  $\alpha = 0.05$  and degrees of freedom (n-2), the t-table value was obtained 1,7011. Based on the results of the statistical calculation of the t-test of motivation, can be seen in the output results with the t statement in Table 8 which is 3.193 and t count of work environment is 5,174. So, the results of the motivation and work environment variable obtained by the value of t-count > t-table. This means that H<sub>0</sub> is rejected and H<sub>1</sub> is accepted for both variabel. The conclusion is that there is an influence of motivation independently on work productivity. And so, there is an influence of work environment independently on work productivity.

## V. DISCUSSION

### A. Motivation

Based on the descriptive analysis, it is known that the respondents' assessment of motivation, is on a quite good criterion, meaning that employees carry out work activities well but not maximal, this is evidenced by the responses regarding working hard in achieving targets, there are still some people who are less enthusiastic about working on their work activities. Respondents' responses regarding being responsible for work, there are still some employees who respond that there is a lack of responsibility for the work they are charged with. In response to optimism, there are still some employees who are pessimistic about the targets achieved. Respondents' responses regarding the opportunity for promotion, this is considered less important by most employees, because the company still retains employees who already have positions. The response regarding maximizing abilities is considered quite good, meaning that the company's leadership is still lacking in terms of providing motivation to employees, thus causing employee morale to decrease. Thus the provision of worker motivation at Leather craft SMEs in Garut can be said to be quite good, although there are still shortcomings that must be improved. Steer (1994) believed that the aim of motivation is to help worker to enhance productivity, improve efficiency and enhance performance of overall organizational. Garut SMEs need to propose new strategies that motivate employees to reach their optimum potential. Malhotra (2021) argue that Managers need to be more pay attention on "intrinsically motivated" workers through the right intrinsic motivators that will be to be essential for organizations in the future. intrinsic motivation may drive what an individual chooses to work on and with whom. The greater the number of dependents of the family, the greater the cost of living that must be met by the head of the family. This is a trigger for workers to be more active in providing for their family's needs (Sari and Rauf, 2020)

### B. Work Environment

Due to descriptive analysis results work environment variabel is considered quite good in terms of the dimensions of the physical and non-physical work environment, this is evidenced by respondents regarding lighting in the workplace that is not good for eye health, color schemes in the workspace that are not supportive, good equipment but still traditional, relationships between co-workers who at certain times are sometimes good, sometimes not good, usually there are differences of opinion when employees are working together in carrying out their work activities, as well as comfort at work, this is due to the pungent odor that comes from the leather, although this is a risk for employees, but there are still some employees who are disturbed by the smell of it. Notoatmodjo (2009) argue that factors involved in the work environment include lighting, odor and Noise. Because of that, manager need to enhance their work environment. Nitisemito (2010) that the work environment is everything that is around the worker that can affect in carrying out the tasks he carries out. Employees will not work well and effectively if they are not supported by a adequate work environment.

### C. Work Productivity

Based on the descriptive analysis, it is known that the respondents' assessment of work productivity at Leather SMEs Company is considered quite good, this is evidenced by the respondents' responses regarding the quality of work considered quite good, meaning that some employees carry out work activities in accordance with the quality determined by the company. it's about timeliness in carrying out work is considered quite good too, meaning that it is sometimes right sometimes also exceeds the specified time limit, this is evidenced during an interview if the employee has not completed his work, then the employee works beyond the time limit determined by the company. The response regarding carrying out work immediately, this can be said to be quite good, because sometimes employees are slow in carrying out work activities, this is due to a lack of motivation from the leadership. In addition, regarding initiative and self-confidence in work, it is considered quite good, this has not been fully carried out by employees.

### D. The Influence of Motivation and Work Environment on Work Productivity

Based on the results of the hypothesis test, the F-count value is 277.977 and the F-table is 3.3541. Thus, comparing the two values, it is concluded that  $F\text{-count } 277.977 > F\text{-table } 3.3541$ , the conclusion is that  $H_0$  is rejected, meaning that there is a positive effect. significant relationship between motivation and work environment on work productivity. Then reinforced by productivity theory. One of the factors supporting success in achieving productivity is motivation. Theoretically, Fahmi (2016) suggests that motivation and productivity are interrelated parts of each other. Increased motivation will affect work productivity, and vice versa. This means that empirical data supports the theory that high productivity can be achieved and supported by employees who have high motivation. Motivation is very important to note as a driver so that employees are enthusiastic in carrying out work activities. If employees have high morale, it will certainly produce optimal performance and productivity

achievement will be achieved. And make a good contribution to the success of organizational goals. Apart from motivation, the determining factor for success in achieving work productivity is the work environment. A good and conducive work environment will provide a sense of security, comfort, and enable employees to work optimally. While a bad work environment will cause employee dissatisfaction so that it will affect employee performance which will have an impact on employee work productivity. The work environment has an influence on work productivity. Companies must realize that to increase employee productivity, it is necessary to maximize a good and conducive and adequate work environment.

From the results of the hypothesis test, the t-count value is 3.193 and the t-table value is 1.701, thus comparing the two values, it is concluded that  $t\text{-count } 3.193 > t\text{-table } 1.701$  then the conclusion is  $H_0$  is rejected, meaning that there is a significant positive effect between motivation on work productivity. Similar finding also found by Lutfi (2014) motivational variables simultaneously and partially influencing the employee performance. Then reinforced by Hasibuan's motivation theory (2012) that the purpose of motivation is to stimulate and encourage individuals to work more actively, effectively and efficiently in order to achieve company goals. In general, one of the goals to be achieved from providing motivation is to increase employee productivity. So the provision of motivation is very important in order to provide good feedback for the company. Lamsah (2018) argue the motivation given by business actors to employees is proven to increase employee job satisfaction and can directly improve the performance of SMEs.

From the results of hypothesis testing, the t-count value is 5.174 and the t-table value is 5.701. Thus, comparing the two values, it is concluded that  $t\text{-count } 5.174 > t\text{-table } 1.701$ , the conclusion is  $H_0$  is rejected, meaning that there is a significant positive influence between the environment work on work productivity. The result is in line with Cahya et al (2021) work environment has a positive and significant effect on employee performance. Then reinforced by the theory of the work environment Sedarmayanti (2015) The condition of the work environment can be said to be good if employees can carry out their work in a healthy, safe and comfortable manner. An unfavorable work environment can demand more manpower and time and does not support obtaining an efficient work system. The main purpose of regulating the work environment is to increase company productivity. Therefore, the provision of good working environment facilities is sufficient, lest the workforce feel too pampered at work, so that the results achieved are not as expected. In this regard, the planning and regulation of the work environment cannot be ignored, because it affects the company's operations.

## VI. CONCLUSION AND RECOMMENDATION

### A. Conclusion

Based on the analysis results that has been done, then some conclusions can be drawn as follows that Motivation and Work Environment simultaneously able to explain changes in Work Produktivity of SMEs Leather Craft Employee. While, independently both Motivation and Work Environment have an influence on Work Produktivity

### B. Recommendation

- a. In proving an increase in work productivity, further research is needed by adding other different variables or using a different analysis
- b. The Owner or manager of SMEs in Garut need to pay more attention to their worker need such as providing incentives, health insurance and promotions for employees who excel in order to generate high motivation and achieve higher productivity, besides that in terms of the work environment the company must facilitate the work environment as well as possible so that employees feel comfortable at work so as not to hinder the work process carried out by employees

## **Analysis Of The Influence Of Monetary Policy On Inflation In Indonesia, 1997-2021.**

Muhammad Nuzul Haidar Ghazi<sup>1</sup> and Dr. Daryono soebagyo, M. Ec<sup>2</sup>

<sup>1,2</sup>Muhammadiyah Surakarta University; Economic Development, Faculty of Economics and Business Muhammadiyah Surakarta, Sukoharjo, Central Java, Indonesia.

### **Abstract**

*Inflation can be defined as a general and continuous increase in the price of goods and services over a certain period of time. Deflation is the opposite of inflation, which is a general and continuous decline in the price of goods. This study analyzes the case of inflation in Indonesia, the underlying reason for this study is the problem of rising price levels (inflation) is a classic problem in the economy. This study aims to analyze the influence of each variable in the model on inflation. In this study using OLS regression with data sources from the Central Statistics Agency. the variable used is inflation which is the dependent variable and the variable is the money supply, exchange rate, Foreign Investment, bi rate. In the regression model, it is known that the variable exchange rate and Bi Rate affect inflation in Indonesia in 1997-2021. It is known that the test F is 0.0000 which means that the variables of the money supply, exchange rate, Foreign Investment, Bi Rate on inflation are known. R-Square is 0.871261 or 87.12%, influenced by variables in the model and the remaining 12.88% influenced by variables outside the model.*

*Keywords— Bi Rate, Exchange Rate, Foreign Investment, Inflation, Money Supply*

---

### **I. INTRODUCTION**

Inflation is a problem that haunts the economy of every country. ever-increasing developments put a drag on economic growth in a better direction. Economic development is an effort to improve the standard of living of society which is often measured through the high and low income of the population each year or per capita income.

Inflation is a monetary phenomenon which is a process of price increase, namely the tendency that prices increase continuously. This does not mean that the prices of various goods go up by the same percentage. The increase may not be at the same time. Most importantly, there is a continuous increase in the general price of goods during a certain period, the price increase that occurs only once (albeit with a considerable percentage) is not inflation, unless reflected in the state of excess supply money. While from the real sector, inflation is caused by the demand for goods against the offer (excess demand for goods). Inflation is the tendency of prices to attract generally and continuously (Boediono, 2005:155).

How to prevent inflation according to Saputra, (2016) is by using policies related to the increase in production including monetary policy, fiscal policy, output policy and pricing policy and indexing. Interest rates are a benchmark for a country's economic activities that can affect the turnover of banking financial flows, inflation, investment and currency movements in a country. In raising and lowering interest rates must take sides and prioritize the welfare of the people in the country (Kurniasari, 2011).

Inflation in Indonesia is likened to an endemic disease and is rooted in history. Inflation in Indonesia had reached its highest level during the time of President Sukarno, because fiscal and monetary policies were not at all prudent (money needs to be printed). In Suharto's time, the government tried to suppress inflation, but it could not be below 10% a year on average, among others because Bank Indonesia still has a dual mission, one of which is as an agent of development that can disburse unlimited liquidity loans. When in the reform period, starting with the Habibie government, the function of Bank Indonesia prioritizes the preservation of the value of the rupiah. However, history and because people's inflationary expectations reflect history, core inflation is still greater than 5% a year. Signs of Indonesia's economy is declining is in 1997 where that was the beginning of the crisis. Mid-1997 Indonesia experienced an economic crisis due to the weakening of the rupiah exchange rate against the United States dollar and reached a low point up to Rp. 18,000-per US\$ in 1998. After the crisis in 1997, Indonesia reached its highest peak inflation rate of 77.63%. Inflation occurs due to increased speculation on the exchange rate and soaring market demand due to price uncertainty. However, inflation decreased dramatically to 2.01% in 1999, while in 2000 the inflation rate then jumped again and exceeded the target of 9.35%. In general, from 1998 to 2021 (research period) Indonesia has experienced rising and falling inflation. With the highest inflation rate in 1998 at 77.63% and the lowest inflation rate was in 1999 with an inflation rate of 2.01%.

Table 1. Inflation rate Data for 1997-2021

Year	Inflation rate
1997	11,1
1998	77,6
1999	2
2000	9,4
2001	12,55
2002	10,03
2003	5,16
2004	6,4
2005	17,11
2006	6,6
2007	6,59
2008	11,06
2009	2,78
2010	6,96
2011	3,79
2012	4,3
2013	8,38
2014	8,36
2015	3,35
2016	3,02
2017	3,61
2018	3,13
2019	2,72
2020	1,68
2021	1,87

Indonesia as a country with an open economy that cooperates in trade with foreign countries is very affected by inflation that occurs with its trading partner countries. When inflation in other countries increases, it will affect its own imports and domestic prices. When the price of imported goods increases, domestic prices will increase also because of the high cost of imported goods as raw materials for production, especially goods that cannot be produced by a country. Interest rate is one indicator of healthy or unhealthy economic condition of a country. High and low interest rates will greatly affect the economy. High interest rates will encourage investors to invest in banks instead of investing in higher-risk industrial sectors so that inflation can be controlled. Conversely, when interest rates fall, people are more likely to hold money rather than save in banks that cause the money supply to increase. This causes the price of goods to increase.

The money supply is the responsibility of the monetary system and must be controlled so that the amount in circulation is not too much or less than the economic capacity of a country which consists of cash plus cash and quasi money (BPS, 2019).

## II. LITERATURE REVIEW

### A. Money Supply

The money supply includes kartal money in circulation, giral money, and quasi money. Kartal money is money issued by the Central Bank consisting of banknotes and coins. There kartal money goes to the state treasury. The emergence of giral money and kartal money comes from money circulated by the central bank, because the money circulated is held by the public partly for the purpose of consumption and partly for the purpose of saving or saving. The money supply consists of kartal money and giral money alone is commonly referred to as the money supply in the narrow sense (M1). The money supply consisting of kartal money, giral money, and quasi money is commonly referred to as the money supply in the broad sense (M2). The money supply M2 is a sum of m1 and M2 and quasi money (Soeratno, 2004:164).

When public demand for goods (aggregate demand) increases (for example due to increased government enforcement financed by printing money, or increased foreign demand for export goods, or increased private investment spending due to cheap credit), the general price level will increase. The price level is one of the factors that determine the demand for money (money demand). The price increase will then drive up the amount of money demanded by the public. In the end, the economy will reach a new equilibrium, when the amount of money demanded is again balanced with the amount of money circulated. An explanation that describes how price levels are determined and change as the money supply changes is called the quantity theory of money. Based on this theory, the amount of money in circulation in an economy determines the value of money, while the growth of the money supply is the cause of inflation.

#### *B. Exchange Rate*

The exchange rate of a currency or exchange rate is a comparison of the value of a country's currency against the currency of other foreign countries (Thobarry, 2009). Another definition of a currency exchange rate (exchange rate) is the exchange between two different currencies, that is, the comparison of the value or price of a currency between the two different currencies. The exchange rate usually changes, the change can be in the form of depreciation or appreciation. Depreciation of the Rupiah against the US Dollar means a decrease in the price of the Rupiah against the US Dollar, while the appreciation of the Rupiah against the US Dollar is an increase in the price of the Rupiah against the US Dollar (Anwary, 2011:17).

Exchange rate systems can be classified according to the rate at which the exchange rate is controlled by the government. Exchange rate systems usually fall into one of the following categories, namely fixed exchange rate, freely floating exchange rate, managed float exchange rate, pegged exchange rate (Madura,2010:171).

The balance of the currency exchange rate will change at any time according to changes in the demand and supply of that currency. Thus, the factors that affect the change in demand and supply of the currency will also affect the fluctuations in the exchange rate of the currency. Factors that affect the fluctuation of the currency exchange rate of a country with other countries, namely (Madura, 2010:99).

#### *C. Foreign Investment*

Foreign investment (PMA) is a form of investment by building, buying a total or acquiring a company. Investment in Indonesia is established through law no.25 year 2007 on investment Aing (PMA). Foreign investment in this law is the activity of investing capital to conduct business in the territory of the Republic of Indonesia carried out by foreign investors, either using foreign capital entirely or in cooperation with domestic investors (Article 1 of law no.25 of 2007 on investment).

Foreign investment (PMA) or foreign investment is the activity of capital flows obtained from outside parties moving into the field of Foreign Investment. The United Nations Conference on Trade and Development (UNCTAD) defines foreign investment as investments carried out by companies in the country against companies in other countries for the purposes of managing company operations in that country (Arifin et al, 2008 in Fadilah, 2017).

According to Ma'ruf and Wihastuti (2008), endogenous growth theory explains that investment in physical capital and Human Capital play a role in determining long-term economic growth. The government's contribution to economic growth can be explained through its influence in making changes in consumption or expenditure on public investment and receipts from taxes (Ma'ruf and Wihastuti, 2008). This group of theories also considers that the existence of infrastructure, laws and regulations, political stability, government policies, bureaucracy, and the basis of international exchange as important factors that also affect economic growth (Ma'ruf and Wihastuti, 2008).

Foreign Direct Investment (FDI) occurs when a company from one country invests its capital in a long period of time to a company in another country. The country of origin of the company that invests the capital is called host country while the country where the intended investment is called home country (Igamo, 2015).

#### D. BI Interest Rate

According to Cashmere (2014: 14) a Bank is a business entity that collects funds from the public in the form of deposits and distributes them back to the public in the form of credit and or other forms in order to improve the standard of living of the people. While the banking business includes three activities, namely collecting funds, distributing funds, and providing other bank services. The activities of collecting and distributing funds are the main activities of the bank while providing other bank services are only supporting activities.

The implementation of credit activities of all banks operating in Indonesia must follow the rules set by Bank Indonesia (BI) as a bank supervisory institution. One of them is the determination of interest rates, where the implementation of banking loans is based on the benchmark interest rate issued by Bank Indonesia through the Bank Indonesia Rate.

According to Cashmere (2013: 114) understanding loan interest rate is the interest given to the borrower or the price to be paid by the borrower customer to the bank. According to Irham Fahmi (2013: 88) the understanding of the loan interest rate is the amount of money required to the party who borrowed it with a calculation based on the percentage and done based on the period of time specified.

Interest rates play several important roles in the economy, Rose (2006: 115) namely: 1. Interest rates help ensure deposits can flow to investment to support economic growth. 2. Interest rates distribute funds to eligible credits, providing borrowed funds to investment projects that generate the highest estimated rate of return. 3. Interest rates bring the supply of funds into balance with the demand for funds from the public. 4. S interest rate as an important tool for the government to influence the amount of deposits and investments. If economic growth is very slow and unemployment increases, then the government can use its policy by lowering interest rates in order to stimulate lending and investment. On the other hand, if the economy experiences a high inflation rate, the government uses its policy to raise interest rates to slow down lending and investment rates to increase deposits.

### III. RESEARCH METHODOLOGY

This study will observe the effect of monetary policy on inflation in Indonesia, using multiple regression analysis tools

$$INF_t = JUB_t + KURS_t + INV_t + SBI_t + \varepsilon_t$$

INF = Inflation

JUB = Money supply

INV = Foreign Investment

SBI = SBI interest rate

$\varepsilon$  = Error Term

$\beta_0$  = Constant

$\beta_1, \beta_4$  = Independent variable regression coefficient

$t$  = Year to t

### IV. RESULT / FINDING

This study uses multiple linear regression method. Multiple linear regression test is done to determine how much influence the independent variable to the dependent variable. This test uses the Ordinary Least Square (OLS) method with the Eviews 10 application.

The results of multiple linear regression the relationship between the variables money supply, PMA, exchange rate, BI interest rate to inflation obtained the following results:

Table 2. Multiple Linear Regression Test Results

Variable	Coefficient	Std. Error	t-Statistic	Prob.
----------	-------------	------------	-------------	-------

C	-27.71337	7.088344	-3.909709	0.0010
JUB	5.05E-06	6.99E-06	0.722441	0.4793
KURS	0.001820	0.000924	1.970273	0.0644
PMA	-0.000315	0.000363	-0.867195	0.3972
BI_RATE	2.038714	0.224861	9.066537	0.0000
R-Squared	0.871261			
F-Statistic	0.000001			

Source: Eviews Output Results

Based on the results of the regression test in the table above, the equation can be written as follows:

$INF = -27.71337 + 5.05 \text{ E-}06 \text{ JUB} + 0.001820 \text{ exchange rate} - 0.000315 \text{ PMA} + 2.038714 \text{ Bi Rate}$ . The value of the Jub coefficient of 5.05 E-06 which means that the Jub increases every 1 unit will increase inflation by 5.05 e - 06 units, the value of the exchange coefficient of 0.001820 which means that the exchange rate increases every 1 unit will increase inflation by 0.001820 units, and the value of the PMA coefficient of -0.000315 which means that the PMA increases every 1 unit will decrease inflation by 0.000315 units. The value of the BI rate coefficient is 2.038714 which means that the Bi Rate increases every 1 unit, it will increase inflation by 2.038714 units.

#### Classical Assumption Test

##### a) Normality Test

Table 3. Normality Test Results

Jarque Bera	0,921383
Probability	0,630847

Source: Eviews Output Results

Based on the test results in the table above, it is known that the probability value of  $0.630847 > 0.05$  (UTC) and the value of Jarque Bera is  $0.921383 < 2$  which means that the data in this study is normally distributed.

##### b) Autocorrelation Test

Prob. F(4,14)	0,7665
Prob. Chi-Square (4)	0,0678

Source: Eviews Output Results

Based on the test results in the table above, it is known that the probability value of chi-square is  $0.0678 > 0.05$  (UTC) which means that there is no autocorrelation problem in this research

##### c) Multicollinearity Test Data

Table 4. Multicollinearity Test Results

Variable	Nilai VIF
C	NA
JUB	6.437375
KURS	3.433691
PMA	7.140107
BI_RATE	1.668426

Source: Eviews Output Results

Based on the test results in the table above, it is known that the value of VIF for variable JUB, exchange rate, PMA, BI rate value of VIF < 10 which means that there is no multicollinearity problem in this research.

d) *Heteroscedasticity Test Data*

Table 5. Heteroscedasticity Test Results

Prob. F(14,8)	0,0288
Prob. Chi-Square(14)	0,9472

Source: Eviews Output Results

Based on the test results in the table above, it is known that the probability value of chi-square is  $0.9472 > 0.05$  (UTC) which means that there is no problem of heteroskedasticity in this research data.

V. DISCUSSION

- In the regression model, it is known that the exchange rate and interest rate variables affect inflation in Indonesia in 1997-2019. Known test F of 0.0000 means the variable money supply, exchange rate, Foreign Investment, Bi Rate to inflation. R-Square is 0.871261 or 87.12%, meaning 87.12% is influenced by variables in the model and the remaining 12.88% is influenced by variables outside the model.
- In this OLS regression the value of VIF > 10 is stated that there is no multicollinearity problem in the prediction model.
- The result of normality Residua test is 0.921383 with P value of  $0.630847 > 0.05$  so that  $H_0$  is accepted. Which means that the residual attribution is normal
- Note the value of prob Chi Square is equal to  $0.6175 > 0.05$  so that  $H_0$  is received which means there is no problem of serial auto corelasi.
- At the value of OBS R square is equal to  $0.1275 < 0.05$  then  $H_0$  is rejected which means that modelregresi is heterokedasticity
- T-statistic test

Table 6. t-statistical test results

Variable	t-Statistic	Prob.
C	-3.909709	0.0010
JUB	0.722441	0.4793
KURS	1.970273	0.0644
PMA	-0.867195	0.3972
BI_RATE	9.066537	0.0000

Source: Eviews Output Results

Based on the results of testing the probability of variable JUB of  $0.4793 > 0.10$  (UTC) which means that the JUB has no significant effect on inflation. The results of the test are known that the value of the probability of the exchange rate of  $0.0644 < 0.10$  (UTC) which means that the exchange rate has a significant effect on inflation. The results of the test is known that the probability value of PMA is  $0.3972 > 0.10$  (ironic) which means that PMA has no significant effect on inflation. The results of the test are known that the BI-rate probability value of  $0.0000 < 0.01$  (UTC) which means that the bi rate has a significant effect on inflation.

F-statistical test

- Based on the results of the test, it is known that the probability value of F is  $0.000000 < 0.05$  (UTC) which means that JUB, exchange rate, PMA, BI RATE jointly affect inflation. Koefisien Determinasi (R-Squared)

The test results obtained R-squared value of 0.871261 which means the variable JUB, exchange rate, PMA and BI RATE can affect the inflation variable of 87.12% and the rest of 12.88% explained by other factors that are not contained in this study.

## VI. CONCLUSION AND RECOMMENDATION

Inflation is a problem that haunts the economy of every country. ever-increasing developments put a drag on economic growth in a better direction. Economic development is an effort to improve the standard of living of society which is often measured through the high and low income of the population each year or per capita income.. the results of the probability test variable JUB is  $0.4793 > 0.10$  (UTC) which means that the JUB has no significant effect on inflation. The results of the test are known that the value of the probability of the exchange rate of  $0.0644 < 0.10$  (UTC) which means that the exchange rate has a significant effect on inflation. The results of the test is known that the probability value of PMA is  $0.3972 > 0.10$  (ironic) which means that PMA has no significant effect on inflation. The results of the test are known that the BI-rate probability value of  $0.0000 < 0.01$  (UTC) which means that the bi rate has a significant effect on inflation. the test results are known that the probability value of F is 0.000000. The test results obtained R-squared value of 0.871261

## Determinants Of The Human Development Index In Central Kalimantan Province

A. Istianah<sup>1</sup> and B.Muhammad Arif<sup>2</sup>

<sup>1,2</sup> Development Economic, Muhammadiyah University of Surakarta

### Abstract

*The Human Development Index is a way of measuring how far humanity has progressed. Considering Central Kalimantan Province is located in eastern Indonesia, it has weaknesses in its efforts to enhance human life quality. The government's efforts to improve the quality of human life are attempting year after year, yet the results demonstrate that the human development index remains deficient. The aim of the research is to see how the Human Development Index is determined by factors including poverty percentage, primary sector GRDP, secondary sector GRDP, and tertiary sector GRDP. Panel data analysis was used as the analytical approach in this study. The focus of this study is Central Kalimantan Province, and it is based on secondary data from the Central Agency on Statistics. The Fixed Effect Model was chosen as the model based on the test results for optimum model selection. According to the findings of this study, the poverty percentage, primary sector GRDP, and tertiary sector GRDP all have a significant effect on the Human Development Index in Central Kalimantan during 2010 to 2020. The secondary sector's GRDP has no effects on the human development index. For example, in the manufacturing sector, there are challenges, such as low human resource quality in grasping current processing technologies and the majority of the workers having only completed elementary school. Because it directly affects the development of human resources and societal welfare, the secondary sector requires additional focus.*

*Keywords— Human Development Index; poverty percentage; primary sector GRDP; secondary sector GRDP; tertiary sector GRDP*

### I. INTRODUCTION

In general, life welfare is described as a cycle that includes a variety of dimensions of basic human living in community groups, lifestyle, and social connections, all of which result in a better state of being (Sari & Pratiwi, 2018). The quality of human resources is reflected in an increase in educational Figs, an increase in the quality of health services in an equal manner, and an improvement in the economy of a region. The Human Development Report, which was originally published in 1990, has introduced innovative strategies for improving human well-being that are superior than economic growth. The focus of human growth or advancement is more on the wealth of human life than the riches of human affluence. The human progress approach gradually came to the realization that monetary indicators of progress, such as GDP per capita, were insufficient. The human development index (HDI) was created in the inaugural human development report as a measure of performance in the fundamental areas of human development amongst nations (Çağlayan-akay & Van, 2017).

The Human Development Index is a widely utilized measurement by governments around the world today (HDI). The Human Development Index is interpreted by the Central Agency on Statistics as a representation of how the people might acquire development outcomes such as income, health, education, and etc. A basic 3-dimensional approach to human development includes a long and healthy life, knowledge, and a reasonable level of living. Life expectancy at birth is used to represent the health dimension, while indicators of average length of schooling and school expectations are used to represent the education dimension, and adjusted per capita expenditure is used to represent the decent living standards dimension.

The province of Central Kalimantan is located in Indonesia's eastern region, and it has flaws in its efforts to improve human life quality. The government's efforts to improve the quality of human life have been ongoing year after year, yet the results demonstrate that the human development index remains low. When examined nationwide in 2021, the Central Kalimantan Human Development Index as a whole attained high rank. However, when the data is broken down by district/city, there is still a discrepancy, as shown in Table 1.

Table 1: Human Development Index by Central Kalimantan District/City (2019-2021)

District/City	[New Method] Human Development Index by District/City		
	2019	2020	2021
Central Kalimantan	70,91	71,05	71,25
West Kotawaringin	72,85	72,87	73,07
East Kotawaringin	71,16	71,31	71,38
Kapuas	69,38	69,48	69,63
South Barito	70,1	70,22	70,54
North Barito	70,52	70,59	70,79
Sukamara	67,95	68,03	68,27
Lamandau	70,51	70,51	70,58
Seruyan	67,57	67,58	67,67
Katingan	68,55	68,68	68,89
Pulang Pisau	68,34	68,45	68,53
Gunung Mas	70,65	70,81	71,03
East Barito	71,34	71,39	71,47
Murung Raya	67,89	67,98	68,12
Palangka Raya	80,77	80,77	80,82

Source: BPS Kalteng several editions, processed

Palangka Raya City is the only region with a such a high HDI rating (80.82). This is impacted by Palangka Raya's role as the capital of Central Kalimantan Province, which means that this region has better infrastructure and community welfare guarantees than other areas in Central Kalimantan. Seruyan Regency, on the other side, has the lowest HDI score in Central Kalimantan Province, with a score of 67.67. Seruyan Regency is a new territory formed through regional expansion, therefore it is still in the process of regional development; in other words, the low HDI statistic is the result of programs in the three essential dimensions that have yielded few results. In terms of education, people who got education up to the high school level or its equivalent had a lower average population than those who had education at the elementary and junior high school levels. This is owing to a lack of access to education, high costs, and a desire to provide for one's family (Kanwil DJPb Kalteng, 2021).

Based on the foregoing, this research will look at the effect of the percentage of people living in poverty, primary sector GRDP, secondary sector GRDP, and tertiary sector GRDP on the Human Development Index of Central Kalimantan Province during 2010 to 2020.

This study varies from earlier studies in two ways. The first has to do with the time frame for the observation. The panel data analysis approach is typically used for studies on human development that last under ten years. The study covered the years 2010 through 2020. Second, the GRDP variables for the primary, secondary, and tertiary sectors become variables that are tested using the approach. The average GRDP variable utilized in earlier studies only accounts for GRDP per capita, GRDP overall, and just one specific economic sector. As a result, the Province of Central Kalimantan acquired the alternative information required to determine which aspects may be developed and concentrated on to create prosperity.

## II. LITERATURE REVIEW

### A. Grand Theory

In order to realize quality of community life, social welfare, as according Zastrow (2000), is a system that consists of programs and services that assist individuals in addressing fundamental requirements including social, economic, educational, and health (Kresna, 2019). In accordance with the goals of families and society, the United Nations further defined social welfare as organized activities aimed at assisting people or communities in meeting their fundamental requirements. According to Nasikun (1993), the indicators of a sense of security, welfare, freedom, and identity show that the idea of welfare has the same meaning as the concept of human dignity (Rosni, 2017).

There are quite a lot of success indicators that may be used to gauge a person's quality of life. The community's standard of living, as evidenced by reduced poverty, improved health, the attainment of a high level of education,

and an increase in local output, serves as a proxy for welfare for the lower-middle class. The improvement in the lower middle class community's income level is reflected in each of these metrics (Thomas, 2005).

#### B. Poverty and Human Development Index

Poverty is considered as a multidimensional problem that is difficult to quantify, so it is vital to agree on the method of measurement. The ability to meet basic requirements is a notion that is widely used by many countries around the world. Suhariyanto, (2011) defines poverty as an inability to meet fundamental food and non-food needs due to a lack of resources. Food commodities contribute approximately three-quarters of the poverty line. The phenomena of rising food prices has the potential of reducing consumption of healthy food, as low-income people are forced to try and eat within economical expenses, among other things by lowering the quality of the food consumed (Pudjianto & Syawie, 2015). Poor food quality contributes to the prevalence of malnourished people, and it has the potential to distort the quality of human resources as a result of suboptimal human development achievements. As a result, it is possible to state that poverty and human development have an inverted or negative relationship. As according Panjaitan & Nasution, (2015) the percentage of people living in poverty has a significant and negative relationship with the human development index achievement in North Tapanuli. A reduction in the poverty rate will have an impact on the region's human development achievements.

#### C. GRDP and Human Development Index

The Gross Regional Domestic Product (GRDP) is a measure of economic growth that can be used to characterize the state of a community's well-being. Simon Kuznets proposes that high output per capita is one of the criteria of a country's economic progress. (Todaro & Smith, 2006). High output growth causes changes in consumption in terms of people's purchasing power, which is the per capita economic growth in question. In other words, rising economic growth will raise output per capita and alter consumption patterns (in this case, boosting people's purchasing power). People's purchasing power is one of the dimensions of human development, therefore their high purchasing power has the ability to raise the Human Development Index. As a result, in theory, GRDP and human development are positively or directly proportional. Based on its findings, Bangun, (2020) indicates that GRDP has a positive impact on the Human Development Index in North Sumatra. Zamruddin Hasid, (2019) concluded, claiming that the Agricultural Sector's GRDP has an impact on the HDI in West Sulawesi and contributes significantly to the establishment of regional GRDP.

### III. RESEARCH METHODOLOGY

#### A. Research Instruments

Using secondary data obtained from information documentation from the Central Agency on Statistics and analyzed with a quantitative approach, this study aims to investigate the effect of the Poverty Percentage, Primary Sector GRDP, Secondary Sector GRDP, and Tertiary Sector GRDP on the Human Development Index. Fig 1 illustrates the research design.

Fig 1. Research Design

#### B. Research Instruments

Quantitative data methodologies are used in the research instrument. For the years 2010-2020, secondary data was gathered from the Central Agency on Statistics. The Human Development Index is the study's dependent variable. The poverty percentage, primary sector GRDP, secondary sector GRDP, and tertiary sector GRDP are all independent variables in this study.

Table 2. Definition of Variables

Variable	Definition
Human Development Index	A instrument for interpreting human development achievements based on the fundamental characteristics of living standards. The HDI of Central Kalimantan Province was calculated for the period 2010-2020. The data was gathered from the Central Kalimantan BPS's official website.
Poverty Percentage	The percentage of people living on the poverty line, or simply the proportion of people who are poor. The unit of measurement is the percentage.
Primary Sector GRDP	A sector that generates exclusively natural resources, such as land and everything on it, rather than processing raw materials. This sector includes agriculture, as well as mining and quarrying. The GRDP is calculated using constant pricing per line of business from 2010. Millions of rupiah are the unit of measurement.
Secondary Sector GRDP	The industry that transforms raw resources from the primary and secondary sectors into higher-value commodities. Buildings, manufacturing, and electricity, gas, and water supply are all included in this sector. The GRDP is presented using 2010 constant prices per business field. The unit of measurement is million rupiah..
Tertiary Sector GRDP	A sector whose output is in the form of services rather than physical goods. Trade, hotel and restaurant sector, transportation and communication sector, finance sector, rental and enterprise services sector, and services sector are all included in this sector. The GRDP is presented using 2010 constant prices per business field. The unit of measurement is million rupiah.

### C. Data Analysis Technical

To acquire the regression findings, the study data was analyzed using the EViews 10 application. The Human Development Index was used to evaluate economic wellbeing in this study, and it also served as the dependent variable. The Poverty Percentage, Primary Sector GRDP, Secondary Sector GRDP, and Tertiary Sector GRDP are assumed to influence the Human Development Index of Central Kalimantan Province. In general, the panel regression model's formula is as follows:

$$IPM_{it} = \beta_0 + \beta_1 POV_{it} + \beta_2 \log PDRB PRIM_{it} + \beta_3 \log PDRB SEK_{it} + \beta_4 \log PDRB TER_{it} + \varepsilon_{it}$$

Where :

$IPM$	= Human Development Index
$Pov$	= Poverty Percentage (percent)
$PDRB PRIM$	= Primary Sector GRDP (million rupiah)
$PDRB SEK$	= Secondary Sector GRDP (million rupiah)
$PDRB TER$	= Tertiary Sector GRDP (million rupiah)
$\log$	= Logarithmic operators based on $e$
$\varepsilon$	= Error term
$\beta_0$	= Constant
$\beta_1 \beta_2 \beta_3 \beta_4$	= Independent variable regression coefficient
$i$	= Observation in the region of $i$
$t$	= t-year period

## IV. RESULT / FINDING

### A. Chow Test

The chow test is used to assess whether of the Common Effect Model and the Fixed Effect Model is the best to utilize. If the probability value of Cross-section F and Cross-section Chi-square > 0.05, the F-Stat/Chow test is approved, and the regression model chosen is the Common Effect Model (CEM). H0 is rejected if the probability value of Cross-section F and Cross-section Chi-square is less than 0.05, and the regression model selected is Fixed Effect Model (FEM).

Table 3. Chow Test Results

Effects Test	Statistic	d.f.	Prob.
Cross-section F	246.308525	(13,136)	0.0000
Cross-section Chi-square	492.873221	13	0.0000

Source: The author used Eviews to process the data, 2022.

Based on the results of the Chow test in Table 3, the probability value is  $0.0000 < 0.05$ , implying that the Fixed Effect model is the preferred model.

#### B. Hausman Test

The Hausman test compares the Fixed Effect Model and the Random Effect Model in order to determine which is the best. If the probability value of a random cross-section  $> 0.05$ , Hausman's test conditions are met, and  $H_0$  is accepted. The regression model used is the Random Effect Model (REM).  $H_0$  is rejected if the random cross-section probability value is less than 0.05. The Fixed Effect Model was chosen as the regression model (FEM).

Table 4. Hausman Test Results

Test Summary	Chi-Sq. Statistic	Chi-Sq. d.f.	Prob.
Cross-section random	46.024786	4	0.0000

Source: The author used Eviews to process the data, 2022

Table 4 shows that the probability value for the Hausman test is  $0.0000 < 0.05$ , indicating that the model chosen is the Fixed Effect Model.

#### C. t-Test

The partial coefficient test, often known as the t-test, is used to measure the significance of an independent variable's influence on a dependent variable. If the P-value  $>$  then  $H_0$  is acceptable for the partial coefficient / t test, indicating that the independent variable has no influence on the dependent variable.  $H_0$  is rejected if the P-value is less than one, indicating that the independent variable has an influence on the dependent variable.

Table 5. Results of t-Test / Partial Coefficient

Variable	Prob.	P-value	Description
Pov	0,0157	$P < 0,05$	Significant
Log(PDRB_primer)	0,0009	$P < 0,05$	Significant
Log(PDRB_sekunder)	0,7011	$P > 0,05$	Not Significant
Log(PDRB_tersier)	0.0002	$P < 0,05$	Significant

Source: The author used Eviews to process the data, 2022

The t-test findings in Table 5 reveal that the variables of poverty percentage, primary sector GRDP, and tertiary sector GRDP all have an influence on the Human Development Index individually.

#### D. F Test

The F test was used to see if the independent factors had an influence on the dependent variable at the same time (simultaneously). If the P-value  $> \alpha$ , the criteria for accepting  $H_0$  is that the independent variables have no influence on the dependent variable simultaneously (simultaneously). When the  $H_0$  condition is rejected, i.e. when the P-value is less than  $\alpha$ , it implies that the independent variable has a simultaneous effect on the dependent variable (simultaneously).

Table 6. F-Test Results

Variable	Prob (F-Statistic)	Criteria	Conclusion
Pov, log(PDRB_primer), log(PDRB_sekunder), log(PDRB_tersier)	0,000000	$P < 0,05$	Take effect

Source: The author used Eviews to process the data, 2022

The probability value (F-Statistic) of the F test in the table is  $0.000000 < 0.05$ , indicating that the variables poverty percentage, primary sector GRDP, secondary sector GRDP, and tertiary sector GRDP all have an influence on the Human Development Index simultaneously time.

#### E. Determination Coefficient Test ( $R^2$ )

According to Widarjono, the Coefficient of Determination (R-Squared) test was used to explain the proportion of variance explained by the independent variable. The coefficient of determination is a number that runs from 0 to 1. The closer you get to one model, the better, since it demonstrates how appropriate or appropriate a regression line is and how much the independent variable's change may explain the dependent variable's variation.

Table 7. Coefficient of Determination Test Results ( $R^2$ )

R-square	Adjusted R-square	S.E. of Regression
0,987261	0,985669	0,459375

Source: The author used Eviews to process the data, 2022

Table 7 shows that the variables poverty percentage, primary sector GRDP, and tertiary sector GRDP have an effects of 98.73 percent on the Human Development Index, whereas factors outside the model had an effects of 1.27 percent.

#### F. Test for Significance of Regression Coefficients

Because this analysis integrates time series data represented by observations from 2010 to 2020 with cross section data representing all districts/cities in Central Kalimantan, the panel data approach was adopted. Table 8 shows the outcomes of panel data analysis regression using the chosen model approach.

Table 8. Regression Results of Selected Model FEM

Variabel	Coefficient	Std. Error	t-Statistic	Prob.
C	-54.22142	6.519891	-8.316309	0.0000
Pov	-0.220140	0.090008	-2.445781	0.0157
Log (PDRB_primer)	3.895725	1.144615	3.403524	0.0009
Log (PDRB_sekunder)	0.399192	1.037919	0.384608	0.7011
Log (PDRB_tersier)	4.353975	1.126589	3.864742	0.0002

Source: The author used Eviews to process the data, 2022

## V. DISCUSSION

### A. The Effects of Poverty Percentages on The Human Development Index

With a coefficient of 0.220140, the poverty percentage has a negative influence on the human development index in the province of Central Kalimantan throughout the 2010-2020 period, according to the regression results in Table 8. This indicates that if the percentage of people in poverty rises by 1%, the human development index will decrease by 0.220140. This finding is in line with Panjaitan & Nasution, (2015) research, "Application of Path Analysis in Analyzing Factors Affecting the Human Development Index of North Tapanuli Regency," which concluded that when the poverty percentage increases, the human development index decreases. Arafat et al., (2020) published research titled "Factors Affecting the Human Development Index in Central Kalimantan Province" that indicated that in ceteris paribus conditions, if the percentage of poverty decreased, the human development index would increase in average.

According to the Central Agency on Statistics, the percentage of people in poverty in Central Kalimantan has been declining since March 2021, and it now ranks fifth lowest in the country, down from 5.94 percent to 5.16 percent. The government claims that through implementing different social assistance programs such as financial aid and non-monetary support in the form of expenditure on basic needs, it has been successful in eliminating poverty in Central Kalimantan (RRI, 2021). On the other side, the Human Development Index for September 2021 increased by 71.25 points, with complete support from all dimensions. Human development in Central Kalimantan is continuing to advance, as seen by the trend over the previous decade. Although, because to the Covid-19 epidemic, there was a slowdown in 2020 (Gumi, 2021).

### *B. The Effect of Primary Sector GRDP on Human Development Index*

With a regression coefficient of 3.895725, the primary sector GRDP variable has a positive effect on the human development index of Central Kalimantan over the 2010-2020 period, as shown in Table 8. This indicates that if the primary sector's GRDP increases by 1 million rupiah, the human development index increases by 3.895725 as well. This finding is also supported by previous research conducted by Utama et al., (2015) under the title "The Influence of GRDP, Capital Expenditures, and Poverty on the Human Development Index (Case Study: Ex. Residency Besuki)," which found that GRDP has a significant impact on the human development index in the former Besuki Residency area.

The primary sector GRDP has an impact on the human development index in Central Kalimantan since farming and oil palm plantation are the main sources of income for the inhabitants of Central Kalimantan. Meanwhile, most people in the Katingan region, particularly in Central Katingan, work as farmers and miners in the mining and quarrying industry. Gold and puya (red zircon sand) are the most common mining products (Kanwil DJPb Kalteng, 2021).

### *C. The Effect of Secondary Sector GDP on Human Development Index*

In Central Kalimantan, the secondary sector's GRDP has no effects on the human development index. For example, in the manufacturing sector, there are challenges, such as low human resource quality in grasping current processing technologies and the majority of the workers having only completed elementary school (Bappenas, 2016). Furthermore, the electrical industry in Central Kalimantan is still plagued by supply issues. Central Kalimantan power plants are part of the Central Kalimantan energy system, which is still heavily reliant on supplies from South Kalimantan. Meanwhile, current power capacity is still insufficient to fulfill the demands of two provinces. As a result, in Central Kalimantan, blackouts are a typical occurrence (MMCKalteng, 2019).

### *D. The Effect of Tertiary Sector GDP on Human Development Index*

With a regression coefficient of 4.353975, the tertiary sector GRDP variable has a positive effect on the human development index of Central Kalimantan over the 2010-2020 period, as shown in Table 8. In other words, if the tertiary sector's GRDP increases by 1 million rupiah, the human development index improves by 4.353975. The tertiary sector's GRDP has an impact on the human development index considering sectors including wholesale and retail trade, repair and car maintenance are the second largest absorbers of labor, accounting for 17.50 percent. Government Administration, Defense, and Mandatory Social Security are the third-largest contributors, accounting for 7.66 percent of the total (Kanwil DJPb Kalteng, 2021).

## VI. CONCLUSION AND RECOMMENDATION

### *A. Conclusion*

Based on the findings and discussions mentioned in a previous step, it is possible to conclude: (1) The Fixed Effect Model was chosen as the model. (2) The results of the t-test show that the variables of poverty percentage, primary sector GRDP, and tertiary sector GRDP individually have an impact on the Human Development Index. (3) Poverty percentage, primary sector GRDP, secondary sector GRDP, and tertiary sector GRDP all impact the Human Development Index simultaneously time. (4) The variables poverty percentage, primary sector GRDP, and tertiary sector GRDP have an effects of 98.73 percent on the Human Development Index, whereas factors outside the model had an effects of 1.27 percent. (5) With a coefficient of 0.220140, the poverty percentage has a negative influence on the human development index in the province of Central Kalimantan throughout the 2010-2020 period, according to the regression results in Table 8. (6) With a regression coefficient of 3.895725, the primary sector GRDP variable has a positive effect on the human development index of Central Kalimantan over the 2010-2020 period, as shown in Table 8. This indicates that if the primary sector's GRDP increases by 1 million rupiah, the human development index increases by 3.895725 as well. (7) In Central Kalimantan, the secondary sector's GRDP has no effects on the human development index. For example, in the manufacturing sector, there are challenges, such as low human resource quality in grasping current processing technologies and the majority of the workers having only completed elementary school. (8) With a regression coefficient of 4.353975, the tertiary sector GRDP variable has a positive effect on the human development index of Central Kalimantan over the 2010-2020 period, as shown in Table 8. In other words, if the tertiary sector's GRDP increases by 1 million rupiah, the human development index improves by 4.353975.

### *B. Recommendation*

The government of Central Kalimantan has to focus more on the secondary sector, which consists of buildings, the manufacturing industrial sector, as well as the energy, gas, and clean water sectors. The capacity of facilities like power, internet, gas, and clean water must be improved in order to promote the growth of high-quality human resources and enhance community welfare. As a result, human growth may be made sustainable.

## Categorization Of Digital Cooperative Features Using Kano Model

Firman Edi Saputra <sup>1</sup>, Kristina Sisilia <sup>2</sup> and Yahya Peranginangin <sup>3</sup>

<sup>1,2</sup>Business Administration Program, School of Communication & Business, Telkom University,

<sup>3</sup>Computer Engineering, School of Electrical Engineering, Telkom University, Bandung, Indonesia

### Abstract

*Cooperatives that initially carried out their organizational activities manually began to need to digitize their organizational activities. The transformation of cooperatives into digital cooperatives is because of the demand to serve the needs of better data and report management from an increasing number of members and support the business lines that cooperatives carry out to provide more significant benefits for cooperatives and their members. eKopz, as a student startup, answers this need by collaborating with a cooperative financial partner who needs a digital service platform. The research wants to understand and satisfy eKopz consumers by prioritizing the features classifications available on the eKopz platform. This study uses the Kano Model to determine the degree of priority classification of all the features available in the market today, then confirms it to several administrators and members of cooperatives in the city of Bandung. The result shows that no features fall into the Must-be category, which means that the currently available digital cooperative platform is considered a nice-to-have application. The rest of features are Performance and Attractive features dominantly. Insights from research can help eKopz and similar businesses find and research killer features that make a high urgency of adopting a digital cooperative platform.*

*Keywords—digital cooperative; data and report management; Kano Model; marketplace platform*

---

### I. INTRODUCTION

A Cooperative is an organization that all members own, and each member has one vote in the election of the board of directors in the cooperative. Cooperatives offer a variety of services aimed at serving their members. Operationally, cooperatives differ from economic activity, how management and its members interact. There are various classifications of cooperatives, ranging from financial cooperatives, consumer cooperatives, worker cooperatives, producer or marketing cooperatives, housing cooperatives, and other types of cooperatives adapted to their members (Cook and Chaddad, 2004). The type of financial cooperative is the most dominant in Indonesia, covering 70% of the total number of cooperatives. Financial cooperatives offer financial services for their members, such as saving members' monthly dues, deposit taking, and loans. The benefits offered are to provide lower loan interest than bank interest for members who make loans to cooperatives and give the best return in the form of residual profits—business at the end of the operating year.

Along the way, several financial cooperatives with many members began to diversify by carrying out several business activities that benefited the cooperative. This cooperative began selling daily necessities that members could buy through the cooperative and sold services and products to external parties outside of the cooperative's members. In operational and financial monitoring, this cooperative begins to require the support of digital tools for data and report management and even requires an online platform to reach members and externals in their business lines that sell cooperative products and services. Financial cooperatives and other cooperatives are considering adopting digital tools and transforming them into digital cooperatives to be more competitive and effective in member operations and services. On the other hand, the Government of the Republic of Indonesia, through the Ministry of Cooperatives and Small and Medium Enterprises, promotes digital cooperative programs in all cooperatives in Indonesia.

Ekopz is a students' startup in a private university in Bandung that provides data management and reporting services for manual cooperatives to become digital cooperatives and provides an online sales platform. Besides eKopz, several startup companies offer data management services like eKopz for cooperatives, such as Nectico, Medina, Kodi, Olah, and Smartcoop. In their second year this year, eKopz already has a financial cooperative owned by a large organization in Bandung as a client on a pilot project that will adopt the eKopz digital cooperative platform. This client is a hybrid cooperative that started as a financial cooperative and then also as a consumer cooperative by selling goods for their members and external parties. In this pilot project, eKopz understands the cooperative's demands and needs for the addition and improvement of features to be carried out continuously to satisfy its customers. This project is also significant so that eKopz can compete with similar companies in the future. Currently, eKopz needs to understand their client and other potential cooperatives to provide better value

propositions through features in the application that align with the data and report management and marketplace platform needs for selling cooperatives' products.

Digital cooperatives must provide ease of use for members, management, and external stakeholders in using the application because of the integrated system. This research wants to understand the features needed in the application platform for data management services and cooperative reports. This case will classify the various available features in the market provided by competitors and the attributes built and developed by eKopz in the current pilot project. This study uses the Kano method to confirm and classify several collected features to the administrators and members of several cooperatives in the city of Bandung. It is rare to find research that discusses cooperatives in terms of the digital features needed to become a modern cooperative. The Kano method has the advantage of classifying items or features based on the degree that is considered satisfactory for the targeted consumers (Chaddad & Cook, 2004). The priority framework provided by the Kano model can be a valuable input for eKopz to focus on building and developing their digital platform now and in the future.

## II. LITERATURE REVIEW

### A. *Digital Cooperative*

A cooperative system was recognized in 1844 in England, named Rochdale Society of Equitable Pioneers. Cooperatives are self-governing organizations with democratic characters to meet the members' needs and promote social equity (Mojtahed, 2007). A cooperative is an organization owned by its members with a specific purpose or a consensus to benefit its member (Sexton and Iskow, 1993). Cooperatives have several reasons and goals that emphasize cooperation for mutual benefit and base, avoiding competition and selfishness in their activities. Cooperative has its business role, many different types, and functions in society and economy (The Role of Cooperatives in Business).

Cooperatives are the pillars of the Indonesian economy and are also considered an appropriate economic model. It is also a driver of potential financial resources for the welfare of members and society. Cooperatives prioritize common interests and provide welfare to members and organizations. In addition, it also contributes significantly to the economy (one of which contributes to GDP, employment, increased exports, income distribution). The cooperative principles adopted in Indonesia are open and voluntary membership, democratic control, limited interest and share capital, the proportion of surplus distribution, cash trading, education and training, political and religious neutrality. The Ministry of Cooperatives and SMEs of Indonesia is prioritizing the cooperative modernization agenda by consistently overseeing the achievement of the target of 500 modern cooperatives by 2024 (The Minister of Cooperative & Small Medium Enterprise, 2020) by transforming them into digital cooperatives. Digital cooperatives are considered a challenge for today in facing the all-digital era of the industrial revolution 4.0.

### B. *Features in Digital Cooperative Application*

Digitalization in cooperatives is by integrating business processes that maximize performance capabilities and resource utilization. Cooperative is unique because it is a sharing economy with various stakeholders and multi-dimensional performance. According to the ministry's report, the current condition of cooperatives in Indonesia is that, on average, 50% of cooperatives are inactive, and the rest are active. However, their condition is not operationally and business healthy. This information came through the measurement of collective performance, which must be reported by each cooperative to the government. The results show resource gaps, low data accuracy, less attractive for young people to join, less efficient work. These conditions demand the support of digital tools or platforms that can improve cooperative performance, such as having more accurate transactions, monitoring and reporting speed, integration between functions and units, and having simpler business processes (The Minister of Cooperative & Small Medium Enterprise, 2020).

Digital cooperatives must support by essential features that are useful for cooperative management to meet the needs of every cooperative, starting from the requirements of data archiving, administrative records, bookkeeping, reports, and calculating the patronage refund, including for other purposes by external stakeholders. Digital cooperatives can provide solutions for managing cooperative information needed by cooperative management to dashboards for stakeholders, from membership, various transactions, reporting systems to cooperative performance appraisals [6]. Digital cooperatives must provide convenience for all cooperative activities for members, administrators, and external stakeholders at any time and situation.

### C. *The Kano Model*

The Kano model uses two dimensions, namely in terms of satisfaction to functionality by Noriaki Kano (Kano, 1984), who initiated the Kano Model framework in 1984. The Satisfaction dimension uses levels from delight and excitement to total dissatisfaction, namely frustration from consumers. Dimensions of functionality, called an

investment, implementation, or sophistication, means how much consumers will get from a given feature, how well these features were implemented, and how much invested in its development; this dimension is measured from none to none the best level. These two dimensions in the Kano Model will jointly determine how consumers feel about the product's features.

Kano's model uses four categories based on how consumers react to the available functionality levels. The first category is Must-be, a product feature expected by consumers, but if it is not available, the product is considered incomplete or just plain wrong. The Must-be feature is also often referred to as Basic Expectation, which means that consumers need the must-be features to be available but does not satisfy consumers. If this feature is not available, consumers will be dissatisfied, as is the make calls function on the phone. Companies need to ensure that the basic level of expectation of the product has been achieved so that it does not require further investment for this must-be feature. The second category is One-Dimensional or Performance, which is considered a feature that gives satisfaction to consumers; where this feature is better or more widely available, the more satisfied consumers will be. The consequence is that adding more functionalities means the more significant the investment and resources required. The third category is Attractive or an unexpected feature, i.e., if it is available, it can cause a positive reaction. The reaction that arises from the feature is that it has a scale from mild appeal to absolute delight, which can be said to be something attractive. Consumers can perceive attractive features as an excellent reason to come and buy them. Companies can invest in each feature at a certain point without over-killing the feature. The fourth category is Indifferent, or which we feel indifferent. The presence or absence of this feature in the product will not make a real difference to consumers' reactions. Knowing features that fall into the indifferent category means helping companies to see that no matter how much effort is put into those features, consumers will not care about them. Not throwing investment funds into this feature is considered a money sink. There is a fundamental fact that Kano categories of features can change over time; they are not static

### III. RESEARCH METHODOLOGY

This study wants to understand the degree of application features on the digital cooperative platform into a prioritization framework. The method chosen is descriptive quantitative using a survey by following the rules in the Kano Model. This study uses three steps: selecting features that came from incumbents in digital applications for cooperation and eKopz's features. The second step is getting data from potential customers, which are chosen respondents (users); they are administrators and members of several cooperatives because they will become users of the application that consists of 3 cooperatives (19 of cooperative's members and 19 from the administrators, the total was 38 respondents). All possible feature turned into the list of questions is provided in table 2. The last step is analyzing the results from the discrete and continuous analysis.

Kano model aims to categorize the attributes of a product or service based on how well the product can meet customer needs. The Kano model focuses on reducing product features focused on customer needs. The Kano model also maps customer responses in the questionnaire. The mapping can produce answers according to service attributes divided into six categories, as shown in Fig 1 and Table 1 below.

Fig 1. Kano Diagram (taleproduction.com)

Table 1. The Kano Model Evaluation Table

Customer requirements → ↓		Dysfunctional (negative) question				
		1. like	2. must be	3. neutral	4. live with	5. dislike
Functional (positive) question	1. like	Q	A	A	A	O
	2. must-be	R	I	I	I	M
	3. neutral	R	I	I	I	M
	4. live with	R	I	I	I	M
	5. dislike	R	R	R	R	Q

Customer requirement is ...

**A:** Attractive  
**M:** Must-be  
**R:** Reverse

**O:** One-dimensional  
**Q:** Questionable  
**I:** Indifferent

Source: Burchill (1993)

The questionnaire has two kinds of questions: functional and dysfunctional questions to determine customers' perceptions of the product's attributes. The functional question form (positive) asks about how customers feel if they have the feature, and the Dysfunctional question form (negative) asks customers' feelings if they don't have the feature or the absence of the functionality (Moorman, 2013). The possible answer that customers or respondents can choose is I like it, expect it, neutral, tolerate it, and dislike it (Burchill, 1993). Their answer to those two questions will allow us to categorize each feature.

The results of questionnaire data collection were transferred to the evaluation table to determine the criteria for each attribute. The evaluation table combines all answers from the functional dan dysfunctional questions in its rows and columns, as seen in table 1. Using this question format, we make every answer pair lead to one of those categories. The two questions can then be classified into six categories, namely: A = Attractive, M = Must-be, O = One-dimensional, I = Indifferent, R = Reverse, and Q = Questionable. Reverse (R) would be better if the system did not exist or probably not interested in feature offering. Questionable (Q) indicates that the attributes assessed by respondents are inconsistent or respondents showed conflicting responses.

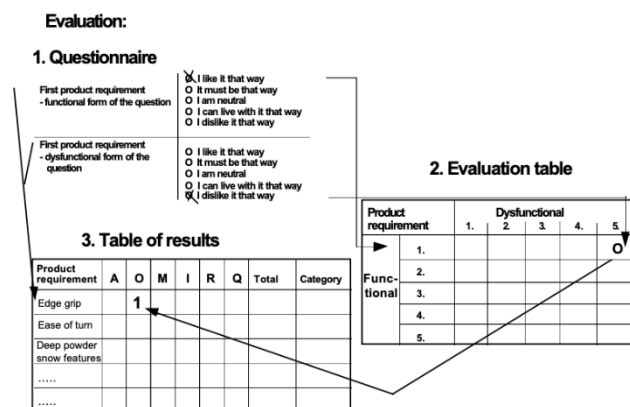

Fig 2. The Kano Evaluation Process Discrete Analysis (Burchill (1993))

We tested the questionnaire to check the validity and reliability of all functional and dysfunctional questions. The results showed all 18 features have  $r\text{-count} \geq 0,320$ , with  $n = 38$ ,  $\alpha = 0.05$  and the value of  $r$  (0.05,38) from the distribution table of values = 0.320.

We examine the results with two levels of analysis: discrete and continuous. We used two methods due to the lack of standard procedures and how they help map respondents' responses to Kano categories. The discrete analysis starts the overall result's sense and the simplest way to work in the Kano Model by categorizing all answers using the evaluation table, then tallying the total answers in each category for each feature, finding the most frequent response. The last is the following rule (left most wins): Must-be > Performance > Attractive > Indifferent.

The continuous analysis (Du Mochel, 1993) translated answers into a numerical value from -2 to 4 of the potential satisfaction scale. The higher the number, the more answers suggest how much the respondent wants the feature. The Functional's response scale is -2 (Dislike), -1 (Live with), 0 (Neutral), 2 (Must-be), 4 (Like); and Dysfunctional scale is -2 (Like), -1 (Must be), 0 (Neutral), 2 (Live with), 4 (Dislike). The continuous analysis helps to weaken the Reverse and Questionable answers and more positive end for Must-be and Performance feature; also, it does not need a standard evaluation table like in discrete output. The output of the continuous analysis is a two-dimensional plane on its positive quadrant (the strongest responses). The prioritization rule of thumbs in continuous is the same with discrete analysis

#### IV. RESULT / FINDING

This research collects up to 18 attributes from 38 respondents who have filled out the questionnaire completely.

Table 2. Digital Cooperation's Features Were Checked Using the Kano Model Questionnaires

Feature Code	Description
X1	Automated financial reports
X2	Automatic transaction reports
X3	Import list of members
X4	Adding members or administrators
X5	Member verification
X6	Edit member information.
X7	Admin access rights
X8	Loan approval
X9	Online billing notification.
X10	Automatic the patronage refund report
X11	Real-time deposit balance information
X12	Bill payment top-up information.
X13	Online loan application.
X14	Save reminder notification
X15	Financial report information
X16	Public online shop
X17	News about cooperative activities
X18	News about cooperative finance

Source: Authors' data analysis, 2022

After calculating and weighing the responses obtained from the questionnaire, the results of the discrete analysis can be seen in Table III below. It tells that all features do not have the Must-be attributes. It shows sixteen attributes are Attractive features, one attribute X11 real-time deposit balance information is a Performance feature, and X1 automated financial report is an Indifferent feature. The performance feature means that X11 real-time deposit balance information is the one the customers like and dislike not having.

None of the Must-be or basic features found means those respondents dislike not having them, or they go from bearing to expecting to have those features. The linear Performance graph inferred that the X11 could be more detailed or better in the respondent's perspectives. There are sixteen Attractive features assumed respondents like to have those features that are not expected at this time. We have one indifferent feature, X1 automated financial reports, that respondents felt no real difference in their response; most respondents' answers where I am neutral, or I can tolerate it.

Table 3. Discrete Output

FEATURES	M	P	A	I	R	Q	CATEGORY
X1: Automated financial reports	7,5%	20,0%	27,5%	32,5%	5,0%	7,5%	I
X2: Automatic transaction reports	5,0%	27,5%	42,5%	17,5%	7,5%	0,0%	A

X18: News about cooperative finance	10,0%	22,5%	45,0%	20,0%	0,0%	2,5%	A

Source: Authors' data analysis, 2022

Features or attributes that appear in digital cooperative applications are almost the same as applications used by business companies. It turns out that for cooperatives, features that can assist in reporting and monitoring their business activities are considered not mandatory. These attributes are deemed not included in the Must-Be or basic features, as is the case in business companies that consider them a must-have attribute. The absence of attributes in Must-Be means a product that does not attract consumers' attention. The urgency of its existence is still considered low and viewed as a delighter product. This result is like another research conducted by (Sisilia & Peranginangin, 2019) which compares non-formal education products with formal ones where non-formal products do not have Must-Be attributes. They are considered only as product delighters by consumers.

Table 4. Continuous Output

FEATURES	Dysfunctional (X-Axis)	Functional (Y-Axis)	CATEGORY
X1: Automated financial reports	1,89	2,92	A
X2: Automatic transaction reports	2,03	3,18	P
X3: Import list of members	2,27	2,84	P
X4: Adding members or administrators	2,11	3,00	P
X5: Member verification	2,00	2,80	A
X6: Edit member information.	2,16	3,32	P
X7: Admin access rights	1,82	2,68	A

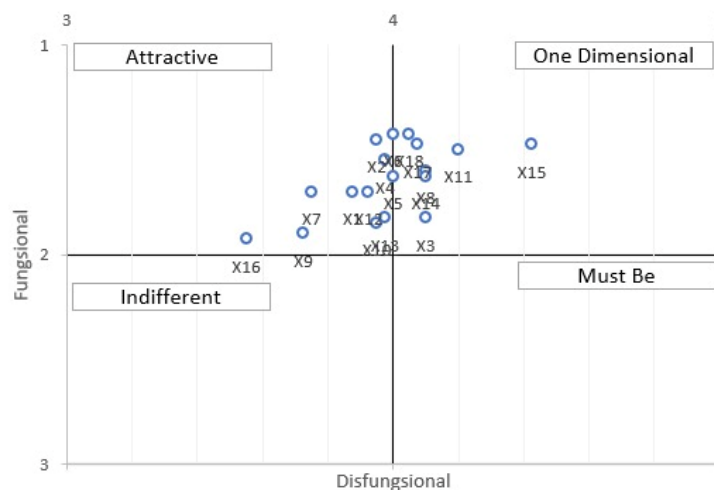

Fig 3. Continuous Output (Authors' data analysis, 2022)

V. DISCUSSION

As shown in table 4 and fig. 3 above were results from continuous analysis where several attributes are spread across the Attractive and One-Dimensional or Performance zones. There are still none for Must-be feature, twelve (X2, X3, X4, X6, X8, X10, X11, X13, X14, X15, X17, and X18) of Performance features, six (X1, X5, X7, X9, X12, and X16) of Attractive feature, and none of the Indifferent attribute were found in this study.

Table 5. The Different Output from Discrete and Continuous Analysis

Features	Discrete Output	Continuous Output
X1: Automated financial reports	I	A

X2: Automatic transaction reports	A	P
X3: Import list of members	A	P
X4: Adding members or administrators	A	P
X5: Member verification	A	A
X6: Edit member information.	A	P
X7: Admin access rights	A	A
X8: Loan approval	A	P
X9: Online billing notification.	A	A
X10: Automatic the patronage refund report	A	P
X11: Real-time deposit balance information	P	P
X12: Bill payment top-up information.	A	A
X13: Online loan application.	A	P
X14: Save reminder notification	A	P
X15: Financial report information	A	P
X16: Public online shop	A	A
X17: News about cooperative activities	A	P
X18: News about cooperative finance	A	P

Source: Authors' data analysis, 2022

Table 5 shows the difference output from two data analysis methods in Kano Model: Discrete and Continuous analysis (Zacarias, 2015). The first level for understanding the results of data analysis is provided by discrete analysis. After the same data was analyzed using the continuous method with a scale of -2 to 4, it further strengthened the positive value towards the must-be zone (follow the rule: Must-be > Performance > Attractive > Indifferent). Eleven attractive features in discrete analysis become Performance features in the continuous method. Thus, the eleven Performance features are that consumers think they like having it in cooperative digital applications and do not like it if it is unavailable. Fig 1 of the Performance feature shows a linear reaction relationship between the satisfaction and functional dimensions; The context of "more is better" in the Performance features is what consumers expect, if not over-killing those features. The same thing also happens to X1 in the discrete output, which is Indifferent and becomes an Attractive feature in the continuous output. The rest are still in the same output category between the discrete and continuous analysis results

## VI. CONCLUSION AND RECOMMENDATION

Kano model output tells eKopz about chosen attributes to be developed. The Kano categorization that appears is the dominant feature in the Performance and Attractive categories. eKopz can focus on investing its resources to build and provide Performance features to satisfy its customers. Maintaining Attractive features helps to be a positive reaction to attract potential consumers. Although the basic or Must-be features have not appeared when this research is conducted, eKopz can consider several Performance features for further investigation so that they can rise to the Must-be level.

The limitation of this study is that it is limited to three large cooperatives in the Bandung region with a relatively small number of respondents. The results obtained today can provide an initial overview of academics and stakeholders who need information on manual cooperatives migrating into digital cooperatives.

## ACKNOWLEDGEMENT

The authors would like to thank for three cooperatives that willing to become respondents and source of information for this study, which are Kopdit Boromius, Koperasi Suargi Bakti Mandiri, and Koperasi Wanita in Bandung regions, Indonesia.

## Analysis of the Wage, Investment, Human Development Index, and Number of Industry on Labor Productivity in East Java Province 2016-2020

Wahida Reza Mustika Wardhani<sup>1</sup>, Maulidiyah Indira Hasmarini<sup>2</sup>  
<sup>1,2</sup> Economic Development, Muhammadiyah Surakarta University

### Abstract

*Labor productivity is a description of the output produced by each worker in a certain year. Labor productivity is one indicator to measure economic performance in a region. This study aims to estimate the effect of regional minimum wages, investment, human development index, and number of industries on labor productivity in districts or cities in East Java province during the 2016-2020 period. The data used in this study is secondary data that is quantitative in nature obtained from the Badan Pusat Statistik (BPS). The data analysis method used is panel data regression which combines time series data and cross section data. The results with the Fixed Effects Model (FEM) approach show that the number of industries has a negative effect on labor productivity. Meanwhile, the regional minimum wage, investment, and human development index have no effect on labor productivity in districts or cities in East Java province during the 2016-2020 period.*

*Keywords— regional minimum wage; investment; human development index; number of industries; labor productivity.*

### I. INTRODUCTION

Manpower is one of the important factors in economic development in developing countries such as Indonesia, improving the quality of labor will increase production and the economy which is very important for the achievement of community welfare. Labor productivity is related to the welfare of the workforce. Increasing labor productivity can increase income, so that welfare can be achieved (Indra *et al.*, 2017).

Sari & Oktora (2021), Labor productivity describes the output produced by each worker in a certain year. The higher the productivity, the more productive the workforce is, so that economic growth can be achieved if the availability of reliable and quality labor is available. In addition, labor productivity is also one of the indicators used to measure progress towards achieving the Sustainable Development Goals (SDGs) on the eighth point, namely promoting inclusive and sustainable economic growth, productive and comprehensive employment opportunities, and decent work for everyone.

East Java is one of the provinces in Indonesia which has a rapidly growing economic activity. This region has various natural, economic, and socio-cultural resources which are a challenge and also an obstacle in achieving equitable economic development in East Java Province. According to Badan Pusat Statistik (BPS), the number of workers in East Java Province in 2020 reached 20,962,967 people. This high number of workers is a challenge for the East Java government to maximize labor productivity in order to achieve the desired economic growth. The measure of labor productivity can be calculated from the amount of GRDP per worker in an economic activity. Labor productivity in East Java Province in 2016-2020 is presented in Table 1.

Table 1. Labor Productivity in East Java Province

Year	Number of Manpower (Person)	GRDP (Million Rupiah)	Productivity (Million Rupiah/Person)
2016	18449854	1386443090	75,15
2017	19014273	1424066080	74,89
2018	19735051	1548451430	78,46
2019	19909379	1634456380	82,09
2020	19833978	1578010560	79,56

Source: Badan Pusat Statistik, (2021) processed

Based on Table 1., it can be seen that labor productivity in East Java Province reached the highest in 2019 of 82.09 million/person. However, in the following year it fell to 79.56 million/person. This is due to the efficiency of the workforce carried out by the company because its business or production is affected by the Covid-19 pandemic. In addition, this pandemic has also reduced various economic activities in each region, so that economic performance has declined in various sectors.

Various factors can affect labor productivity in an area, one of which is the applicable minimum wage. Wage policy has become an important issue in employment issues in several developed and developing countries. The purpose of the wage policy is to cover the living needs of the workers. Thus, the minimum wage policy can increase labor productivity, because it can be an encouragement or encouragement to work, especially if wages are high (Sari & Oktora, 2021).

The next factor that is thought to have an effect on labor productivity is capital or investment. Sufficient capital will lead to economic growth and will improve people's welfare. Capital or Investment can make a better contribution to the process of development and economic growth. Direct investment can encourage the economy in a region, this will increase people's income and consumption levels in the region. Companies will respond to the increasing number of requests by increasing their workforce in order to increase their production output. Thus, labor productivity will also increase (Putri & Soelistyo, 2018).

In addition to wages and capital, the Human Development Index (HDI) is also thought to have an effect on labor productivity. HDI is an important indicator to measure success in efforts to build the quality of human life, HDI can determine the ranking or level of development of a region. Thus, if the HDI in an area is high, then the quality of human beings is also high, so that they are able to carry out productive activities well and labor productivity will also increase. (Todaro & Smith, 2003).

The last factor is the number of industries, an increase in the number of companies in an area that produces the same goods is expected to increase the amount of production so that the value of output in an area will increase. The company will increase its production capacity with a certain amount of capital. Likewise with the workforce, if the workforce used by the company is large, it will produce greater output, so that the productivity of its workforce will also increase (Sari & Oktora, 2021).

The purpose of this study is to estimate the direction and magnitude of the effect of the minimum wage, investment value, human development index, and number of industries on labor productivity in all districts or cities in East Java Province in 2016-2020 with using panel data regression.

## II. LITERATURE REVIEW

Economic development and development is strongly influenced by labor productivity in the region. Productivity is one of the indicators used to assess the development performance of a region. In addition, labor productivity is one of the keys to promoting economic growth and increasing the standard of living of a region. The high absorption of labor that is not followed by poor productivity will lead to a low standard of living of workers. On the other hand, high employment absorption followed by high labor productivity will drive the economy to be more advanced (Todaro & Smith, 2003).

Badan Pusat Statistik (2021), labor productivity is the comparison between a work achieved (output) with the overall resources used (input) to increase economic growth and achieve national development targets. Mishkin (2012), argues that labor productivity is a comparison of the results achieved from the role of labor per unit time, so that labor productivity is simply a measure of the effectiveness of labor in producing products in a certain time unit. In addition, labor productivity is also used as an indicator of the welfare of an economy. According to Mishkin (2012), productivity is very important for a country, because a country's ability to increase its standard of living over time depends almost entirely on its ability to increase output per worker. Increased productivity can be driven by increasing working hours, training, education, income or remuneration, job security guarantees, as well as comfortable, safe and healthy working conditions.

During the 2009-2012 period in Malaysia, Nahar et al. (2015), using panel data regression with the Fixed Effects approach found that human capital has a positive effect on labor productivity. Fadillah et al. (2020) also found that the provincial minimum wage had a positive effect on labor productivity, while the HDI had no effect on labor productivity in Indonesia in 2014-2019. Meanwhile, Sari & Oktora (2021) found that wages and the human development index had a positive effect on labor productivity in all provinces on the island of Java in 2010-2015. Katovich & Maia (2018) using a Random Effects Model (REM), found that the minimum wage had a positive effect on labor productivity in Brazil in 1996-2014. Rahman & Octaviani (2020) found that life expectancy had an effect on labor productivity Indonesia in 2011-2015.

Samargandi (2018) in 1980-2014 in Middle East and North Africa (MENA), using Ordinary Least Square (OLS) regression analysis found that human capital (education and health) had a positive influence on labor productivity. Putri & Hasmarini (2021) found that education and the minimum wage had a positive effect on the labor productivity of the Jenang Industry in Kudus in 2020. Meanwhile, Rahmadi et al. (2019) also found that wages had a positive effect on labor productivity in Muara Enim Regency in 2017.

Based on the theoretical basis and the results of previous research, the hypothesis in this study is that all independent variables in this study, namely the regency or city minimum wage, investment, Human Development Index (HDI), and number of industries have a positive effect on labor productivity in all regencies or cities in East Java Province 2016-2020.

### III. RESEARCH METHODOLOGY

The dependent variable in this study is labor productivity in each Regency or City in East Java Province in 2016-2020. Labor productivity is calculated through the ratio of GRDP to 2010 constant prices divided by the number of workers. The unit for this variable is million rupiah per person. Meanwhile, the independent variables used in this study are 1. regency or city minimum wage, investment, Human Development Index (HDI), and number of industries. Source of data obtained from Badan Pusat Statistik.

This study will observe the direction and magnitude of the influence of HDI, investment, minimum wage, and the number of industries on labor productivity in each Regency or City in East Java Province in 2016-2020 using panel data regression analysis with the following equation:

$$\log PTK_{it} = \beta_0 + \beta_1 \log IPM_{it} + \beta_2 \log INV_{it} + \beta_3 \log UMK_{it} + \beta_4 \log JI_{it} + \varepsilon_{it} \quad (1)$$

which:

<i>PTK</i>	= Labor Productivity (Million Rupiah/Life)
<i>IPM</i>	= Human Development Index (Index)
<i>INV</i>	= Investment (Rupiah)
<i>UMK</i>	= Regency or City Minimum Wage (Rupiah)
<i>JI</i>	= Number of Industries (Units)
<i>log</i>	= Logarithmic Operators
$\varepsilon$	= Error term
$\beta_0$	= Constant
$\beta_1 \dots \beta_4$	= Independent variable regression coefficient
<i>i</i>	= cross section
<i>t</i>	= time series

### IV. RESULT / FINDING

The results of panel data regression estimation using the Common Effects Model (CEM), Fixed Effects Model (FEM), and Random Effects Model (REM) approaches along with the selection of the best estimator model using the Chow Test and Hausman Test are presented in Table 2 below:

Variable	CEM		FEM		REM	
	Coefficient	Prob.	Coefficient	Prob.	Coefficient	Prob.
C	-24.277	0.000	11.387	0.085	-10.201	0.002
Log(IPM)	4.624	0.000	-2.535	0.223	3.421	0.001
Log(INV)	0.011	0.463	-0.004	0.557	0.000	0.977
Log(UMK)	0.570	0.004	0.299	0.116	-0.035	0.760
Log(JI)	0.035	0.443	-0.190	0.008	0.037	0.439
R <sup>2</sup>	0.492		0.972		0.102	
Adj. R <sup>2</sup>	0.481		0.964		0.082	
F-stat.	44.629		122.573		5.203	

Prob.(F-stat)	0.000	0.000	0.001
Model Selection Test:			
(1)	Chow		
	<i>Cross-section</i> $F(37, 147) = 66.983$ ; Prob. $F = 0.000$		
(2)	Hausman		
	<i>Cross-section random</i> $\chi^2(4) = 29.855$ ; Prob. $\chi^2 = 0.000$		
Source: EViews regression output results, processed.			

Based on the results of the model selection test, it is known that the selected model is the Fixed Effects Model (FEM). The results of the complete FEM estimation are presented in Table 3.

Table 3. Estimated Results of Fixed Effects Model

$$\log PTK_{it} = 11,387 - 2,535 \log IPM_{it} - 0,004 \log INV_{it} + 0,299 \log UMK_{it} - 0,190 \log JI_{it} \\ (0,008)^*$$

$$R^2 = 0,972; DW = 2,779; F\text{-stat} = 122,573; \text{Prob.}(F\text{-stat}) = 0,000$$

Source: EViews regression output results, processed. Note: \*Significant at = 0,01; \*\*Significant at = 0,05; \*\*\* Significant at = 0,10.

The fit statistic shows that the model exists, as can be seen from the empirical probability F statistic, which is 0.000 ( $< 0.01$ ), with  $R^2$  of 0.972. This means that overall the independent variables, HDI, investment, minimum wage, and number of industries are able to explain 97.2% of the variation in labor productivity.

Separately, only the number of industries has a significant effect on labor productivity with an empirical probability  $t$  of 0.008 ( $< 0.01$ ). The variables HDI, investment, minimum wage have no significant effect on labor productivity, because they have an empirical probability of 0.223 ( $> 0.10$ ); 0.557 ( $> 0.10$ ); and 0.116 ( $> 0.10$ ).

The variable number of industries has a regression coefficient of -0.19. The pattern of the relationship between the number of industries and labor productivity is logarithmic, so that if the number of industries increases by 1%, then labor productivity will decrease by 0.19%.

## V. DISCUSSION

Based on the results of the validity of the effect, HDI has no effect on labor productivity in every region in East Java in 2016-2020. This result contradicts the research hypothesis which states that HDI has a positive effect on labor productivity. However, this result is in line with the findings of Yuniasih et al. (2013) which states that human capital has no effect on labor productivity. East Java Province is one of the major provinces in Indonesia, East Java is also the largest contributor to Gross Domestic Product in Indonesia. However, high economic performance only occurs in areas with advanced industries such as the Residency of Surabaya. This is in contrast to coastal areas such as in Ngawi and Pacitan where in these areas still rely on traditional economies such as the fisheries and agriculture sectors which have not been managed optimally, this condition is exacerbated by the low level of health and education infrastructure development, so that the HDI in this region tends to low and human quality has no effect on labor productivity.

The results of the t-test in this study stated that investment had no effect on labor productivity. Similar to the HDI, investment realization in East Java is only concentrated in areas with high economic performance. Meanwhile, in coastal areas, the investment value is still low, so that this disparity in investment between regions results in not all regions having sufficient capital to spur their economy and in the end the productivity of their workforce is not affected by investment. The results of this study are in line with the research of Baskoro et al. (2019) which states that the realization of foreign investment has no effect on labor productivity in the industrial sector in Indonesia.

The results of this study state that the minimum wage has no effect on labor productivity in East Java in 2016-2020. These results contradict the results of research by Battacharya et al. (2011) which states that real wages have a positive effect on labor productivity. Wages are an important part of driving labor productivity. With adequate wages, it will motivate workers to be more active in work and can be used to fulfill body nutrition so that their health is maintained. However, the condition of the workforce in most areas in East Java is still working

in the informal sector such as agriculture and plantations, so that the size of the wage does not affect labor productivity.

Based on the results of the validity of the effect, the variable number of industries was found to have a negative effect on labor productivity. Industry is an important role for the community's economy because industry is able to absorb a large workforce and can increase the GDP of a region. In practice, in terms of industrial capital, it is divided into two, namely capital-intensive industries and labor-intensive industries. Capital-intensive industry is an indicator that capital production has a greater ability than labor, so that the utilization of the latest technology is more than the labor used, so that high production output does not require a large number of workers. The results of this study are supported by the findings of Qu & Cai (2011) which states that the high number of capital-intensive industries in China actually reduces labor productivity in the industrial sector in the country.

## VI. CONCLUSION AND RECOMMENDATION

Based on the data analysis that has been carried out using panel data regression analysis tools, several conclusions are obtained, namely as follows::

- a. Based on the results of the cross section panel data estimation, the best model was selected, namely the Fixed Effects Model (FEM).
- b. Based on the model existence test (F test), the estimated model exists, with the coefficient of determination ( $R^2$ ) of 0.972. This means that overall the independent variables, HDI, investment, minimum wage, and number of industries are able to explain 97.2% of the variation in labor productivity.
- c. 3. Based on the effect validity test (t test) that has been carried out, the results show that the number of industries has a negative effect on labor productivity. Meanwhile, the Human Development Index (HDI), investment, and the regency or city minimum wage have no effect on labor productivity in each region in East Java Province in 200116-2020.

Based on the results of the analysis obtained, the suggestions that can be given are as follows:

- a. The Regional Government and the Manpower Office in each Regency or City are expected to be able to synergize in determining economic policies such as determining regional minimum wages in order to improve the welfare of the community. In addition, the East Java Provincial Government is expected to pay more attention to development in coastal areas in order to encourage the economy and attract more investors to invest their capital.
- b. 2. The Manpower Office in each region is expected to provide special training so that the workforce in Kalimantan has special abilities and is more easily absorbed in important positions needed by the workforce.
- c. The government in each district or city in East Java is expected to encourage the development of other sectors that are still small and can develop so that they can contribute more to local revenue receipts.

## Analysis of The Effect Number of Industry, Population, and Value of Investment on Employment Opportunities in Kendal Regency

Muhammad Nabel Ihza Ramadian<sup>1</sup>, Ir. Maulidyah Indira Hasmarini, MP<sup>2</sup>

<sup>1,2</sup>Muhammadiyah Surakarta University; Economic Development, Faculty of Economics and Business Muhammadiyah Surakarta, Sukoharjo, Central Java, Indonesia.

### Abstract

*Employment problems are still a major problem in economic development due to the low quality of human resources, limited job opportunities, and high unemployment. The main indicator of employment problems is employment opportunities. This study aims to determine the effect of the number of industries, population, and investment value on job opportunities in Kendal Regency during 2017-2021. This research uses panel data and chooses the model random effects (REM). The results showed that employment opportunities in Kendal Regency during the 2017-2021 period are influenced by the number of industries while population and investment do not affect job opportunities in Kendal Regency.*

*Keywords— Number of Industry, Population, Investment Value and Employment Opportunity.*

## 6. INTRODUCTION

Economic development is one of the important factors that can be considered by a country, especially a developing country, because a country's economy is influenced by economic development in the country (Sukirno, 2006). Along with national economic development, according to Setiawan (2019) in (Darmawan et al., 2019) if there is a gap between the growth of the labor force and the willingness of various economic sectors to absorb labor to become job opportunities, it is still a major problem in the economic field. Job opportunities are not only related to problems in the economic field, but also in the social field. Employment problems are still a major problem in economic development due to the low quality of human resources, limited job opportunities, and high unemployment. Although the government has made efforts to overcome these problems, in reality the policies made have not been able to overcome the problems that occur. The main indicator of employment problems is employment opportunities. Factors that can affect job opportunities in Kendal Regency are the number of industries, population, and investment value.

Table 1. Kendal Regency Employment Conditions in 2017-2021

Year	Population	Workforce	Working	Idle	Unemployment Rate
2017	978,672	484,459	460,967	23,892	4.85
2018	964,106	487,366	457,814	29,552	4.83
2019	971,086	504,535	745,175	31,823	-47.7
2020	1,018,505	533,376	493,062	40,314	7.55
2021	1,025,020	534,030	493,732	40,298	7.54

It can be seen in table 1 that the population in Kendal Regency has increased from 2017 to 2021. The number of the workforce also increases every year, due to the rapid growth of the workforce but not supported by job growth. Meanwhile, the number of people working fluctuated from 2017 to 2019 and decreased in 2020 and increased again in 2021. This is because in 2020 there was a Covid-19 pandemic which resulted in the layoff of some people who worked so this also led to unemployment. with the highest number, namely in 2020 as many as 40,314 people.

Factors related to job opportunities are industry. According to Rakhmawati and Boedirochminarni (2018) Industry is one of the drivers in creating new jobs. This shows that the more industries or the number of businesses, the more choices and job opportunities there will be that will create new job opportunities. The diverse industrial potential in Kendal Regency causes the industrial sector to become one of the economic pillars of Kendal Regency.

In addition to the number of industries, another factor that is an indicator of employment opportunities is the population. The population in Kendal Regency which always increases every year illustrates that the potential of

its human resources will have an increasingly large role in the economy, optimizing the potential of human resources in the economy is not easy, the labor force participation rate in Kendal Regency is on average 69,93%, this shows that the potential of human resources in Kendal Regency is not optimal in supporting economic activities (BPS Kendal Regency, 2022).

Increasing the population must be balanced with an increase in employment opportunities so that people of productive age can be absorbed in the world of work. One of the efforts that can be made to increase employment in Kendal Regency is by building labor-intensive industries. Industrial development is inseparable from investment, both domestic investment (PMDN) or foreign investment (PMA). Government investment is made to provide public goods. One of the increases in investment in the industrial sector occurs because the Kendal Regency area will be projected as a labor-intensive industrial area.

According to previous research conducted Fara Eka Wahyuni, Wahyu Hidayat Riyanto, and Setyo Wahyu Sulistyonoby title "Analysis of the Effect of Education Level, Provincial Minimum Wage and Number of Industries on Employment Opportunities in East Java Province in 1995-2020" states the results of research using multiple linear regression analysis data with time series data that with the F test the variables of education level, provincial minimum wage and total industry has a simultaneous effect on job opportunities in East Java Province. Education level with a coefficient value of 0.334135, a t-statistic value of 3.349515 and a probability value of 0.0023. The minimum wage with a coefficient value of 0.701092, a t-statistic value of 2.603004, and a probability value of 0.0162. While the variable number of industries with a probability value of 3.890773, a t-statistic value of 2.157856, and a probability value of 0.0421.

Research conducted by SriDanawati, I KG Bendesa, dan Made SuyaMain nawith the title "The Effect of Government Expenditure and Investment on Employment Opportunities, Economic Growth and Income Inequality in Regency/City in Bali Province" through the calculation of the path coefficient in this study using the Moment of Structural Analysis (AMOS) program shows that government spending and investment have a positive and significant effect to job opportunities. Investment has a positive and significant effect on economic growth. Employment opportunities have a positive but not significant effect on economic growth. Investment has a positive but not significant effect on income inequality in districts/cities in Bali Province. Government spending, job opportunities, and economic growth have a positive and significant impact on income inequality in districts/cities in Bali Province.

The comparison between previous research and this research is that previous research has the same dependent variable, namely Job Opportunities. The difference from previous research is in the independent variable, this study uses the number of industries, population, and investment value and the latest time span. Each of the previous studies has a significant result or there is a positive influence on job opportunities which of course can be a strong basis for researchers to get the same results due to evidence from previous research. This study aims to determine and analyze the effect of the number of industries, population, and investment value on job opportunities in Kendal Regency in 2017-2021.

## II. LITERATURE REVIEW

Law No. 13 of 2003 article 1 states that the workforce is everyone who is able to do work both inside and outside the employment relationship to produce goods and services to meet the needs of the community. According to Suparmoko (inNalle and Hidayat 2015)The population of working age can be classified into two, namely the labor force and the non-labor force. The labor force is the population who have not worked but are ready to work or are looking for work at the prevailing wage level. The labor force consists of those who are working, those who are unemployed and looking for work. Meanwhile, what is meant by non-labor force are those who are still in school, taking care of the household, and receiving income.

Job opportunities are closely related to population. The more the population, the more people who are looking for work to fulfill their needs(Febriyanto, 2014). Employment opportunities have the meaning of employment or employment opportunities available to work as a result of economic activity (production). According to , Job opportunities are the number of workers who can be accommodated to work in companies or agencies. To estimate the need for labor in a certain period, both for each sector and the whole economic sector can use the concept of elasticity.

$$E = \frac{\frac{\Delta N}{N}}{\frac{\Delta Y}{Y}}$$

E= Elasticity of employment opportunities

N= Total increase in employment opportunities in the economic sector

N = Total employment opportunities in the economic sector

Y= Total production increase in the economic sector

Y= total production of the economic sector

One of the main goals of industrial development is to overcome unemployment which is expected to absorb labor. This is supported by Huda's opinion (in Indrawati, 2015) that the more the number of industries established, it is hoped that it will increase the opportunities for work so that the community's economy will also increase. Industrial development must actually be the main driver of increasing the rate of economic growth and at the same time can be a provider of jobs that are starting to not be accommodated in the agricultural sector. According to the Central Statistics Agency, an increase in the number of business units or the number of industries in a sector will increase the demand for labor due to the increase in the number of employment opportunities as a result of the growth in the number of business units.

Population is the main factor in the development of a region. So if there is a high population growth, the government must be able to provide facilities for the community so that people's lives are also prosperous. One of the facilities that must be available is employment because with the existence of employment opportunities, unemployed residents can be absorbed to work. For developing areas, a large population does not automatically become a large capital for development, it will become a burden of dependence for other residents, this role is supported by Marx's opinion, namely that the more the population, the higher the production and employment will also increase as a result of the large demand. manufactured goods. However, Dijkheirn said differently. he said that high population growth will result in competition between residents in maintaining life so that job opportunities are getting narrower. The high number of labor force will directly or indirectly narrow the available job opportunities (Mantra, 2003).

Efforts to encourage investment are one of the steps that can be taken to create job opportunities. In theory, the greater the value of the investment made or invested in a company, the greater the additional use of labor. In addition, classical economic theory also argues that investment or capital formation will enhance capital tools in society so that it will increase the production of national income, will increase economic growth and finally increase employment opportunities for Sasongko and Suparmoko (in Tapparan, 2017). According to Sukirno (in Abbas.

### III. RESEARCH METHODOLOGY

This research is a type of quantitative research by associative properties. The purpose of associative research is to find out the relationship between two or more variables, which is looking for the role, influence and causal relationship, such as between the independent variable and the dependent variable. In this study the independent variables consist of the number of industries, population, and investment value, while the dependent variable is employment opportunities.

The population in this study is Kendal Regency. In this study, the sampling technique of the collection is by using a saturated sampling technique. Based on Sugiyono (2018) Saturated sampling technique is a sampling technique when all members of the population are sampled. This is done when the population is relatively small, less than 30, or the study wants to make generalizations with very small errors.

The type of data in this study is secondary data. Data sourced from the Central Bureau of Statistics of Kendal Regency and journals. Data was obtained through direct access from the Kendal Regency BPS website (kendalkab.bps.go.id). Data collection in this study was carried out using the documentation method, namely analyzing data on the number of industries, population and investment value in Kendal Regency in 2017-2021.

The data analysis technique used in this research is panel data regression analysis. The data model used is panel data, where panel data is a combination of cross section data and time series data, namely observations of several individuals who are observed in a certain period of time. The purpose of panel data analysis is to see the economic impact that cannot be separated between each individual in several periods, and this cannot be obtained

from using cross section data or time series data separately. Data analysis in this study begins with testing the best model to choose the right model. Based on Winarno (2015) There are three panel data regression models, namely the Common Effect Model (CEM), Fixed Effect Model (FEM) and Random Effect Model (REM). In determining the most appropriate and best model, it is necessary to test first based on the Chow Test and Hausman Test. Then a hypothesis test was conducted to determine the effect of the independent variable on the dependent variable in the study in the form of the R<sup>2</sup> test, F test and t test.

$$EO_{it} = \beta_0 + \beta_1 NOI_{it} + \beta_2 POP_{it} + \beta_3 INV_{it} + \varepsilon_{it}$$

where:

- EO* : Employment Opportunity (%)  
*NOI* : Number of Industry (Unit)  
*POP* : Total Population (Soul)  
*INV* : Investment (Trillion)  
 $\beta_0$  : Constant  
 $\beta_1 \dots \beta_3$  : Independent variable regression coefficient  
*i* : Districts in Kendal Regency (20 Districts)  
*t* : Year t (2017-2021)  
 $\varepsilon_{it}$  : Error Term

#### IV. RESULT / FINDING

The estimation results of the econometric model above and its complementary tests are summarized in Table 1. From the results of the Chow test and Hausman test in Table 1, the Random Effects Model (REM) was chosen as the best estimated model, as seen from p-value (p-value), probability or empirical significance of F Chow test is 0.8600 (> 0.10) and p-value (p-value) probability or empirical statistical significance  $\chi^2$  Hausman test is 0.2930 (> 0.10). The complete results of the estimated Random Effects Model and the inter-regional constants are presented in Table 2 and Table 3.

Table 2. Results of Chow Test and Hausman's Test

Variable	Regression Coefficient		
	Pls	FEM	BRAKE
<i>C</i>	3.604866	10.78184	3.604866
<i>NOI</i>	0.012309	0.012427	0.012309
<i>POP</i>	0.000000	-0.000139	0.000000
<i>INV</i>	-0.001843	-0.003355	-0.001843
$R^2$	0.545800	0.608068	0.545800
Adjusted $R^2$	0.531607	0.496088	0.531607
<i>F stats</i>	38.45361	5.430123	38.45361
<i>Prob. F stats</i>	0.000000	0.000000	0.000000
Model Selection Test			
(1) Chow			
Cross-section F(19.77) = 0.643856; Prob. F(19.77) = 0.8600			
(2) Hausman			
Cross-section random $\chi^2$ (3) = 3.722485; Prob. $\chi^2$ (4) = 0.2930			

The model goodness test shows that the Random Effects Model (REM) estimated model exists, it can be seen that the p value (p value), probability, or statistical empirical significance of F is 0.0000 (< 0.01), with R<sup>2</sup> or predictive power of 0.6080, meaning that 60.80% of variable variation Labor absorption can be explained by the

variables Number of Industry, Number of Population, and Investment. The rest, 39.2%, was influenced by other variables or factors that were not included in the model.

Table 3. Random Effects Model (REM) Estimation Model

$$\bar{EO}_{it} = 3.604866 + 0.012309NOI_{it} + 0.000000POP_{it} - 0.001843INV_{it}$$

(0.0000) (0.4048) (0.2726)

---

$R^2 = 0.6080$ ;  $DW = 4.4113$ ;  $F = 5.430123$ ;  $Prob. F = 0.0000$

Information: \*Significant at = 0.01; \*\*Significant at = 0.05; \*\*\* Significant at = 0.10; The number in brackets is the probability value of the t statistic.

Separately, it can be seen that the Number of Industries (NOI) variable has an influence on Labor Absorption (EO) with p (p value), probability, or significance of 0.0000 (< 0.01) respectively. Population (POP) and Investment (INV) have no effect on Employment Opportunities (EO) with p (p value), probability, or significance of 0.4048 (> 0.10) and 0.2726 (> 0.10), respectively.

Variable Number of Industries (NOI) has a regression coefficient of 0.0123, with a linear-linear relationship pattern. This means that if the number of industries increases by 1 unit, then employment opportunities will increase by 0.0123 percent. On the other hand, if the number of industries decreases by 1 unit, then employment opportunities will decrease by 0.0123 percent.

Table 4. Regional Effects and Constants

No	Region	Effect	Constant
1	Plantungan	-1,416,431	2,188,435

20	Kendal	-0.021628	3.583238

The constant value of each region can be seen in Table 4. The highest constant value is owned by Boja District, which is 7.011014. That is, related to the influence of the variables Number of Industry (NOI), Number of Population (POP), and Investment (INV) on Employment Opportunities (EO), Boja District tends to have higher job opportunities than other sub-districts. After Boja District, the sub-district area with the largest constant is Kaliwungu District.

The lowest constant value is owned by the Limbangan District, which is 0.380,031. Associated with the effect of the variables Number of Industry (NOI), Number of Population (POP), and Investment (INV) on Employment

Opportunities (EO), Limbangan District tends to have lower job opportunities than other sub-districts. Before Limbangan District, the sub-district area with the smallest constant was Pengandon District.

#### V. DISCUSSION

Based on the results of the Chow test and Hausman test, the panel data regression test in this study was carried out using the Random Effects Model (REM). Testing with the Random Effects Model (REM) was chosen because p-value (p-value), probability or empirical significance of F Chow test is 0.8600 ( $> 0.10$ ) and p-value (p-value) probability or empirical statistical significance Hausman test is 0.2930 ( $> 0.10$ ). The result of the variable value of the number of industries is very influential on job opportunities in Kendal Regency, indicated by the Prob value of 0.0000 less than 0.01 ( $P < 0.01$ ). The value of the variable population and investment value does not affect employment opportunities in Kendal Regency, indicated by the Prob value of 0.4048 more than 0.01 ( $P > 0.10$ ) and 0.2726 more than 0.01 ( $P > 0.10$ ). The number of industries is very influential on job opportunities in Kendal Regency because of this..

The results of the t test show that the variable number of industries has a positive effect on employment. Every increase in the number of industries will have a direct positive effect on job opportunities. If the number of industries increases, there will be an increase in demand workforce, because the increasing number of industries will increase the One of the factors of production is labor The results of this study are related to research conducted by Saputra et al., (2021) which states that the number of companies has a significant effect on job opportunities.

Based on the results of the t test, it is known that the population has no effect on employment opportunities. This happens because the population is not proportional to the supply of work. High population growth has an impact on the lack of available jobs and can lead to increased unemployment. The results of this study are related to the results of research conducted by Mahsunah (2018) Large population it is a great potential. According to Smith population growth able to promote economic growth. Residents viewed from the side employment is a supply for labor market in an area. If population growth and quality human resources do not get attention from the government, can lead to population growth uncontrolled. This is worrying increase the number of unemployed and increase the number of poor people.

Based on the results of the t-test investment has no effect on employment opportunities, this happens because of the lack of investment invested to create the industry. Investments are invested in several sectors, if investment in the industrial sector is high, job opportunities will be created. The results of this study are related to research conducted by Helen et al., (2018) show that indirect effect Investment on job opportunities is not significant, this is because investment in Malinau Regency is still focused on a few sectors so that it is not evenly distributed in all sectors so that its contribution is also still small to economic growth, uneven investment has an impact on less labor absorbed so that employment opportunities are also low.

Based on the calculation of the constant value, the area with the highest constant value is Boja District with a constant value of 7.011014. The reason for the high job opportunities in Boja District is due to the balance between the number of job opportunities and the workforce. Boja District has a higher number of industrial units than other sub-districts in Kendal Regency. So the job opportunities tend to be high. The area with a low constant value is the Limbangan District area with a constant value of 0.380,031. The reason for the low absorption of work in Limbangan District is because the number of job opportunities is still minimal. The number of industries is less compared to other regions, so the labor force absorbed is relatively low.

#### VI. CONCLUSION AND RECOMMENDATION

The results of research on job opportunities in Kendal Regency during the 2017-2021 period show that job opportunities are influenced by the number of industries, while population and investment do not affect job opportunities. There is a conclusion that can be used as a reference, namely the result of the value of the number of industries that greatly influences employment opportunities in Kendal Regency, marked by a Prob value of 0.00000 less than 0.01 ( $P < 0.01$ ). The value of the variable population and investment value does not affect employment opportunities in Kendal Regency, indicated by the Prob value of 0.4048 more than 0.01 ( $P > 0.10$ ) and 0.2726 more than 0.01 ( $P > 0.10$ ). The number of industries is very influential on job opportunities in Kendal Regency because it is related to the absorption of labor. Population Number has no influence on Employment Opportunities because the population is not proportional to the job offer. And the investment value has no effect on job opportunities, because of the lack of investment invested to create the industry.

The subjects studied in this study only focused on data from Kendal Regency. It is hoped that future researchers can provide samples for the research to be carried out. Future research is expected to use a different research area because job opportunities do not only exist in Kendal Regency, so the data can be generalized to other areas.

#### ACKNOWLEDGMENT

The author would like to say thank you to the supervisors and all parties who have helped in this research so that this research can be completed properly. support in participating in this manuscript/research.

### Abstract

*This study aims to determine and analyze the effectiveness of the budget and to see how the variance of direct expenditure on the Garut Regency fire department from 2017-2020. The phenomenon that occurred from 2017 to 2019 the realization of the expenditure budget did not match the target. Meanwhile 2020, the target has decreased due to government policies that have reallocated the spending budget for handling COVID-19. The results of previous research from Silaban and Vanrio (2021) said the results of his research showed that the absorption of direct expenditure budgets during the Covid-19 pandemic had been running effectively but the results were not optimal because many direct expenditure budgets were diverted for handling and Covid-19 prevention. The problem in this study is how the level of effectiveness of the budget and how the criteria for the variance value of the direct expenditure budget are. The novelty of this research is the existence of a direct expenditure variance variable because no one has do this researched, so that is why the writers get interested to do it. The research method used is a qualitative method. And data collection is in the form of unstructured interviews, documentation, literature studies and direct observations with the head of the financial sub-section of the fire department. Based on the results of the study showing the budget period within the last 4 years (2017-2020) at the Garut Regency Fire Department for the effectiveness of budget use, the results of the overall analysis are effective, it indicates the planned program has been realized quite well. While the results of the calculation of the direct expenditure variance at the Garut Regency Fire Department in 2017-2020 are in the good category because the realization of spending does not exceed the set budget. The impact of this research is to provide information for the long term regarding budget measurement tools, making it easier for other researchers to study more deeply.*

### I. INTRODUCTION

Budgeting is an important role in an organization/institution either central or regional. The regional government annually prepares a budget plan or what is called the Regional Revenue and Expenditure Budget. Thus, the use of regional budgets and revenues cannot be separated from local governments. Budget planning aims for public services that must be improved, so as to encourage regional economic growth and increase the effectiveness and efficiency of regional government administration. Estimates of conditions that will occur in the future are an important consideration in budgeting. The ability to see far ahead will determine the accuracy of the budget with its realization. The difference in variance between the budget and its realization is an indicator of the success of budgeting.

The budget according to the Law of the Republic of Indonesia No. 9 of 2020 concerning State Revenue and Expenditures in 2021 states that the State Revenue and Expenditure Budget for the 2021 fiscal year is prepared in accordance with the needs of the administration of the State government and the ability to collect state revenues in order to support the realization of a national economy based on economic democracy. with the principles of togetherness, efficiency, justice, sustainability, environmental insight, independence, and maintaining balance, progress and national economic unity.

Thus, the budget regulates government spending and serves as the basis for revenue and financing by the government for a certain period which usually includes an annual period. However, it is possible to prepare a budget for a period of more or less than one year. So in a government environment, the budget function has an important impact on accounting and financial reporting. According to Adisaputro and Anggraeni (2017: 4) "Budget or Budget is the preparation of a budget.

The Fire Department is one of the Regional Apparatus Performance Units in Garut Regency which plays an important role in peace and public order as well as community protection. Financial management at the Regency Fire Department must carry out financial control by the Head of the Garut Regency Fire Department so that the predetermined budget can cover all required activities, so that the set budget can be realized properly. In Law

Number 23 of 2014 concerning Regional Government, namely Regional Heads, and Regional Apparatuses are prohibited from spending at the expense of the regional budget for other purposes than those stipulated in the APBD. Thus, the budget obtained is like a budget from the government which must be demanded to maximize the budget and be realized properly and effectively and efficiently.

The phenomenon that occurs in the fire department is In the period of 3 consecutive years from 2017, 2018 and 2019 the budget target increased but the realization of the budget was otherwise below the budget. While the budget and realization of the Fire Department's expenditure in 2020 decreased compared to the previous year due to government policies that reallocated the budget for handling COVID-19 for 3 years in a row from 2017, 2018 and 2019 the budget target increased, but On the other hand the realization was below the budget

The budget and realization of the Fire Department's expenditure in 2020 decreased compared to the previous year due to government policies that reallocated the budget for handling COVID-19. After the determination of covid-19 as a national virus outbreak, the government automatically made an adjustment policy. With the adjustment, many activities/programs that had been planned and budgeted for next year had to be canceled and postponed

Previous researchers conducted by Octania and Endang in the health department work unit office (2020) said that the level of effectiveness in the capacity of 90% which means that financial management of the budget is done well. While the research conducted during the covid-19 period conducted by Silaban and Vanrio (2021) said the results of his research showed that the absorption of direct expenditure budgets during the Covid-19 pandemic had been running effectively but the results were not optimal because many direct expenditure budgets were diverted for handling and Covid-19 prevention

The purpose of this study was to determine the level of effectiveness and the value of the variance in the realization of the direct expenditure budget. The reason the researcher only examines the direct expenditure budget is because direct expenditure is expenditure that is directly related to government programs, while indirect expenditure is expenditure that is not directly related to local government programs. This is important to do to evaluate the budget of the Garut Regency Fire Department. Making it easier to solve the problem to find out how the level of effectiveness of the budget and the criteria for the value of the variance between the direct budget and the realization of the budget at the Garut Regency Fire Department can be achieved.

## II. LITERATURE REVIEW

### A. *Public Sector Accounting*

The public sector is an economic sector that provides various public services to the community. To realize effective and efficient governance. There is no difference between the public sector and the private sector in achieving its goal of demanding quality human resources in carrying out financial management. However, the private sector cannot completely replace the public sector in some situations and activities, for example the function of the bureaucracy in government. Government agencies and State-Owned Enterprises, and Regional-Owned Enterprises are part of the public sector.

In the simplest system, a public budget is a document that describes a financial condition in an organization that includes information on revenues, expenditures, and activities.

### B. *Government Accounting Standards*

Mardiasmo (2002) defines accounting standards as guidelines or principles governing accounting treatment in the preparation of financial statements for reporting purposes to users of financial statements.

### C. *Financial Statements*

Kasmir (2018) Financial Statements are reports that show the company's current financial condition or within a certain period

### D. *Public Sector Budget*

Mardiasmo (2018: 76) said that: "The public sector budget contains an activity plan which is described in the form of a plan for obtaining income and spending in monetary/money units".

*E. Budget Realization Report*

Mahsun (2017:45) states that: "The budget realization report is financial planning for the future which generally covers a period of one year and is expressed in monetary units".

*F. Regional Expenditure*

Government Regulation No. 12 (2019) Regional expenditures are all regional obligations that are recognized as a reduction in the value of net assets in the period of the relevant fiscal year.

*G. Direct Expenditure*

Baldic Siregar (2017) Direct expenditures are budgeted expenditures that are directly related to the implementation of programs and activities

*H. Effectiveness*

Effectiveness basically shows the results achieved in a program/activity related to the intended target. A program or activity is said to be effective, then the results must meet the stated goals. The thing to know is that effectiveness does not refer to the money used to achieve a goal. Effectiveness only determines that a program or activity has achieved the stated goals. According to Abdul and Iqbal (2019:163) that: "Effectiveness is the relationship between the output of a responsibility center and the goals or objectives that must be achieved".

To determine the percentage of targets that have been achieved, it can be measured by measuring effectiveness using the formula below:

$$\text{Effectiveness} = \frac{\text{Budget Realization}}{\text{Budget Target}} \times 100\%$$

Source: Adisasmita (2018:170)

Regarding the criteria for assessment and financial performance in the Decree of the Minister of Home Affairs Number 690,900-329 , the effectiveness criteria are determined by the presentation of measurements which can be seen in the following table:

Table 1. Effectiveness Criteria

Percentage	Effectiveness Criteria
>100%	Very effective
90%-100%	effective
80%-90%	Effective enough
60%-80%	Less effective
>60%	Ineffective

Source the Minister of Home Affairs Number 690.900.329

*I. Analysis Of Expenditure Variance*

Analysis of variance is an analysis of the difference between the realization of expenditure and the budget. Analysis of variance is quite simple but can provide very meaningful information. Based on the budget realization report presented, the reader of the report can find out directly the magnitude of the budget variance with its realization which can be expressed in the form of a nominal value or a percentage. categorized as disliked difference (Mahmudi, 2019:155). According to Mahmudi (2019:157) stated in this study the analysis of variance of the direct expenditure budget was formulated as follows:

$$\text{Variance} = \text{Actual Expenditure} - \text{Budget}$$

Measuring the value of the spending variance based on the following assessment criteria:

Table 2. Variance Criteria

Size	Variance Criteria
Actual Expenditure < Budget	Good
Realization $\geq$ Budget	Not Good

Source: Mahmudi (2019:157)

The results of previous researchers Dwi Novita Sari Erika Z showed that the level or criteria for the effectiveness of the budget for the Samarinda City Government from 2011-2015 varied. Where in 2014 it was included in the criteria of being quite effective, and in 2011, 2012, 2013 and 2015 it was included in the criteria of being less effective, because the realization of the expenditure budget had a big difference with the budget target. So there are some activities that are budgeted for but not realized effectively. while Lasupu (2021) research results show that the Effectiveness and Efficiency of Budget Execution at the National Unity and Political Agency of Tojo Una-Una Regency, on average, are included in the effective and efficient criteria according to the level of criteria according to the Decree of the Minister of Home Affairs Number 690,900,329.

### III. RESEARCH METHODOLOGY

The method used by the researcher in this study is a descriptive method which was studied qualitatively. The object of research is the Garut Regency Fire Department, which is located at Jalan Merdeka No. 100, Tarogong Kaler, Garut, 44151. Researchers used data collection techniques in this study as follows: Field Research, unstructured interview.

Library Research. Operationalization of the variables in this study is the Effectiveness Ratio where the indicators are Budget Realization and budget targets, while the second variable, namely analysis of variance, contains indicators of expenditure realization and budget.

- a. Researchers used qualitative data analysis by measuring the effectiveness ratio and the value of variance. The analysis of this research process is carried out as follows: Requesting data from the Garut Regency Fire Department for research materials that focus on measuring the level of effectiveness and efficiency of the budget using the financial ratio formula.
- b. Checking the data is seen from its completeness to ensure the data can be processed at a later stage.
- c. Classification of data, namely grouping data according to the instrument and the dimensions of the research variables
- d. Calculating Financial Ratio Analysis from the Budget Realization Report from 2017-2021

### IV. RESULT/ FINDING

The following is the data taken is the Budget Realization Report from the 2017-2020 Fire Department. The objects of research are Regional Expenditures, Indirect Expenditures and Direct Expenditures at the Fire Department.

Table 3. Garut Regency Fire Department Budget Realization Report 2017

Description	Budget (Rp)	Realization (Rp)	The remaining budget	%
			(Rp)	
Expenditures Budget	9.602.538.592	9.425.720.625	176.817.967	98,16
Indirect	3.541.627.456	3.522.729.807	18.897.649	99,47

Direct	6.060.911.136	5.902.990.818	157.920.318	97,39

Based on the table above, it can be seen that the total budget and budget for the Garut Regency Fire Department in 2017 was Rp. 9,602,538,592, - with a realization of Rp. 9,425,720,625, - or 98.16% with the remaining budget of Rp. .176,817,967,-.

Table 4. Garut Regency Fire Department Budget Realization Report 2018

Description	Budget (Rp)	Realization (Rp)	The remaining budget	
			(Rp)	
Expenditures Budget	13.156.752.988	12.660.941.243	495.811.745	96,23
Indirect	5.403.120.338	5.173.663.689	229.456.649	95,75
Direct	7.753.632.600	7.487.277.554	266.355.046	96,56

Based on the table above, it can be seen that the total budget and budget realization at the Garut Regency Fire Department in 2018 was a budget of Rp. 13,156,752,988, - with the realization of Rp. 12,660,941,243, - or 96.23% with the remaining budget. of Rp. 495,811,745,-.

Table 5. Garut Regency Fire Department Budget Realization Report 2019

Description	Budget (Rp)	Realization (Rp)	The remaining budget	%
			(Rp)	
Expenditures Budget	14.343.776.450	13.906.545.274	437.231.176	96,95
Indirect	5.314.167.450	5.120.130.001	194.037.449	96,35
Direct	9.029.609.000	8.786.415.273	243.193.727	97,31

Based on the table above, it can be seen that the total budget and budget realization at the Garut Regency Fire Department in 2019 the budget was Rp. 14,343,776,450, - with the realization of Rp. 13,906,545,274, - or 96.95% with the remaining budget. of Rp. 437.231.176,-.

Table 6. Garut Regency Fire Department Budget Realization Report 2020

Description	Budget (Rp)	Realization (Rp)	The remaining budget	
			(Rp)	
Expenditures Budget	10.123.135.136	9.998.199.411	124.935.725	98,77
Indirect	5.104.550.207	5.024.061.957	80.488.250	98,42
Direct	5.018.584.929	4.974.038.454	44.546.475	99,11

Based on the table above, it can be seen that the total budget and budget realization at the Garut Regency Fire Department in 2020 is a budget of Rp. 10,123,135,136, - with the realization of Rp. 9,998,199,411, - or 98.77% with the remaining budget. amounting to Rp.124.9355.725, -.

## V. DISCUSSION

Based on the findings of the implementation of the budget from 2017 to 2020, the following is the discussion:

A. *Effectiveness Ratio*

To determine the percentage of targets that have been achieved, it can be measured by measuring effectiveness using the formula below:

$$\text{Effectiveness} = \frac{\text{Budget Realization}}{\text{Budget Target}} \times 100\%$$

The calculation of the effectiveness ratio of the Garut Regency Fire Department in 2017-2020 is as follows:

$$\begin{aligned} 2017 &= \frac{\text{Rp. Rp}9.425.720.625}{\text{Rp. Rp}9.602.538.592} \times 100\% \\ &= 98,16\% \end{aligned}$$

$$\begin{aligned} 2018 &= \frac{\text{Rp.}12.660.941.243}{\text{Rp.}13.156.752.988} \times 100 \\ &= 96,23\% \end{aligned}$$

$$\begin{aligned} 2019 &= \frac{\text{Rp.}13.906.545.274}{\text{Rp.}14.343.776.450} \times 100\% \\ &= 96,95\% \end{aligned}$$

$$\begin{aligned} 2020 &= \frac{\text{Rp.}9.998.100.411}{\text{Rp.}10.123.135.136} \times 100\% \\ &= 98,76\% \end{aligned}$$

The analysis of the measurement of the effectiveness of the Garut Regency Fire Department in 2017-2020 can be seen in table 4.5 as follows:

Years	Budget Realization (a)	Budget Target (b)	Effectiveness Level ( $\frac{a}{b} \times 100\%$ )	Kriteria
2017	Rp. 9.425.720.625	Rp. 9.602.538.592	98,16%	Effective
2018	Rp.12.660.941.243	Rp.13.156.752.988	96,23%	Effective
2019	Rp.13.906.545.274	Rp.14.343.776.450	96,95%	Effective
2020	Rp.9.998.100.411	Rp.10.123.135.136	98,76%	Effective
Rata-Rata			97,53	Effective

Based on table 5.1 the Effectiveness Ratio of the Garut Regency Fire Department from 2017 is the same as in 2020 as follows:

- a. In 2017 the Effectiveness Ratio of the Garut Regency Fire Service was 98.16%, which means that it is in the Effective criteria (80-100%). This is because in 2017 the Garut Regency Fire Department has just become a Department so that the budget is widely used well. However, in 2017 there were activities with the smallest realization, namely the provision of communication services, water resources and electricity by 76.55% because electricity and internet payments were adjusted to the usage that generated the amount of the bill
- b. In 2018 the Effectiveness Ratio of the Garut Regency Fire Service was 96.23%, which means that in the effective criteria (80-100%) the effectiveness presentation decreased by 1.93% from the previous year but the criteria remained the same, this was due to the budget in 2017 which was not budgeted for in 2018, namely transportation and accommodation of fire engines from Japan.
- c. In 2019 the effectiveness ratio of the Garut Regency Fire Department is 96.95%, which means the criteria are Effective (80-100%). This year the percentage of effectiveness again increased by 0.72% from the previous year. Based on the results of an interview with the Head of the Sub-Division of Finance Fire Departement stated that in 2019 there were several changes of Commitment Makers and Power User Budget officials within the Fire Department due to mutations and rotations so that they had to wait for the proposed replacement of new commitment-making officials which caused delays in the implementation of procurement activities. a problem for the Garut Regency Fire Department.
- d. In 2020 the effectiveness ratio of the Garut Regency Fire Department is 98.76% with an Effective criteria (80-100%). In 2020 the presentation increased by 1.81%, the percentage increase was greater than the previous year. However, this year the percentage level of realization in coordination meetings and consultations outside the region has decreased by 0.88% from the previous year, so this is a problem for the Garut Regency Fire Department. Based on the results of an interview with the Head of the Finance Subdivision of the Fire Departement stated that in 2020 the obstacles that occurred in the realization of the budget included several budget changes, the existence of budget efficiency, the Covid-19 outbreak which caused delays in the implementation of activities related to the community at large such as socialization, as well as in activities coordination meetings and consultations outside the region experienced a decrease in the presentation of realization this was due to transportation payments in accordance with the needs that had to be paid and the Covid-19 outbreak situation, the implementation was also delayed and could not even be completed on time due to restrictions imposed by the government.

Based on the data and analysis above, it can be concluded that the Garut Regency Fire Department is quite good at using funds, so that the program can be achieved. In order for the budget level to be very effective, it is necessary to coordinate and cooperate between the relevant fields in the context of achieving a program. In addition, there is a need for better supervision in the preparation of the expenditure budget, so that the target or program budget plan that will be used can be realized to the maximum. This is in line with Mahmudi theory (2019: 86) that "Effectiveness is a measure of the success or failure of achieving the goals of an organization to achieve its goals, if an organization achieves its goals then the organization has been running effectively".

#### A. Expenditure Variance

To determine the criteria for spending variance, it can be measured using the formula below:

$$\text{Variance} = \text{Actual Expenditure} - \text{Budget}$$

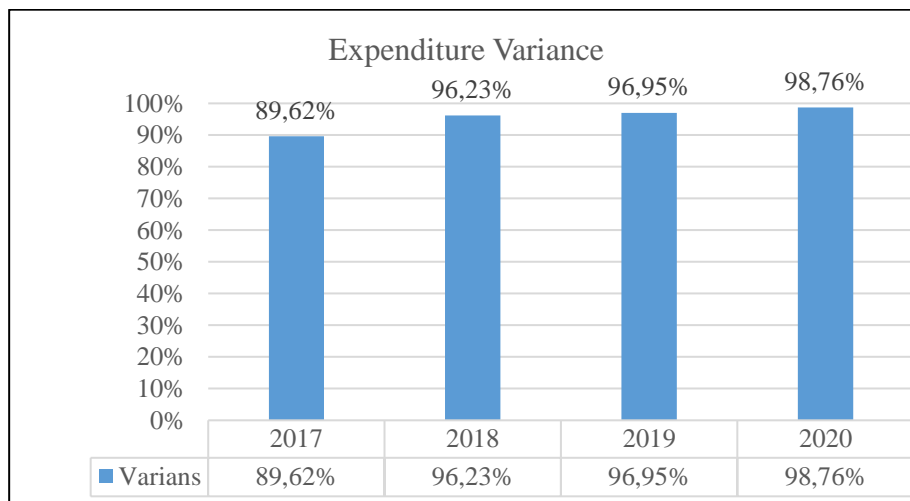

The calculation of the expenditure variance of the Garut Regency Fire Department in 2017-2020 is as follows:

$$\begin{aligned} 2017 &= \text{Rp}8.605.556.512 - \text{Rp}9.602.538.592 \\ &= - \text{Rp}996.982.080 \\ 2018 &= \text{Rp}12.660.941.243 - \text{Rp}13.156.752.988 \end{aligned}$$

= - Rp495.811.745  
 2019 = Rp13.906.545.274- Rp14.343.776.450  
 = - Rp437.231.176  
 2020 = Rp9.998.100.411 - Rp10.123.135.136  
 = - Rp125.034.725

Table 7. Garut Regency Fire Department Expenditure Variance in 2017-2020

Year	Difference	Percentage (%)	size	Variance Value
2017	-Rp. 176.817.967	89,62	a < b	Good
2018	-Rp. 495.811.745	96,23	a < b	Good
2019	-Rp. 437.231.176	96,95	a < b	Good
2020	-Rp. 125.034.725	98,76	a < b	Good

Based on the graph above, it shows that the value of the variance (difference) of the direct budget with the realization of the direct budget at the Garut Regency Fire Department in 2017 was Rp. 2018, 2019, and 2020. The statement is explained from the calculation results above which show that:

- In 2017 the absorption of the remaining use of the budget in the Expenditure Variance table above is around Rp. 996,982,080 or around 89.62% which indicates that not all activities and activities carried out by the agency are fully absorbed in the financing that runs for one period of the relevant fiscal year.
- In 2018 the absorption of the remaining budget usage based on the Expenditure Variance is around Rp. 495,811,745 or around 96.23%, leaving a percentage ratio of around 3.77% of the absorption of the existing budget in the realization of the expenditure budget at the agency. When viewed from the previous year, there was an increase in the effectiveness of the use of the budget by around 6.61% from the previous year.
- In 2019 the absorption of the remaining use of the budget based on the Expenditure Variance is around Rp. 437,231,176 or around 96.95%, leaving a percentage ratio of around 3.05% of the existing budget absorption in the realization of the expenditure budget at the agency. When viewed from the previous year, there was an increase in the effectiveness of the use of the budget by around 0.72% from the previous year.
- In 2020 the absorption of the remaining use of the budget based on the Expenditure Variance is Rp. 125,034,725 or about 98.76%, leaving a percentage ratio of around 1.24% of the existing budget absorption

in the realization of the expenditure budget at the agency. Seen an increase in budget use from the previous year by 1.81% if you look at the previous year.

Judging from all the changes from year to year in the absorption of budget use, it can be said to be good, but basically the existing budget performance can be said to be good because of budget savings. The interview results stated that the cause of the expenditure budget was not realized significantly, it is because there were several changes in commitment making officials and budget users in the Garut Regency Fire Department due to mutations and rotations which caused delays in the implementation of procurement so that they had to wait for the proposal to replace the new official commitment maker. The government's performance will be indicated to be unfavorable if the actual expenditure is greater than the budgeted amount. These results support the opinion expressed by Mahmudi (2019: 60) performance measurement is part of the management control function because performance measurement can be used to control activities. Each activity must have a measurable performance in order to know the level of efficiency and effectiveness. In public sector organizations, performance measurement is mainly carried out to measure the 3E level, namely: economy, efficiency and effectiveness (value for money). If an activity does not have a performance measure, it will be difficult for the organization to determine whether the activity is a success or failure.

## VI. CONCLUSIONS AND RECOMMENDATIONS

Based on the results of research and discussion, it can be concluded from research on the Analysis of the Effectiveness and Variance of Expenditures at the Garut Regency Fire Department as follows:

- a. The budget period in the last 4 years (2017-2020) at the Garut Regency Fire Department for the effectiveness of the use of the budget, the results of the analysis are overall effective, it indicates the planned program has been realized quite well
- b. The results of the calculation of the expenditure variance at the Garut Regency Fire Department in 2017-2020 are in the good category because the realization of spending does not exceed the set budget

Based on the conclusions described above, the following are recommendations that can be given by researchers:

- a. For the Garut Regency Fire Department, it is expected to be able to improve and pay attention to the performance of budget management in the next period in preparing the budget plan so that the budget can be realized more effectively and efficiently so that it can be used to evaluate the budget and expenditure plans for the following year by conducting coaching and internal, external training or through increasing the level of education as well as improving the work system and infrastructure that supports the achievement of performance targets.
- b. For further researchers who will conduct research with the same discussion, it is hoped that by increasing the ratio by including other ratios, for example by using other ratios such as growth ratios, independence ratios, and compatibility ratios.

### Abstract

*The theft of motorcycle vehicles in the last three years 2019-2021 is still relatively high, there are around 100 thousand cases of theft. Therefore, motorcycle owners secure their vehicles by using a padlock and can also close the ignition for today's motorcycles. Even though this has been done, the vehicle can still be stolen by giving liquid to open the padlock and breaking into the ignition using the "T" key. And vehicle owners do not get information early on the theft of their vehicles. So he made a motorcycle security tool that has a system to provide information in the form of notifications to motorcycle owners if there are indications of theft and can also find out the whereabouts of motorcycles in real time. The use of Arduino Uno R3 using IoT (Internet of Things) technology which is supported by the GSM/GPRS SIM808 module. This is useful for making it easier to send vehicle information using the MQTT protocol as a communication link between motorcycle security tools and broker servers. The information is sent to the motorcycle owner via the WhatsApp application message media.*

*Keywords— Motorcycle security; MQTT Arduino; IoT*

---

### I. INTRODUCTION

Theft is a criminal act, which greatly disturbs the comfort of the community. One of them is the theft of motorcycles, both two-wheeled and four-wheeled. The number of cases of motorcycle theft in the last three years 2019-2021 is still relatively high, there are around 100 thousand cases of motor vehicle theft (Bandung, 2018), although statistically there is a decrease, but it does not reduce the sense of security to the owner much vehicle. Sourced on the official website of the Indonesian Statistics Center, throughout 2019-2021 there have been thousands of cases of motor vehicle theft, 23,476 cases occurred in 2019, 18,557 occurred in 2020, 19,798 occurred in 2020.

Some motor vehicle owners simply lock the handlebars feel quite safe, even though key breaking techniques are currently increasingly diverse. Usually the theft technique is carried out using a T letter key or a liquid inserted in the motorcycle keyhole. The security system of the motorcycle's default keyhole cover can apparently be opened with a box-shaped key that has four small holes. In addition to locking the handlebars, another security that is still relatively used today is to use a padlock that is mounted on the disc so that the wheels cannot run, but even with a padlock, thieves can still break into it. As for other safeguards, namely by adding switches and relays for connecting and breaking electric current to the motor coil, although in such a way motor vehicle thieves can casually carry out their actions without inviting suspicion. (Bagenda, 2014) Therefore, motorcycle owners need to increase their vigilance and further enhance the safety of their motorcycles.

Based on the information above, then how to design an appropriate motorcycle security system model, where this security system can provide information on indications of theft as early as possible and provide information on the position of the motorcycle vehicle through a mobile device that is sent to the motorcycle owner directly, so as to avoid motorcycle theft. An innovative tool to secure motorcycles from theft is to combine Arduino Uno R3 microcontroller, two 5 volt Relay modules by combining IoT (Internet of Things) technology which is supported by the GPS Shield module and the GSM/GPRS SIM808 module. In connection with the development of smart cellular technology, on the user side, the tool will be integrated with the WhatsApp application. It aims to make it easier for users to track the location of the vehicle or control the device and monitor vehicle activity. So with the above technology, it is hoped that the prototype security system can anticipate the occurrence of vehicle theft and can minimize the number of motorcycle thefts.

### II. LITERATURE REVIEW

(Bagenda and Prasetya, 2014) in their article entitled prototype of motorcycle security and control system based on the atmega8535 microcontroller, discusses the motorcycle security system using the Atmega8535 Microcontroller which is integrated with mobile phones via the Sort Text Message (SMS) feature. The purpose of

their research is to provide an alternative to motorcycle security from the criminal act of theft, so it is hoped that vehicle owners can find out vehicle information when an indication of theft occurs. The results of their research showed that after the implementation of this motorcycle security system, vehicle owners who previously had difficulty in obtaining vehicle position information became easier to find the position of their vehicle. Another study on motorcycle safety with a microcontroller by (Juwariah, et al., 2019) in his article entitled -Based Motorcycle Safety System, discusses a motorcycle security system using a microcontroller using fingerprints. The purpose of this research is to create a motorcycle security system with fingerprints, so that only people who have registered their fingerprints can start the motorcycle engine.

The research (Begenda and Prasetya, 2014) and (Juwariyah, et al., 2019) has a relationship with the author's research because it discusses where the motorbike is using an IoT-based Microcontroller module that is connected to an application on a smartphone, but of course there are some modifications to the type of Microcontroller and smartphone application that is adapted to the object of research.

### III. RESEARCH METHODOLOGY

There are two stages in this research, the system design scheme in the first stage is the design of a motorcycle security system using Arduino as shown in Fig 1.

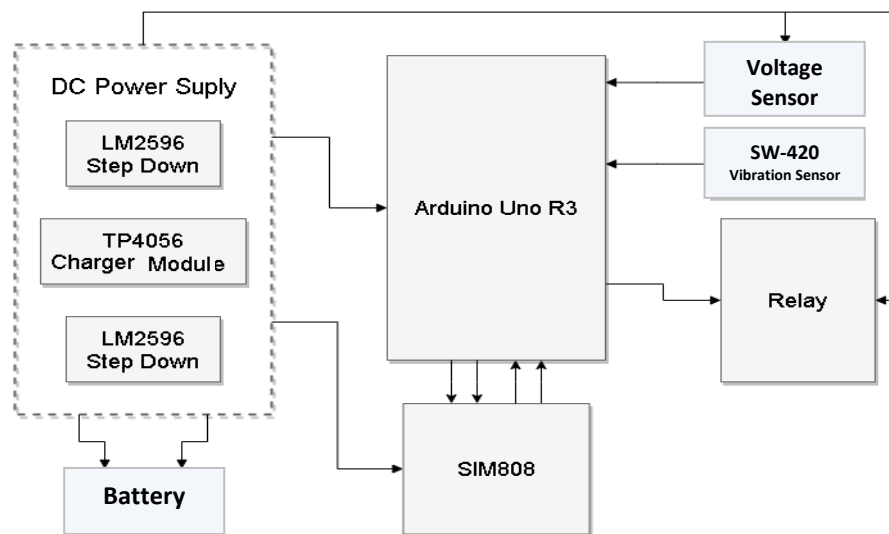

Fig 4. Block Diagram of a Motorcycle Security Prototype

The second stage of designing a motorcycle security system is IoT design using the MQTT protocol such as in Fig 2.

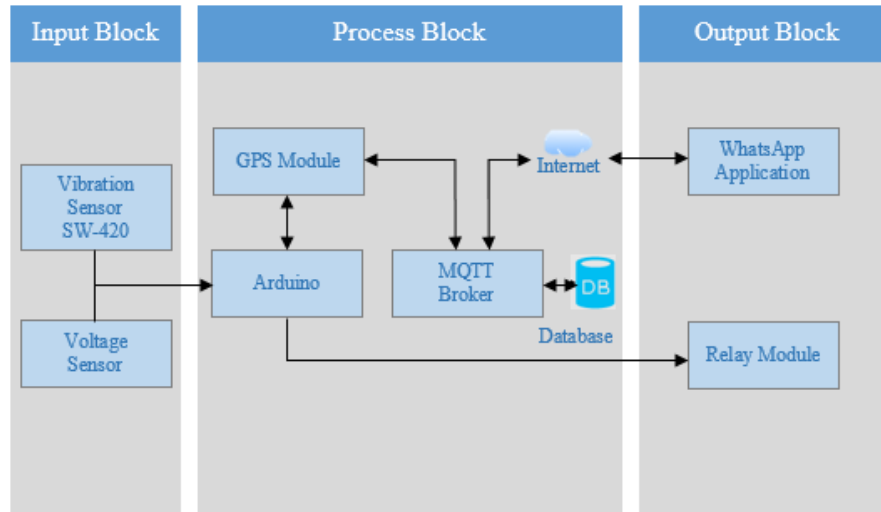

Fig 2. MQTT Communication Block Diagram

#### IV. RESULT / FINDING

In the first stage the results of the design of the motorcycle security system cable using Arduino which are integrated with the WhatsApp application, are shown in Fig 3.

Fig 3. Motorcycle Security Prototype Interface

The results of this prototype design were tested on a motorcycle and showed the motorcycle security system was running smoothly good. All trials carried out show that a motorcycle that is turned on in an inappropriate procedure will provide information in the form of a WhatsApp message and information on the latest motorcycle position, and users can turn off the motorcycle engine through the WhatsApp application.

Table 1 is the result of testing of relay devices, there are four test scenarios carried out on relay devices. The first test scenario to turn off the ignition system on a motorcycle vehicle by sending the code `/engine,1` was successfully carried out. The second test scenario to activate the ignition system by sending the code `/engine,0` was successfully carried out. The third test scenario is to test whether the system rejects other instructions by sending code that has not been set, and the results show that the system does not respond to unrecognized instructions. The fourth scenario is to test the connectivity of the device by assigning the number 1 to the NC pin, and it was successfully done.

Table 6. Relay Test Result

Testing	Test scenario	Expected result	Test results
1	<code>/engine,1</code>	Turning off the ignition system	[√] successful [ ] unsuccessful
2	<code>/engine,0</code>	Turning on the ignition system	[√] successful [ ] unsuccessful

3	Other commands	Not responding	[√] successful [ ] unsuccessful
4	Gives a value of 1 on the NC pin	Can connect	[√] successful [ ] unsuccessful

Table 2 is the result of testing the SIM888, this test is carried out to determine whether the system can connect using the GPRS cellular network and test the system of sending and receiving SMS. From the test results show that all the expected results in the testing process run as expected, so that the system can communicate via the GPRS cellular network, and the system can communicate by sending and receiving short messages (SMS) between cellular networks.

Table 7. SIM808 Test Result

Testing	Test scenario	Test expected	Test results
1	Activate GPRS	Can connect to the internet	[√] successful [ ] unsuccessful
2	Activate GPS feature	Successfully retrieve GPS coordinate data	[√] successful [ ] unsuccessful
3	Turn on SMS feature	Can receive and send SMS	[√] successful [ ] unsuccessful
4	Combining MQTT feature	Publish and subscribe was successful	[√] successful [ ] unsuccessful
5	Input voltage 4 volt	GPRS and GPS standby	[√] successful [ ] unsuccessful

Table 3 is the result of testing the MQTT protocol. The test results show that the Arduino Microcontroller and the server can be connected so that they can exchange information, and the connection between the two is stable.

Table 8. MQTT Protocol Testing Result

Testing	Test scenario	Test expected	Test results
1	Publish	Sending data from Arduino to server	[√] successful [ ] unsuccessful
2	Subscribe	Received data from Server to Arduino	[√] successful [ ] unsuccessful
3	Connection	Connection stable	[√] successful [ ] unsuccessful

Table 4 is the result of testing the WhatsApp application, this test was carried out to test the interaction between the system and the WhatsApp application. The test results show that the system can send messages to the user's WhatsApp number to send the latest information from the system, besides that the system can also be controlled via the WhatsApp application by using pre-set commands.

Table 9. WhatsApp Testing Results

Testing	Test scenario	Test expected	Test Results
1	Message "/device list"	Data can be saved in database	[√] successful [ ] unsuccessful
2	Message "/engine"	Controls motorcycle ignition system	[√] successful [ ] unsuccessful
3	Message "/location"	Getting data location from tools	[√] successful [ ] unsuccessful

Table 5 is the result of testing the GPS device, from the test results obtained the speed of data transmission during the day and night. The results of testing data transmission using a GPS device during the day from 5 experiments carried out resulted in an average data transmission of 196.6 seconds. While the average data transmission via GPS at night shows 72 seconds. So the difference in data transmission time between night and day is 124.6 seconds.

Table 10. Testing Results of GPS Device

Data - (n)	Day (s)	Night (s)	Difference (x)	(Xi - X)	(Xi - X) <sup>2</sup>
1	208	64	144	19.40	376.36
2	188	56	132	7.40	54.76
3	193	75	118	-6.60	43.56
4	198	79	119	-5.60	31.36
5	196	86	110	-14.60	213.16
<b>SUM</b>	983	360	623	0.00	719.20
<b>Average</b>	196.6	72	124.6		

$$\text{Standard Deviation} = \sqrt{\frac{\sum(x_i - \bar{x})^2}{n-1}} = \sqrt{\frac{719.0}{4}} = \sqrt{179.80} = 13.04$$

$$\text{Absolute Error} = \frac{\text{Standard Deviation}}{\sqrt{n}} = \frac{13.04}{\sqrt{4}} = 5.83$$

$$\text{Relative Error} = \frac{\text{Absolute Error}}{\bar{x}} \times 100\% = \frac{5.83}{124.6} \times 100\% = 4.67\%$$

$$\text{Tools Accuracy Value} = 100\% - \text{Relative Error} = 100\% - 4.67\% = 95.33\%$$

Based on the calculation data in Table 5, there is a difference in the value of the time spread, which is 144 seconds while the smallest difference is 110 seconds and the average difference is GPS signal locking for 124 seconds. By knowing the average difference, it can be seen that the standard deviation is 13.04 with an error value of 5.83 for each sample.

## V. DISCUSSION

The results of this study indicate that the use of the MTQQ on a smartphone is well integrated as shown by the success of the system in controlling for monitoring and controlling with a smartphone. These results are in accordance with research conducted by (Rochman, et al., 2007) which showed that the use of the MQTT protocol succeeded in controlling for controlling and monitoring on smartphones, the application of the MQTT protocol was used to send and receive messages with the publish/subscribe mechanism. Where publishers will send messages and subscribers will receive messages. The same thing was also stated by (Suryatini, et al., 2021) who stated that the use of the protocol had succeeded in connecting Android devices via smartphones with servers, with test results reaching 100% accuracy and data sent by publishers and data received by subscribers achieving conformity. 100%.

Another factor that supports the successful implementation of this motorcycle security system is the suitability of the latest location data sent via GPS. The results show that GPS has succeeded in sending motorcycle vehicle location data with an accuracy value of 95.33% with an error value of 5.83, these results indicate that data transmission via GPS is very good and accurate. This is in line with research conducted by (Rahman, et al., 2019) showing that GPS managed to send location data with a margin of error of 4.58, this result shows that the use of GPS is accurate and reliable to get the latest vehicle location information. Research conducted by (Nugroho & Dzulkiyoh, 2021) which states that the use of GPS is considered more efficient in obtaining vehicle location points because it is real time.

## VI. CONCLUSION AND RECOMMENDATION

Based on the results of the analysis, design and implementation that have been carried out, the conclusions obtained are that the prototype motorcycle security system is able to provide vehicle information to motorcycle owners in the form of message notifications or calls in the event of an indication of theft. And the owner can find out the whereabouts of the motorbike if there has been a theft by sending a location request message via the WhatsApp application.

This study only uses a vibration sensor, relay, and SIM module in building a prototype motorcycle security system. research can use RFID modules such as research conducted by (Musyafa, et al., 2021) or adopt research conducted by (Normawan & Supriyono, 2019) which uses usernames and passwords in making motorcycle security systems.

## Factors Affecting Consumer Perception Using E-Payments

Hedi Cupiadi<sup>1</sup>, Wati Susilawati<sup>2</sup> and Fitin Rawati Suganda<sup>3</sup>  
<sup>1,2,3</sup> Faculty of Economics, Universitas Garut, Garut, Indonesia

### Abstract

*Electronic payment (e-payment) is one of the conveniences of the current development of financial technology innovation. The existence of e-payment causes changes in consumers' behavior in making payments, from conventional to electronic. The research aims to determine the factors that affect consumer perceptions of e-payments for transactions. The difference with other research is determining the dominant factors that influence consumer perceptions. This research uses a quantitative descriptive method with a survey approach to e-payment users with a research sample of 100 people. The data obtained were processed and analyzed using a Confirmatory Factor Analysis approach with the factors studied: benefits, trustworthiness, self-efficacy, ease of use, and safety. The results showed that two dominant factors influence consumer perceptions of e-payment: self-efficacy and benefits. The conclusion is consumers who use e-payment are influenced by their perception of making payment transactions. Hence, companies that issue e-payment systems need to adopt these factors to improve the quality of their e-payments..*

Keywords— Consumer Perception; E-payment; Financial Technology.

---

### I. INTRODUCTION

The development of financial technology innovation that is happening today provides many conveniences and advantages in daily activities. Electronic payment (e-payment) is a tangible form of convenience provided by the current development of financial technology innovation (Bank Indonesia, 2021). Electronic payments are slowly becoming more popular in Indonesia, this can be seen from the many e-wallet applications that are present in Indonesia, e-wallet is an electronic wallet in which there is an account with a number of money data that can be used for buying and selling transactions online (iprice.co.id, 2019). Digital technology innovation is no longer a support system but has become a necessity, especially financial technology innovation.

Research on e-payments has been carried out by several researchers, including Octavia & Hafizh (2019), Mandariza et al. (2019), and Sulistyowati et al. (2020) have something in common is that the research aims to determine the effect of independent variables on consumer perceptions with a regression analysis approach, while this research focuses on knowing the dominant factors that influence consumer perceptions with a factor analysis approach.

In Indonesia, there has been a growth in users of payment systems with electronic devices or electronic payments for shopping needs, both online shopping and shopping at retail stores. The Pricewaterhouse Coopers (PwC) survey related to Global Consumer Insights, illustrates that 47% of respondents in Indonesia currently use electronic payments to transact in 2019 (Bisnis.com, 2019). That number is higher than in 2018 which was recorded at around 38%.

The PwC survey involved 21,480 respondents from 26 countries and countries in the Middle East region. In the Southeast Asia region, Indonesia is one of the countries that participated as respondents along with Thailand, Singapore, the Philippines, Malaysia, and Vietnam. PwC pays special attention to the rapid growth of mobile payment users in Vietnam. Based on data from Bank Indonesia, 38 e-wallets have been officially licensed. In 2018, e-wallet transactions in Indonesia reached US \$ 1.5 billion and are predicted to increase to the US \$ 25 billion by 2023. (Bisnis.com, 2019; Malik, 2020 ).

iPrice Group collaborated with data analysis company App Annie, to summarize processed data regarding the most popular e-wallet applications in Indonesia. Their research uses data on the number of application downloads and monthly active users, this research presents more concrete statistics to find out who are the e-wallet applications in Indonesia. (Selular.id, 2019) The following are 5 e-wallets in Indonesia based on the number of users in the Q2 until 2019 period.

Fig 1. List of E-wallet in Indonesia (selular.id, 2019)

The Fig shows that Go Pay, OVO, and Dana occupy the top three electronic payment applications that are most widely used by Indonesians in the second quarter of 2019. iPrice research shows that Go Pay has the most monthly active users in Indonesia. Research by iPrice Group and App Annie shows that Go Pay has the most monthly active users in Indonesia. As a result, transactions through the digital wallet made by Gojek reached US\$ 6.3 billion or around Rp 89.5 trillion as of February 2019. The research company noted that 70% of transactions in the Gojek application use Go Pay as a means of payment. Lippo Group's e-wallet application, OVO, was ranked second based on the number of downloads as of the second quarter of 2019, DANA has been relatively stable since the end of last year. Link Aja occupies the fourth position with the highest number of application downloads in the second quarter of 2019 (katadata.co.id, 2019).

So many advantages to using e-payment, including useless cash to make transactions, only using a smartphone, safer than cash, no need to worry if the wallet is left behind, and there are many bonuses and discounts if you pay using the e-payment application. In contrast to conventional payments, e-payment utilizes internet and smartphone technology as a means of payment by entering a shopping nominal, scanning a barcode, or placing a smartphone device in the space provided.

At this time e-payment has become one of the modern lifestyles of society, because, in addition to having many benefits, e-payment is also very suitable in practical era like now. The decision to use e-payment applications on based on various reasons and perceptions expressing consumers as users of e-payment applications. The phenomena, can be used as a reference to determine the factors that influence consumer perceptions of e-payments related to their use in transactions.

## II. LITERATURE REVIEW

### a. Consumer Perception

Perception is a process of selecting, organizing, and interpreting information about a product or service by consumers. Perception does not only occur in the form of physical stimulation but is also influenced by existing marketing conditions. According to Kotler and Keller (2016), perception does not only depend on physical stimuli but also stimuli related to the surrounding environment and the circumstances of the individual concerned.

According to Jalaludin (Ashadi and Salim, 2020), perception is the experience of objects, events, or relationships obtained by inferring information and interpreting messages. The process of perception is not just a psychological process but begins with a physiological process known as sensation.

Perceptions can be negative and positive, if consumers have a positive impression of the products offered by the company then this will result in positive perceptions, and vice versa (Kotler and Keller, 2016). Perception in

a person is strongly influenced by thoughts and the surrounding environment. In addition, perceptions can be substantially different from reality.

*b. E-payment*

Electronic payment is a payment model that makes it easy and offers convenience to its users in making payment transactions (Teoh et al., 2013). Users only need to make transactions using the internet, namely online, without having to meet or come all the way to meet the seller. Electronic payment is representative of all non-cash payments, also interpreted as electronic payment transactions between buyers and sellers using a savings account via the internet or electronic networks (Teoh et al., 2013).

E-Payment is defining as a digital payment instrument that can be represented and transferred in electronic form (Lestari, Purnomo, & Sembiring, 2021). Nugroho (2016) says that e-payment is a payment system that uses internet facilities as an intermediary.

Electronic payments currently used for long-distance transactions such as online shopping, as along the increasing use of the internet and the increasing number of e-commerce, electronic payment is a solution that exists to replace the old method of payment transaction tools. Electronic payments include payment cards, e-wallets, smartcards, e-cash, and e-checks (Apergis, Kunitsyna & Dyudikova, 2020).

### III. RESEARCH METHODOLOGY

This research uses a quantitative descriptive method with a survey approach to e-payment users. The research used primary data obtained through questionnaires distributed to 100 respondents with a non-probability sampling technique using purposive sampling. The data obtained were processed and analyzed using a Confirmatory Factor Analysis approach through the stages of the Bartlett Test, Measure of Sampling Adequacy (MSA), and Rotation Factors. In this research, the investigated factors refer to the research of Teoh et al. (2013) suggested the factors that influence consumer perceptions of e-payment, are benefits, trust, self-efficacy, ease of use, and security.

### IV. RESULT / FINDING

In this research, the factors to be analyzed consist of 5 factors with 25 indicators are online shopping (X1), offline shopping (X2), faster payments (X3), more proper payments (X4), balance storage (X5), understanding and recognizing behavior (X6), consistent with values and beliefs (X7), motivation to become better (X8), problem-solving ability (X9), individual ability standards (X10), difficulty level (X11), faith in overcoming difficulties (X12), valuation of self-skills (X13), ability to maintain behavior (X14), variations in valuation (X15), easy to learn (X16), easy to understand (X17), practical (X18), cuts bureaucracy (X19), used anywhere (X20), used anytime (X21), saving safety (X22), ease of use (X23), convenience of use (X24), and convenience of saving (X25).

*a. KMO and Bartlett's Test*

The factor analysis starts with determining the correlation matrix and assessing the feasibility of all indicators using KMO (Kaiser-Meyers-Olkin measure of sampling adequacy), Bartlett Test of Sphericity, and Anti-Image, the results are as follows:

Table 1. KMO and Bartlett's Test

Kaiser-Meyer-Olkin Measure of Sampling Adequacy (MSA)	.826
Bartlett's Test of Sphericity	Approx. Chi-Square 1038.183
	df 300
	Sig. .000

Based on the results of KMO with an MSA value (0.826) > 0.50 and Bartlett's test of Sphericity with a Sig value. (0.000) < 0.05 (Ghozali, 2019), then these indicators are correlated and feasible for further analysis.

*b. Extraction Factors.*

Factoring process by extracting a set of existing indicators using the Participants Component Analysis (PCA) method, the results are as follows:

Table 2. Communalities

	Initial	Extraction
Online shopping	1.000	.729
Offline shopping	1.000	.817
Faster payments	1.000	.669
More proper payments	1.000	.605
Balance storage	1.000	.692
Understanding and recognizing behavior	1.000	.479
Consistent with values and beliefs	1.000	.473
Motivation to become better	1.000	.721
Problem-solving ability	1.000	.707
Individual ability standards	1.000	.665
Difficulty level	1.000	.707
Faith in overcoming difficulties	1.000	.767
Valuation of self-skills	1.000	.695
Ability to maintain behavior	1.000	.549
Variations in valuation	1.000	.690
Easy to learn	1.000	.707
Easy to understand	1.000	.703
Practical	1.000	.421
Cuts bureaucracy	1.000	.733
Used anywhere	1.000	.587
Used anytime	1.000	.713
Saving safety	1.000	.745
Ease of use	1.000	.624
Convenience of use	1.000	.566
Convenience of saving	1.000	.624

From Table 2, it's known that the extraction value of each indicator that shows the variance of the initial indicators explained by the existing factor's, means that the greater the Communality of each indicator, the closer the relationship with the factor formed. Furthermore, the calculation of Total Variance Explained aims to find out how many factors (components) are formed, the results are as follows:

Table 3. Total Variance Explained

Component	Initial Eigenvalues			Extraction Sums of Squared Loadings			Rotation Sums of Squared Loadings		
	Total	% of Variance	Cumulative %	Total	% of Variance	Cumulative %	Total	% of Variance	Cumulative %
1	8.177	32.708	32.708	8.177	32.708	32.708	2.844	11.376	11.376
2	1.940	7.760	40.468	1.940	7.760	40.468	2.639	10.557	21.933
3	1.577	6.309	46.777	1.577	6.309	46.777	2.503	10.014	31.947
4	1.382	5.527	52.305	1.382	5.527	52.305	2.445	9.782	41.729
5	1.179	4.717	57.022	1.179	4.717	57.022	2.371	9.486	51.215
6	1.112	4.448	61.470	1.112	4.448	61.470	1.894	7.576	58.791
7	1.022	4.088	65.558	1.022	4.088	65.558	1.692	6.767	65.558
8	.997	3.986	69.544						
9	.954	3.816	73.359						
10	.781	3.124	76.484						
11	.726	2.903	79.387						
12	.654	2.617	82.004						
13	.562	2.248	84.251						
14	.536	2.145	86.397						
15	.473	1.890	88.287						
16	.452	1.810	90.096						
17	.419	1.675	91.771						
18	.380	1.518	93.289						
19	.362	1.447	94.736						
20	.290	1.159	95.895						
21	.274	1.098	96.993						
22	.234	.936	97.929						
23	.199	.795	98.724						
24	.181	.725	99.449						
25	.138	.551	100.000						

Based on Table 3. there are 25 indicators included in the factor analysis summarized into seven factors, namely Component 1, Component 2, Component 3, Component 4, Component 5, Component 6, and Component 7, where the Eigen Values 1 to 7 have values above 1.

c. *Rotated Component Matrix*

Aiming to find out whether these indicators are included in the seven factors that are formed based on the loading factor value  $> 0.5$  (Ghozali, 2019), the results as follow:

Table 4. Rotated Component Matrix

	Component						
	1	2	3	4	5	6	7
Online shopping	.103	.196	.119	.235	.173	.747	-.150
Offline shopping	.173	-.026	.778	-.243	.191	.236	.174
Faster payments	.187	.136	.487	.524	-.008	.318	.055
More proper payments	-.002	.234	.547	.342	.198	.220	.215
Balance storage	.153	.136	.091	.121	.047	-.037	.790
Understanding and recognizing behavior	.160	.063	.232	.121	.591	.055	.169
Consistent with values and beliefs	.107	-.023	.078	.019	.056	.650	.170
Motivation to become better	.469	.387	.218	-.109	-.017	.461	.283
Problem-solving ability	.018	.068	.333	.304	.265	.309	.577
Individual ability standards	-.148	.138	-.030	.335	.666	.234	.108
Difficulty level	.440	.155	-.016	-.212	.203	.354	.528
Faith in overcoming difficulties	-.024	.798	.188	.080	.187	.224	-.059
Valuation of self-skills	.079	.719	.178	.266	-.009	-.067	.255
Ability to maintain behavior	.167	.485	.010	-.144	.506	.025	.093
Variations in valuation	.345	.694	-.051	-.088	.226	.079	.145
Easy to learn	.435	.280	.370	.119	.524	.090	-.070
Easy to understand	.347	.399	.350	.141	.501	-.032	-.169
Practical	.182	.019	.273	.333	.343	.289	.042
Cuts bureaucracy	.183	.199	.748	.287	.121	-.057	.026
Used anywhere	.182	.015	.060	.657	.323	-.022	.117
Used anytime	.245	.050	.061	.794	.063	.101	.039
Saving safety	.803	-.050	.046	.264	.013	.134	.086
Ease of use	.656	.309	.141	.163	.127	.083	.173
Convenience of use	.473	.208	.246	.139	.433	.130	.122
Convenience of saving	.593	.125	.260	.372	.206	.074	.066

It's known that the colored loading factor values are indicators included in each component in the following table:

Table 5. New Factors Formed

Factor	Indicator	Loading Factor
Factor 1	Saving safety	0.803
	Ease of use	0.656
	Convenience of saving	0.593
Factor 2	Faith in overcoming difficulties	0.798
	Valuation of self-skills	0.719
	Variations in valuation	0.694
Factor 3	Offline shopping	0.778
	More proper payments	0.547
	Cuts bureaucracy	0.748
Factor 4	Faster payments	0.524
	Used anywhere	0.657
	Used anytime	0.794
Factor 5	Understanding and recognizing behavior	0.591
	Individual ability standards	0.666
	Ability to maintain behavior	0.506
	Easy to learn	0.524
	Easy to understand	0.501
Factor 6	Online shopping	0.747
	Consistent with values and beliefs	0.650
Factor 7	P Balance storage	0.790
	Problem-solving ability	0.577
	Difficulty level	0.528

In Table 5, each factor has an indicator that is ordered based on the value of the loading factor calculated from the rotated component matrix, which explains the clear and fact distribution of indicator's for each component.

*d. Component Transformation Matrix*

The Component Transformation Matrix aims to know the dominant factors influencing consumer perceptions to use e-payment based on the eigenvalue > 0.5(Ghozali, 2019). The calculation results are as follows:

Table 6. Component Transformation Matrix

Component	1	2	3	4	5	6	7
1	.463	.406	.424	.340	.419	.304	.242
2	.135	.572	-.223	-.759	.042	.002	.164
3	.376	-.481	-.006	-.199	-.380	.403	.529
4	-.695	-.023	.452	-.242	.120	.477	.109
5	-.343	.212	-.629	.396	.074	.176	.498
6	.161	-.155	-.406	-.069	.301	.626	-.546
7	.005	-.455	-.074	-.220	.754	-.309	.275

From Table 6, it's known that the components with a correlation value > 0.5 are the dominant components, namely component 2 of 0.572 and component 6 of 0.626. It proves that two of the seven factors which formed with a high correlation are the most dominant factors.

## V. DISCUSSION

Based on the results of data testing using factor analysis, it's known that the factors affect consumer perceptions using e-payment by two dominant factors, namely self-efficacy factors and benefit factors.

The self-efficacy factor consists of indicators of faith in overcoming difficulties, valuation of self-skills, and variations in valuation. Based on information obtained from one of the respondents, the reason for using e-payment is because it provides its own challenges and to keep up with technological developments that have developed in all sectors including financial services. In addition, because e-payment is relatively easy to use, it provides its own motivation to be used as a means of payment at certain times, even on every occasion.

According to Bandura (in Octavia and Hafizh, 2019), self-efficacy is an individual's belief about his ability to perform tasks or actions needed to achieve results. Meanwhile, according to Dory et al. (in Toeh et al., 2013), defining self-efficacy describes how a user understands and believes in his skills and abilities complete a task.

The benefit factor consists of online shopping and is consistent with values and beliefs indicators. Based on information from respondents, the reason for using e-payment is because of the many benefits they will receive, including the payment process can be done easier and practically, transaction payments do not need to use banking services or minimarket outlets, and are very useful for online buying and selling transactions.

In line with the opinion according to Chandon et al. (in Octavia and Hafizh, 2019), perceived benefits are beliefs about positive outcomes associated with behavioral responses to real or perceived threats. Meanwhile, according to Rogers (in Octavia and Hafizh, 2019). Perceived usefulness refers to the degree to which an innovation delivers more benefits than its predecessor.

## VI. CONCLUSION AND RECOMMENDATION

The research concludes that there are two dominant factors, namely the self-efficacy factor with indicators of faith in overcoming difficulties, valuation of self-skills, and variations in valuation, and the benefit factor with online shopping indicators and consistent with values and beliefs that affect consumer perceptions of using e-payment.

Recommendations from the research results are that consumers must pay attention to the type of e-payment that suits their needs and ease of use, and be careful in online transactions.

## ACKNOWLEDGEMENT

We thank the Dean of the Faculty of Economics, the University of Garut who facilitated the seminar and call paper at the 10th SCBTII in 2022, also the team of writers who have conducted research and compiled this paper.

### Abstract

*The academic performance is one of aspect which has remained the benchmark of the success in learning activities at the university. The indicator of academic performance in the university is the students able to complete their studies on time. Unfortunately, the problem regarding academic performance was associated with the completion time of student studies in Faculty of Economics, Garut University. In this research explore the model that able to classify the graduation of student through the data mining classification technique using Neural Network Algorithm. The classification conducted by evaluating the academic performance based on Semester Performance Index (IPS) during first years, Semester Credit Unit (SK S) at second years and use the demographics of students as attributes that will be used in the dataset. Based on the examinations that conducted by using k-fold cross validation, there are 12 attributes that influence the graduation of students. Moreover, based on the evaluation of accuracy and recall score, with some modified number of hidden layers, and number of hidden nodes and removing some features will indicated the high value. The model that represented able to applied for classify the active students from 2012 to 2017 that indicate accuracy value of 82.96% and recall value was 66.54%.*

*Keywords— Data Mining; Student Graduation; Classifications; Neural Network; K-Fold Cross Validation; Confusion Matrix.*

### I. INTRODUCTION

Academic performance is an aspect to measure the success of universities in carrying out learning activities. A good indicator of academic performance for tertiary institutions is that students can complete the study period with a predetermined minimum time limit. Problems regarding student academic performance in terms of accomplishing the study period on time occur in the Faculty of Economics, University of Garut. Table 1 shows the percentage of graduate students from the economics faculty who accomplish their study period on time from the 2012 – 2017 class. This case makes the ratio between lecturers and students not ideal. In other words, the value of accreditation of study programs regarding student affairs is not optimal, and too many active students lead teaching and learning activities to be less conducive. The obstacles occur in determining the indicated students will not graduate on time because each lecturer guides too many students, and the number of human resources in the study program does not match the number of students.

Table 1. Percentage of Graduates of the Faculty of Economics on time in 2015-2021

Period	Accounting Department	Management Department
2012	5,7%	6,2%
2013	14,5%	7,7%
2014	13,5%	4%
2015	26,9%	27,7%
2016	8%	5,7%
2017	10,3%	23,9%

The rapid growth of information technology creates the accumulation of data but lacks information. In the process of browsing for that information, the term Data Mining appears. Data mining is regarded as the process of finding interesting patterns and knowledge from data collections of databases, data warehouses, data marts, and repositories (Han et al., 2012) that focus on extracting hidden knowledge (Hussain et al., 2018). Educational Data Mining (EDM) is widely used in education to explore and analyze student academic performance, predict dropouts, feedback analysis, data visualization, and assessment in the learning process. The classification method is the method in Data Mining that is often operated in EDM to predict student performance (Shahiri et al., 2015).

This study aims to find a model for classifying student graduation patterns using the Data Mining classification technique by the Neural Network algorithm. Classification is used by evaluating the output of student academic performance in the form of social studies in the first year and the number of credits in the second year and using student demographics as a feature to be used in the dataset. The methodology for designing Data Mining uses the CRISP-DM with the model performance test method through Cross Validation. The model from the classification implemented on a graph and a list of students classified by graduation time is a data visualization. The classifications of student graduation support decision-makers in taking the necessary actions if the student's study period can be known earlier.

## II. LITERATURE REVIEW

Educational Data Mining (EDM) is an emerging discipline with a series of computational and psychological methods as well as a research approach to understanding how students learn (Baker, 2010). EDM is a Data Mining concept that is used to explore educational data, identify patterns and predict descriptively what characterizes student behavior and achievement, domain content knowledge, assessment, educational functions, and educational applications (Peña-Ayala, 2014). EDM analyzes data generated by various types of information systems that support learning or education. Data in education have distinctive characteristics such as multiple hierarchical levels (subjects, assignments, question levels), context (certain students in a particular class encountering certain questions at specific times and on specific dates), and longitudinal (lots of data recorded over many sessions in a while) (Romero & Ventura, 2013).

(Shahiri et al., 2015) conducted a review of studies related to the implementation of Data Mining to predict the study period and produced a review of the attributes in the dataset used in predicting graduation using Data Mining and the algorithm used. The results of this study suggest that the Neural Network algorithm is the most popular and has a good level of accuracy for predicting student graduation. In addition, the Neural Network algorithm is a suitable algorithm for classifying student graduation after a comparison experiment has been carried out between Neural Network, Support Vector Regression, and Linear Regression (Obsie & Adem, 2018)

This study uses the CRISP-DM methodology, referring to (Shafique & Qaiser, 2014) who compared several methodologies in the development of Data Mining and concluded that the Data Mining project mostly uses CRISP-DM and is considered quite complete. Classification of data that has accuracy or similarity to measurement data with actual numbers or data, testing is carried out based on accuracy with test data parameters and training data determined by Cross-Validation. Therefore, data accuracy affects the final results of data classification because when data accuracy is not accurate it will affect the percentage of grouping test data and training data (Hulu et al., 2020) Cross validation is a standard procedure for evaluating performance classification algorithms (Cao et al., 2007) and has been extensively used in data mining for the sake of model selection or modeling procedure selection (Hastie et al., 2009) given a priori or developed by modeling procedures. Based on data splitting, part of the data is used to fit each competing model and the rest is used to measure the predictive performance of the model with validation errors, and the model with the best overall performance is selected (Zhang & Yang, 2015).

## III. RESEARCH METHODOLOGY

The methodology used in this study adopted the Cross-Industry Standard Process for Data Mining (CRISP-DM) method. As depicted in Fig.1 CRISP-DM consists of six phases, namely (Chapman et al., 2000): Business Understanding; Data Understanding; Data Preparation; Modeling; Evaluation and Deployment.

Fig. 1. Methodology Process

### A. Business Understanding

The purpose of implementing this data mining is to classify students who graduate on time and graduate not on time. This information is used by guardian lecturers (mentors) and study programs to understand the characteristics and provide special treatment to their students such as suggesting taking a short semester and

several other treatments based on the policy of the study program. Institutions expect graduation classification data to increase the number of students who complete their studies on time.

### B. Data Understanding and Preparation

This study uses data from graduates from an academic information system that runs within the economics faculty from the class of 2012 to 2017. The data taken is in the form of a worksheet file with 20 features for 2022 data. The data is raw data with data conditions that do not meet the standards to enter the mining process. In the next stage, the researcher selects features by deleting several features that do not influence the Data Mining process. Many factors influence the data mining process, namely accuracy, completeness, consistency, timeliness, trustworthiness, and interpretability (Han et al., 2012). Next, check the data to see the mistakes, inconsistencies, and noise that affect the modeling results. In addition, cleaning data by handling missing values in the dataset, then assigning a constant value, middle value, or average of the feature or giving a lot of values for the feature (Han et al., 2012). Next, look for the information gain value for each feature in the dataset. Researchers use information gained as a reference for modeling scenarios. Table 2 describes the features that will be used after going through the data preparation stage.

Table 2. Description of the features of the data used

Attribute	Description	Values	Information Gain
PROG	Program reg	Reg, Non Reg	0.004
GND	Gender	Male, Female	0.011
AGE	Age when	16 - 38	0.002
MRG	Marriage status	Marriage, Not Marriage	0.002
LOC	Local city	Local, Out Of Town	0.023
FTSCH	Father last school	SD, SMP, SMA, S1, S2, S3	0.042
MTSCH	Mother last school	SD, SMP, SMA, S1, S2, S3	0.049
FTJOB	Father job	gov emp, soldier, priv emp, entpr, laborer, not, etc	0.048
MTJOB	Mother job	gov emp, soldier, priv emp, entpr, laborer, not, etc	0.001
IP1	Semester 1 Performance Index	0,0 – 4,0	0.098
IP2	Semester 2 Performance Index	0,0 – 4,0	0.112
IP3	Semester 3 Performance Index	0,0 – 4,0	0.118
IP4	Semester 4 Performance Index	0,0 – 4,0	0.083
SKS3	Semester 3 Credit Unit	0 – 24	0.159
SKS4	Semester 4 Credit Unit	0 – 24	0.095
LULUS		On time / Not on time	-

### C. Modeling

The modeling in this research is using Neural Network. Determination of train data and testing data in this modeling process uses the Cross Validation method. The dataset has a total of 1304 records. In finding the comparison value, the researcher look for the resulting accuracy and recall values. Features are sorted by information gained. The test scenario of this model uses all the features in the first scenario with a different number of hidden layers and hidden nodes, then deletes the feature with the lowest information gain value in the next experiment. In doing the modeling, this research was assisted by using Rapidminer software.

## IV. RESULT/FINDING

### A. Evaluation

Evaluation of models at the modelling stage to find out which model is the best in classifying student graduation. The comparison appears in the number of hidden layers, the size of each hidden layer, and features. The way to evaluate the model is to analyse the accuracy and recall values generated by each model. Table 3-6 is a recapitulation of the performance of all models.

Table 3. Classification results using all attributes	Table 4. Classification results by removing 1 attribute with the lowest information gain value	Table 5. Classification results by removing 2 attributes with the lowest information gain value	Table 6. Classification results by removing 3 attributes with the lowest information gain value

<b>M30</b>	81,93	57,99	<b>M60</b>	80,79	61,15	<b>M90</b>	80,85	61,34	<b>M120</b>	82,24	58,74

Accuracy shows the ratio of True positives (true positives and true negatives) of the overall data. Accuracy answers the question about the percentage of students who are predicted to pass on time and graduate on time from all students. Recall indicates the ratio of true positive predictions compared to all data that is true. Recall answers the question about the percentage of students is predicted to graduate on time compared to the total number of students who graduate on time.

In classifying students, it is highly expected that the resulting value will have a False Positive value or pass on time. The results of the classification are used as a warning to the guardian lecturer or the head of the Study Program to take action against students classified as graduating on time. Therefore, it can be concluded that the recommended model is the model with the best recall value as the model that chooses False Positive is better than False Negative. Based on the test results, the highest recall value is in the M95 model, where the model has 12 features (PROG, GND, LOC, FTSCHE, MTSCH, FTJOB, IP1, IP2, IP3, IP4, SKS3, SKS4) with a recall value of 66.54 %, besides that the M95 model has a fairly high accuracy value, which is 82.96%.

### B. Deployment

Data collection for students of 2019-2020 who have not passed and meet the feature criteria used in the recommendation model. The number of data is 999, consisting of 423 2019 students and 576 students from the 2020 batch. Furthermore, the data preprocessing process is carried out and leaves as many as 809 data (436 data from the 2019 batch and 373 from the 2020 batch). Table 7 is a recapitulation of the graduation classification of 2019 and 2020 students of the Faculty of Economics. Fig 2 shows the distribution of graduation classification data by batch.

Table 7. Recapitulation of the graduation classification of 2019 and 2020

Graduation Prediction	Amount	Fraction	Percentage
On Time	205	0,756	24%
Not On Time	636	0,244	76%

Fig 2. Distribution of graduation classification data by batch

## V. DISCUSSION

From the results of research conducted at the Faculty of Economic Garut University, it can be concluded that:

- The predicted results show results that illustrate that student graduation tends to be late because the dominant training data used has a late trend
- The number of hidden layers and the number of hidden nodes greatly affect the accuracy and recall of the neural network algorithm.
- From the results of the research conducted and the results of the application of the neural network algorithm, the most influential parameter is the student's SKS3 (Third Semester Credit Unit).
- The results of the prediction of the application of the neural network algorithm to the prediction of graduation of management students at the Faculty of Economic University of Garut with a sample from 2012 to 2017 batches were 82.96% for accuracy and 66.54% for recall.

With the results obtained from this study, the accuracy can be improved by reducing the number of parameters and increasing the number of input nodes and layers in the next study. The discussion and application of a comprehensive feature model are expected to increase the accuracy value which is getting closer to 100% in subsequent studies.

## VI. CONCLUSION AND RECOMMENDATION

The finding concluded that student graduation tends to be late because the dominant training data used has a late trend. In addition, the number of inputs such as input nodes, hidden layers, and hidden nodes greatly affect the accuracy of neural network algorithms. The results of the neural network algorithms illustrated the most influential parameter is the SKS3 (Third Semester Credit Unit) of students. The calculation of predictions of the accuracy of the application of neural network algorithms to the graduation predictions of the Faculty of Economic University of Garut with batch samples from 2011 to 2017 was 98.27%. The students who are predicted to not graduate on time, FEKON UNIGA, in this case, the study program and the student guardian lecturer, perform several treatments such as suggesting taking a short semester, more routine counseling, and other treatments based on the policy of the study program.

Furthermore, the accuracy and recall improve by reducing the number of features and increasing the number of hidden layer layers and nodes in subsequent studies. Discussion and implementation of comprehensive feature models are expected to increase the accuracy value closer to 100% in future studies.

## Analysis of Financial Literacy Factors for SMEs

Eti Kusmiati<sup>1</sup>, Virly Cahyani<sup>2</sup>

<sup>1,2</sup> Department of Digital Business, Faculty of Economics, Universitas Garut, Garut, Indonesia

### Abstract

*Financial governance is a major issue in the operations of small and medium enterprises (SMEs). Financial literacy and financial management are intertwined. Increasing financial literacy in SMEs will help them to function more efficiently, prepare for their financial future, and increase economies of scale. This study aims to analyze the determinants that shape financial literacy in SMEs in Garut Regency. The research participants represent the state of the art in this study. SMEs in the food industry, which sell utilizing wheels (street food), make up the research participants. Exploratory Factor Analysis (EFA) is used in this study to analyze the elements that contribute to financial literacy. Five SME actors were interviewed to discover the elements that contribute to financial literacy, and a questionnaire was then provided to 70 SME actors as research samples. Financial behavior variables, financial planning elements, financial management factors, and financial control factors were discovered in the study's findings. These elements are thought to be capable of representing the financial literacy variable, in which SME actors' comprehension of these aspects influences effective decision-making about the use and management of financial resources, allowing SMEs to expand their business size in the long run.*

*Keywords— Exploratory Factor Analysis; Financial Literacy; Small and Medium Enterprises.*

---

## I. INTRODUCTION

SMEs have demonstrated their ability to survive and compete amid economic downturns as one of the pillars that can support the nation's economy (Mutamimah, Tholib and Robiyanto, 2021; Damayanti *et al.*, 2018). SMEs encounter a number of challenges that contribute to their high economic contribution, including limited working capital, human resources, product and technology innovation, and marketing (Junoha, bin Hidthiir and Basheer, 2019). Small businesses frequently complain about capital shortages, but this is a tired excuse for why they aren't growing because the true issue is financial management (Hossain, Ibrahim and Uddin, 2020). One of the most serious issues in SME firm governance is financial management. (Agyapong and Attram, 2019).

Financial literacy and financial management are inextricably linked. Financial literacy is defined as knowledge, skills, and beliefs that impact attitudes and behavior to improve the quality of decision-making and financial management in order to achieve prosperity, according to Financial Services Authority Regulation (POJK) Number: 76/POJK/07/2016. Growing financial literacy in SMEs will help them to run their businesses more efficiently, plan for their financial future, and have an impact on increasing economies of scale (Golubić and Huertas, 2021).

Several studies on financial literacy include examining: the determinants of financial literacy (Anshika, Singla and Mallik, 2021); the influence of financial literacy on the financial performance of SMEs (Omiunu, 2019; Kulathunga *et al.*, 2020; Ali and Li, 2021); the influence of SME demographic factors that contribute to financial literacy (Hakim, Oktavianti and Gunarta, 2018); the influence of literacy finance on entrepreneurial activities (Li and Qian, 2020); the impact of financial literacy on SME innovation (Liu *et al.*, 2021); the role of culture in financial literacy between women and men (Rink, Walle and Klasen, 2021), and others.

This study aims to analyze the determinants that shape financial literacy in SMEs in Garut Regency. The research participants represent the state of the art in this study. SMEs in the food industry, which sells utilizing wheels (street food), make up the research participants.

## II. LITERATURE REVIEW

### A. Financial Literacy

Financial literacy is defined as the ability to identify and comprehend financial risks in order to make sound financial decisions, as well as the ability to understand financial products and concepts with the help of information and advice (Fatoki, 2014; Susan, 2020). The ability to make informed judgements and make effective decisions about the use and management of financial resources is characterized as financial literacy (Tuffour, Amoako and Amartey, 2020; Lyons and Kass-Hanna, 2021). Given its major impact on the stability and viability of their particular enterprises, financial literacy has become a key skill for SME owners (García-Pérez-de-Lema, Ruiz-Palomo and Diéguez-Soto, 2021). SMEs will be better able to organize their firm finances in the long run if they

have a better understanding of finance (Baporikar and Akino, 2020; Rahim and Balan, 2020). Low financial literacy encourages people to make poor decisions and has a negative impact on their engagement in formal financial institutions (Mabula and Ping, 2018; Eniola and Entebang, 2017; Munyuki and Jonah, 2022).

### *B. Small and Medium Enterprises in Indonesia*

According to the Indonesian Central Statistics Agency (BPS), Indonesia's jobless rate grew to 6.88 million persons in February 2020, up 60 thousand individuals over the previous year. This high number has a negative impact on community welfare; restricted work options have increased the number of unemployed, and Indonesia's economic situation is deteriorating. When the Indonesian economy is in a state of flux. The Small and Medium Enterprises (SME) sector is one that continues to operate well.

Because SMEs account for 99.9% of all company units in Indonesia, while only 0.1% of all business units are large, SMEs play a critical role in employment and economic growth. According to the Central Statistics Agency, the number of SMEs in Indonesia in 2018 was 64,199,606 units, up 2.02% from the previous year, with a total workforce of 116,978,631 persons who contributed to the country's Gross Domestic Product (GDP). By 61.07 percent, or 8,573,895.3 billion rupiah, Indonesia has gained. SMEs in Indonesia have various features, including being a family firm, having one person in charge of management, not going public on the stock exchange, having restricted financial access, and non-SMEs having lower credit risk than SMEs (Mutamimah, Tholib and Robiyanto, 2021).

## III. RESEARCH METHODOLOGY

### *A. Research Characteristics and Stages*

Exploratory Factor Analysis (EFA) is used in this study to analyze the elements that contribute to financial literacy. Interviewing SMEs is the first step. Interviews with open-ended questions about the factors of financial literacy achievement in SMEs were performed, followed by data tabulation and categorization. Interviews were done with five SMEs in Garut Regency, two of which were female and three of which were male, with a business age range of 5-20 years and a culinary business. The informants are vendors of street food who operate carts that roam or occupy certain locations.

The EFA's second stage involves distributing questionnaires to 70 SMEs in Garut Regency who were chosen at random as study subjects. The questionnaire uses a Likert scale with a choice category range of 1 to 5 to ask closed questions regarding the determinants of financial literacy in SMEs. The terms "very not considered" and "highly regarded" are used to describe categories 1 and 5. The data that has been collected is analyzed as the final stage in the EFA.

### *B. Conceptual Framework*

The EFA consists of four steps: 1) testing the feasibility of the data by looking at the correlation matrix, Measure of Sampling Adequacy (MSA), and Keisher-Meyers-Oklin (KMO) values; 2) factor extraction by looking at the eigenvalue criteria; 3) rotating factors with the varimax technique; and 4) interpreting the formed factors by looking at the loading factor and communality value.

The research was carried out in Garut Regency, which contains a diverse range of SMEs in the culinary sphere, including street food, cafés and restaurants, and others. The participants in this study were all SMEs in Garut Regency, both registered and unregistered with government institutions. Because the number of firms could not be determined, the Lemeshow method was utilized to calculate the number of samples in this study. A total of 70 small business owners in the culinary industry responded to the survey.

## IV. RESULT / FINDING

### *A. Profile of Respondent*

According to age, gender, education level, business longevity, business ownership status, and business debt ownership status, Table 1 below summarizes the profile of the research respondents.

Table 1. Profile of Research Respondents

Criteria	Sub Criteria	Amount
Age	12 – 25 years	14

	26 – 55 years	35
	> 56 years	21
Gender	Male	43
	Female	27
Education Level	Junior High School	21
	Senior High School	46
	Diploma/Bachelor Degree	3
Business Longevity	< 5 years	12
	5 – 10 years	22
	> 10 years	36
Business Ownership Status	A person's own	56
	Managing another person's company	14
Business Debt Ownership Status	Free of debt	2
	Have a bank debt	7
	Have a debt to another institution or party	61

Source: Data processed

According to the Ministry of Health of the Republic of Indonesia, the majority of respondents in the age group are between the ages of 26 and 55, which falls between early adulthood and early old age. This is demonstrated by the distribution of respondent data above. This age range is also seen as a productive age, which denotes that a person is still thought to be capable of working and producing anything at that time. The majority of SMEs fall under the male gender category. This occurs as a result of the cultural norm that males are the bread-winners of the family and are in charge of providing for them. Most of the responders in the education category hold a high school diploma. This denotes a change in the workforce. High school graduates used to be able to enter the workforce with ease; currently, the trend is toward SME players. This can be a result of the current work market being more competitive.

Most of the respondents have owned their company for more than 10 years, which is the most common business status. These circumstances suggest that the responder has a clear understanding of his business environment and is capable of organizing and managing his operations, including his recording company. Most respondents in the company debt ownership category had debts owed to entities other than banks, such as cooperatives, internet lenders, or loans from family members. This indicates that SMEs are still not deemed to have access to credit from financial institutions since they are restricted by a number of laws, including ownership of permits, guarantees, and other items.

### B. Tabulation of Interview Results

The tabulation of the results of interviews that have been conducted with selected informants shows that the factors that encourage the improvement of financial literacy in SMEs are as follows:

Table 2. Tabulation and Categorization of Interview Results

Number	Determinants of Financial Literacy	Code
1.	Recording of financial transactions	P1
2.	Financial segregation for the company's personal interest	P2
3.	Have a goal in financial management	P3
4.	Have savings to achieve financial goals	P4
5.	Make a financial budget	P5
6.	Buy something according to need	P6
7.	Understand the comparison of cash inflows and cash outflows	P7
8.	Have an understanding that business volume is related to cash flow	P8
9.	Paying off debts to more than one person/institution	P9
10.	More than one source of income	P10

11.	Recording accounts payable and accounts receivable	P11
12.	Keeping inventory records	P12
13.	Have a reserve fund for urgent personal needs	P13
14.	Have reserve funds for business needs and business risks	P14

Source: Data processed

### C. Kaiser-Meyer-Olkin Measure of Sampling Adequacy

Data processing was carried out several times, by removing factors that had an Anti-Image Correlation value  $< 0.500$ , namely P12 and P13 factors. The results of data processing by excluding P12 and P13 factors are shown in Table 3 as follows:

Table 3. KMO and Bartlett's Test

Kaiser-Meyer-Olkin Measure of Sampling Adequacy.		,638
	Approx. Chi-Square	172,581
Bartlett's Test of Sphericity	df	66
	Sig.	,000

Source: Data Processing Output using IBM SPSS 23

The test results in table 3 show the value of Kaiser Meyer Olkin and Bartlett's Test, it can be seen that the KMO Measure of Sampling number is 0.638. Because the KMO Measure of Sampling number is above 0.5, the attribute set can be processed further. The Bartlett's Test number expressed in Chi-Square numbers also shows a very real significance number (0.000). Value of Sig. on Bartlett's Test of 0.000 which is  $< 0.05$ , which means the sample is adequate for further analysis.

### D. Factoring

The extraction (factoring) of a collection of variables results in the formation of one or more new factors. The eigenvalue of the newly generated factor must be 1. The eigenvalues are always arranged in ascending order from greatest to lowest, with the criterion that eigenvalues less than 1 are not considered in determining the number of components generated. After the factoring procedure, four additional factors are generated from the original 12 variables, namely components 1 through 4. This demonstrates that the similarity of features of specific variables causes the grouping of multiple variables into particular factor analyses.

Table 4. Total Variance Explained

Component	Initial Eigenvalues			Rotation Sums of Squared Loadings		
	Total	% of Variance	Cumulative %	Total	% of Variance	Cumulative %
1	2,432	20,266	20,266	2,282	19,013	19,013
2	2,020	16,836	37,102	2,018	16,814	35,827
3	1,893	15,777	52,878	1,942	16,183	52,010
4	1,136	9,465	62,343	1,240	10,333	62,343
...	...	...	...			
12	,316	2,637	100,000			

Extraction Method: Principal Component Analysis.

Source: Data Processing Output using IBM SPSS 23

The next stage is to identify the composition of the newly produced variable after knowing that the preceding variables are formed into four ideal components. As a consequence, the processing results are shown in Table 5 in the form of a component matrix table.

Table 5. Component Matrix

Original Factor	Communalities	Component				Name of the New Factor Formed
		1	2	3	4	
Financial records (P1)	,624	,709				Financial Behavior
Financial goals (P3)	,578	,662				
Separation of personal and company finances (P2)	,612	,643				

Business risk reserve (P14)	,532	,396	
Financial budget (P5)	,658	,727	
Cashflow comparison (P7)	,695	,722	
Cash flow is directly proportional to the volume of business (P8)	,668	,586	Financial planning
Accounts payable and accounts receivable recording (P11)	,642	,702	
Source of income (P10)	,717	,643	
Debt installment (P9)	,781	,549	Financial Management
Savings (P4)	,588	-,437	
Purchasing suitability with needs (P6)	,624	,698	Financial Control

Source: Processed Data

The component matrix table displays the distribution of the 12 variables among the four produced factors, with the loading factor value indicating the extent of the connection between a variable and its formation factor. The names of the factors should correspond to the properties of each component produced. Factor 1 in this study is FINANCIAL BEHAVIOR, which includes financial records, financial goals, the separation of personal and company funds, and business risk reserves. Factor 2 is FINANCIAL PLANNING, which includes a financial budget, a cash flow comparison (cash inflows and outflows), and cash flows that are directly proportionate to business volume. FINANCIAL MANAGEMENT is the third factor, and it entails keeping track of accounts payable and receivable, revenue sources, debt payments, and savings. FINANCIAL CONTROL is the fourth factor, and it is concerned with the appropriateness of purchases to needs.

## V. DISCUSSION

The results showed that the first factor (financial behavior) included financial records (0.709), financial goals (0.662), separation of personal and corporate finances (0.643), and business risk reserves (0.396). This shows that the factors that shape financial behavior can support the success of SMEs in their business operations. This means that if SMEs can carry out financial records with discipline and consistency, have financial goals in the future, separate the use of personal finance and for business purposes, and have reserve funds for business risks, SMEs will be able to easily make the right financial decisions. This financial behavior factor is in line with research conducted by Rahim and Balan (2020); Mabula and Ping, (2018b); Ye and Kulathunga (2019).

The second factor (financial planning) includes financial budget (0.727), cash flow comparison (0.722), and cash flow is directly proportional to business volume (0.586). This shows that the factors that shape financial planning can support the success of SMEs in their business operations. That is, if SMEs can carry out financial planning properly, they are expected to be able to anticipate problems that arise so that in the end they can help SMEs in making appropriate financial decisions. This financial planning factor is in line with research conducted by Fatoki (2014); Anshika, Singla and Mallik (2021) and Baporikar and Akino (2020).

The third factor (financial management) includes the recording of accounts payable and accounts receivable (0.702), sources of income (0.643), debt installments (0.549), and savings (0.437). This shows that the factors that shape financial management can support the success of SMEs in their business operations. This means that if SMEs can manage their finances well, such as by calculating the debt-to-equity ratio and having savings as reserves for business expansion, in the end, they will be able to help SMEs in making appropriate financial decisions. This financial management factor is in line with research conducted by Jappelli and Padula (2013); Lyons and Kass-Hanna (2021); and Mutamimah, Tholib and Robiyanto (2021).

The fourth factor (financial control) includes the suitability of purchases with needs (0.698). It is very important for SMEs in controlling their finances. Control can be done by controlling the suitability between planning and implementation in corporate financial governance. By exercising proper control, SMEs are expected to be able to make appropriate financial decisions. This financial control factor is in line with research conducted by (Fatoki, 2014).

## VI. CONCLUSION AND RECOMMENDATION

The goal of this research is to discover the factors that influence financial literacy in small businesses. The first stage was to conduct an open-ended interview with five SMEs to learn more about the factors that influence financial literacy achievement. The second phase is to deliver questionnaires to 70 SMEs, each with closed questions on the determinants of financial literacy in SMEs on a Likert scale.

The findings show that four factors shape financial literacy in SMEs: financial behavior, which includes financial recording activities, financial goals, separation of personal and company finances, and business risk reserves; financial planning, which includes budgeting activities, cash flow planning, and cash flow planning with business volume; and financial management, which includes activities such as recording accounts payable and accounts receivable, recording of source documents, and financial management with business volume. Further study shows that applying financial literacy to SMEs improves the accuracy of their financial decision-making and, in the long run, can help them grow their firm.

## Public Sentiment Analysis of The National Movement Bangsa Buatan Indonesia on Twitter Social Media Using Big Data Analytics

Ilham Pandika Haris Chandra<sup>1</sup> and Arga Hananto<sup>2</sup>

<sup>1,2</sup>Faculty of Economic and Business, University of Indonesia, Jakarta, Indonesia

### Abstract

*Twitter is one of the social media used by an organization and/or individual to actively promote their agenda and mobilize social action and campaigns. This study aims to identify sentiment analysis on Twitter related to the Bangsa Buatan Indonesia campaign held by the Indonesian government. Given the importance of the role of MSMEs in the Indonesian economy, the Indonesian government established the Bangsa Buatan Indonesia campaign. This campaign aims to encourage the Indonesian people to support and use domestically made products. Based on the recent study, this research applied topic modeling and sentiment analysis of various topics from the Bangsa Buatan Indonesia campaign on Twitter. The data were taken from Twitter API between May 2020 and December 2021 using the Twitter API and analyzed using R version 4.1.2 with the Naïve Bayes algorithm. Based on the results of tweet sentiment analysis, positive sentiment dominates, followed by neutral sentiment and negative sentiment from a total of 49,833 tweets with topics modeling including Nationalism, MSMEs, and Politics & Economics. The accuracy of the model shows a value of up to 82%. The results of this study will be useful for several parties, especially the Government of Indonesia, to better understand public sentiment towards the campaign program carried out to encourage ethnocentrism of the Indonesian people towards domestically made products.*

*Keywords— Sentiment Analysis; Bangsa Buatan Indonesia; Text Mining; Twitter*

---

### I. INTRODUCTION

MSMEs are the pillars of the Indonesian economy. Based on BPS data in 2018 shows 64 million MSMEs in Indonesia, of which 61.1 percent of their role contributes a large number to GDP, the remaining 38.9 percent are contributed by large business actors whose number is only 5,500. Not only that, but MSMEs also open up 98 percent of employment opportunities. During the Covid-19 pandemic, MSMEs were the most affected sector (Tayyiba, et al., 2021). Given the importance of the role of MSMEs in the Indonesian economy, the Indonesian government through the Communications and Informatics Ministry established the National Movement for Bangsa Buatan Indonesia campaign. This campaign aims to encourage the Indonesian people to support and use domestically made products. In 2020, the Proudly Made in Indonesia National Movement succeeded in inviting more than 3.8 million creative players and MSMEs to enter the e-Commerce platform to be able to expand market potential nationally and even internationally. Until now, there have been 11.8 million MSME units that have gone Digital.

The Communications and Informatics Ministry is actively promoting this National Movement through social media and news portals with the hashtag #BanggaBuatanIndonesia (Tayyiba, et al., 2021). Campaigns on social media networks create prerequisites for organizations to not only inform users more effectively, understand changing information needs, receive feedback, observe user interest and engagement in the activities carried out by the organization and the products (services) it provides, but also bring a particular challenge is how to evaluate the effectiveness of advertising campaigns on social media networks and how to improve these campaigns in an ever-dynamic environment.

The data generated on social media is very large and varied which includes structured and unstructured data. Seeing the potential of social media data in evidence-based decision-making processes, organizations need an efficient process to transform high-volume, fast, and diverse data into meaningful insights. Text analysis (text mining) is a technique commonly used to obtain information from textual data. Examples of textual data are feedback on social media, e-mail, blogs, surveys, company documents, news, and telephone log data. The textual analysis involves statistical analysis, programming languages, and machine learning. The textual analysis enables an organization to turn large volumes of text into summaries that support evidence-based decision making (Chung, 2014).

One of the most widely used text classification methods is sentiment analysis. Sentiment Analysis is a term that covers many scopes of work such as sentiment extraction, sentiment classification, subjectivity classification, opinion summary or opinion spam detection and more. Marketers and companies use this analytical data to understand their products or services in such a way that they can be offered according to user needs. There are several methods for conducting sentiment analysis, including the machine learning approach and the lexicon-based approach. The machine learning-based approach uses classification techniques to classify text, while the lexicon-based approach uses a sentiment dictionary with opinion words and matches them with data to determine polarity (Farhadloo & Rolland, 2016).

The Naïve Bayes algorithm is a supervised machine learning algorithm. Several studies have been conducted regarding the analysis of public sentiment through the Twitter platform using the Naïve Bayes algorithm by Vasudha et al. (2016) related to sentiment analysis of Made-In-India products. The results showed positive, negative, and neutral sentiments towards Made-In-India products. Data shows that positive sentiment has the largest sentiment score compared to negative and neutral sentiment. However, this study does not elaborate further on other exploratory data such as keywords that appear the most in Make-in-India products. Another study was also conducted by Harun et al. (2021) related to public sentiment on covid-19 vaccination in Indonesia through the Indonesian Ministry's Facebook page using the Naïve Bayes and Decision Tree methods. From the results of the study, the accuracy of the Naïve Bayes method for analyzing public sentiment reached 100% and the Decision Tree method was only 50.3%.

Based on the recent study, this research will analyze public sentiment on the topic of the National Movement *Bangga Buatan Indonesia* on the Twitter platform with the Naive Bayes Classifier method to measure people's ethnocentrism towards Indonesian-made products.

## II. LITERATURE REVIEW

### A. MSME

MSME stands for Micro, Small and Medium Enterprises. According to Law no. 20 of 2008, MSMEs are productive economic enterprises owned by individuals and/or business entities that have MSME criteria. based on net worth and earnings per year.

Table 1. An example of a table.

<b>Enterprise Scale</b>	<b>Total net worth</b>	<b>Earnings per year</b>
Mikro	≤ 50 million	≤ 300 million
Small	50 – 500 million	300 million – 2,5 billion
Middle	500 million – 10 billion	2,5 – 500 billion

### B. *Bangga Buatan Indonesia* Campaign

*Bangga Buatan Indonesia* is an Indonesia government program to support MSME. Indonesian President Joko Widodo launched the *Bangga Buatan Indonesia* program on May 14, 2020. This program aims to encourage Indonesian people to love and use products made by the nation's children, especially local MSME products. Local MSME actors have been affected by the crisis of the Covid-19 pandemic.

Fig. 1. *Bangga Buatan Indonesia* Logo

To get through this difficult period of the Covid-19 pandemic, the government through the National Movement *Bangga Buatan Indonesia* invites the public to appreciate the products and services of MSME business actors. Moreover, MSMEs are the backbone of the nation's economy.

### *C. Consumer Ethnocentrism*

Consumer ethnocentrism comes from a more general concept, namely ethnocentrism. Ethnocentrism was originally proposed more than a century ago by William Graham Sumner in 1906. In general, the concept of ethnocentrism represents the general tendency for people to see their group as the center of the universe and view other social units from the perspective of their group.

Consumer Ethnocentrism is defined as the beliefs held by consumers about propriety, even morality, in buying foreign-made products. It is agreed that Consumer Ethnocentrism harms consumers' purchase intentions for foreign products. This implies that high ethnocentric tendencies lead to unfavorable attitudes towards purchasing imported products.

The National Movement of *Bangga Buatan Indonesia* is a campaign carried out by the government to encourage people to love and use domestically made products (Tayyiba, et al., 2021). Regarding the concept of consumer ethnocentrism, such a campaign was successfully used by Barack Obama at the beginning of his candidacy for President of the United States, the moment which coincided with the debut of the recession. The campaign was named "Buy American", and it sparked a real international hysteria.

### *D. Country of Origin*

The country associated with the product is considered to influence the consumer's quality assessment. The image of the manufacturing country has a great impact on the assessment of product quality. According to Wang & Chen (2004), the country of origin of a product often serves as a cue that motivates consumers' ethnocentric tendencies. However, sometimes it can also be a sign to demotivate consumers' ethnocentric tendencies as is the case in most developing and less developed countries. The influence of consumer ethnocentrism on purchase intention becomes more evident especially after consumers encounter products manufactured in less developed countries. This means that the country of origin has a strong influence even on the attitudes of highly ethnocentric consumers.

### *E. Twitter*

Twitter is a free microblogging service that allows users to post short text messages with a maximum of 140 characters. People who subscribe to individual Twitter feeds are called "followers". Users can follow anyone they like, unlike Facebook, where you have to be recognized and accepted as a "friend". Proving its popularity, Twitter now has 320 million registered users who "tweet" 500 million posts a day.

### *F. Big Data*

According to Gartner (2015), big data is a data unit that has 3V characters, namely volume, velocity, and variety that is processed to increase insight and as a basis for decision making. Data management is obtaining and storing data and preparing it for analysis with supporting processes and technologies. On the other hand, analysis refers to the techniques used to process and gain insight from big data. The following techniques represent a relevant subset of the tools available for big data analysis: text mining, audio analysis, video analysis, social media analysis, and predictive analysis.

### *G. Data labelling*

Data labeling, or data annotation, is part of the preprocessing stage when developing a machine learning (ML) model. This process requires identifying the raw data (i.e., images, text files, videos), and then adding one or more labels to that data to define its context for the model, enabling the machine learning model to make accurate predictions. Data labeling supports a variety of machine learning and deep learning use cases, including computer vision and Natural Language Processing (NLP).

### *H. Krippendorff's Alpha-Reliability*

Krippendorff alpha ( $\alpha$ ) is a reliability coefficient developed to measure agreement among observers, coders, judges, raters, or measuring instruments describing differences between normally unstructured phenomena or assigning quantifiable values to them.  $\alpha$  appears in content analysis but is widely applicable wherever two or more methods of generating data are applied to the same set of objects, units of analysis, or items and the question is how much of the data generated can be trusted to represent something real. The formula for  $\alpha$  is :

$$\alpha = 1 - \frac{D_o}{D_e}$$

### I. Sentiment Analysis

Sentiment Analysis is a term that covers many scopes of work such as sentiment extraction, sentiment classification, subjectivity classification, opinion summary or opinion spam detection, and others. This analysis aims to analyze people's attitudes, emotions and opinions towards elements such as products, individuals, topics, organizations, and services.

### J. Topic Modeling

Topic modeling is a class of generative models whose aim is to capture latent distributions that support a given observational data (eg distribution of words in a document set). In the context of natural language processing, topic modeling is particularly useful for discovering statistical regularities hidden in textual data in supervised/semi-supervised/unsupervised settings.

### K. Topic Modeling

Several studies have been conducted regarding the analysis of public sentiment through the Twitter platform using the Naïve Bayes algorithm by Vasudha et al. (2016) related to sentiment analysis of Made-In-India products. The results showed positive, negative, and neutral sentiments towards Made-In-India products. Data shows that positive sentiment has the largest sentiment score compared to negative and neutral sentiment. However, this study does not elaborate further on other exploratory data such as keywords that appear the most in Make-in-India products. Another study was also conducted by Harun et al. (2021) related to public sentiment on covid-19 vaccination in Indonesia through the Indonesian Ministry's Facebook page using the Naïve Bayes and Decision Tree methods. From the results of the study, the accuracy of the Naïve Bayes method for analyzing public sentiment reached 100% and the Decision Tree method was only 50.3%.

## III. RESEARCH METHODOLOGY

In this study, a cross-sectional descriptive research method was applied to see public sentiment towards the idea of the Bangga Buatan Indonesia campaign. The Bangga Buatan Indonesia campaign was launched on May 14, 2020, for this reason, samples of Twitter data will be taken in the period from May 2020 to December 2021. The Twitter data is obtained using the Twitter API and processed using big data analytics.

### A. Research Sample

The type of sample used in this study is non-probability sampling. Twitter data searches will only be carried out using the keyword #BanggaBuatanIndonesia.

### B. Stages of the Research Process

In this study, the authors used Twitter data. To be able to collect Twitter data, the author uses the Twitter API (Application Program Interface) provided by Twitter for developers. Broadly speaking, Twitter's data processing steps are described in the following diagram:

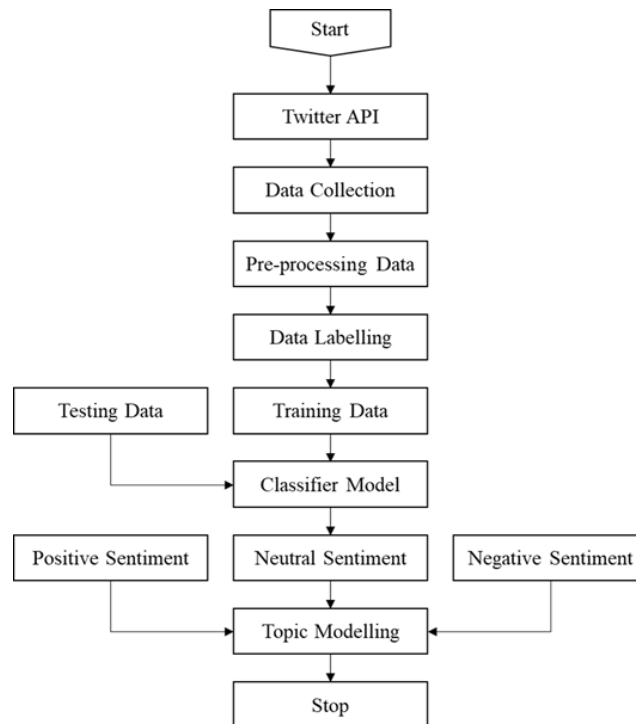

Fig. 2. Flow diagram of research stages

- **Data collection** stage begins with authenticating to be able to access the Twitter API. When the authentication is successful, the next process is to define several parameters that are used to filter Twitter data based on research needs. The search terms applied to filter Twitter data include the hashtag #BanggaBuatanIndonesia with the range of the date the tweet was published (start\_date and end date), as well as the use of language types without limiting the type of Twitter user itself. An example of a search term application is filtering Indonesian-language twitter using the hashtag #BanggaBuatanIndonesia in the period from May 14th, 2020 to October 31th, 2021. All of these filters become parameters to call the tweepy.Cursor() function whose results are extracted and stored in an output file in CSV (Comma-separated values) format.
- **The data pre-processing** stage is carried out with the Rstudio program. R is succinctly described as “a language and environment for statistical computing and graphs,” which makes it worth knowing if you are in data science/statistics arts and exploratory data analysis. R has a variety of packages that are useful in text analysis. This stage consist of filtering bot tweet, cleaning text, slangword and stopword removal, and stemming.
- **Descriptive analysis** is the process of using current and historical data to identify trends and relationships. Sometimes called the simplest form of data analysis because it describes trends and relationships but doesn't dig deep.
- **Data labelling** is carried out to see the opinion or tendency of opinion on a problem or object by someone, whether it tends to have a negative or positive opinion. In this study, sentiment labeling was carried out manually with the score label as positive (1), neutral (0), and negative (-1). Labeling is carried out by 2 observers, namely the researcher himself and an independent observer with a minimum education level requirement of a bachelor's. To assess the reliability between the 2 observers, Krippendorff's Alpha-Reliability is calculated where the expected value of is  $1 \geq \alpha \geq 0$ .
- **Classifier Model Evaluation** consist of 2 process. The first is learning (training phase), where a classification algorithm is created to analyze the training data and then it is represented in the form of classification rules. The second process in which test data is used to estimate the accuracy of the classification rules. Based on this, the data contained in the testing data should not be contained in the training data so that it can be seen that the classification model can classify properly and correctly. In the process of dividing the training data and testing data, it is not binding, but so that the variation in the model is not too large, it is recommended that the training data have a larger comparison than the testing

data. In general, 2/3 of the total data is used as training data while the rest is used as testing data. Research that results in the accuracy of the optimum classification model with a proportion of 80:20 for training data and testing data.

- **Topic model** will be made based on data that has been cleaned using the topicmodels package. The researcher uses the LDA() function from the topicmodels package, with the setting  $k = 20$ , to create a ten-topic LDA model with the most frequent 20-word terms. The slice\_max() function in the dplyr package can be used to find the 10 most common terms in each topic.

#### IV. RESULT AND DISCUSSION

##### A. Data Collection

In the process of scraping or retrieving data on Twitter, the keyword used is #BanggaBuatanIndonesia. The data collection period was from May 14, 2020, to October 30, 2021. The results of data scraping showed 49,833 tweets with 74 variables including string and integer data. To simplify data analysis, the 74 variables were simplified into 12 variables **as shown in table 2**.

Table 2. Twitter data variables.

Variables	Description
Time	The date and time when the tweet was posted on Twitter
Text	The text of the tweet uploaded by the user
Source	Twitter data source
Username	Twitter user account name
Location	Location when tweet was posted
Like Count	Number of likes on posted tweets
Retweet Count	Number of retweets on posted tweets
Quote Count	Number of tweets with quotes on twitter
Reply Count	Number of replies to uploaded tweets
Followers	The number of followers on the account
Following	Number of accounts followed by the account
Number Tweets	Number of tweets posted by the account

##### B. Preprocessing Data

To avoid bias in data analysis, Twitter Bot is filtered by filtering the same tweet content. According to Gadiraju (2012), tweet bot is a type of bot software that controls Twitter accounts through the Twitter API. Bot software can independently perform actions such as tweeting, retweeting, liking, following, unfollowing, or sending direct messages to other accounts. After filtering identical data using the distinct() function, the total number of data is 8,699 tweets. This data will be used for the cleaning process.

Table 3. Preprocessed tweet text

Before	After
--------	-------

festival diskon nasional pamit undur diri namun semangat bangga buatan indonesia ini akan terus bergelora melalui estafet berbagai kolaborasi yang akan datang	"festival" "diskon" "nasional" "pamit" "undur" "semangat" "bangga" "gelora" "estafet" "kolaborasi"
--	---

From the data that has been filtered to remove identical tweets, then preprocessing the data is carried out which includes cleaning, case folding, filtering, tokenizing to remove characters that are not needed in the study such as punctuation marks, emoticons, emoji, URLs, numbers, and non-ASCII characters.

### C. Descriptive Analytics

Descriptive statistics is a type of analysis used to see an overview of the data used and tested on all research variables, both dependent and independent variables. In this study, descriptive statistical analysis was conducted on Twitter data related to #BanggaBuatanIndonesia. Rstudio can analyze the extracted date and time with each tweet, so understanding the tweet frequency is easy to analyze. This analysis can provide an overall overview of each account's activity and can be a useful metric to analyze against the most tweets in a given period.

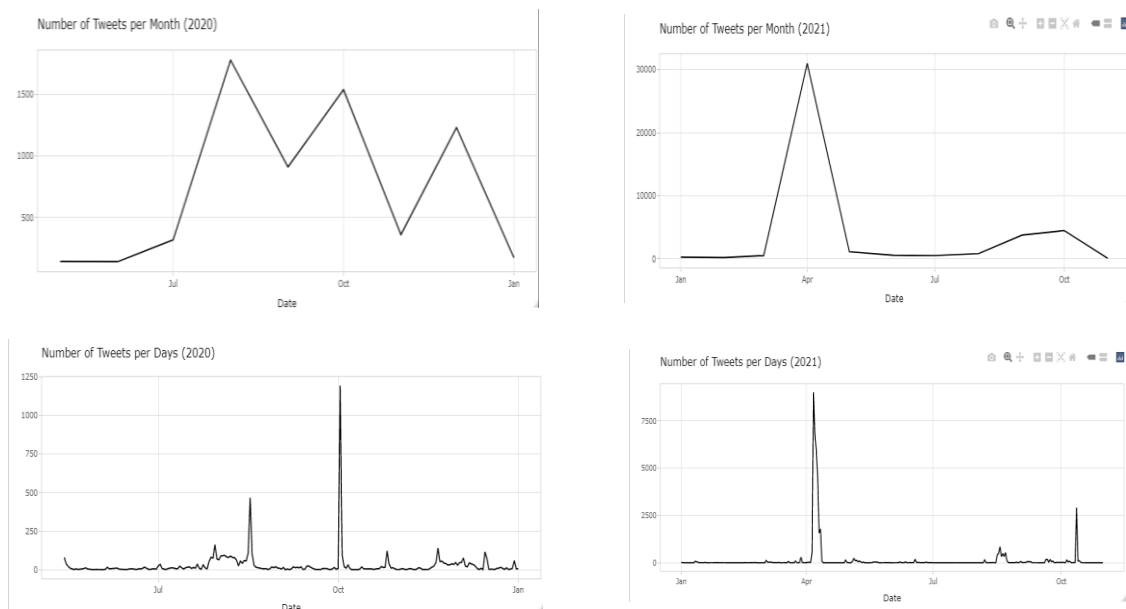

Fig. 3. Tweet upload trend of #BanggaBuatanIndonesia

Twitter engagement refers to the retweets, following, replies, favorites, and click-throughs that a tweet gets (including hashtags and links included in the tweet). Twitter engagement rate is equal to tweet engagement divided by the number of impressions made by that tweet. In the analysis of twitter data with the hashtag #BanggaBuatanIndonesia, data obtained from the top 10 tweets with the highest number of likes and retweets as described in the table 4.

Table 4. Top 3 tweets with the most likes and retweets

Accounts	Tweet	Retweet	Like
Mohmahfu- --	arloji anak bangsa merek pamor kayu ukir tradisional gelang kulit harmonis tahan air akurat pamer bangga diselenggarakan kemenperin borobudur	3203	371
Ronaviol---	lho piye nih luhut ketua tim gerak bangga produk ind wuling pasar mobil nya ind dorong esemka produksi mobil listrik	918	328

#### D. Statistical Term Frequency-Invers Document Frequency (TF-IDF)

The TF-IDF method is a method used to determine the relationship of words to the document by giving each word a weight. The TF-IDF value is strongly influenced by the occurrence of words in one document and the number of words or the frequency of words that appear as a whole. Based on the analysis, the words product, batik, gerak, nasional, and UMKM are the words that have the highest frequency of occurrence in tweets discussing the *Bangga Buatan Indonesia* Movement.

Fig. 4. Term frequencies of #BanggaBuatanIndonesia

#### E. Data Labelling

Sentiment analysis is carried out by scoring the Tweet text data with #BanggaBuatanIndonesia with three classifications, namely positive, negative and neutral sentiment. Labeling is done manually by researchers and independent observers. To assess the reliability of the scores of independent researchers and observers, the Krippendorff alpha ( $\alpha$ ) was calculated. The data that has been labeled and then calculated the value of Krippendorff Alpha ( $\alpha$ ). Calculation of Krippendorff Alpha ( $\alpha$ ) was carried out at Rstudio with the irr library. The results of the calculation of on 100 samples showed a value of 0.846. The value of indicates the reliability of the two coders is quite good because the value of is close to 1.

```
Krippendorff's alpha
Subjects = 5000
Raters = 2
alpha = 0.99
```

Fig. 5. Krippendorff Alpha ( $\alpha$ ) value

#### F. Classifier Model Evaluation

Sentiment classification is done with Naïve Bayes classifier. The Nave Bayes classifier requires training data and test data. Training data can affect the level of accuracy produced. Test data is data used to test the accuracy of the model that has been made by training data. Of the total 5000 data that have been manually labeled, 80% is used as training data and 20% is used for test data. By using the R Studio application, the Naïve Bayes classifier accuracy value is 0.82. With a fairly high accuracy value, it can be said that the classification is good. It is found that the predicted value and other values can be calculated manually as follows :

$$Recall = \frac{TP}{TP+FN} 100 = \frac{1185}{1185+260} = 0.8201 = 82 \% \quad (2)$$

#### G. Sentiment Analysis

Based on the prediction results, an analysis of the distribution of sentiment scores was carried out to see the overall score distribution of the three sentiments. The data shows that the distribution of scores on tweets with the hashtag #BanggaBuatanIndonesia tends to be neutral and positive with the most positive sentiment. The data

shows 6104 tweets (70%) labeled positive sentiment, 2184 tweets (25%) labeled neutral sentiment, and 411 tweets (4.7%) labeled negative sentiment.

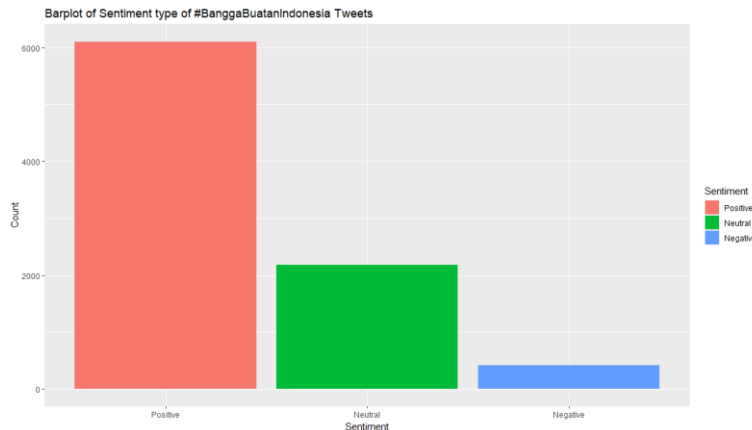

Fig. 6. Positive, neutral, and negative sentiment distribution

Based on the explanation in descriptive analytics regarding the trend of uploading tweets per month, we can also see the trend of sentiment per month from the period May 2020 to October 2021. In 2020, the discussion regarding Bangga Buatan Indonesia as a whole gives positive sentiments where the upload trend Most tweets are done in July, August, and October. Meanwhile, in 2021, positive sentiment has the highest frequency in May, August and October. This relates to the launch of the Bangga Buatan Indonesia program in May, independence day in August, and national batik day in October.

Fig. 7. Positive, neutral, and negative sentiment trend each month

### H. Topic Modelling

Topic modeling is a clustering method that is included in unsupervised learning. In unsupervised learning, there is no label for an object. This study wants to group public tweets about the #BanggaBuatanIndonesia National Movement with LDA. The main measure in topic modeling is the likelihood method. Likelihood is generally a log likelihood, naturally derived from a probabilistic topic model. Here, the optimal iteration value for each topic can be determined. The other metrics for evaluating topic models is looking at topic coherence and prevalence. Topic Coherence measures the degree of semantic similarity between the top words in a topic. Prevalence tells the topics that appear most frequently in the corpus. Prevalence is the probability of a topic spreading across a document.

Fig. 8. Likelihood log and K value

Fig. 9. Topic proportions over time of #BanggaBuatanIndonesia

LDA can also find out the proportion of topics in each period. As illustrated in Figure 4.6, for tweets about the #BanggaBuatanIndonesia National Movement as time goes by, more and more tweets are preaching about politics and the economy. And the frequency of discussion about nationalism increases from August to October 2020 and 2021. This can be influenced by the frequency of tweets discussing the anniversary of the Republic of Indonesia every August.

To find out which topics represent texts with positive, neutral, and negative sentiments, this study conducted a modeling analysis of topics that represent the three sentiments. The analysis is carried out by classifying the text based on sentiment classes including positive, neutral, and negative sentiments. Each of these sentiment classes was analyzed using LDA.

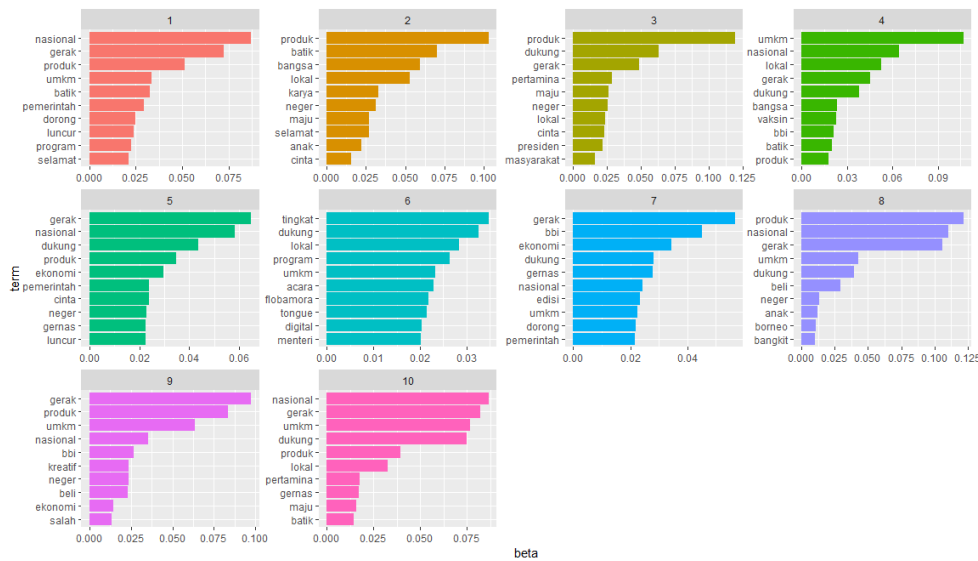

Fig. 10. Topics represents positive sentiment

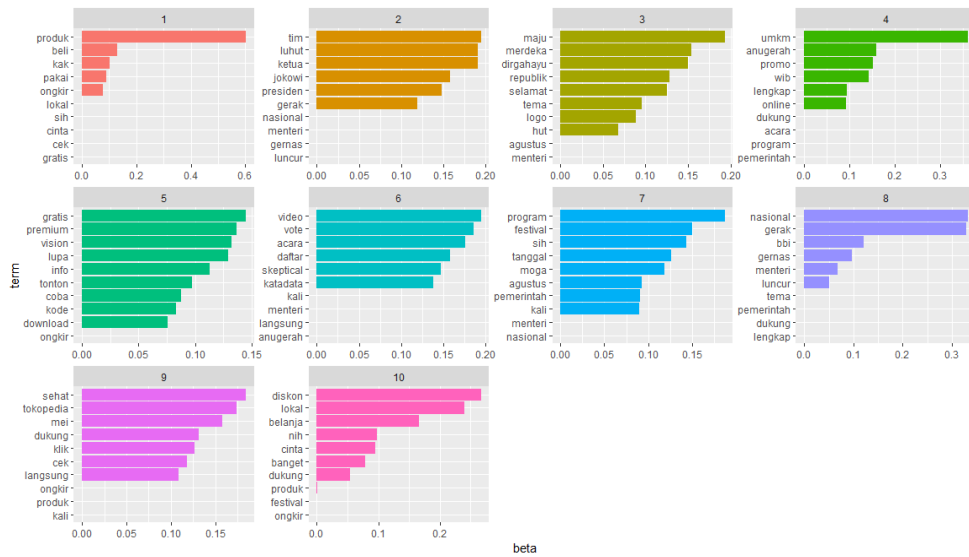

Fig. 11. Topics represents neutral sentiment

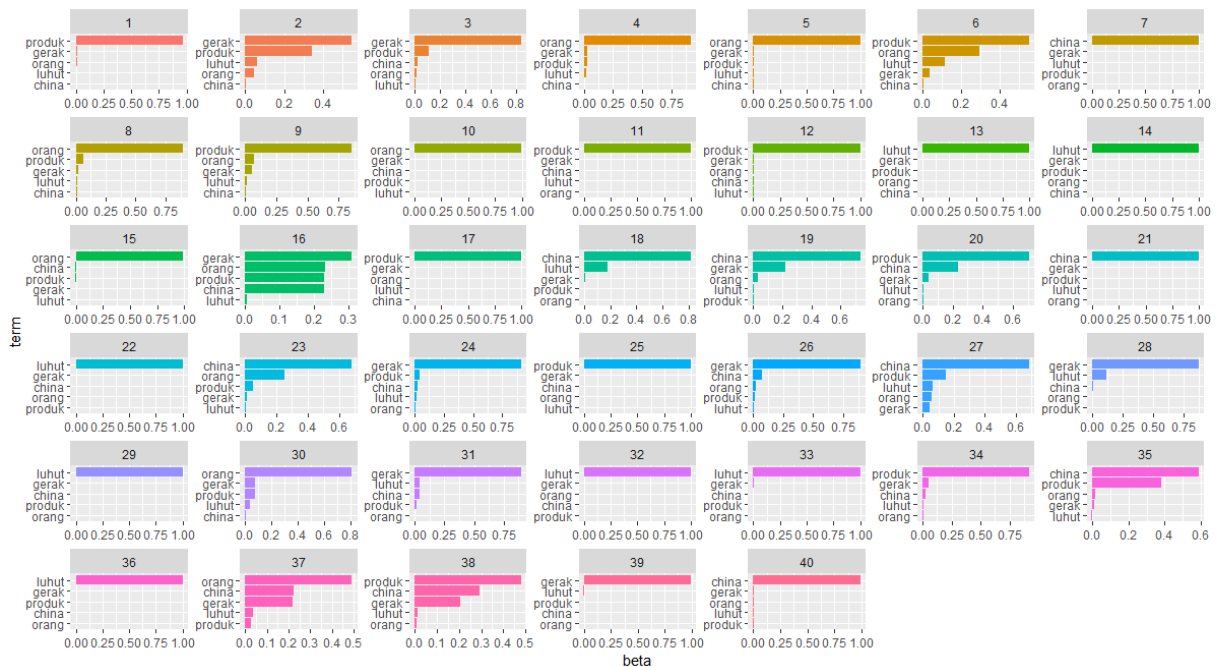

Fig. 12. Topics represents negative sentiment

Overall, the words that often appear on the topic of positive sentiment class are the words *gerak*, *nasional*, *produk*, *umkm*, and *dukung*. So based on these observations, the topic in the positive sentiment class is classified as a topic of Nationalism. The results of the analysis of the LDA model in the neutral sentiment class show that the words that often appear are *produk*, *UMKM*, *program*, *nasional*, *Tokopedia*, and *diskon*. Based on the emergence of this word, the neutral sentiment class discusses MSMEs. The results of the analysis on the negative sentiment class show that the words that often appear are *produk*, *china*, *orang*, and *luhut*. This shows that the discussion in the negative sentiment class is about political topics.

## V. CONCLUSION AND RECOMMENDATION

Sentiment analysis or opinion mining is a field of study that analyzes people's sentiments, attitudes, or emotions towards certain entities. This paper discusses the fundamental problem of sentiment analysis,

categorization of sentiment polarity. #BanggaBuatanIndonesia campaign was chosen as the data used for this research. Sentiment analysis is very important in making business decisions. Using sentiment analysis decision maker get the customer's need and weak points of product or service and accordingly take decision for improvement based on the findings.

From the results of topic modeling based on the sentiment class of the tweet, there were thirty topics discussed in a tweet with #BanggaBuatanIndonesia. The three most popular topics have the highest coherence value, namely topics related to nationalism, MSMEs, and politics. Specifically, the topic of nationalism is about batik products and the celebration of the Independence Day of Republic of Indonesia. The MSME topic specifically discusses MSME products and e-commerce. While the political topic specifically discusses political figures such as Luhut Binsar Pandjaitan.

Based on the results of the research conducted and the limitations contained in it, the researcher provides several suggestions for developing further research, including the following:

- a. Filtering bot tweets by deepening account profiles so that the analysis results can be more specific to real accounts. Bot accounts tend to show neutral sentiment, so this bot filtration will be useful when conducting sentiment analysis to find out the trend of sentiment towards a topic.
- b. Classification of sentiment based on 8 emotions sentiment so that sentiment analysis can be carried out in more detail. This analysis can be an insight for stakeholders regarding customer engagement with their products or programs. Engagement can also involve emotions contained in the context of discussing a topic.

## VI. MANAGERIAL IMPLICATIONS

Based on the results of the sentiment analysis and the results of the topic modeling analysis on the #BanggaBuatanIndonesia tweet that had been done previously, several findings were obtained that could have implications for various stakeholders in the #BanggaBuatanIndonesia program, including the government (Ministry of Communication and Information), MSME business actors, and e-commerce company.

Twitter presents many benefits for organizations in doing business. One of the biggest benefits is that Twitter offers exposure to a wide target audience. In measuring exposure, there are metrics that can be measured through analysis, namely impressions, engagements, engagement rates, profile clicks and media engagements. The most important measure of engagement with tweets is retweets, as retweets indicate that a follower has read the tweet and imply personal endorsement of the tweet (except in relatively rare circumstances where a follower retweets a message with a negative comment). Retweeting indicates user engagement with the brand, and is correlated with brand identification, brand trust, community commitment, and community membership intentions (Kim et al., 2014). Retweeting is also important because it represents an electronic word of mouth (e-WOM) to a brand's follower network (Zhang et al., 2011), and thus increases the potential reach of a brand's tweets to a network of followers. The results of the descriptive analysis show that tweets about *Bangga Buatan Indonesia* have a fairly large engagement with the number of retweets and likes shown for personal public figure accounts, e-commerce company accounts, and educational institution accounts.

Sentiment Analysis has many applications, both to industry and government, and is well suited for quantitatively and qualitatively measuring the performance of marketing campaigns. The results of this study indicate that positive sentiment dominates the overall response related to the #BanggaBuatanIndonesia program. This shows the positive response of the community to the program.

Based on the results of descriptive analysis, the trend of uploading tweets about #BanggaBuatanIndonesia increases in certain months in 2020 and 2021, namely in May, August and October. In these three months, the frequency of positive sentiment is higher than in other months due to the influence of national days, namely the Independence Day of the Republic of Indonesia in August and National Batik Day in October. Based on this analysis, the government can promote the Proudly Made in Indonesia program on national days, especially on independence day and national batik day. By increasing exposure in this month, it is hoped that several other stakeholders such as MSME business actors and e-commerce companies can take advantage of this moment to hold promotions to encourage purchases from the Indonesian people of MSME products.

## Analysis the Effect of GDP, Income Inequality, Human Development Index, and Government Expenditure on Poverty in Regencies/Cities in Bali Province 2017-2021 period.

A.Dhila Dwi Anggie Nugroho<sup>1</sup> and B.Sitti Retno Faridatussalam<sup>2</sup>,  
<sup>1,2</sup>Development Economic, Muhammadiyah University of Surakarta, Sukoharjo, Indonesia

### Abstract

*Poverty is a complex problem that cannot be solved in a short time because problems poverty can concern various sectors in people's lives, both nationally and regionally. This study aims to analyze the effect of GDP, Income Inequality, Human Development Index, and Government Expenditure on Poverty in Regency/Cities in Bali Province in 2017-2021. The dependent variable used is Poverty while the independent variables used are GDP, Income Inequality, Human Development Index, and Government Expenditures. The data used is panel data for districts/cities in Bali Province in 2017-2021. The model selected in the study was the Fixed Model Effect (FEM), from the model it is known that GDP and Income Inequality have a significant effect on Poverty, while the Human Development Index and Government Expenditure have no significant effect on poverty in districts/cities in the province of Bali for the 2017-2021 period.*

*Keywords— Poverty; GDP; Income Inequality; Human Development Index; Government Expenditure.*

### I. INTRODUCTION

Poverty is a multi-dimensional concept of human well-being that includes various traditional measures of prosperity such as income, health, and security. Poverty is one of the central issues in the Millennium Development Goals (MDGs) declared by the United Nations in 2000, so the United Nations hopes that all countries that are members can reduce the number of poor people and the state of food shortages in each of their countries.

Bali has a tourism sector that is growing very rapidly. Bali is the country's second-largest foreign exchange contributor to Indonesia after the oil and gas industry. The foreign exchange earned from Bali's tourism sector in 2021 will be around the US \$20 billion a year. However, Bali, as one of the provinces in Indonesia, is also inseparable from the problem of poverty (Sudibia dan Marhaeni, 2012). During the rapid economic development that occurs in Bali Province, the number of poor people is still relatively high. The advancement of the tourism sector in Bali Province does not necessarily eliminate the poor population in Bali (Dariwardani, 2014)

Table 1. Poverty According to Regencies/Cities of Bali Province in 2017-2021.

Districts/Cities	Number of Poor People in Bali Province According to Regencies/Cities (Thousand People)				
	2017	2018	2019	2020	2021
Jembrana District	14.78	14.35	13.55	12.60	14.24
Tabanan District	21.66	19.77	18.74	19.11	23.11
Badung District	13.16	12.97	11.89	13.75	18.52
Gianyar District	22.42	21.26	19.85	21.01	25.36
Klungkung District	11.15	10.43	9.66	8.76	10.19
Bangli District	11.76	11.05	10.08	9.56	11.68
Karangasem District	27.02	26.02	25.99	24.69	28.52
Buleleng District	37.48	35.20	34.26	35.25	40.92
Denpasar City	20.70	20.72	19.83	20.48	29.41
Districts/Cities	180.13	171.76	163.85	165.19	201.97

Source: Central Statistics Agency of Bali Province

From the table above, the number of poor people in Bali Province in 2017 was 180,130 people per person, in 2018 it was 171,760 people per person, in 2019 it was 163,850 people per person, in 2020 it was 165,190 people

per person, and in 2021 it was 201,970 people per person. The number of poor people per regency/city in Bali Province has fluctuated; in 2018–2019 it has decreased, while in 2020–2021 it has increased again. Buleleng Regency is the district with the highest number of poor people, which is 40,920 people per person in 2021, and the district that has the lowest number of poor people is Klungkung Regency, with 10,190 people per person.

The goal of national development is poverty alleviation. Poverty alleviation is very influential in economic development in an area both locally and nationally, so the government in an area must overcome the problem of poverty completely. In order to overcome the poverty problem, the various causes of the problem must be identified. any effort to reduce poverty should refer to and address the causative factors.

The Bali Provincial Government seeks development to advance community prosperity. Economic growth is the impact of development in the economic field, in addition to other fields such as social, cultural, political, and security. Especially in the economic field, the added value generated by the economic field indirectly raises the level of development achieved in an area. For the province of Bali, this is very necessary to be a reference for the next better development. In line with this, various developments have been directed to densely populated yea areas and areas that have a fairly high level of poverty.

Poverty alleviation continues to be pursued in Bali Province by conducting several programs. This program consists of: (1) Bali Mandara Health Insurance (JKBM); (2) Home Surgery; (3) Integrated Agricultural System (Simantri); and (4) Integrated Village Development Movement That Is Advanced, Safe, Peaceful, and Prosperous (Gerbangsadu Mandara).

Based on the background that has been described, this study will concentrate on observing the influence of GDP, income inequality, human development index, and government expenditure on Bali Province Poverty in 2017–2021.

## II.

### LITERATURE REVIEW

#### A. *Poverty*

According to (Todaro, 2000) poverty is the low per capita income and the widening of the income distribution gap. One of the most valid generalizations about the poor is that they generally reside in rural areas, with a basic livelihood in agriculture and other activities closely related to the traditional economic sector. Development economists began to measure the level of poverty within a country and the relative poverty between countries by determining a boundary commonly referred to as the poverty line. Another circle of poverty also concerns human backwardness in the development of natural resources. The development of natural resources in an area depends on its human productive capabilities. If the population is backward and illiterate, then technical ability, knowledge, and entrepreneurial effectiveness are low, so natural resources will be abandoned, lacking, and even abused. (Kecuk, 2011) narrows down the meaning of poverty as the inability from the economic side to meet the basic needs of food and not food.

#### B. *GDP*

GDP can describe the ability of an area to manage the natural resources it has, therefore the amount of GDP produced by each region is very dependent on the potential of natural resources and the production factors of the area. GDP based on constant prices describes the growth rate of a region's economy both in aggregate and sectorally. The economic structure of a region can be seen from the distribution of each economic sector to the total value of GDP based on prevailing prices. In addition, the per capita income derived from the comparison of GDP based on the prevailing price with the total population in the year concerned can be used to compare the level of prosperity of one region with that of another. Referring to previous research conducted by Made Ade (2019) GDP has a positive effect on the poverty rate in Bali Province.

#### C. *Income Inequality*

The relationship between inequality and poverty is pragmatic, namely that inequality causes poverty to get worse or inequality is a form of poverty (Sugiyarto, Mulyo, JH., 2015). In measuring income inequality, you can use the Gini ratio. The inequality value lies between 0 (perfect evenness) to 1 (perfect unevenness). The Gini coefficient of moderate unevenness ranges from 0.36-to 0.49, high unevenness ranges from 0.50-to 0.70 and low unevenness ranges from 0.20-to 0.35 (Arsyad, 2010).According to (Todaro, 2000), as long as the income distribution is uneven (the Gini ratio is high) the poverty rate will be higher as well (positive and significant effect). Similarly, it has been following the research of (Zulfachri, 2006), that the increase

in per capita income encourages a slowdown in the growth rate of poverty, on the contrary, income unevenness will increase the growth rate of the poor population.

#### D. Human Development Index

The concept of human development index (HDI) or known as human development index (HDI) is one of UNDP's programs for poverty reduction which is directed at three (3) index standards that are systematically arranged, namely education, health, and purchasing power (Hariawan dan Swaningrum, 2015)). The low Human Development Index (HDI) will result in low work productivity which has an impact on the low-income generation so that low income causes a high number of poor people. Eigbiremolen and Anaduaka (2014). Research from Zuhdiyaty and David K, 2017 (in Triariani) also shows the presence of a significant negative influence of HDI on poverty. (Arsyad, 2010) said that one of the strategies for poverty alleviation is the development of human resources. HDI is a measure for the development of human resources, if the HDI increases, the quality of its human resources will also increase, causing its productivity to also increase which will have an impact on improving people's welfare, thus poverty will decrease.

#### E. Government Expenditure

In addition to being used as an investment in human development, government spending is also used as an instrument of government policy in alleviating poverty. In several studies, several types of government spending can be categorized as pro-poor expenditure, namely health expenditure, education spending, infrastructure spending, agricultural and rural development spending, and social protection (Situmorang, 2014)

### III. RESEARCH METHODOLOGY

#### A. Types of research

This research uses a quantitative approach that emphasizes the analysis of numerical data processed by statistical methods to determine the significance of the relationship between the variables studied. This study was conducted to analyze the factors affecting poverty in Bali Province in 2017-2021. The location of the study was conducted in Bali Province from 2017 to 2021. This research was conducted in April 2022.

#### B. Research Object

The object of the study was poverty in all districts/cities in Bali Province from 2017-to 2021. This study analyzes the effect of Gross Domestic Product (GDP), Human Development Index (HDI), Government Expenditure, and Income Inequality on Poverty in Bali Province.

#### C. Variable Definition.

Table 2. Variabel Definition.

Variable	Definition
Poverty	Poverty is a state of inability to meet basic needs such as food, clothing, shelter, education, and health.
GDP	GDP is the amount of added value generated by all business units in a certain area or is the amount of value of final goods and services produced by all economic units in an area.
Human Development Index	The Human Development Index is a comparative measurement of life expectancy, literacy, education, and standard of living. HDI explains how residents can access development outcomes in earning income, health, education, and so on
Government Expenditures	Expenditures on goods and services consumed by the general government consist of collective services as well as goods and services of certain individuals.

Income inequality

Income inequality is a concept that explains the differences in prosperity, the standard of living, and income received or generated by individuals or households in society resulting in uneven distribution in regions due to differences in production factors and available resources.

#### D. Data Collection Technique

The secondary data used in this study is in the form of studies from various relevant institutions and published by related parties or institutions such as the Central Statistics Agency (BPS) of Bali Province, and previous research reports, journals, and other literature. The data used in this study from 2017-to 2021 are all research variables in Bali Province.

#### E. Data Analysis Techniques

The research data was processed using the EViews 10 program to obtain regression results. Poverty in this study serves as a dependent variable. The variables are suspected to affect Gross Domestic Product (GDP), Human Development Index (HDI), Government Expenditure, and Income Inequality. This research uses a quantitative approach with panel data. Descriptive statistical analysis is used to provide an overview by analyzing and presenting quantitative data. According to (Nuryanto and Pambuko, 2018), panel data is a combination of time series and cross-sectional data. In general, the formula of the panel data regression model is as follows:

$$POV_{it} = \beta_0 + \beta_1 GDP_{it} + \beta_2 HDI_{it} + \beta_3 GINI_{it} + \beta_4 GOV_{it} + \varepsilon_{it}$$

Where :

<i>POV</i>	Poverty
<i>GDP</i>	Gross Domestic Product
<i>HDI</i>	Human Development Index
<i>GINI</i>	Income Inequality
<i>GOV</i>	Government Expenditure
$\varepsilon$	Error term (error factor)
$\beta_0$	Constanta
$\beta_1 \dots \beta_4$	Coefficient of regression independent variable
<i>i</i>	Observation to i
<i>t</i>	Year to t

## IV. RESULT / FINDING

Table 3. Estimation Results of Panel-Cross Section Data Regression Econometric Model

Variable	Regression Coefficient		
	PLS	FEM	REM
C	114.5994	67.38767	34.99701
GDP	0.000567	-0.001021	-0.000345
HDI	-1.415141	-0.631001	-0.396019
GOV	-15.97452	33.84623	35.69938
	2.91E-06	2.73E-06	4.45E-06
R-squared	0.400297	0.925406	0.171948
Adjusted R-squared	0.340327	0.897434	0.089142
F-statistic	6.674925	33.08253	2.076530

Model Selection Test :

(1) Chow

Cross-Section F (8,32) = 93.796988 ; Prob. F(8,32) = 0,0000  
 (2) Hausman  
 Cross-section random  $\chi^2$  (4) = 15.404433; Prob.  $\chi^2$  = 0,0039

Source: Data processed by the author with Eviews, 2022

The Chow Test and Hausman Test show that the Fixed Effect Model (FEM) was selected as the best estimation model, as can be seen from the p-value, probability, or statistical empirical significance of the F Chow Test which is worth 0.0000 (<0.05), probability or statistical empirical significance  $\chi^2$  of the Hausman Test, which is 0.0039 indicating that the prob (<0.05) so that the selected model is the Fixed Effect Model (FEM). The complete results of the Fixed Effect Model (FEM) estimated model are presented in the table 4.

Table 4. Econometric Model Estimation Results

$\overline{POV}_{it} = 67,38767 - 0,001021 GDRP_{it} - 0,631001 HDI_{it} + 33,84623 GINI_{it} + 2,73E - 06 GOV_{it}$				
	(0.0019)***	(0.3717)	(0.0399)***	(0.3484)
$R^2 = 0.925406$ ; $DW-Stat. = 1.958933$ ; $F-Stat. = 33.08253$ ; $Prob. F-Stat. = 0,0000$				

Source: Data processed by the author with Eviews, 2022. **Description** : \*significant at  $\alpha = 0.01$  ; \*\*significant at  $\alpha = 0.05$  ; \*\*\*significant at  $\alpha = 0.10$ . The number in parentheses is the probability of the statistical value t.

The statistics of the goodness of the model show that the fixed effect model (FEM) estimates exist, as can be seen from the p-value (p-value), probability, or statistical empirical significance of F which is worth 0.0000 (<0.10), with or forecasting power of 0.9254. This means that 92.54% variation of the Poverty variable can be explained by the variables Gross Domestic Product, Human Development Index, Income Inequality, and Government Expenditure. The remaining 7.46% was influenced by variables or other factors that were not included in the model.

Separately Gross Domestic Product and Income inequality (GINI) influence Poverty, with a p-value probability or statistical empirical significance t OF GDP of 0.00019 (<0.10) and a p-value (p-value) of probability or statistical empirical significance t Income Inequality of 0.0399 (<0.10). Meanwhile, the Human Development Index and Government Expenditure do not influence Poverty, with a p-value (p-value) probability or statistical empirical significance of t of 0.3717 (<0.10) and 0.3484 (<0.10), respectively.

The Gross Domestic Product (GDP) variable has a regression coefficient value of 0.001021, with a linear-linear relationship. This means that if the Gross Domestic Product (GDP) increases by 1%, then Poverty will also increase by 0.001021%, on the contrary, if the Gross Domestic Product (GDP) decreases by 1% then Poverty will decrease by 0.001021%.

The Variable Income Dependence (GINI) has a regression coefficient value of, with a linear-linear relationship. This means that if Income Inequality (GINI) increases by 1%, then Poverty will also increase by 33,84623%, on the other hand, if the gross domestic product (GDP) decreases by 1% then poverty will decrease by 33,84623%.

## V. DISCUSSION

### A. The Effect of Gross Domestic Product on Poverty

The regression results in Table 3 show that GDP negatively affects poverty in Bali Province during the period 2017-2021 with a coefficient of 0.0001021. This finding is in line with a study conducted by I Wayan Sudiana and I Ketut Sudiana, (2013) under the title "The Influence of GDP, Education, and Labor Structure on poverty in Bali Province" which concluded that the Per capita GDP research had a negative but significant impact on the poverty rate in Bali Province, 1995 – 2013. this is in line with research by Siregar and Winarti (2006) who said that an increase in GDP would reduce the poverty rate. The opinion of the World Bank (2006) in Wahyudi is not the same as this study that economic growth cannot be concluded can reduce the level of poverty because it is caused by income inequality between regions.

### B. Effect of Human Development Index on Poverty

The HDI variable in the table above shows that it has a negative influence on poverty in Bali Province during the period 2017- 2021 with a coefficient of 0.631001. This is following the hypothesis and theoretical basis of this study. Research conducted by Desi Yulianti (2016) also showed the same results, namely the human development index has a negative and significant effect on poverty in DIY Provinces, which means that the increase in HDI will reduce poverty in DIY Provinces.

*C. The Effect of Income Inequality on Poverty*

The regression results on the GINI (Income Inequality) variable show that the Gini variable has a positive effect on poverty in Bali Province during the 2017-2021 period with a coefficient of 33.84623. This means that if the Gini index increases by 1 (one) percent, then poverty will also increase by 33.84623. This is following the theory expressed by Todaro, as long as the income distribution is uneven (high Gini ratio) then the poverty rate will be higher as well (positive and significant effect). Similarly, it has been following the research of Budi Zulfachri (2004), that an increase in per capita income encourages a slowdown in the growth rate of poverty, on the contrary, income inequality will increase the growth rate of the poor population.

*D. The Effect of Government Spending on Poverty*

The GOV (Government Expenditure) variable in the regression results of table 3 shows that the variable has a positive effect on poverty in Bali Province during the period 2017-2021 with a coefficient of 2.73. This means that if government spending increases by 1 million rupiahs, poverty will also increase by 2.73. This result is following previous research conducted by Dya Ayu (2020) with the title "The Effect of Government Expenditure on Poverty Rate through Economic Growth and HDI in East Java Province in 2015-2019", which collects Government Expenditure has a positive and significant effect on poverty.

IV. CONCLUSION AND RECOMMENDATION

Based on the results and discussions that have been presented in the previous stage, it can be concluded that:

- a. The results of the best model selection test prove that the Fixed Effect Model is the selected model.
- b. The results of the t-test found that the variables of GDP and Income Inequality individually had a significant effect on poverty.
- c. The results of the F test that have been carried out conclude that the simultaneous variables of the VARIABLES GDP, HDI, GINI, and GOV jointly affect POV (Poverty).
- d. The Determination coefficient test showed that the variables GDP, HDI, GINI, and GOV had an effect of 9 2.54% on POV (Poverty), while 7.46% was influenced by variables outside the model.
- e. GDP negatively affects poverty in Bali Province during the period 2017-2021 with a coefficient of 0.0001021.
- f. HDI negatively influenced poverty in Bali Province during the period 2017-2021 with a coefficient of 0.631001.
- g. The GINI (Income Inequality) variable shows that the GINI variable has a positive effect on poverty in Bali Province during the 2017-2021 period with a coefficient of 33.84623.
- h. The GOV (Government Expenditure) variable in the regression results of table 3 shows that the variable has a positive effect on poverty in Bali Province during the period 2017-2021 with a coefficient of 2.73.

With this research, it is hoped that poverty in Bali can be reduced in the next year by increasing tourist visits. With an increase in tourist visits to Bali, it will be able to increase the value of GDP and the rate of economic growth, because tourism is the main source of the economy in Bali. As well as the need for expansion of economic sectors in Bali Province so that there is no income gap. And so that the Government can increase MSME empowerment programs for rural communities because they can improve the welfare of the community in general in addition to that it is also accompanied by efforts to increase the equitable distribution of income through the balance of equitable development of economic zones in Bali Province.

ACKNOWLEDGEMENT

The Praise to Allah SWT who has bestowed His grace and guidance so that this research can be carried out so that the author can complete the writing this journal in the planned time. The writing of this research cannot be separated from the support and encouragement and cooperation of various parties. So the author would like to thank my Supervisor, Mrs. Sitti Retno Faridatussalam, S.E., M.M, as an academic supervisor. Thanks also to my parents, my friend and various parties that I cannot mention one by one, who have helped so that articles can be completed.

## **Analysis Influence Income Original Area, Fund Allocation General and Fund Allocation Special To Human Development Index in the Besuki Ex-Resident Area, East Java Province Year 2014-2020**

Rini Ilwida Wahyu Ningrum<sup>1</sup> and Muhammad Arif<sup>2</sup>

<sup>1,2</sup> Faculty Economy and Business University Muhammadiyah Surakarta, Surakarta, Indonesia

### **Abstract**

*This study aims to examine the effect of Regional Original Income, General Allocation Funds and Special Allocation Funds on the Human Development Index in the Ex-Residency of Besuki, East Java Province in 2014-2020. This research was conducted considering that regional expenditures have been used for routine expenditures which are relatively less productive. Therefore, in an effort to improve the quality of public services, create an increase in public welfare, especially in the fields of health, education, economy and in order to increase the achievement of the Human Development Index, local governments should change the composition of their spending. The data used in this research are secondary data obtained from the Directorate General of Fiscal Balance of the Ministry of Finance, the Regional Revenue Agency, the Central Bureau of Statistics of East Java Province and the Central Bureau of National Statistics. The data analysis used is panel data analysis with Common Effect Model (CEM), Fixed Effect Model (FEM), and Random Effect Model (REM) approaches. Selection of the best model using the Chow test and Hausma test. The result of this research is to prove that the fixed effect model is the chosen model. Based on the goodness of the fixed effect model approach, it is proven that the estimated model exists with a determinant coefficient value or R-square (R<sup>2</sup>) of 0.8915, this means that 89.15% of the Human Development Index variable is explained by variations of three independent variables, namely Regional Original Income, General Allocation Fund and Special Allocation Fund. Based on the goodness-of-fit test of the model (F test) it proves that Regional Original Income, General Allocation Funds and Special Allocation Funds together have an effect on the Human Development Index. Based on the effect validity test (t test) it can be seen that partially the Special Allocation Fund variable has a significant positive effect on the Human Development Index. Meanwhile, Regional Original Income and General Allocation Funds have a negative and insignificant effect on the Human Development Index.*

*Keywords— Income Original Area; General Allocation Fund; Special Allocation Fund; Human Development Index*

### **I. INTRODUCTION**

Development is a process of making changes for the better development the covers various change base status social, attitudes Public, institutions national, chase acceleration growth economy, handling inequality income, and poverty alleviation programs. Where in essence, development must reflect change total community or adjustment system social overall with no ignore diversity basic needs and desires of individuals and social groups that exist to move forward towards a condition the life that everything better, by material and spiritual (Todaro & Smith, 2011).

Process development on basic not just phenomenon economy only. Besides considering aspects of growth and equity, as well as considering the economic aspects of only social life. More than that, in the development process, efforts were made to changing the structure of the economy to direction which more good (Kuncoro, 2000).

*Human Capital* is one of the important factors in economic development. With quality human resources, economic development as measured by increased output or growth economy considered more good. And on the contrary, development economy also could increase source quality human power. With growth economy, will there is enough funds for improve the quality of human resources. Thus, there is a mutually influencing relationship or can called connection two the direction is between growth economy and human development.

One indicator that can be seen to measure human quality and economies of scale is Human Development Index. The Human Development Index is an indicator that can be used to measure the success rate of human quality development. Human Development Index made and popularized by *the United Nations Development Program* (UNDP) since 1996 in a series of reports which is entitled "*Human Development Report*". This index

is compiled as one of the indicators alternative to assessing the success of development carried out by a country other than income per capita, UNDP defines the Human Development Index as “ a *process of enlarging people's choice* ”. processes that improve aspects of people's lives. There are three most important indicators that are used as a starting point measure to compile the Human Development Index. First, longevity as measured by the old average population or life expectancy in a country. Second, knowledge as measured by the average weighted by number of adults who can read (weighted two-thirds) and average years of schooling (given weight one third). Third, income which be measured with income per capita real which has adjustable power buy it for each country (Putu Gde Mahendra Son, 2015).

The Human Development Index is a composite index used to measure achievement the average of a country in 3 basic terms, namely: a) Life expectancy index as measured by the number of expectations birth, b) Education index is measured by the average length of school and the literacy rate of the population aged 15 yearsto on and c) Index income measured by income and people's purchasing power.

With this the Human Development Index is an important indicator to measure success in efforts to build quality of human life (society/population). The Human Development Index can determine the level or level of development of aregion/country. The Human Development Index is strategic data because apart from being a measure of government performance, the Human Development Index is also used as one of allocator Fund determination Allocation Common in a region (BPS, 2020-2021)

East Java Province is one of the largest contributors to state revenue supported by the abundance of existing natural resources and other influential economic sectors on the progress of development in East Java Province. However, this is still not supported by even distribution development at each districts Province Java East. So that Ministry Development Disadvantaged Regions in 2014 stipulates that East Java Province has 4 (four) regencies which considered to be left behind include Bondowoso Regency, Situbondo Regency, Sampang Regency and Bangkalan Regency (Knight Viratama, 2018).

The former Besuki Residency area is an area located in the eastern part of East Java Province. This region consists of four government agencies, namely Jember Regency, Banyuwangi Regency, Regency Bondowoso, and Regency Situbondo. Two of them is area left behind, that is Regency Bondowoso and Regency Situbondo. Identification center growth on Region Ex Besuki Residency should be the driving force behind the development of the area, especially in development area left behind Among other Regency Bondowoso and Regency Situbondo. Area which becomes center growth expected Becomes focus activity and stimulate area other for Keep goingdevelop.

Fig. 1 Average Level of Human Development Index inEx Residency Besuki Province Java East Year 2014-2020  
Source : Body Center Statistics Province Java East, 2020

If seen, Index Development Man based on chart 1 on, that index construction Man Region Ex Residency Besuki could classified Becomes three category achievements Index Development human that is Index Development Man tall with range (HDI > 80), Index Upper middle-class Human Development with a range (66 < HDI < 80), and lower - middle Human Development Index with range (50 < HDI < 66). After averaging over the last seven years, it was found that the Development Index Humans in the last 7 years, Banyuwangi Regency has the highest Human Development Index value, then the Regency of Situbondo, Regency Jember and Regency Bondowoso.

The value of the Human Development Index of an area is certainly strongly influenced by policies internal

local government. Government policies that support aspects of human development, In fact, it can be seen from the proportion of the government's budget for the development of the education and health sectors (Arsyad, 2010) in (Puji Lestari, 2019). Especially in the era of decentralization as it is today, there is a delegation of from the central government to autonomous regions (Law No. 32 of 2004), indicating that the government regions are expected to be able to explore and utilize their respective regional resources and be allocated for increase well-being Public.

The implementation of fiscal decentralization has consequences, where regions are required to be able to finance regional expenditures using Regional Original Revenue, but not all regions are able to do this. This causes development in an area to be uneven, to overcome this, the central government allocates a Balancing Fund. Balancing funds are directly related to the implementation of local government in the context of regional autonomy or decentralization. In accordance with the provisions in Article 6 of Law Number 25 of 1999, balancing funds consist of, Profit Sharing Funds, General Allocation Funds, and Special Allocation Funds. By increasing Local Original Income, the General Allocation Fund and the Special Allocation Fund, it is possible to increase the welfare of the community as measured by the Human Development Index if the funds are allocated to sectors that can increase the Human Development Index such as education, health, and infrastructure.

Based on the description above and the phenomenon that occurs, the average value of the Human Development Index for the Besuki Residency in East Java Province has increased and decreased in the Human Development Index every year in the 2014-2020 period. This reflects that the revenue of the East Java Provincial government has not been optimal in its ability to increase the level of community welfare. Local governments should be able to manage Original Regional Revenues well and use them for productive budgets that can be felt by the community such as the education, health, and infrastructure sectors so that the Human Development Index can increase.

This indicates that each region must explore the potential of their respective regions, because the measure of the success of decentralization is how much the regions depend on the central government. Local governments are free to use Regional Original Revenue in order to finance government activities and regional development. The growth of Regional Original Income should be sensitive to the increase in economic growth which will have a direct impact on the Human Development Index in the area.

Big small Income Original Area could increase or reduce dependency on Central government. The level of independence of a region can be seen from the ability of Regional Original Income in finance development his own area. Regional reception which comes from from Income Original regions are expected to increase investment in local government capital expenditures so that the quality of service public the more good. According to Setyowati and Suparwati in (Putu Milan Pradnyantari, 2017).

Fund balance is fund which sourced from income A budget Revenue B spending N State \_ which allocated to area for fund needs area in skeleton implementation decentralization with destination for reduce the fiscal gap between the central government and local governments. The Balancing Fund consists of: General Allocation Fund, Special Allocation Fund, and Revenue Sharing Fund. According to Law Number 23 Years 2014 about Government Area, Fund Allocation General is fund which sourced from income State Revenue and Expenditure Budget allocated with the aim of equitable distribution of financial capacity between regions to fund regional needs in the context of implementing decentralization. Use of Funds Allocation General expected for necessity which oriented on well-being Public (Gede Ferdi Williantara, 2016).

According to Law Number 23 of 2014 concerning Regional Government, the Special Allocation Fund are funds sourced from revenues from the State Revenue and Expenditure Budget allocated to d area certain with destination for help fund activity special which is u rusan government which is the authority of the region. The use of the Special Allocation Fund is an authority from government area because Fund Allocation Special is part from Budget Income Shopping Regions, so that the use of the Regional Government's Special Allocation Fund is in line with national interests then the use of the Special Allocation Fund is regulated through various rules regulated by the central government. After the implementation of the decentralization system in 2001, the scope of activities to be financed Fund Allocation Special the more increase which covers seven field service government, that is: 1) Education, 2) Health, 3) Agriculture, 4) Public Works (roads, irrigation, and clean water), 5) Government Infrastructure, 6) Marine Affairs and Fisheries, and 7) the environment. Allocation of Special Allocation Funds through Capital Expenditure directly affect the welfare of society. If the Special Allocation Fund is used wisely, so will impact on enhancement quality education, health, and infrastructure support economy Public (Gede Ferdi Williantara, 2016).

## II. LITERATURE REVIEW

### A. *Theory Growth Man*

Theory growth endogenous (*endogenous ous growth theory*) explain that investation on capitalphysique and capital man play a role in determine growth economy period long. Contribution government on economic growth can be explained through its influence in making changes consumption or expenditure for investation public and reception from tax. Group theory this also considers that the existence of infrastructure, laws and regulations, political stability, government policies, bureaucracy, and the basis of international exchange as important factors that also affect economic growth (Ahmad Ma'ruf, 2008).

### B. *Theory Agency (Agency theory)*

According to Jensen and Meckling (1976) problem agency could appear because every individual assumed will have preference for maximizing utility personal which possibility big against the interests of other individuals. This agency relationship problem resulted in the occurrence of information asymmetry and conflicts of interest. According to Scott, information asymmetry is divided into two, namely: adverse selection and moral hazard. Adverse selection is a type of information asymmetry in which there are parties who related to company transactions that have information benefits while other parties do not have benefit of the same information. Meanwhile, moral hazard is a type of information asymmetry in which there are parties who related to company transactions that can directly observe the running of the transaction, whereas the other party cannot do the same. Ardiansyah and Widiyaningsih (2014) in (Hastu sarkoro, 2016).

The relationship between agency theory in this study can be seen through the relationship between the central government and local governments in the distribution of balancing funds and also the relationship between community represented by the Regional People's Representative Council (principal) with the regional government (agent). The central government delegates authority to local governments in managing households the area alone. By because that, consequence from delegation authority, government center has channeling balancing funds, the purpose of which is to assist local governments in funding day-to-day governance needs and in providing better public services to the community. In addition, agency theory is also implicit in the relationship between local government and the community. Public as the principal providing resources for the region by paying local taxes, regional levies and others to increase regional income itself. In addition, agency theory implicitly includes in connection Among government area and Public. Public as principal has give source power to area in the form of payment tax area, retribution and etc for could increase local revenue. In this case the local government as an intermediary must provide feedback to the community in the form of adequate public services, funded by revenue the area itself (Hastu Sarkoro, 2016).

### C. *Theory Fiscal Federalism*

Federalism fiscal which discuss about connection finance between level government whichput it on a different level. The relationship between the theory of fiscal federalism and this research is by The existence of a decentralization policy in Indonesia is expected to be able to build a better region by creating reliable human resources in all fields in order to become a society that productive so that society prosperous (Graceful Claudia Melgiana, 2020).

### D. *Income Original Area*

In the Law of the Republic of Indonesia Number 33 of 2004 concerning Financial Balance Between the Central Government and the Regional Government Article 1 states that the Regional Original Revenue is income which obtained Area which collected based on Regulation Area in accordance with regulation legislation. In Chapter 3 state that Income Original Area aim give authority to the Regional Government to fund the implementation of regional autonomy in accordance with the potential Region as embodiment Decentralization.

In line with research conducted by (Gede Ferdi Williantara, 2016) that Original Income Area no influence Index Development Man. It means ability Income Original Areain financing Capital Expenditures does not affect the HDI achievement. This is because Original Income Area more many used for finance personnel expenses and direct shopping other than finance capital expenditures that will have an impact on human development. Real Income Usage Area by the government should make the region's ability to finance shopping capital to be to support public facilities and infrastructure such as supporting health, education, and public

facilities that will have a greater impact on the welfare of people's lives. Local government should wiser in allocating regional expenditures, especially capital expenditures so that the public interest can be fulfilled and the local government is expected to continue to explore the revenue potentials. Original Region in their respective regions in order to minimize dependence on the central government and for increase achievements HDI in the future.

H<sub>1</sub> : Income Original Area no effect to Human Development Indeks.

#### *E. Fund Allocation General*

In Regulation Government of the Republic of Indonesia Number 55 2005 about Balancing Fund Article 1 states that the General Allocation Fund is a fund originating from the income of the Revenue Budget Shopping Country which allocated with destination even distribution ability finance between area for fund needs area in skeleton implementation Decentralization.

In line with research conducted by (Hastu Sarkoro, 2016) that the General Allocation Fund does not affect the Human Development Index. There is no influence of the General Allocation Fund on The Human Development Index is caused because the allocation of the General Allocation Fund is more focused on destination others, such as increasing the quality of the local economy. Besides that, Dana General Allocation mostly used for personnel expenses. This can be seen from the formulation of the General Allocation Fund which include the basic allocation component as the main component that dominates the entire Allocation Fund Generally accepted by the region. The basic allocation is the budget allocation used for expenditures employee. (Ardiansyah and Widiyaningsih, 2014) in (Hastu sarkoro, 2016).

H<sub>2</sub> : Fund Allocation General no effect to Human Development Indeks.

#### *F. Fund Allocation Special*

Government Regulation of the Republic of Indonesia Number 55 Year 2005 concerning Balancing Fund Article 1 states that the Special Allocation Fund is a fund sourced from the Revenue Budget State Expenditures allocated to certain regions with the aim of helping fund activities which are regional affairs and in accordance with national priorities. Amount of Special Allocation Fund set every year in State Revenue and Expenditure Budget.

In line with research conducted (Renggo, 2019) that the Special Allocation Fund has an effect on increasing the human development index and the increasing Special Allocation Fund, then will further increase the Human Development Index. According to Law no. 33 of 2004, Allocation Fund Specifically used to fund special activities which are regional affairs in accordance with the function which has set Budget Income Shopping Country. With Allocation Special used for increase service public in the form of development means and infrastructure public like service health, education, agriculture, public works, government infrastructure, marine and fisheries and the environment (Gede Ferdi Williantara, 2016) and (Putu Gde Mahendra Putra, 2015) describe one of the services education is rehabilitate room study which damaged because with provide service and affordability of access, providing quality education services can improve the quality of where it can improve the quality of existing human resources in the area and can help in enhancement Human Development Index.

H<sub>3</sub> : Fund Allocation Specially influential to Human Development Indeks.

### III. RESEARCH METHODOLOGY

The population in this study is the data on the realization of the entire Regional Revenue and Expenditure Budget County/City Region Ex Residency Besuki Province Java East Year 2014 – 2020. In this study the data used is quantitative data because it is expressed by numbers that indicate the value of the magnitude of the variable it represents and is in the form of data secondary which obtained from Central Bureau of Statistics of East Java Province, Badan National Statistics Center, Directorate General balance Finance/Ministry of Finance and Regional Revenue Agency of East Java Province. This study uses a panel data analysis tool to determine the effect of variable independent to dependent variable.

#### *A. Tool and Model Analysis*

This study uses a panel data analysis tool to determine the effect of the independent variables to the dependent variable. With the following econometric model:

$$HDI_{it} = \beta_0 + \beta_1 \log(IOA)_{it} + \beta_2 \log(FAG)_{it} + \beta_3 \log(FAS)_{it} + s_{it}$$

Information :

<i>HDI</i>	= Human Development Index (Number Index)
<i>IOA</i>	= Income Original Area (Billion)
<i>FAG</i>	= Fund Allocation General (Billion)
<i>FAS</i>	= Fund Allocation Special (Billion)
$\beta_0$	= Constant
$\beta_1$ --- $\beta_3$	= Coefficient regression variable independent
<i>i</i>	= <i>Cross Section</i> (4 Regencies/Cities Region Residency Besuki Province JavaEast)
<i>t</i>	= <i>Time Series</i> (Period 2014-2020)
$\varepsilon$	= <i>Error term</i> (Factor Error)
<i>Log</i>	= Logarithmic Operation

Stages estimation model econometrics in on will include: Estimate regression data panel with *Common Effect Model* (CEM), *Fixed Effect Model* (FEM), and *Random Effect Model* (REM) approaches ; election model best with using the Chow test and Hausman test; goodness test data models panel selected and interpretation coefficient determination; and which final is with test significance simultaneous (Test F).

#### B. Definition Operational Variable

1. **Index Development Human**  
The Human Development Index in this study is a composite index used for measure achievement average something country in three Thing fundamental development man that is : life expectancy index is measured by birth expectancy, education index is measured by averagelength of schooling and literacy rate and income index are measured by purchasing power of per capita consumption in 4 Regencies/Cities in Besuki Residency, East Java Province in the period 2014-2020 which served in unit index number.
2. **Income Original Area**  
Regional Original Income in this study is the income earned by the region which is gut based on Regional Regulations in accordance with statutory regulations. in 4 districts/cities in the Besuki Residency Region, East Java Province in the period 2014-2020 which is presented in unit lam billion rupiah.
3. **Fund Allocation General**  
The General Allocation Fund in this study is a fund sourced from Budget revenue State Expenditure Revenue allocated with the aim of equitable distribution of financial capacity among regions to mark regional needs in the context of implementing decentralization. General Allocation Fund allocated for provincial and regency/municipal areas in 4 regencies/cities in the residency area Besuki Province Java East within time 2014-2020 served in units billion rupiah.
4. **Fund Allocation Special**  
Special Allocation Funds are funds sourced from the Revenue and Expenditure Budget pendapatan Country which allocated to area certain with destination for help fund activity which are regional affairs and in accordance with national priorities. In 4 Regencies/Cities in The Besuki Residency of East Java Province in the period 2014-2020 which is presented in billion rupiah units.

## IV. RESULT / FINDING

### A. Results Estimate

Based on explanation previously that Income Effect Analysis Original Region, Fund General Allocation and Special Allocation Fund for Human Development Index in Ex Residency Area Besuki Province of East Java in 2014-2020 is estimated by panel data regression analysis through the formulation model econometrics as follows :

$$HDI_{it} = \beta_0 + \beta_1 \log(IOA)_{it} + \beta_2 \log(FAG)_{it} + \beta_3 \log(FAS)_{it} + \varepsilon_{it}$$

Information :

<i>HDI</i>	= Human Development Index (Number Index)
<i>IOA</i>	= Income Original Area (Billion)
<i>FAG</i>	= Fund Allocation General (Billion)
<i>FAS</i>	= Fund Allocation Special (Billion)
$\beta_0$	= Constant
$\beta_1$ --- $\beta_3$	= Coefficient regression variable independent
<i>i</i>	= <i>Cross Section</i> (4 Regencies/Cities Region Residency Besuki Province Java East)
<i>t</i>	= <i>Time Series</i> (Period 2014-2020)
$\varepsilon$	= <i>Error term</i> (Factor Error)
<i>Log</i>	= Logarithmic Operation

Results estimation regression data panel with use approach *Common Effect Model* (CEM), *FixedEffect Model* (FEM), and *Random Effect Model* (REM) can be seen in table 1.

Table 1. Results Regression Data Panel

Coefficient Regression Variable	CEM		FEM		BRAKE	
		Prob		Prob		Prob
C	17.46597	0.4351	27.08137	0.0671	17.46597	0.0591
Log(IOA)	-0.677825	0.2639	-0.178276	0.6351	-0.677825	0.0087
Log(FAG)	1.267459	0.1775	-0.064964	0.8764	1.267458	0.0020
Log(FAS)	1.206690	0.0898	1.740424	0.0000	1.206690	0.0002
R <sup>2</sup>	0.227611		0.891547		0.227611	
Adj.R <sup>2</sup>	0.131062	0.860560			0.131062	
F-Statistics	2.357473	28.77205			2.357474	
Prob.F.Statistic	0.096929	0.000000			0.096929	

## B. Election Model

### Test Chow

The Chow test is one of the tests used to choose which model is better on the panel data regression, which is between the *common effect* estimation model and the *fixed effect estimation model*. By hypothesis as follows :

$H_0$  : *common effect model* better from on *fixed effect model*

$H_A$  : *fixed effect model* better than on *common effect model*

The Chow test is carried out by looking at the *p-value*, if the *p-value* is significant < by 5%, then the it is better to use the *fixed effect model*, but if it is not significant with a *p-value* > of 5% which more good used is *common effect model*.

Effect Test	Table 2. Result Test Chow		
	Statistics	d.f	Prob
Cross Section F	42.853160	(3.21)	0.0000
Cross-Section Chi-Square	54.968809	3	0.0000

Based on Table 2, the results of the Chow test show that the probability value of the Chi- square of 0.0000 < of 5%, meaning that the *p-value* is smaller than (0.05) so that reject the null hypothesis ( $H_0$ ) and fail to reject the alternative hypothesis ( $H_A$ ). so that the conclusion is the model *Fixed effect* estimation is better than the *common effect* estimation model, so the estimation model is suitable for analyze is *fixed effect* model.

### Test Hausman

In the initial test of the Chow test, it was found that the *fixed effect model* was better to use than on *the common effect model*, then perform the Hausman test. Hausman test is one of the tests which is used to compare the appropriate model used in panel data regression, namely between *fixed effect model* or *random effects models*. With hypothesis as follows :

$H_0$  : *random effect models* better from on *fixed effect model*

$H_A$  : *fixed effect model* is better than at *random effect*

Hausman test can be done by looking at the p-value, if the p-value is significant  $<$  then it is better to use the *fixed effect model*, but if the p-value is not significant  $> 0.01$  then which is more good used is *random effects model*.

2. Table 3. Results Test Hausman

Test Summary	Chi-Sq. Statistics	Chi-Sq. df	Prob
Cross-Section Random	128.559422	3	0.0000

Based on Table 3, the results of the Hausman test show that the probability value of *Cross-section Random* of 0.0000  $<$  of 5%, meaning that the *p-value* is smaller than (0.05) so that reject the null hypothesis ( $H_0$ ) and fail to reject the alternative hypothesis ( $H_A$ ). so that the conclusion is the model *Fixed effect* estimation is better than *Random effect* estimation model, so the estimation model is suitable for analyze is *fixed effect model*.

Based on the model selection test, both the Chow test and Hausman test which have been described above, the best and selected model is the *Fixed Effect Model (FEM)*. With *Fixed* estimation results *Effect Model (FEM)* who presented in table 4.

3. Table 4. Results Estimate Fixed Effect Model

$$HDI_t = 27,0813 - 0,1782 \text{ Log}(IOA) - 0,0649 \text{ Log}(FAG) + 1,7404 \text{ Log}(FAS) + \varepsilon_t$$

(0,6351) (0,8764) (0,0000)\*

$R^2$  0,8915;  $DW - Stat.$  = 0,8104;  $F - Stat.$  = 28.7720;  $Prob. F - Stat.$  = 0,0000

Source: Central Statistics Agency, Regional Revenue Agency, Directorate General of Fiscal Balance/ Ministry of Finance, data processed.

**Note** :\*Significant at = 0.01; \*\* Significant at = 0.05; \*\*\*Significant at = 0.10. The number in brackets is the empirical significance (p-value) t statistic.

Table 5. Effects and constant Fixed Effect Model (FEM)

No.	County/City	Effect	Constant
1	Jember Banyuwangi	-1,5791	25,5022
2	Bondowoso	3,1986	30,2799
3	Situbondo	-1,3509	25,7304
4		-0,2685	26,8128

**Model Goodness Test**

*Coefficient Determination (R2)*

Based on table 4 shows that the coefficient of determination or R-square ( $R^2$ ) is 0.8915 Thing this means 89.15% variable Index Development Man explained by variation from three variable independent namely Regional Original Revenue, General Allocation Fund and Special Allocation Fund. While the rest as big as 10.85% explained by other variables in outside model who does not included in study.

*Test Existence Model (F-Test)*

The model can be said to exist if all the number of independent variables simultaneously have an effect to variable dependent. Following is a hypothetical formula test existence model study:

$H_0$ :  $\beta_1 = \beta_2 = \dots = \beta_n = 0$ , the model used does not exist

$H_A$ :  $\beta_1 \neq \beta_2 \neq \dots \neq \beta_n \neq 0$ , the model used exists

Criteria in this test that is:

$H_0$ : accepted if the probability or significance  $F > \alpha$

$H_A$ : rejected if the probability or significance  $F \leq \alpha$

Based on table 4 shows that the probability value of F-statistics is  $0.0000 < 0.01$  so that reject the null hypothesis ( $H_0$ ) and fail to reject the alternative hypothesis ( $H_A$ ). So, in conclusion, the model that used to exist or simultaneously variable Regional Original Income, General Allocation Fund and Allocation Fund Special together effect on Index Human Development.

#### *Test Validity Influence (t-test)*

The effect validity test tested the significant effect of the independent variables individually. The effect validity test is the t test.  $H_0$  on the t test is  $\beta = 0$ . Which means the independent variable  $i$  has no significant effect; and its  $H_A$   $\beta \neq 0$ , which means the  $i$ th independent variable has a significant effect.  $H_0$  will be accepted if the  $p$  (p value), probability or significant empirical statistic  $t > \alpha$ ;  $H_0$  will be rejected if the  $p$  (p value), probability, or significant empirical statistic  $t \leq \alpha$ .

4. Table 6. Test Validity Influence Variable Independent

Variable	$t$	Prob.t	Criteria	Conclusion
IOA	-0.481550	0.6351	>0.10	Not Significant
FAG	-0.157465	0.8764	>0.10	Not Significant
FAS	6.218025	0.0000	0.01	Significant on 0.01

#### *Interpretation Influence Variable Independent Model Selected*

Based on test validity influence which there is on table 6 has proved that variable independent which has a significant influence on the Human Development Index in Ex Territory Besuki Residency of East Java Province is the variable of the Special Allocation Fund. While the income variable Original Area and Fund Allocation General no have influence which significant. Based on the research results, the Special Allocation Fund Variable has a probability of 0.0000 which is statistically significant at a degree = 1% (0.01) with a linear-logarithmic relationship pattern. This means that if the Special Allocation Fund increases by 1 Rupiah, the Human Development Index will increase by  $(1.740424:100) = 0.01740424$  index number. On the other hand, if the village fund decreases by 1 Rupiah, the Human Development Index will decrease by 0.01740424 index number.

The Special Allocation Fund has a positive and significant effect on the Human Development Index, which means that every increase in the Special Allocation Fund variable has an influence and also increases the Human Development Index in the Besuki Ex Residency Region, East Java Province in 2014-2020. According to Law no. 33 of 2004, the Special Allocation Fund is used for special funds which are regional affairs that have been determined by the State Revenue and Expenditure Budget. With the Special Allocation, it can be used to improve public services in the form of building public facilities and infrastructure such as health services, education, public works, government infrastructure, marine and fisheries and the environment (Gede Ferdi Williantara, 2016) and (Putu Gde Mahendra Putra, 2015) describing one of the educational services is to rehabilitate damaged study rooms because by providing services and affordability of access, providing quality education services can improve the quality of education which can improve the quality of existing human resources in the area and can assist in increasing the Human Development Index.

This is in line with the theory of endogenous growth in which the Human Development Index is influential in determining the long-term economy. And it is also in line with the agency theory where the balancing fund is the Special Allocation Fund, one of the goals of which is to assist local governments in funding day-to-day governance needs and special funds which are regional affairs in accordance with the assigned functions and in providing public services. better for society. So that it can improve the quality of human resources and achieve a better level of the Human Development Index.

## V. CONCLUSIONS AND RECOMMENDATIONS

Based on the results of the research that has been done, it can be concluded that the test results for selecting the best estimator model prove that the fixed effect model (FEM) is the chosen model. Based on the goodness of the fixed effect model (FEM) approach, it is proven that the estimated model exists with a determinant coefficient value or R-square (R<sup>2</sup>) of 0.8915, this means that 89.15% of the Human Development Index variable is explained by variations of the three independent variables, namely Regional Original Revenue, General Allocation Fund and Special Allocation Fund. Meanwhile, the goodness-of-fit test of the model (F test) proves that Regional Original Income, General Allocation Funds and Special Allocation Funds together have an effect on the Human Development Index. The last is that the effect validity test (t test) can be seen that partially the Special Allocation Fund variable has a significant positive effect on the Human Development Index. Meanwhile, Regional Original Income and General Allocation Funds have no significant negative effect on the Human Development Index.

Based on the table of effects and constants of the random effect coefficient model, it can be seen that the constant value of each district/city in the Ex-Residency of Besuki, East Java Province, the highest constant value is Banyuwangi Regency with a value of 30.2799. Meanwhile, the district with the lowest constant value is Jember Regency with a value of 25.5022. Thus, in relation to the influence of the variables of Regional Original Income, General Allocation Funds and Special Allocation Funds on the Human Development Index in the Besuki Former Residency Area, East Java Province, Banyuwangi Regency has a higher Human Development Index level while Jember Regency has a lower Human Development Index level.

This study has several limitations, namely the research period is only 7 years, only using the realization of Regional Original Income, General Allocation Funds, and Special Allocation Funds as variables. The object of research is only the Regency/City in the Ex-Residency of Besuki, East Java Province. For further research, it is expected to increase the vulnerability of the research time, to add new independent variables and data by using different methods and to increase the number of samples by expanding the research area so that the research results are expected to be much better.

## Analysis Of The Effect Of Locally Revenue, Regional Shopping, And The Workforce On The GDP Of The Central Java Province In 2019-2020 Period

A.Afidatul Iza<sup>1</sup> and B.Maulidyah Indira Hasmarini<sup>2</sup>;

<sup>1,2</sup>Development Economic: Muhammadiyah University of Surakarta, Sukoharjo, Indonesia

### Abstract

*The country's economic growth is generally supported by the economic growth generated by each region. Regional economic growth can be seen from the value of Gross Domestic Product (GDP). This GDP value will indicate the level of progress of the regional development. This study aims to determine the effect of Locally Revenue, Regional Shopping, and the Workforce on the GDP of the Central Java Province in 2019-2020. The dependent variable used is GDP while the independent variables used are locally revenue, regional shopping, and the workforce. The data used is panel data using 29 districts and 6 cities in the Central Java Province in 2019-2020. The method in this study uses panel data regression analysis using the FEM (Fixed Effect Model) model. From the model, it is known that the locally revenue and regional shopping variables have no significant effect on the GDP in the Central Java Province in 2019-2020, while the workforce variable has a significant effect on the GDP in the Central Java Province in 2019-2020.*

*Keywords— GD;, Locally Revenue; Regional Shopping; Workforce*

---

### I. INTRODUCTION

One goal of a country is to increase its economic growth. One measure of economic growth in national income. A country's national income may indicate just how much economic activity there is overall. The concept of national income is a measure that is most often used as an indicator of economic growth but is not the only indicator of economic growth. Economic growth is a process, not a picture of the economy at any given period. There is a development or change and use of time (Boediono, 1999).

Meanwhile, national development is a continuous, ongoing activity aimed at promoting both the material and spiritual welfare of society based on Pancasila and the 1945 constitution. National development includes various aspects such as economic, social, political, legal, and other development aspects in which they synergize with one another to achieve success at both the central and regional levels. Therefore, there is a need for participation in both society and government in achieving these goals. Broader development may be defined as an attempt to increase the potential resource productivity of a country, whether natural resources, human resources, capital, or the resources of technology, with the ultimate goal of improving people's lives (Todaro & Smith, 2006).

One important indicator of economic conditions in a particular area or province is indicated by the gross domestic product (GDP). This GDP value will explain the extent to which the region's ability to manage or utilize existing resources. Besides that, the economic condition as a whole in each region can also be seen by how much spending is done in the region. Government spending, or regional spending, is a form of stimulation carried out by the government on the regional economy. The greater the value of spending areas allotted for development, the better of the population will be. This means that the economic conditions in the region will also improve (Rahman & Chamelia, 2015).

Table 1. GDP of the Regency/City of Central Java Province based on constant prices in 2010 during the period 2019-2020

Regency/city in Centra Java Province	Year	
	2019	2020

Source: BPS Central Java Province (Badan Pusat Statistika, 2021)

Based on table 1 above, the highest GDP per capita during 2019-2020 is owned by the City of Semarang, with a GDP per capita in 2019 of Rp. 140199517.36 and in 2020 with a GDP per capita of Rp. 137609712.18. Then, Cilacap Regency in 2020 with a GDP of Rp. 90011584.10; Kudus Regency in 2020 with a GDP of Rp. 70961748.50 Magelang City has the lowest GDP per capita in 2020, with Rp. 6312054.41 (Rahman & Chamelia, 2015).

The calculation of GDP has become a very important part of macroeconomics, especially regarding the analysis of the economy of a region. The results of this GDP calculation provide the basic framework used to measure economic activity that occurs and takes place in an economy. These GDP figures serve as macroeconomic indicators and also serve as a basis for evaluating economic performance and formulating various policies. This economic indicator also provides an overview of the entire flow of value-added goods and services produced and all the production factors used by the economy to produce value-added goods and services (Rahman & Chamelia, 2015).

Exploring regional income, increasing the participation of the private sector, and increasing the participation of local workers as capital for regional development are expected to be one of the factors driving regional growth. Local governments must implement a bottom-up regional development planning approach (bottom-up) so that the

development carried out by the regions is a shared desire and following the existing potential so that sustainable development can be achieved (Adisetiawan, 2017). Based on the description above, it can be seen that local revenue, regional expenditure, and the labor force influence regional GDP, Central Java Province. If the value of each variable increases, the increase also occurs in economic growth in this case GDP. If there is a decrease in these variables, a decrease also occurs in GDP, from the above phenomenon, it is necessary to have a study that is expected to provide recommendations for the continuation of economic growth in the Central Java Province. The purpose of this study was to determine the effect of local revenue, regional shopping, and workforce on the GDP of the Central Java Province, and how much influence each variable of local revenue, regional shopping and workforce had on the regional GDP of the Central Java Province.

Based on the background that has been described, this study will focus on observing the influence of Local Revenue, Regional Shopping, and the Workforce on the GDP of the Central Java Province in 2019-2020.

## II. LITERATURE REVIEW

### A. *GDP*

Gross Regional Domestic Product is a reflection of the production capability and level of income of a society so that Gross Regional Domestic Product has a strong relationship with Local Revenue. Because in theory, if there is an increase in public consumption, it will cause an increase in tax payments which are included in the component of local revenue (BPS, 2015).

The benefits of calculating the value of GDP are: (1) knowing and studying the structure or composition of the economy. From the GDP calculation, it can be seen whether an area is included in industrial, agricultural, or service areas and how much the contribution of each sector; and (2) comparing the economy over time. Because the value of GDP is recorded every year, it will get a record number from year to year. Thus, it is hoped that information on the increase or decrease in whether there is a change or reduction in material prosperity or not (Adisetiawan & Ahmadi, 2016).

### B. *Local Revenue*

Local Revenue is regional revenue from various regional government efforts to collect funds for the needs of the region concerned in financing routine and development activities, which consists of regional taxes, regional levies, part of regionally owned business profits, and other legitimate regional original revenues. Local Revenue is defined as regional income which depends on the state of the economy in general and the potential of the sources of local revenue itself.

Sutrisno, (1984) local revenue is an income that shows the ability of a region to collect sources of funds to finance regional activities. So the notion of local revenue can be said to be routine income from local government efforts in utilizing the potential of financial sources to finance their duties and responsibilities. According to article 6 of Law no. 32 of 2012 local revenue comes from regional tax results, regional levies, results from regionally owned companies and the results of separated regional wealth management; and receipts from the service and other legitimate regional income.

### C. *Regional Shopping*

Each regional head in the regional expenditure planning system is a form of implementing the vision, mission, and program of a regional head according to what was conveyed in the campaign so that the budget allocation is not only allocated for routine expenditures but is allocated more for development expenditures. Because through development spending activities it will be seen how far a regional head is committed to a public service orientation. Along with the enactment of Law Number: 32/2004 concerning Regional Government and Law Number: 33/2004 concerning Financial Balance between the Central and Regional Governments, since then the authority of regional governments has increased to regulate their households.

### D. *Workforce*

The workforce is the population of working age between 15-64 years. The population of this working age can be classified into two, namely the labor force and the non-labor force (Suparmoko, 2002). In summary, the workforce consists of the labor force and not the labor force. What is meant by the labor force is the part of the workforce that is involved or is still trying to be involved in productive activities that produce goods and services. According to Suparmoko, (2002), the labor force is the population who have not worked but are ready to work or are looking for work at the prevailing wage level. The labor force consists of groups who are working, and those who are unemployed and looking for work (P. Simanjutak, 1985). Meanwhile, what is meant by non-labor force are those who are still in school, those who take care of the household, and other groups or income recipients (P. Simanjutak, 1985).

An area is said to be advanced if it is supported by high public knowledge, and adequate natural resources managed by human resources who have great potential to achieve regional development progress. One indication is a large number of workers and little unemployment (Arifin, 2009, Kusuma, 2017).

#### E. Previous Research

Research conducted by Simanjutak, (2008) with the title "Analysis of the Influence of PAD on economic growth in Labuhan Batu Regency". This study uses secondary data with the type of time series data during the period 2001–2004. The data used are sourced from the Labuhan Batu Regency Revenue Service, BPS, Finance of Departement and journals and research results. The dependent variable used is GDP based on current prices. The independent variables used were PAD, DAU, APBD, and Degree of Fiscal Autonomy. The analytical method used in this research is Ordinary Least Square. The results of the research show that PAD and DAU have a positive and significant effect on economic growth in Labuhan Batu Regency, and the previous year's economic growth has a positive and significant effect on economic growth for the current year in Labuhan Batu Regency.

The research conducted Wijayanti, (2002), on "Analysis of the Influence of Locally Revenue, Contributions of the Central Government, and Workforce on Economic Growth in Kudus Regency" concluded that in addition to workforce, which had a positive effect on economic growth, there was also PAD, which also had a positive effect on economic growth in the district. This is also very true for Central Java's GDP growth.

Research conducted by Pujiati, (2007) entitled "Analysis of Economic Growth in the Residency of Semarang in the Era of Fiscal Decentralization". The type of data used is panel data, which is a combination of time series and cross-section. Time Series data from 2001-2006 and the objects are 6 regency/cities in the Residency of Semarang. The model used in this study is the Fixed Effects model. The results showed that PAD and DBH had a positive and significant effect on economic growth, while DAU had a negative effect on economic growth. Workforce as the main factor in accelerating economic growth has a positive and significant influence on economic growth.

The research was conducted Rustiono, (2008) with the title "Analysis of Investment, Workforce, and Government Expenditures on Economic Growth in Central Java". This study uses a log linear regression model with the least squares method (OLS). The results of data analysis show that the F-count value is greater than the F-table ( $4,499 > 2.81$ ), so that  $H_0$  is accepted and  $H_a$  is rejected, meaning that together the variables of PMDN, PMA, Workforce, and government expenditures have a positive effect. and are significant to economic growth in Central Java Province.

### III. RESEARCH METHODOLOGY

#### A. Research Design

This study aims to examine the effect of local revenue, regional shopping, and workforce on GDP using secondary data obtained from the information documentation of the BPS and analyzed with a quantitative approach. The research design is shown in Figure 1.

Fig 1. Research Design

#### B. Operational Definition

The research uses quantitative data methods. Secondary data is obtained from the BPS Jateng Province during the 2019-2020 period. The dependent variable in this research is GDP. The independent variables of this research are locally revenue, Regional shopping, and the Workforce.

Gross Domestic Product (GDP), GDP is the amount of added value generated by all economic sectors in a region. The data used is constant price GDP in 2010 according to regency/cities in the Central Java Province in 2019-2020. The unit of GDP data is a million rupiah.

Locally revenue, as one of the regional revenues, reflects the level of regional independence. The greater the locally revenue, the greater the ability of the region to implement fiscal decentralization and less dependence on

the central government. The income received by the region in a certain period is obtained from regional revenue sources in the Central Java Province in 2019-2020. The unit of PAD data is the rupiah

Regional shopping has a role to bring together community request with the provision of facilities and infrastructure that are not fulfilled by the private sector. Locally revenue are intended to be all regional obligations which are recognized as a reduction in the value of net assets in the period of the year concerned. The data used is the number of regional expenditures from the realization of direct and indirect expenditures in the Central Java Province in 2019-2020. The rupiah is the Regional Expenditure Data Unit.

The labor force is the workforce or population of working age who is working, or has a job but temporarily does not work, and who is looking for work (Dumairy, 1997). The number of workers who work is a description of the conditions of the available employment. The greater the number of available jobs, the greater the total production in a country, where one indicator to see the development of employment in Indonesia is the workforce Participation Rate (Novianto, 2013) The data used is the number of workers in the Central Java Province in 2019-2020. The Workforce Data Unit is a soul.

### C. Data Analysis Technique

The research data was processed using the EViews 10 program to obtain the regression results. GDP is the dependent variable and Locally Revenue, Regional Shopping, and the Workforce as independent variables. The econometric model of panel data regression is as follows:

$$PDRB_{it} = \beta_0 + \beta_1 PAD_{it} + \beta_2 BD_{it} + \beta_3 AK_{it} + \varepsilon_{it}$$

Where:

PDRB	= Gross Domestic Product (million rupiah)
PAD	= Locally Revenue (rupiah)
BD	= Regional Shopping (rupiah)
AK	= Workforce (soul)
$\varepsilon$	= Error term
$\beta_0$	= Constant
$\beta_1 \beta_2 \beta_3$	= Independent variable regression coefficient
$i$	= Observation in the region of $i$
$t$	= t-year period

## IV. RESULT / FINDING

### A. Chow Test

The chow test is used to assess whether of the Common Effect Model and the Fixed Effect Model is the best to utilize. If the probability value of Cross-section F and Cross-section Chi-square  $> 0.05$ , the F-Stat/Chow test is approved, and the regression model chosen is the Common Effect Model (CEM).  $H_0$  is rejected if the probability value of Cross-section F and Cross-section Chi-square is less than 0.05, and the regression model selected is Fixed Effect Model (FEM).

Table 2. Chow Test Result

Effects Test	Statistic	d.f.	Prob.
Cross-section F	250.726863	(34,32)	0.0000
Cross-section Chi-square	391.211488	34	0.0000

Source: The author used Eviews to process the data, 2022

Based on the result of the Chow test in Table 2, the probability value is  $0,0000 < 0,05$ , implying that the Fixed Effect Model is the preferred model.

### B. Hausman Test

The Hausman test compares the Fixed Effect Model and the Random Effect Model to determine which is the best. If the probability value of a random cross-section  $> 0.05$ , Hausman's test conditions are met, and

$H_0$  is accepted. The regression model used is the Random Effect Model (REM).  $H_0$  is rejected if the random cross-section probability value is less than 0.05. The Fixed Effect Model was chosen as the regression model (FEM).

Table 3. Hausman Test Result

Test Summary	Chi-Sq. Statistic	Chi-Sq. d.f.	Prob.
Cross-section random	57.889113	3	0.0000

Source: The author used Eviews to process the data, 2022

Table 3 shows that the probability value for the Hausman test is  $0,0000 < 0,05$ , indicating that the model chosen is the Fixed Effect Model.

### C. t-Test

The partial coefficient test, often known as the t-test, is used to measure the significance of an independent variable's influence on a dependent variable. If the P-value  $>$  then is acceptable for the partial coefficient/t-test, indicating that the independent variable does not influence the dependent variable. is rejected if the P-value is less than one, indicating that the independent variable influences the dependent variable.

Table 4. Result of t-Test/Partial Coefficient

Variable	Prob.	P-value (Significance 10%)	Description
PAD	0,2482	$P > 0,10$	Tidak Berpengaruh
BELANJA DAERAH	0,9623	$P > 0,10$	Tidak Berpengaruh
ANGKATAN KERJA	0,0615	$P < 0,10$	Berpengaruh

Source: The author used Eviews to process the data, 2022

The t-test findings in Table 4 reveal that the variables of Workforce an influence on the GDP individually.

### D. F Test

The F test was used to see if the independent factors had an influence on the dependent variable at the same time (simultaneously). If the P-value  $> \alpha$ , the criteria for acceptance is that the independent variables do not influence the dependent variable simultaneously (simultaneously). When the condition is rejected, i.e. when the P-value is less than  $\alpha$ , it implies that the independent variable has a simultaneous effect on the dependent variable (simultaneously).

Table 5. F-Test Result

Variable	Prob (F-Statistic)	Criteria	Conclusion
PAD,BELANJA DAERAH,ANGKATAN KERJA	0,000000	$P < 0,05$	Take effect

Source: The author used Eviews to process the data, 2022

The probability value (F-statistic) of the Ftest in the table is  $0,000000 < 0,05$ , indicating that the variables locally revenue, Regional Shopping, and Workforce all have an influence on the GDP.

### E. Coefficient of Determination Test Results ( $R^2$ )

According to Widarjono, the Coefficient of Determination (R-Squared) test was used to explain the proportion of variance explained by the independent variable. The coefficient of determination is a number that runs from 0 to 1. The closer you get to one model, the better, since it demonstrates how appropriate or appropriate a regression line is and how much the independent variable's change may explain the dependent variable's variation.

Table 6. Coefficient of Determination Test Results ( $R^2$ )

R-square	Adjusted R-square	S.E. of Regression
0,998900	0,997628	1245548

Source: The author used Eviews to process the data, 2022

Table 6 shows that the variables locally revenue, regional shopping, and workforce have an effects of 99,89 percent on the GDP, whereas factors outside the model had an effects of 0,11 percent.

#### F. Test for Significance of Regression Coefficient

Table 7 shows the outcomes of panel data analysis regression using the chosen model approach.  
Table 7. Regression Result of Selected Model FEM

Variable	Coefficient	Std. Error	t-Statistic	Prob.
C	38784899	7203694.	5.384029	0.0000
PAD	0.003443	0.002927	1.176135	0.2482
BELANJA_DAERAH	5.16E-05	0.001084	0.047646	0.9623
ANGKATAN_KERJA	-23.24845	11.99717	-1.937829	0.0615

Source: The author used Eviews to process the data, 2022

## V. DISCUSSION

### A. The Effect Of Locally Revenue On GDP

The regression results in Table 7 show that local revenue has no effect on the GRDP of the Central Java Province for the 2019-2020 period. If you pay attention to the PAD component of the 2020 APBD, the Regency/City government revenues throughout Central Java Province have increased compared to the realization of the 2019 APBD by 1.19 percent, from Rp. 14.23 T to Rp. 14.40 T. The largest portion of PAD in Central Java Regency/City Government revenues in the 2020 APBD was contributed by Other Legitimate PAD of Rp. 7.17 T, followed by local tax revenues of Rp. 5.58 T. Regional Retribution is Rp. 1.03 T, and the proceeds of Regional-Owned Companies and Regional Wealth Management, which are separated, are Rp. 62 T (Badan Pusat Statistik Provinsi Jawa Tengah, 2021).

### B. The Effect Of Regional Shopping On GDP

The regression results in Table 7 show that regional expenditures have no effect on the GRDP of the Central Java Province for the 2019-2020 period. Indirect spending has the largest contribution to the realization of the 2019 APBD, with a contribution of 68.27 percent. The percentage increased in the 2020 APBD to 68.4 percent. This increase was more influenced by the increasing contribution to personnel expenditure and grant expenditure. Meanwhile, the contribution of direct spending in 2019 was 26.86 percent, and in the 2020 APBD, it increased quite a bit to 31.32 percent, with the hope that the increase in direct spending could spur regional officials to further improve their public services. Indirect expenditure consists of personnel expenditure, interest expenditure, subsidy expenditure, grant expenditure, social assistance expenditure, profit-sharing expenditure, financial aid expenditure, and unexpected expenditure. Meanwhile, direct expenditure consists of personnel expenditure, goods and service expenditure, and capital expenditure (Badan Pusat Statistik Provinsi Jawa Tengah, 2021).

### C. The Effect Of Workforce On GDP

The regression results in Table 7 show that the workforce hurts the GDP of the Central Java Province for the 2019-2020 period with a coefficient of -23,24845. The relationship between manpower and GDP shows that the increase in available manpower can reduce the unemployment rate, and regional economic growth will increase much more. According to the theory, human resources are the most important development capital, apart from regional finance and investment. The active participation of the entire community will accelerate regional development because of a greater sense of ownership of the region itself so that later it can stimulate public awareness of building in their respective local areas. To support the implementation of development requires quality human resources in addition to fulfilling the quantity of labor demand (Untari, 2017).

## VI. CONCLUSION AND RECOMMENDATION

### A. Conclusion

Based on the results that have been described in the previous stage, it can be concluded that:

- The test results for selecting the best model prove that the Fixed Effect Model is the chosen model.
- The results of the t-test show that the individual labor force variable has an effect on GDP.

- c. The results of the F test that have been carried out conclude that the simultaneous variables of Locally Revenue, Regional Shopping, and the Workforce have an effect on GDP.
- d. The coefficient of determination test shows that the variables of Locally Revenue, Regional Shopping, and the Workforce have an effect of 99.89 percent on GDP, while 0.11 percent is influenced by variables outside the model.
- e. Locally Revenue has no effect on the GDP of the Central Java Province for the 2019-2020 period, perhaps because the largest portion of PAD in Central Java Regency/City government revenues in the 2020 APBD is contributed by other legitimate PAD of Rp. 7.17 T.
- f. Regional Shopping have no effect on the GRDP of the Central Java Province for the 2019-2020 period, one of which is due to personnel expenditures, both direct and indirect.
- g. The Workforce has a negative effect on the GRDP of the Central Java Province for the 2019-2020 period with a coefficient of -23,24845.

#### B. Recommendation

To optimize the realization of Locally Revenue as a source of development funds in a region, it is necessary to have direct, good, and precise supervision and control from the central government and the community on the performance of regional governments. In particular, in allocating sources of development funds, including PAD and its sources, so that the implementation of regional autonomy through fiscal decentralization runs in accordance with its objectives to improve the welfare of the community and the independence of a region.

Local governments must be able to optimize the realization/allocation of regional shopping proportionally between direct and indirect expenditures that are more in favor of the interests of the community to be able to have a positive effect on the economy of the Central Java region.

Local and central governments must be able to provide better facilities and infrastructure to create community welfare and promote development so that problems caused by high population density, such as unemployment and poverty, can be prevented. For example, providing high employment opportunities and providing training for labor and human resources in the area will encourage community economic activity that can increase the economy (GDP) in the area.

#### ACKNOWLEDGEMENT

Thanks to Allah SWT who has bestowed His grace and guidance so that this research can be completed properly. The writing of this article could not be separated from the support, encouragement, and cooperation of various parties. I thank my supervisor, Mrs. Ir. Maulidiah Indira Hasmarini, MP. and Mr. Daryono Soebagyo, Dr. M.Ec. as academic advisor. Thanks also to my parents, my sister, and my friends, as well as the Sustainable Collaboration in Business, Technology, Information, and Innovation held by Telkom University for allowing me to participate in this international conference.

## How to Maintain Bank Customer Loyalty

Siska Marlina<sup>1</sup>, Fitri Syakinah<sup>2</sup>, and Cepi Juniar Prayoga<sup>3</sup>

<sup>1,2,3</sup>Accounting Departement. Economy Faculty, Universitas Garut, Garut, Indonesia

### Abstract

*The problem in this study is about the quality of services provided by banks in achieving loyalty to both parties (customers and banks) which is closely related to trust and relationship commitment and behavior. With high banking competition, customers are getting smarter, more demanding, aware of prices, more and more customer wants and needs as well as other product developments. This is obtained from the advancement of communication technology that is increasingly rapidly. The uniqueness of this research from previous research is how to maintain bank customer loyalty in terms of customer habits that always change along with technological advances. The research method used is a literature study that aims to gain an understanding of the use of technology that encourages customer and bank relationship commitment so as to achieve customer loyalty.*

*Keywords— Commitment Habits and Customer Loyalty*

---

### I. INTRODUCTION

In this era of globalization, competition for companies, including banking, is getting tougher and fiercer. This is due not only to product competition, but customers who are getting smarter, more demanding, more and more customer wants and needs, aware of prices and followed by the development of other products. The development of communication progress is also influential because it can provide access to information to customers. Likewise with the products offered by banks to customers. We understand that communication indicates whether an advisor is technically and functionally qualified. Communication as an important subject in achieving the highest quality of service. High communication skills are needed, to convince his clients. With proper communication a client can know the status of his investment. Opportunities in the future there may be risks encountered and expected capital gain/return.

Seeing these conditions, to get their perception of service quality, a success rate is needed in communicating well with customers. Service quality is an important factor that consumers consider in making purchases, because quality is closely related to customer satisfaction. Consumers are satisfied with the services provided by the provider and lead to increased relationships, consumer agreements in conducting product repurchase transactions. Consumer relationship commitment is strongly influenced by 3 forms: first Communication Effectiveness, second Service Quality, and third Trust. Establishment of good communication so that it can affect the quality of these services on customer communication. Banks have confidence in establishing good communication with service elements within the bank itself and attracting customer confidence in the bank.

The relationship between consumer communication and the bank is very strong through service quality and communication effectiveness. So the bank in achieving increased customer trust, required quality of service and communicate effectively. Then it should be improved with bank management. And the opinion clearly shows the existence of a relationship from the Customer. This means that if the trust of a bank increases, then customer relationship commitment will increase with service quality and communication effectiveness. So that the achievement of good communication between customers and banks can increase bank trust by improving service quality and communication effectiveness from banks to customers.

### II. LITERATURE REVIEW

Before discussing how to process and analyze data, in this reference reference, several definitions related to how to maintain Bank customer loyalty will be explained. There are several things that Managers need to pay attention to in dealing with customers. To increase customer relationship commitment, the bank must increase consumer confidence, communicate with each other and communicate effectively so that it becomes an important issue for the company's activities.

Then based on the background of the formation of consumer loyalty, we can identify various kinds of problems that must be of particular concern regarding customer activities. According to the theory, there is a meaningful communication between consumer responsibility and relationship efficiency, service quality to

customers and consumer confidence with bank customer promises. Before discussing how to process and analyze data, in this library, several definitions related to how to maintain customer loyalty are described in the Bank.

There are several things that Managers need to pay attention to in dealing with customers. To increase customer relationship commitment, the bank must increase customer trust, communication effectiveness and service quality. So that service quality, communication effectiveness and customer trust with bank customer commitment are important issues for the company's operations. Then based on the background of the formation of consumer loyalty, we can identify several issues that need to be considered in managing consumers. Usually, theoretically there is a significant relationship between communication effectiveness and customer commitment, service quality with customer customers and between customer trust and bank customer commitment.

Then based on the background of the formation of consumer loyalty, we can identify several issues that need to be considered in managing consumers. Usually, theoretically there is a significant relationship between communication effectiveness and customer commitment, service quality with customer customers and between customer trust and bank customer commitment. The research conducted by Ayahqih Alfikri with a research entitled "Efforts to Maintain Customer Loyalty for Deposit Products at Bank Muamalat Indonesia Pangkalpinang Branch" in the results of his research explained that in an effort to maintain customer loyalty for deposit products at the Pangkalpinang branch by paying special attention, providing good service to customers, create mutually beneficial relationships between banks and customers, carry out continuous follow-up, offer attractive products to maintain customer loyalty, and provide support/appreciation to loyal customers.

The obstacles faced were intense competition, economic conditions, differences in customer satisfaction levels, limited funds for customer maintenance, far access roads from the office to customers' homes, lack of customer data and information such as banks not having customer phone numbers, customer dishonesty, do not know the customer's home address.

#### *A. Bank Treatment to Customers/Bank Customer Loyalty*

From previous research conducted by Ahmad Mardalis (Journal of Ayahqih Alzikri, 2018, DOI: 10.18860/ed.v6i2.5752, volume 6, no.2, 2018 entitled "Achieving Customer Loyalty" examines the elements of determining customer loyalty and explored where the review is most important for a bank in developing a loyalty initiative.

The existence of excellent and excellent service treatment from the bank to customers that makes customers happy, safe and comfortable so that the quality of the bank is very good in the eyes of its customers and is the key to the success of the bank itself in improving the quality and quality of banking.

Banks as financial institutions that play a role as a form of improving the country's economy. Changes in economic conditions have an impact on the customer's purchasing power decision process. According to Subagyo (2010:13), a collection of news articles, <http://xerma.blogspot.com/2014/04/pengertian-loyalitas-nasabah-menurut.html?m=1> said that customer loyalty is a consistent repurchase of a brand by customers. The word loyalty is always used every day among businessmen and marketing, especially banking.

#### *B. Communication Effectiveness Assessment*

It is said to be effective communication if there is a reciprocal relationship / good communication between the communicator as a provider of appropriate information to consumers. So that consumers feel satisfied and do not believe the information provided. Neeru Sharma (2014:156) in the journal Agustinus Philipus Peppy Fernandez (2020), [www.stiepasim.ac.id](http://www.stiepasim.ac.id) said that customer agreements are determined in the form of: (1) communication effectiveness, (2) service quality and (3) trust (trustworthiness). ), states the most important among relationship efficiency, service quality and consumer confidence.

Consumer trust is the capital for banks to maintain the quality and quality of banking so that customers continue to use bank products properly and smoothly.

### III. RESEARCH METHODOLOGY

This research is descriptive exploratory and carried out with a normative approach. Explorative in nature by conducting field research in its implementation at the bank office, because this study aims to gain knowledge about service quality as the most important element seen by customers to make a purchase, this quality is closely

related to customer satisfaction. So the repurchase of goods or services offered, commitment to consumer relations is very influential with Communication Effectiveness, Service Quality and Trust.

#### IV. DISCUSSION

Effective communication of the right information is essential for successful communication. A financial advisor can be successful in his communication if he is able to provide correct information. So that information as an investment is provided through a communication language that is easy to understand.

Communication indicates a technically and functionally qualified advisor. Communication is the most important element to improve service quality. High communication skills are needed to convince his clients.

From these conditions, success in communicating can create customer perceptions of the quality of bank services. The success of communication and communication agreement of a bank engaged in banking financial services is very strong. As a result, the relationship between advisory clients is so strong. An advisor in providing financial services must successfully communicate with customers in order to instill self-confidence and reduce the perception of the occurrence of dangers/threats.

The emotional element of a good counselor when the client feels comfortable with him. Listening and understanding client needs including effective communication skills. Effective communication is one of the beneficial things that is obtained through the success of financial services. The success of communication is associated with the planned relationship between the advisor and his client.

Through regular contact with customers, answering their questions, allocating participation in an orderly manner through advisory investigations. These problems build trust in the relationship. Excellent communication quality can increase customer trust. Good relationships have the power to increase customer perceptions of the quality of bank services. Explaining various aspects of investment choices with useful information for customers, providing knowledge to customers through easy-to-understand grammar.

In marketing communication there are three goals, to disseminate information to influence purchases, attract consumers and increase audiences to make repeat purchases. Consumer responses form certain information awareness. Influence to make purchases and shape audience patterns into behavior with the hope of repurchasing.

The purpose of communication, trying to find out more, trying to compare, take action, buy or not buy, repurchase or switch brands. Service quality, service with every action is basically intangible and does not result in the ownership of anything.

We need to understand the meaning of service according to economic experts, the service aspect of the business world is closely united with bank services. Service as a stand-alone product. Meanwhile, trade and industry is an addition to the types of goods that are attached to the main product.

Service quality has several dimensions: **Faster** relates to time which describes speed and convenience. **Cheaper** is related to the cost of the product/costs that must be incurred by consumers. **Banking performance** is related to the criteria for the usefulness of various bank services, customer considerations when buying. **Features** as a second aspect of performance add basic functionality with development options. **Reliability** relates to success over a certain period. Measurement of the suitability of goods is related to consistency based on customer desires. **Durability** as a measure of the lifetime of a product with product durability. Serving Ability as speed, friendliness, comfort with improvement. **Aesthetics** as a feature is subjective with personal considerations and individual choices. So the aesthetics of the Bank's services are related to personal feelings, including certain characteristics. Perceived Quality is subjective and relates to the consumer's conscience to own the product.

We can know that one of the gaps due to incorrectly providing services, namely: The gap in customer desires seen from the administrative manager. in the field, bank administration managers do not understand the wishes of their customers well so that it affects customers because managers are not responsive to customer desires for excellent service to their customers.

Gap management view is able to understand customer desires. But not with certain clear performance standards. then three factors arise, first there is a full agreement by the manager on the quality of services provided to customers, secondly there is a shortage of resources, and the third is an excess of demand. Example: Bank management asks its staff to provide fast service without setting standards. The particular gap between the quality of service delivery is partly a result of the occurrence of the gap. Examples: lack of training for bank employees,

do not understand their work, work capacity exceeds the limit unable to meet the work standards set by Bank management.

One of the risks faced by the Bank is when the agreed commitments are not fulfilled. As a result, customer misunderstandings can occur in assessing the quality of the Bank's services. Good interaction between banks and customers is the first step to achieve the Bank's level of service quality. High communication intelligence is required to ensure customer trust.

Customer loyalty commitment is influenced by several variables. The commitment of consumer relations to the excellence of bank services is related to effective interaction, service quality and trust. Communication as a benchmark in achieving high service quality. High communication skills are very necessary to ensure the trust of consumers. This will form customer commitment.

What we need to pay attention to about banking organizations is to provide quality services to consumers. Several points that can be applied to customer service are the sector of effective interaction/relationship, service quality, and trust in bank customer agreements, so that there is a relative consideration of the incidence, distribution and interaction of social and psychological factors. So it is necessary for the managing banking organization to introduce the main criteria of service for all parties who provide banking services in order to be able to show good services/services as desired by consumers/customers.

#### *A. Bank Treatment To Customers*

What we need to pay attention to about banking organizations is to provide quality services to consumers. Some of the points that can be implemented for customer service are the sector of effective interaction/relationship, service quality, and confidence in the bank's consumer agreement, so that considerations are found on the relative incidence, distribution and interaction of social and psychological factors. So it is necessary for banking organizations that managers need to introduce the main criteria for services for all those who provide banking services so that they can show good service/services as desired by consumers/customers.

The principle that we need to understand in the field of commitment is that Directors and Employees have an agreement to communicate well with each other, strive to maintain communication with the Bank and remain loyal to the Bank. The Bank provides clear information about the capital saved by the Customers, Directors and Bank Employees. The bank never doubts the benefits and risks of an investment. The service quality of bank managers and employees is able to please and appreciate consumers.

In the field of consumer confidence, banking directors and employees are active in convincing their customers. Banks can keep their promises in customer funds, banks must be honest. Banks can be trusted, but consumers believe or do not believe in the Bank.

Consumer agreements, effective interactions/relationships and service quality and customer confidence. Without us realizing it, many customers have very strong agreements with banks when customers invest their funds. Due to the high number of customers at the same time assuming that the bank's relationship/interaction effectively is very large, the Bank provides services with such a high quality of service. As a result, consumer confidence through banking is so great. Most banks pay attention to the implementation of fostering customer commitment, communication, about service delivery and very good consumer confidence. So the three variables are considered to have satisfied bank customers, so that customer commitment can increase sharply.

#### *B. Communication Effectiveness Assessment*

From the author's observations that the effectiveness of bank communication to customers is quite good with indicators stating that the bank provides clear information about the investments invested by customers. So the indicator of communication effectiveness is ranked the highest about customer satisfaction served by the bank. The indicator with the lowest value is the indicator that the bank never hesitates to explain the advantages and risks of an investment.

Meanwhile, the assessment of service quality can be seen from the assessment parameters regarding aspects of service quality and has a good performance in investing data. Then the quality of customer service gets the highest rating of bank customer satisfaction. If the assessment is low on the quality of the bank. Banks are interested in their environment, so it implies that banks do not care about their environment.

We need to know the assessment of customer trust, the biggest assessment of customer trust is the indicator that consumers are so comfortable and safe injecting/saving their money to the bank. So with this indicator of customer trust, it can be seen that the highest rank for bank customer satisfaction is seen. While the lowest assessment in the variable of customer trust is that consumers become suspicious of the bank that covers up useful information about investment funds.

To assess customer relationship commitment, customers try their best to establish genuine communication with the bank. The customer commitment indicator is the highest ranking of customer satisfaction served. Meanwhile, the lowest rating is in customer commitment, stating that customers pay attention to alternative bank substitutes. This means that consumers are trying to really believe in the bank.

## V. CONCLUSION AND RECOMMENDATION

The final touch of the business, is very important to be understood by banking managers. The correlation between the effectiveness of communication with the commitment of bank customers is positive. This means that the effectiveness of communication has a strong relationship with bank customers. In conclusion, there is communication that matches the consumer agreement and effective interaction/relationship. We recommend that bank management must improve continuously with the commitment of bank customers through improved communication, service quality and customer trust remain a concern so that success in business can be realized.

The suggestions from the author are:

- a. There is an effective and good approach to customers so that customers are interested in the banking products offered/provided.
- b. Provide excellent and excellent service to customers so that customers feel close, satisfied and comfortable in the bank environment.
- c. Conducting good and accurate communication with customers so that customers believe in the information provided

<sup>1,2,3,4</sup> Departemen of Education, Universitas Pendidikan Indonesia, Bandung, Indonesia

### Abstract

*Nano influencers as one way of tactics that can be considered in digital marketing activities. In the era of the Covid-19 pandemic, the phenomenon of nano influencers is increasingly popular as a brand. Nano Influencers can be closer to ordinary people, many gaps with macro influencers, nano influencers can fill the void. Nano Influencers have the advantage of building relationships to create two-way interactions with their followers. The research method used is a descriptive qualitative method with online observation types of a number of nano influencer activities through Instagram, TikTok and YouTube in the period december 2021 to March 2022. Based on the flow of attention, interest, search, action and share, nano influencers are able to produce content that is able to attract attention, and interest of netizens. Not only the selection of interesting photos, influencers are also able to promote brands with copywriting that sells without eliminating the character and personal branding of the nano influencers themselves. With the nano influencers of regional local products can be lifted so that regional msme will be more advanced and msme will increase sales during the pandemic.*

*Keywords— Nano Influencer; Strategic Promotion; MSME.*

---

### I. INTRODUCTION

The development of the use of the Internet has shown rapid progress. According to the Directorate General of Aptika, in 2021 internet users in Indonesia will increase by 11 percent from the previous year, from 175.4 million to 202.6 million users. This increase needs to be balanced with a good understanding of activities in the digital space. One of the factors that influence the increase in internet users in Indonesia is the growing and diverse social media so that consumers can choose the social media they like.

The number of internet users in Indonesia has increased by 27 million or an increase of 16% from 2020 to 2021. Internet penetration in Indonesia reached 73.7% in January 2021. There are 170 million social media users in Indonesia in 2021. The increase in social media users from 2020 to 2021 increased or 6.3%. In 2021, social media users in Indonesia are equivalent to 61.8% of the total population in Indonesia in January 2021. In 2021 internet connection users on cellular phones are 345.3 million. The number of connection users from January 2020 to January 2021 cellular in Indonesia increased by 4 million users. The number of cellular connections in Indonesia in January 2021 is equivalent to 125.6% of the total population.

The average daily internet usage through any device is approximately 8 hours. For the use of social media through any device approximately 3 hours. Social media platforms that are widely used in Indonesia in 2021 are YouTube as much as 93.8% of the total population, Whatsapp as much as 87.7% of the total population, Instagram users as much as 86.6% of the total population and Facebook users as much as 85.5% of the total population. The summary of Facebook users in Indonesia in 2021 is 140 million people, with the percentage of Facebook users being female as much as 43.9% and Facebook users being male as much as 56.1%. The summary of Instagram users in Indonesia in 2021 is 85 million people, with the percentage of female Instagram users being 52.4% and male Instagram users 47.6%.

The widespread use of social media is no longer just a facility for the needs of personal existence. Today, social media has turned into a business tool. One type of business that is developing on social media is digital marketing called influencers who market products by providing positive testimonials and invitations to purchase in the form of images and videos through social media (Wibawa, C., et.al, 2021). The presence of influencers on social media has a strong impact on society for businesses to convince consumers to buy the products being sold. Influence is the ability to influence, change one's opinion and behavior (Evelina & Fitrie, 2018). An influencer is currently a way of promoting products by influencing many people in various media and platforms as well as through social networking. The phenomenon of social media influencers currently has a major influence on people's consumption patterns. Influencers can influence people to follow the current style. Social media influencers influence people in buying promoted products. Social media influencers make people believe in a certain brand more as much as 51% (Edelman, 2018). The trust built by social media influencers increases the

number of purchases of a particular brand.

With the emergence of various types of social media, Instagram occupies the third position as the most used application, and its users reach 79% of the total population in Indonesia (Putri, N., Nadhifa, L., & Senalasari, W., 2021). The current use of Instagram is considered to be an alternative for business people to market products digitally, as many as 81% of people use Instagram as a search for products or services, besides that every month as many as 130 million people press content with the shopping category on Instagram. 90% of consumers get information digitally through Electronic Word-of-Mouth (E-WOM), and 46% make their purchase decisions based on positive comments on influencer social media accounts. (C. M. K. Cheung and D. R. Thadani, 2012). Influencer Marketing is one of the effective ways of developing a strategy using E-WOM by Social media influencers to influence consumers. Currently, marketers trust and recognize the huge potential of Influencer Marketing, 89% of them agree with the effectiveness of these marketing activities.

Social media influencers are divided into several types, namely macro influencers, micro influencers and nano influencers, of the three types of influencers depending on how many followers follow the social media influencer. Currently the price of macro influencer services is increasing, the presence of micro and nano influencers seems to be a cooling breeze. Nano Influencers are those who have followers below 20 thousand, while Micro Influencers have a number of followers from 20 to 100 thousand, and Macro Influencers whose number of followers is above 100 thousand. Nano influencers are individuals who tend to have high engagement even though they have not many followers. However, the content they share is usually already known by their small community and from experiences or activities in their daily fields that are liked by the audience. Having a small audience makes it easier for nano influencers to interact in two directions. Thus, the message conveyed will be accepted by their followers more easily. Nano influencers are one way to give an authentic impression about the product or service that will be promoted.

## II. LITERATURE REVIEW

### A. MSME

MSMEs are a business group with a large quantity and also have a big role in maintaining economic stability. MSMEs are one of the pillars of the people's economy. Micro, Small, and Medium Enterprises are one of the main pillars of the national economy that must obtain the main opportunity, support, protection and development as widely as possible as a form of firm alignment with people's economic business groups, without neglecting the role of Large Enterprises and State-Owned Enterprises.

Declining economic growth after the COVID-19 pandemic hit this country, the number of poor and unemployed people continues to increase and the quality of life and quality of human development has decreased as an impact that can be felt in everyday life. On the business side, MSMEs, which are one of the important pillars in the national economy, have also suffered a heavy blow due to the COVID-19 pandemic, far more severe than the previous crises that hit this country.

The COVID-19 pandemic poses significant obstacles for MSME actors in every business area, which includes sales, funding, operations, and supply, with the main constraints being in the sales (44 percent) and funding (27 percent) areas. The main obstacle to sales lies in the declining purchasing power of the people, the existence of health protocols that hinder sales and the lack of physical interaction. As the backbone of the Indonesian economy, MSMEs have an important role in the recovery process after this global pandemic and recession.

## *B. Influencer Marketing*

An influencer is someone who has a large number of followers (followers) and has a strong influence on followers such as celebrities, public figures, youtubers, and others (Tokopedia. 2019). Along with the increasing number of social media users, influencer has become a new profession that is quite promising. Well-known brands are starting to look for influencers who are widely followed on social media. One way to promote a product that is quite effective during the COVID-19 pandemic is to use influencers. Influencers themselves are divided into four (Ismail, 2018), namely:

- a. Mega-influencers are the category of social media influencers with the highest ranking. They usually have more than a million followers. Mega-influencers are often more famous than influential. They have a very diverse audience with different topics of interest. Examples are Atta Halilintar, Ria Ricis, Raffi Ahmad, Prilly Latuconsina, Tasya Farasya and many more.
- b. Macro-influencers are influencers who are a level below mega-influencers. One way to identify macro-influencers is by their follower count, usually ranging from 100,000 to one million followers. Macro-influencers typically gain fame through the internet itself, either through vlogging, or by producing funny or inspiring content. For example: Putu Aditya (Videographer), Denis Adhiswara, Rachel Goddard and many others.
- c. A micro-influencer is someone who has between 1,000 and 100,000 followers. Micro-influencers focus on a specific niche or area and are generally considered to be industry experts or topic specialists. Micro-influencers have stronger relationships than regular influencers. This is often driven by their perception of being the opinion leader of a topic. Micro-influencers, not the average celebrity or influencer, and often have a very uniform audience.
- d. Nano-influencers are a relatively new type of influencer.
- e. They tend to have fewer followers than micro influencers, which is less than 1,000 followers. A nano-influencer is someone who has influence in their community.

Social media Influencers who have few followers usually give an inclusive feel or have a close relationship with followers like close friends. They have their own topic that makes the charm so distinctive. Nano Influencers are social media influencers who have an audience of no more than 10,000. Currently, local MSME products have started to be widely promoted by nano influencers. One of the positive impacts of the COVID-19 pandemic is that social media users continue to increase, so nano influencers are one of the promotional tools for MSME products in marketing. One of the factors that make MSMEs want to use nano influencers is the affordable price, original content, authentic content, easy to collaborate with, and most importantly the close interaction with consumers. Thus, the influencer marketing strategy can be said to be effective during the COVID-19 pandemic. Nano Influencers are also said to look more natural when they are promoting so that they are convincing, in other words the influence is not much, but the opportunity to have an impact on the audience is quite large.

According to Sugiyama and Andree (2011:79) AISAS is a model designed to approach the target audience effectively by looking at changes in behavior that occur especially related to the background of internet technology advances. AISAS stands for Attention, Interest, Search, Action and Share where a consumer pays attention to a product, service, or advertisement (Attention) and generates interest so that a desire arises to collect information (Search) about the item. Consumers then make an overall assessment based on the information collected, then make a decision to make a purchase (Action). After the purchase, the consumer becomes a conduit of information by talking to other people or by posting comments and impressions on the Internet (Sharing).

According to Chen Ya li and Huang Tao Zhe (2012), AISAS is a development of AIDMA (Attention, Interest, Demand, Memory, Action) which is used in traditional marketing. Meanwhile, in the digital era, internet users can easily access information or share information, so the AIDMA model has changed to AISAS (Attention, Interest, Search, Action, Share).

### C. Platforms for influencers

The use of social media platforms today makes it easier for influencers to act as intermediaries between potential buyers and brands. Many platforms have included online shopping and affiliate features. With the collaboration and partnership features on Tiktok, Instagram and Youtube, it is easier for brand owners to find the influencers needed in product promotion. With the features that have been prepared, certain product brands will first screen influencers based on the audience they have directly from within the application. On the other hand, influencers are offered a variety of ways to attract traffic to interactively promoted product pages, one of which is a sticker tool on Instagram.

Video content through Youtube has great power for digital marketing campaigns. Through videos uploaded on YouTube, video influencers can be well documented (Xio, Min. et.al, 2018; Angulo, 2016; Chu, 2009; Haryacha, 2014; Main, 2017; Smith, 2014). Video content posted by influencers on YouTube is a potential way of quite effective marketing (Fidelman, 2017). The continuous presence of YouTube influencers on this popular social platform, and the active role of consumers in following content consumption on YouTube, namely the influencer marketing model tends to be different from the traditional advertising or celebrity spokesperson model (Xio, Min. et.all, 2018). In order to explore how the perceived credibility of the information affects consumers' attitudes towards the video and the brands/products mentioned in the video, the exploration should begin by examining the antecedents related to the perceived credibility of the information.

Marketing carried out by social media influencers on the Instagram (IG) platform provides the opportunity for direct conversations with followers without any restrictions on location, time and barriers to communicate with their influencers. Social media influencers online promote the brand and in turn helps in product promotion, followers will usually follow the direction of the influencer. Influencers help in creating brand relationships with their customers. By being honest and using their followers' preferences, we can say that they have some kind of influence who will believe what they say (Buyer, 2016), this phenomenon makes this technique so effective. Traditional marketing techniques are mostly focused on mass consumers, unlike nano influencer marketing which only focuses on target audiences who are really interested in buying products that consumers need. Apart from using Youtube and Instagram, Tiktok is currently one of the most popular platforms. Currently Tiktok is used to explore creativity in making short videos. The trend of short videos uploaded on Tiktok makes Tiktok one of the promotional media for a product by influencers. In Indonesia, there are already a lot of social media influencers who started from Instagram and are now starting to explore TikTok.

TikTok's development is highly innovative and its algorithms globally are rapidly moving proving its appeal to the youth market (Weimann & Masri, 2021) as it mostly features short-form videos to create excitement and encourage creativity among its users. TikTok is a fast growing social media platform that gained 200% market share in the span of two years in April 2019 (Wang, 2020) compared to other social media sites. Chang (2020) states that the development of social media platforms will be both a threat and an opportunity. Just as TikTok is a platform that is currently growing which is still not much researched regarding its effect on marketing communications, consumer behavior, and purchase intention compared to other platforms, namely; Facebook, Twitter and Instagram. Thus, this study focuses on three dimensions of TikTok advertising: emotional, entertaining, and informative. Emotional advertising touches the hearts of its audience through stories and personal experiences, both positive and negative. Entertaining ads consist of video content that is funny and pleasing to the eye. Finally, informative advertisements provide detailed information about products and brands (Clarisse Jane G. Araujo, G.,J.,C., et.al, 2022).

### III. RESEARCH METHODOLOGY

The paradigm used in this research is constructivism paradigm. Social constructivism is a perspective that is usually seen as an approach to qualitative research (Creswell, 2009). Through the constructivist paradigm, research seeks to know and understand. Patton (2009) qualitative analysis was carried out in three ways, namely in-depth interviews and open format interviews, direct observation, and the use of secondary data from other sources. The time of this research is set from December 2021 to March 2022. The first stage of this research is interviews with MSME actors. Data was collected through in-depth interviews with 15 trusted sources using the snowball sampling method. Through the constructivist paradigm, researchers are trying to find out and understand how the nano influencer strategy is to increase the promotion of Micro, Small and Medium Enterprises (MSMEs) during the Covid 19 Pandemic :

- a. Observation methods, namely by searching directly from observing consumer behavior, and marketing strategies carried out by Micro, Small and Medium Enterprises (MSMEs). Collecting data on Nano Influencers that are often used by Micro, Small and Medium Enterprises (MSMEs), and seeing how they affect consumers.
- b. The data research method used is a qualitative descriptive method, where the research analyzes the

Nano Influencer phenomenon which is increasingly in demand by the public. In this descriptive qualitative method, it is done by answering research questions from Nano Influencers who have social media Instagram, TikTok and Youtube, so as to produce a clear description of the role of Nano Influencers in the promotion strategy of MSME products. In addition, the data obtained were also generated from library studies and research literature studies in journals obtained from the internet.

### III. RESULT / FINDING

The use of social media can now be maximized as a promotional media that can reach faraway areas. Since social media, Instagram has released the Instagram For Business tool, making it easier for business people to get data, promote products, and make product innovations. To support business processes, both large companies, as well as MSMEs carry out promotional strategies using influencers. For the selection of influencers, we don't even see the number of followers. With limited funds owned by MSMEs, during the COVID-19 pandemic, sales are not as good as before the pandemic. Even when they will spend promotion costs, they really calculate how the impact will be for the products being sold. Each influencer has their own way of convincingly promoting a product which can later be used as a testimonial to increase the trust of their followers.

Based on research conducted by Sociabuzz (2018) on 82 marketers, both marketers for brands, agencies, startups and online stores stated that the trend of influencer marketing is increasing. The purpose of using influencer marketing is to increase brand awareness (98.8%), educate target consumers (62.7%), increase sales (50.6%), increase followers (39.8%) and Search Engine Optimization/ SEO (25.3%). According to Hera Laxmi (2018) Influencer marketing is one of the important instruments in conducting brand campaigns. This is due to its soft selling nature and has the persuasive power to influence the audience in a subtle way.

The role of influencers is currently being calculated, because it can be one of the marketing strategies in building trust between products and consumers. The largest market share for Instagram, TikTok and Youtube is currently controlled by the millennial generation, namely the Y generation and the Z generation. Currently, the millennial generation is being targeted, because the behavior of purchasing goods is in accordance with marketing communications. According to Sugiyama and Andree (2011:), AISAS is a model of an effective communication approach to the target audience who is so close to the advancement of internet technology. AISAS stands for Attention, Interest, Search, Action and Share. In the AISAS technique, before the target audience makes a decision, consumers first look at the advertisement (attention) so that interest arises. During the information search process, consumers will weigh and compare with competitor products before deciding to buy (Action). After consumers buy products, consumers will provide information about the contents of the product in the form of comments, testimonials or product reviews through social media (Sharing). With this sharing activity, it will become a reference for other consumers in purchasing decisions.

Through marketing activities carried out by influencers, it will accelerate the target consumer to be achieved. An influencer will usually influence his followers to make a purchase. An influencer must have content that is relevant to a particular brand. An influencer has a duty to provide a review that can increase trust in a product, with that trust in addition to increasing followers, consumer confidence will also increase. This can be seen from the interaction between followers and influencers in the comments column of social media owned by the influencer. Content created by influencers must be interesting, diverse, and different from other influencers. Influencers must display a lot of interesting photos, tutorial videos, unboxing and other videos in a humorous style. Consumers usually prefer influencers to be warm, present, have a sense of humor, are good at educating products and can give confidence in the products being reviewed.

Nano influencers are influencers who have fewer followers than micro influencers. A nano influencer is usually someone who has influence in their community. Study found that Nano Influencers can have a positive impact on buying interest for MSMEs. The content provided by Nano Influencers is usually more original and has its own characteristics. Although when creating promotional content, Nano Influencers usually use modest properties. However, there are several things that need to be evaluated using Nano Influencers, namely the credibility of the information still needs to be reviewed, because Nano Influencers are still limited in scope. Apart

from this, Nano Influencers are usually not people who are experts or excel in certain fields, but they have the advantage of having a close relationship with their followers on social media.

The content created by Nano Influencers tends to have originality, because they use their daily lives to be used as content. Followers tend to be happier with original content uploaded by Nano Influencers. Social media users feel happy to see content, talk about content and disseminate information provided by Nano Influencers both on social media and in their immediate environment. Followers realize that Nano Influencers are not someone who has high credibility, but Nano Influencers have the power to build closer relationships with their followers to interact with each other.

## V. CONCLUSION AND RECOMMENDATION

The use of Nano Influencers in the last two years can be a promotional strategy for MSME players to increase product sales during the COVID-19 pandemic. With the use of Nano Influencers by MSMEs, at least it reduces promotional costs which are usually more expensive when using Influencer Macros. Nano Influencer is more effective for less followers, not so large areas. The involvement between Nano Influencers and followers becomes a trust factor that influences the messages conveyed by Nano Influencers. The use of Nano Influencers can be said to be effective in achieving MSME targets in promoting their products.

This research is limited to the perspective of Nano Influencers who have collaborated with several Nano Influencers who have interests in campaigning for MSME products. Researchers did not conduct research comparing Mega, Macro, Micro influencers in this study. This is done because of the Nano Influencer phenomenon which is considered interesting to study. Chen Ya li and Huang Tao Zhe (2012), stated that AISAS is a development of AIDMA (Attention, Interest, Demand, Memory, Action) which is used in traditional marketing. Meanwhile, in the internet era, internet users can easily access information or share information, so the AIDMA model has changed to AISAS (Attention, Interest, Search, Action, Share). Previous research conducted by Hendriyani et al (2013) showed that AISAS can be applied to explain consumer behavior. This study was conducted to test the AISAS model in explaining consumer behavior of Twitter users towards BB (America's Bread and Bagel) products. The results of this study indicate that there is a significant correlation between AISAS variables, except for the Action and Share variables. The following are indicators of the AISAS variables in this study, namely as :

Table 1.

Variable	Item
Attention	Nano influence promotes products on social media such as YouTube, Instagram and TikTok Nano influence product reviews on Instagram, Tiktok and Youtube Nano influence provides promotional information on popular social media Nano influence tries to interact with his followers to establish closeness
Interest	Nano influencers will provide product information that they review in the form of videos and photos that will be shared on their social media Nano influencers will provide information related to purchasing the reviewed product, where to buy it, contact number that can be contacted Nano influencers will provide promos for the products being reviewed, such as discounts or free meals for birthdays, happy hour discounts and other promos.
Searching	Nano influencers will share product information on their social media timelines Nano influencers will share product purchase addresses Nano influencers will share product purchase contact numbers
Action	Nano influencers will provide information on how consumers buy products that have been reviewed The nano influencer will provide a link on social media for the product being informed Nano influencers will always mention social media every time they promote the product they are reviewing Nano influencers will greet followers who faithfully follow them during product live on social media Nano influencers will provide promos for the products being reviewed, such as discounts or free meals for birthdays, happy hour discounts and other promos.
Sharing	Nano influencers will renew the experience while consuming the product Nano influencers will update When visiting the outlet the product is sold Nano influencers recommend reviewed products to buy

## ACKNOWLEDGEMENTS

Thank you to the journal editor who has proposed double-blind reviewers, and therefore, this manuscript has been reviewed and accepted.

### Abstract

*The Village Revenue and Expenditure Budget (APBDesa) indicates the performance and ability of the village government in financing its administrations. But, The village government does not manage its budget properly and organizes financial reports manually. The Financial and Development Supervisory Agency (BPKP) has developed an application to improve the quality of village financial management and reduce cases of manipulation of financial statements. However, several villages have not used the financial system (Siskeudes) due to human resource capabilities. Therefore, this study aims to determine the implementation of Siskeudes to support the Financial Performance of villages in Bayongbong. This research is descriptive qualitative with primary and secondary data sources. Researchers used village documents, interviewed village officials, and observed village governments in Bayongbong to obtain research data. The finding is the implementation of the village financial system in Bayongbong was fair. Unfortunately, several obstacles, such as logging errors and the lack of ability of human resources to operate the system. In addition, human resources in several villages lack knowledge about the flow of the financial report. The conclusion is the implementation of Siskeudes in Bayongbong was implemented, but has not supported by the capacity of its human resources. Therefore, the village government needs to choose a Siskeudes operator who understands the financial system or improves the capability of human resources through training because village financial reports reflect the performance of the village and local government.*

*Keywords— Financial performance; Government Financial Reports; Implementation of the Village Financial System; Village Financial Management.*

### I. INTRODUCTION

According to Law No. 14 of 2014 in the government financial system in Indonesia, article 1 paragraph 1 explains that the village is a legal community unit with certain territorial boundaries that have the authority to regulate and manage government affairs. The managing village finances establish the regulation about rights and obligations following community service needs (Agus & Madya Widyaswara, 2015). This management starts from the planning, implementation, operational, and reporting stages for one fiscal year from January 1 to December 31 for the current year period (Hartanti & Yuhertiana, 2018). To develop village financial management policies, the Financial and Development Supervisory Agency (BPKP) created an application to improve the quality of village financial management (BPKP, 2015). In addition, this application encourages the sustainability of village development with the management of village funds for the welfare of the village community. The Financial and Development Supervisory Agency (BPKP) implemented the Village Financial System (SISKEUDES) in July 2015 and December 2018. Currently (BPKP, 2015), the implementation of the SISKEUDES application reaches 93% or 69,707 out of 74,954 villages throughout Indonesia (Fauziah & Biduri, 2021).

The application (SISKEUDES) has advantages, namely complies with government regulations, makes it easier to manage village finances, makes it easier to use applications, has an internal control system, and has implementation instructions and application manuals. However, the weakness of the SISKEUDES application system is complicated to understand and use the application because it was just released. Even the village secretaries who have been using this application since two years ago are still having difficulties in operating it. The Village Government in Garut Regency, precisely in Bayongbong District, applies a financial system application for 18 villages. During the use of the financial application (SISKEUDES) some villages chose to re-manage and compile financial reports manually. Because employees feel the application slows down the preparation of village financial reports. According to the Bayongbong District, it is difficult to operate the application due to the lack of training for village employees to operate the application. Thus, the human resources of the village government in the sub-district lack control in managing village finances. However, the sub-district government continues to continuously socialize financial management using SISKEUDES to improve the skills and knowledge of the apparatus in operating SISKEUDES and avoid manipulation practices in village financial management. Three villages use the SISKEUDES application optimally in managing financial reports. The success of the three villages is supported by employees who have a bachelor's degree in economics education. Referring to Sahusilawane (2021), the finance system uses technology more effectively to support the financial reporting in the village. Then, it measures the performance of financial more effectively. The research from Musyaffi & Muna (2020) revealed that the SISKEUDES improve financial performance because the financial information reported is relevant to the regulations. Moreover, digital transformation in the process of reporting financial statements in the public sector is very concerned with the quality and reliability of data, especially on data accountability. Therefore, the data is analyzed and used by the local government in managing needs (Agostino, Saliterer, & Steccolini, 2022). This problem encourages researchers to analyze the description of the application of the SISKEUDES application in supporting village financial performance in the Bayongbong District.

## II. LITERATURE REVIEW

### A. *Implementation of Financial Management*

Implementation is a program carried out by an institution on the basis of certain policies (Rani, 2019) In the implementation of facilities and infrastructure to support the planned programs. Policy making on the one hand is a process that has a bottom-up logic, in the sense that the policy process begins with the delivery of aspirations, requests, or support from the community (Hudson, Hunter, & Peckham, 2019; Wahyuni, 2021). While policy implementation on the other hand has a top-down logic, in the sense of reducing abstract or macro policy alternatives into concrete or micro-actions. In this study, the implementation of policies related to the SISKEUDES application. The policy refers to the village financial management regulations in force at that time, namely the Minister of Home Affairs Regulation Number 113 of 2014 concerning Village Financial Management. The Village Financial System Application (SISKEUDES) is an application developed and implemented by the Financial Supervisory and Supervisory Agency (BPKP) to improve the quality of village government financial management (BPKP, 2015). In-Law Number 6 of 2014 village finances are money or property in connection with the implementation of village rights and obligations. The rights and obligations to generate income, financing, and expenditures must be regulated in fair and transparent village financial management.

Village financial management is a process or form of village financial management which includes four stages (BPKP, 2015), namely planning or the stages formulating various activities to be carried out in the village concerned. The village government carries out planning in the context of village development by its competence. The second step is the implementation of village finances as an activity of the existing planning process and in its implementation step by step in the village development process. Furthermore, the administration is a process of preparing reports and grouping all activities that have been carried out. Finally, village financial reporting is the last stage in village financial governance. When all processes are completed, they will be prepared as a financial report and reported to the concerned party.

### B. *Financial Performance*

Financial performance is the determination of an organization and its employees periodically based on criteria, standards, and targets for predetermined operational effectiveness (Ariyanti & Alfatih, 2018). Meanwhile, according to Rudianto (2013) financial performance is the achievement of company management in the form of results or achievements for managing company resources effectively over a certain period (Trisnawati, Achyani, & Ulifiati, 2021). Meanwhile, according to IAI (Indonesian Institute of Accountants), efficiency or financial performance is the ability to control and manage company resources (Wahyuni, 2021). Financial performance is an achievement of the company through various activities to review the extent of the company's success within a certain period.

### C. *Research Framework*

Many factors affect village financial performance in implementing the village financial system or SISKEUDES, namely the level of education, training, and the internal control system (Sari & Biduri, 2021). Those factors relate to the competence of Human Resources (HR), and the utilization of technology affects the quality and performance of financial reports. Meanwhile, data quality, top management support, and system quality do not affect the quality of village financial reports (Fauziah & Biduri, 2021; Musyaffi & Muna, 2020). Referring to Sahusilawane (2021), the finance system uses technology more effectively to support the financial reporting in the village. Then, it measures the performance of financial more effectively. Moreover, digital transformation in the process of reporting financial statements in the public sector is very concerned with the quality and reliability of data, especially on data accountability. Therefore, the data is analyzed and used by the local government in managing needs (Agostino, Saliterer, & Steccolini, 2022).

## III. RESEARCH METHODOLOGY

This study uses a qualitative-descriptive method to systematically describe the phenomenon of the effectiveness of the implementation of SISKEUDES to support village financial performance. This study uses two types of data which include primary and secondary data. Researchers collected data by interviewing sub-district of Bayongbong for 4 people (sub-district head, sub-district secretary, head of the economic and development section for two persons). The data processing technique uses the Miles and Huberman model with three activities namely; (1) Reduction means summarizing, choosing the main points, putting aside the important things, and looking for themes and patterns because the data collected in the field is quite large and must be documented carefully and in detail. Therefore, it will provide a clear picture and make it easier for researchers to collect more data; (2) Presentation of data occurs after collapsing. It presents short descriptions, charts, relationships between categories, flow charts, and narrative text for qualitative research; (3) The final stage of the research process to understand the analyzed data is the Conclusion. Data processing begins with structuring the data in the field, then shrinking it into a unified form and classifying the data. (Creswell & Poth, 2017). This research

## IV. RESULT / FINDING

The implementation of the village financial system takes place through an entry process that is consistent with existing transactions, then produces output in the form of legal documents and administrative reports. There are five

steps in village financial management or the Siskeudes application, namely planning. The village government plans a program or activity very well so as not to cause harm to the village government. Good planning indicates transparent and responsible village financial management in accordance with statutory regulations. In the planning stage, the village government issues Village Regulations and Village Head Regulations as a reference or guideline for implementing the Village Development Planning Deliberation (MusrenbangDes). In general, village governments hold deliberations from October to December about activities for the following year. This deliberation process was attended by the village head as the leader and person in charge, the village secretary, the Village Deliberation Agency (BPD), and village institutions including The Institute of Community Village (LPMD), Indonesian Ulama Council (MUI), and the head of a neighbor as well as other community. Discussions in the deliberation include the program for next year, problems that have occurred, identification of community needs, and others. The district government evaluates the results of the deliberation, then the village government publishes priority programs that are approved by the district government to be implemented for one fiscal year.

The implementation of the Village Revenue and Expenditure Budget (APBDes) includes all implementation activities in one fiscal year. At the program implementation stage, everything underlies the process of purchasing goods and services, preparing cash books, and other things. The initial step in the implementation stage is to implement and make the Village Budget Draft (RAPBDes). Then, the government socializes it to the participants about the amount of the budget for the program implementation on year. Next, carry out comprehensive activities with the parties involved in the village development program. The village government formed an Activity Management Team (TPK). The agreement of the Village Head and village institutions present. The main task of the team is responsible for the procurement of goods and services (Barjas). In addition, the village government and its employees carry out their main tasks and functions in terms of Requests for Funding and the disbursement of Village Funds for one fiscal year. If there is a change in priority program activities such as the occurrence of natural disasters, special local government policies in terms of reducing and increasing the Village Fund Budget in the middle of the activity. Therefore, the village government implements its budget amendment only once and no later than three months or the end of September before the end of the fiscal year. Therefore, the Village Government must immediately socialize the revised of budget to the community. In general, the implementation stages of all villages are the same, the difference is the programs from each village itself because each village has its activities and priority programs.

The administration is the process of recording transactions for one year to manage the processes resulting from budgeting activities and budget execution. In the process of receiving, spending, and administering the Village Fund Budget with the General Cash Book (BKU) which is the result of all transactions that occur, starting from small transactions to large transactions. Furthermore, there is a Bank Subsidiary Book which is used to record receipts and spending of funds in bank accounts. Generally, in the form of the bank statement concerned. There is also a tax supplementary book used to record income from taxes and also used to record (out) taxes received and will be deposited by the treasurer. After all, bookkeeping is prepared, then use the SISKEUDES application in inputting each activity by the village government SISKEUDES operator who is in charge of operating administration for Management. This stage depends on the transactions that occur in the budgeting or planning and the implementation stage. Therefore, the results will automatically be recorded in administration during it well recorded. Reporting reflects the activities carried out on the results of activities during one fiscal year. The village government makes financial reports per semester in the second week of July. This report is referred to as the budget realization report. The government submits a budget realization report to the relevant agencies to be accountable to the district government. Compilation of realization reports through the Siskeudes application by operators and village administrative staff. Then, the village secretary validates the realization report. Meanwhile, the village as the leader approved the report.

Accountability is the final process of financial management activities. The government is responsible for all outputs to all related parties. Accountability covers all Financial Reports of activities as a whole for one fiscal year in contrast to the Reporting Stage which is only one semester or half a year from the Village Financial Report. Accountability begins with Monitoring Evaluation by authorized officials by applicable laws and regulations. Monitoring and evaluation officers hold accountability for all activities, both physical and non-physical. Then, the officer reviews the results of the work and compares the results in the field with the notes on the Realization of Activity Implementation Reports, Budget Realization Reports, and Notes on Financial Statements (CALK). This accountability begins at the end of the fiscal year until March of next year. The results of this Financial Report are operated by the Siskeudes operator in the Siskeudes application and monitored by the Head of the Village Finance Division which is then ratified by the Village Secretary and approved by the Village Head as Village Government Accountability. However, only Cikedokan, Ciela, and Mulyasari villages make Village Government Accountability Reports (LPPDes) with SISKEUDES.

## V. CONCLUSION AND RECOMMENDATION

The conclusion of this research is implementation of SISKEUDES in Bayongbong District has been going well according to the following stages;

- a. Planning, carried out by deliberation to determine what programs or activities are priorities for one fiscal year and as well as drafting and formulating Village activity budgets for the next one-year period, have been implemented very well. every village in the Bayongbong sub-district;
- b. Implementation, in the process the implementation is by applicable regulations and is carried out very well and carefully by each village in Bayongbong District so that the desired program becomes a reality and can be carried out;
- c. Administration, in the administrative process, the village apparatus is concerned as the operator of SISKEUDES in compiling revenues and expenditures that occur in existing Village programs and compiling according to the order of Village programs that occur during one fiscal year,
- d. Reporting and Accountability, the Village Government reports the results of activities to the District Agencies and the Inspectorate by the agency's needs and must be by what they want, and in the Villages in Bayongbong District there are no problems in terms of accountability, the difference is accountability to the community and institutions -village institutions carried out by Cikedokan Village, Ciela Village, and Mulyasari Village by making Village Government Accountability Reports (LPPDes) as a form of Village Government transparency to the general public so that there are no suspicions and allegations of misappropriation of Village Funds.

## Does The Self-Assessment System Run To Collect The Entertainment Tax In Garut?

M. Alkautsar<sup>1</sup>, E.Harahap<sup>2</sup>, M.D Ungkari<sup>3</sup>, and G.D.Surachman<sup>4</sup>

<sup>1,2,3,4</sup>Faculty of Economy, Universitas Garut, Garut, Indonesia

### Abstract

*The entertainment industry in Garut has massive potential to increase the tax revenue as a tourist area in West Java. Unfortunately, the self-assessment system is slightly effective because the truthfulness level of entertainment entrepreneurs is descending, and the number of entertainment entrepreneurs among tax officers is not proportional. This research aims to investigate the tax collection by the government (Bapenda) for entertainment taxpayers. The method in this study uses a descriptive qualitative method. Primary and secondary data were obtained by interviewing tax collectors and using documents related to entertainment tax in Garut from Bappenda. The results showed that the entertainment tax collection system in Garut with a self-assessment system was following established procedures. However, the system is less effective because the taxpayer's understanding of the entertainment tax and self-assessment system is not fully understood. Then, taxpayers have low awareness until they do not report their taxes. In addition, entertainment entrepreneurs whose business licenses have expired do not extend their licenses. Then, the government cannot fully detect it because of the number of officers and the entertainment business imbalance. The conclusion is that the self-assessment system method for collecting entertainment taxes is not yet fully effective due to factors of understanding, awareness of taxpayers, and the insufficient human resources of tax collectors. Therefore, Bapenda requires to socialize the procedure for the self-assessment system and the importance of paying entertainment tax to entertainment industry entrepreneurs. And add more workers to be involved as officers to provide supervision to taxpayers*

*Keywords— Entertainment tax; local tax revenue; self-assessment system*

### I. INTRODUCTION

In managing regional development, it necessary financial sources originating from the region concerned, then it is necessary to have several financial policies taken by the government to regulate the concepts of regional development. Natawijaya (2010) classifies the regional income into two main sources, namely income from the central government including state taxes, customs duties, subsidies, and state donations. Second, income originating from the region itself includes regional taxes, regional companies, regional original income, mandatory contributions, and other revenues. The Law No. 32 of 2004 concerning the Financial Balance of Central and Regional Governments, each region is increasingly required to finance the implementation of government activities and regional development through increase regional original income. The sources of regional revenue i.e regional original income, balancing funds, regional loans, other legitimate regional original income.

Tax as a sources of revenue for a country that is paid by the public. Tax is also a collection fee that can be imposed by the government based on the provisions of laws and regulations, tax is a manifestation of the participation of the community or taxpayers to directly and jointly carry out tax obligations needed in state financing for national and regional development. Therefore, the government continues to explore each potential and optimize revenue. Regional autonomy is a consequence of reforms that must be faced by all regions in Indonesia. Therefore, learning is needed in each region to be able to turn a challenge into an opportunity for the progress of the region

Garut as an autonomous region in West Java tries to increase its regional income every year, because the weak capacity of local revenue affects economic capacity. This district whose revenues are financed by donations and assistance from the central government through general allocation funds and special allocation funds. Therefore, to maximize and increase the revenue or fiscal resources of a region, local governments must increase and have the power to collect levies and local tax revenues. Entertainment tax is a tax for entertainment activities, such as shows, games, and others. The entertainment referred to (a) movie shows, (b) art, music, dance and/or fashion shows, (c) beauty contests, bodybuilding and the like, (d) exhibitions, (e) discotheques, karaoke, nightclubs, pubs, bars, live music (live music), music with disc jockeys (DJ), (f) circus, acrobatics and magic, (g) billiard and bowling games, (h) horse racing, (i) motorized vehicles, (j) agility games, (k) reflexology and fitness center, (l) massage parlors and steam baths/spa; and, (m) sporting events. Therefore, entertainment is the potential sectors for the local government of Garut Regency to be utilized in order to assist economic development in Garut. The Regional Regulation Number 01 of 2016 sets up different rate for entertainment tax i.e 20% for entertainment tax; 75% for fashion shows, beauty contests, discotheques, karaoke, nightclubs, massage parlors and steam baths/spa, tariffs; 10% of folks entertainment; and any kind of facilitate in karaoke or music studio for 10%. From the data obtained, the achievement of targets and the realization of entertainment tax in Garut since 2014 and 2018:

Table 1. Target and Realization of Garut Regency Entertainment Tax Revenue 2014-2018

Period	Budget Amandement (Rp)	Realization (Rp)
2014	1,000,000,000	1,013,880,633

2015	1,250,000,000	1,274,191,039
2016	2,120,000,000	2,219,966,395
2017	3,200,000,000	3,270,710,409
2018	4,200,000,000	5,173,749,937

The table indicates that during five years the revenue of entertainment tax achieved the target. However, this achievement. However, some entertainment business are not registered as taxpayers at the Regional Revenue Agency. Therefore, the realization of entertainment tax does not reflect the reality. Due to many factors namely the ineffectiveness of self-assessment, low honesty from entrepreneurs, and the lack of employees who handle entertainment taxes. Based on the problem, the researcher wants find the collection system of entertainment tax in Garut.

## II. LITERATURE REVIEW

### A. Regional Tax

Mardiasmo (2016) refers to Law No. 28 of 2007 concerning the third amendment to Law Number 6 of 1983 concerning General Provisions and Tax Procedures, are: "Compulsory contributions to the state owed by individuals or entities that are coercive in nature based on the act, with no direct compensation and used for the purposes of the State for the greatest prosperity of the people". The regional tax is a mandatory contribution to the region from an individual or entity that is coercive under the law, without getting direct compensation and is used for regional needs for the greatest prosperity of the people (Mardiasmo,2016). Siahaan (2016) revealed that regional tax is an individual or entity contribution for the local development.

### B. Entertainment Tax

Entertainment tax is a kind of tax on the provision of entertainment. Entertainment is all kinds of spectacles, shows, games and/or crowds enjoyed for free. The object of the entertainment tax is the provision of entertainment for a fee. What is meant by entertainment includes, among others, film shows, arts, music and dance performances, discotheques, karaoke, nightclubs, billiard games, agility games, massage parlors, steam baths, and sports competitions. In the entertainment tax, not all entertainment arrangements are taxed. There are several exceptions that are not subject to tax, namely the provision of entertainment that is free of charge, such as entertainment held in the context of weddings, traditional ceremonies, and religious activities.

### C. The Entertainment Tax Collection

Halim (2015) tax collection is an activities starting from collecting data on objects and subjects of taxes or levies, determining the amount of taxes or levies owed to collecting taxes or levies to taxpayers or levies as well as supervising their deposit. Siahaan (2016) revealed that entertainment taxpayers who take entertainment in the district or city concerned are required to register their business with the district or city Regional Revenue Service (i.e Bapenda). The taxpayer must fill out the registration form clearly, completely and return it to the tax officer, then the tax officer records the registration form and data collection in the taxpayer master list based on the serial number used as the basis for issuing the Regional Taxpayer Identification Number (NPWPD).

According to Siahaan (2016) the procedures for payment and collection of taxes are (1) Payment of the Entertainment Tax owed is made to the regional treasury, bank or other place appointed by the regent or mayor in accordance with applicable regulations. Payment must be made using a Regional Tax Payment Letter (SSPD), it must also be made in full. The installments of tax payments as well as delays in tax payments can be made with the approval of the regent or mayor and must be done regularly; (2) The collection of Entertainment Tax is carried out if the tax payable is not paid after the payment is due. Tax collection is carried out by first giving a warning letter or warning letter or other similar letter as the beginning of the tax collection action. If the amount of tax payable that must be paid is not paid within the period specified in the warning letter, it will be billed with the issuance of a Forced Letter. After the issuance of the Forced Letter, the tax collection action can be continued with confiscation, auction, prevention and hostage-taking if the taxpayer still does not want to pay off his tax debt.

### D. Research Framework

Sumarsan, (2013) explains that taxes have a very important role in the life of the state, especially in the implementation of development because taxes are a source of state income to finance all state expenditures. Currently, with regional autonomy, it is hoped that regional development will grow quickly and evenly. Therefore, each region must maximize the potential in it to increase regional income. According to Siahaan (2016) in accordance with Law Number 28 of 2009 Article 1 points 24 and 25, Entertainment Tax is a tax on the implementation of Entertainment. While what is meant by entertainment is all kinds of spectacles, performances, games, and or crowds enjoyed for free. The determination of the entertainment tax is carried out using a self-assessment system, where taxpayers are given full trust to calculate, calculate, pay and self-report the entertainment tax payable using the Regional Tax Return (SPTPD).

Siahaan (2016) for the entertainment tax procedure, taxpayers who already have a Regional Taxpayer Identification Number at the beginning of each tax period are required to fill out a Regional Tax Return. The Regional Tax Return is filled out clearly, completely and correctly and signed by the taxpayer or his proxy and submitted to the mayor/regent or appointed official in accordance with the specified time period. Generally, the SPTPD must be submitted no later than fifteen days after the end of the tax period. Based on the Regional Tax Return submitted by the taxpayer and data collection carried out by the Regional Revenue Service officer, the regent/mayor or an official appointed by the regent/mayor determines the entertainment tax payable by issuing a Regional Tax Assessment Letter (SKPD).

Halim (2015: 502) defines collection as "a series of activities starting from collecting data on objects and subjects of taxes or levies, determining the amount of taxes or levies owed to collecting taxes or levies on taxpayers or levies as well as supervising their deposit".

With this entertainment tax collection system and procedure, it should be a means to facilitate optimal entertainment tax collection so that entertainment tax collection can make a greater contribution to local revenue. However, in this study, a study was conducted on the collection of entertainment taxes, because based on the data there were several problems, namely that there were several entertainment entrepreneurs who were not registered with the Garut Regency Bapenda due to several factors, including the ineffectiveness of the entertainment tax collection system, the honesty factor of the organizers, entertainment and the lack of local revenue agency data collection employees. The analyzes used to solve the existing problems are collection analysis to find out the real system and procedures.

According to the variable that has been determined, namely the collection of entertainment taxes, the dimensions of these variables are systems and procedures. This system and procedure as a control of the implementation of entertainment tax collection carried out by local revenue agency, so it has indicators that play an important role. In the system, a self-assessment system is carried out, there are Regional Taxpayer Identification Number, Regional Tax Return, Local Tax Deposit. While in the procedure there are indicators of data collection/registration, calculation, deposit and billing.

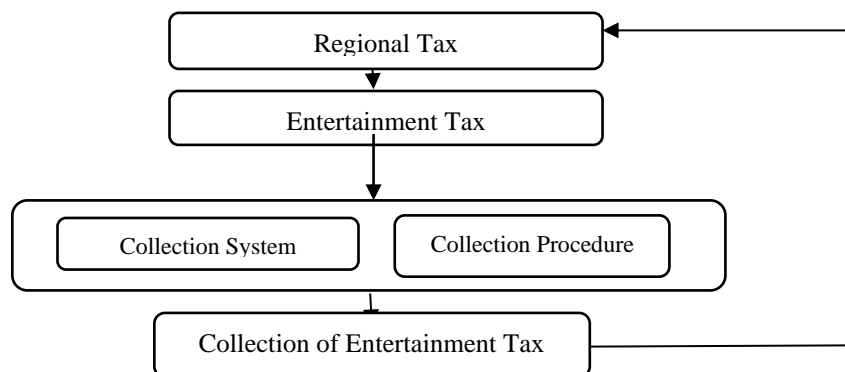

Fig.1 Research Framework

### III. RESEARCH METHODOLOGY

The methods in this research is descriptive analysis. The type of data use qualitative data that obtained from The Regional Revenue Office of Garut Regency. The data source used primary and secondary data relate with entertainment tax. The data collection technique are conducted with literature review, documentation, and interviews. Interview according to Sugiyono (2015: 231) is to find a statement and answer from a certain topic related to certain things through 2 or more people. The researcher used the sample as the object to be studied or as a source of data and the sample was taken using purposive sampling technique. Purposive sampling according to Sugiyono (2017:218) is a sampling technique for data sources with certain considerations. This particular consideration, for example, is the person who is considered the most knowledgeable about what we expect, or maybe he is the ruler so that it will make it easier for researchers to explore social objects / situations and can represent the characteristics or characteristics of the population to be studied. The samples are presented in the following table:

Table.2 Purposive Sampling on the Entertainment Taxpayer sample

No.	Tax Payers	Criteria
1	Cinema XXI	>1 year paid
2	Time Zone GP	>1 year paid
3	Mandi Bola GP	>1 year paid
4	Kolam Renang Lembur Kuring	>1 year paid

The data analysis using the growth, average of entertainment tax, estimated annual entertainment tax, growth rate, effectiveness of tax rate, and contribution. The location of research conducted in Regional Revenue Office at Otista Street No. 278 Garut.

Data analysis in this study, which uses descriptive methods with qualitative data types

- a. Data reduction
- b. Data display
- c. Conclusion drawing/verification

The steps taken in carrying out data reduction are researchers collect various information, theories and documentation studies related to the calculation of potential, growth rate, effectiveness and contribution of entertainment tax, realization budget and target of entertainment tax revenue, Regional Tax Revenue and PAD, as well as an overview regarding the Regional Revenue Agency of Garut Regency. The next stage is to present data on targets and realization of Regional Taxes, regional income and Entertainment Taxes for the last five years from 2014-2018. Then analyzed to assess its potential. The presentation of the data is done by making a chart or table which will then be explained in a narrative manner. In the final stage, the researcher will explain the research results in the form of a description and assisted with graphs to make it easier to draw conclusions from the research results and answer the problems contained in the research.

#### IV. RESULT / FINDING

##### A. *Entertainment Tax Collection System in Garut Regency*

### 1. Collection of Entertainment Tax

The collection Entertainment Tax cannot be left to third parties. However, it is possible to cooperate with third parties in the tax collection process, including printing tax forms, sending letters to taxpayers, or collecting data on tax objects and subjects. Activities that cannot be collaborated with third parties are activities for calculating the amount of tax payable, supervising tax payments and collecting taxes. In the field results, it is also appropriate that there is no tax collection carried out by third parties, only the taxpayer and the tax authorities who supervise. The procedure to collect the entertainment tax reflected in Fig.1:

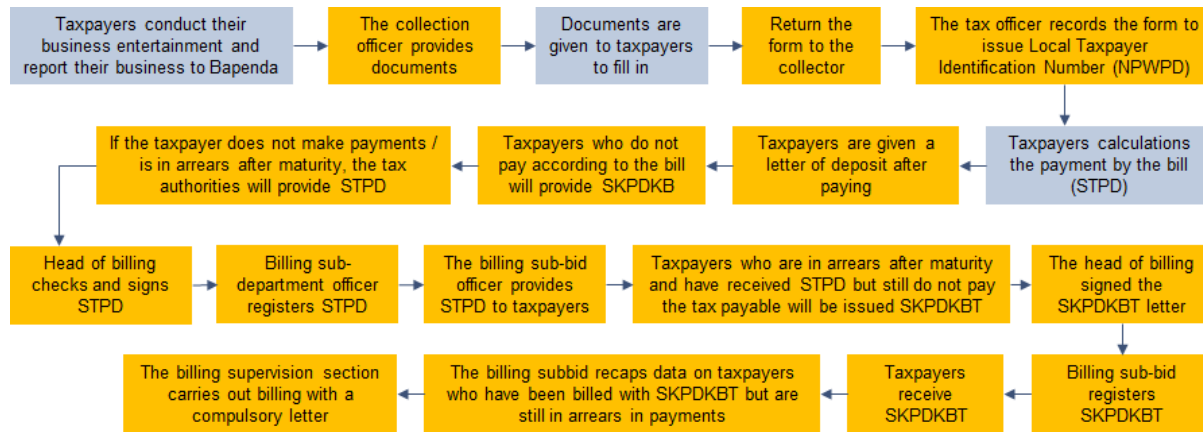

Fig.2. The procedure of entertainment tax collection

### 2. Tax Determination

Entertainment tax is part of district or city taxes in accordance with Regional Regulation No. 01 of 2016 Article 32 concerning Regional Taxes. The entertainment tax rate is set at 20%. specifically for entertainment in the form of fashion shows, beauty contests, discotheques, karaoke, night clubs, massage parlors and steam baths/spa set at 75%. 10% for folk/traditional arts entertainment.

Based on the results of interviews with tax officers at the Regional Revenue Agency of Garut Regency, the entertainment tax collection system in Garut Regency is a self-assessment system. This is confirmed by a statement from Mr. Wardi Sudrajat S.IP which states "the entertainment tax collection system in Garut Regency uses a self-assessment collection system, namely the authority determined by the taxpayer himself in calculating, calculating, paying and self-reporting the tax payable". Meanwhile, according to interviews in the field, not all taxpayers studied stated that they knew about tax collection using the self-assessment system, but there were some taxpayers who still did not fully understand the entertainment tax as a whole and only knew the outline or not in detail.

### 3. Tax Assessment Letter

Based on the Regional Tax Return (SPTPD) and data collection carried out by the officer appointed to determine the tax payable after five years of audit by issuing a Regional Tax Assessment Letter (SKPD), the SKPD must be paid off by the taxpayer no later than thirty days after the receipt of the SKPD by the taxpayer. taxpayer or other specified period. If the tax payer exceeds the stipulated time or is due, the taxpayer does not or underpays, he/she will be subject to a 2% penalty.

### 4. The Strategy of Government

Bapenda also implements an entertainment collection system, according to the results of interviews there is a control system, namely by control or (supervision) in accordance with Regional Regulation No. 01 of 2016 concerning Regional Taxes that the Regent or appointed official is authorized to supervise proof of payment in the form of receipts/tickets/ an equivalent document given to the user/tenant/who enjoys the services or facilities owned or controlled by the taxpayer.

In the implementation of entertainment tax collection, one of the efforts made by the Regional Government of Garut Regency is the socialization which is held once a year including other local taxes. The place for the socialization was carried out at the Garut Hall by inviting all taxpayers. This is a problem because in the field there are several taxpayers who complain about the socialization carried out by the Garut Bapenda which tends to be less effective and does not specifically discuss entertainment taxes, but local taxes in general. And the short socialization time triggers taxpayers to still not understand the explanation of the socialization.

## V. DISCUSSION

During the research, with the imposition of sanctions for taxpayers who do not comply with their taxes, but these sanctions are not effective because some taxpayers consider the sanctions to be less strict and with the implementation of a self-assessment system that should calculate, pay and report taxes owed by the taxpayers themselves will but government also collects taxes by officers, officers who always come to taxpayers and collect taxes owed, should be a good means of implementing entertainment tax collection, but there are still many entertainment providers who are

not registered. This is because taxpayers are not fully aware of the detailed systems and procedures related to the entertainment tax, one of Bapenda's obstacles regarding taxpayers is the awareness of paying taxes. Taxpayers feel that the tax that must be paid is from their pocket while they do not collect taxes from consumers, especially for small taxpayers.

Taxpayers' awareness is still low on their tax debts or in paying taxes. Whereas tax is one of the obligations that must be paid by the community to finance general expenditures in an area. (Erianto: 2018). The theory that supports tax collection according to Mardiasmo (2016) is the theory of devotion, as a devoted citizen, the people must always be aware that paying taxes is an obligation. Also according to Adam Smith (1776) in his book *Wealth of nation* one of its contents is the principle of equality (the principle of balance with ability or the principle of justice): tax collection made by the state must be in accordance with the ability and income of the taxpayer. The state should not act discriminatory against taxpayers.

Simple systems, mechanisms (procedures) and procedures for the implementation of tax rights and obligations are characteristic and features of the self-assessment system. Especially with regard to increasing the balance of rights and obligations for taxpayers in a fair and equitable manner so that taxpayers can carry out their tax rights and obligations better, it can also increase regional revenue along with increasing taxpayer compliance and awareness (Mardiasmo, 2016).

## VI. CONCLUSION AND RECOMMENDATION

Based on the results of research and discussions that have been carried out regarding the analysis of entertainment tax collection at the Garut Regency Regional Revenue Agency, the authors can conclude that the entertainment tax collection system in Garut Regency uses a self-assessment system. However, some taxpayers lack an understanding of the entertainment tax system as a whole.

The overall collection procedure is carried out in accordance with existing theories and regulations. The collection of entertainment tax using self assessment system and the government as supervisor. Unfortunately, the revenue of entertainment tax does not reflect the real value. Due to some entertainment business are not registered as taxpayers at the Regional Revenue Agency. This case indicates the ineffectiveness of self-assessment, low honesty from entrepreneurs, and the lack of employees who handle entertainment taxes.

Therefore, researchers suggest that the government should provide counseling about systems and procedures that are carried out in a simple way. Hence, these systems and procedures can be implemented more effectively. Furthermore, the government should not compare doing a pick test on major holidays or on holidays, because in collecting the entertainment tax the income cannot be generalized to normal days. The Garut Regency Revenue Agency is expected to be more active in carrying out outreach to places of entertainment that have not been registered, such as fitness venues, motorcycle races, sports competitions, exhibitions and arts, music, dance/fashion because based on Regional Regulations the place of business is required. If the socialization is carried out, the number of taxpayers will increase and income from the entertainment tax sector will increase to the maximum. Likewise, taxpayers to be more aware of the importance of paying taxes, entertainment taxpayers are required to collect taxes directly from consumers because those who pay taxes are people who receive services for entertainment services.

## ACKNOWLEDGEMENT

### Abstract

*This study aims to identify supply chain management integration models in the automotive industry in Indonesia through supply chain agility, adaptability and alignment. Supply chain activities are a determining factor for the company's success in facing competition in the market. The speed of responding to the market, the ability to adapt to changes in the internal and external environment, as well as harmony in the production process must be integrated into all supply chain management activities. Supply chain integration connects the internal activities, processes and products within the company. The integration is becoming increasingly complex with the rapid development of technology and increasingly dynamic market needs. This research connects the company's integration process with important capabilities that must be owned by the company, namely agility, adaptability and alignment. Method was used deep in descriptive qualitative research through narrative literature review with a case study approach with focus group discussion, this research by taking case studies on several automotive companies in Indonesia. The narrative literature review is also used to analyze the theory in describing the supply chain integration model. The results of this study indicate that agility, adaptability and alignment are important elements in optimizing supply chain integration, especially in the automotive industry. The application of an integrated supply chain model at this time is suitable to be applied by companies, because this system is able to manage the integration from the internal, processes and products by managing supply chain agility, adaptability, and alignment capabilities.*

### I. INTRODUCTION

The increasingly fierce industry competition, diverse market demands, and increasing customer needs have caused customers to become more demanding with their preferences (Zhang & Chen, 2006). This happens because of changes in the market that make the product life cycle shorter, uncertain and difficult to predict (Christopher & Rutherford, 2004; Goldman, 1982). This change also makes the product introduction stage more competitive and demand volatility high. Globalization greatly affects the development of the automotive industry (Bechmann & Scherk, 2010; Spatz & Nunnenkamp, 2002) in the industrial era 4.0. Globalization creates significant opportunities (Katerina & Aneta, 2014), but at the same time, forces consumers to improve product quality (Alden et al., 2006), organizational efficiency (Ezeh, 2020; Josephine, 2014; Wokoma & Iheriohanma, 2010), and product innovation to attract customer interest and expand markets (Stefanovska & Tanushevski, 2016). This means that automotive companies must be able to be more responsive and flexible in meeting customer demands in order to compete in the market.

Significant development opportunities are created due to the influence of globalization (Ocampo & Martin, 2013), but also put pressure on producers in efforts to improve quality (Lambin & Meyfroidt, 2011; Randhir, 2016), organizational efficiency and product innovation (Petricevic & Teece, 2019; Rajapathirana & Hui, 2018) to attract customer interest and increase a wider market share. If manufacturers in the automotive industry want to succeed in winning the market, then these challenges must be able to be faced, be more flexible and able to adapt to various technological developments (Dachs, 2018; Verhoef et al., 2021) and be responsive to customer demands (Binder & Clegg, 2007).

One indicator of the assessment of the success of a company is the ability to maintain its existence. That is, the company needs to have added value or competitive advantage from similar companies or competitors (Hosseini et al., 2018; Rua & Santos, 2022). Competitive advantage is the company's ability to meet the expectations, desires, needs, income and willingness of service users (Mustaqiem et al., 2021; Prasilowati et al., 2021). If the conditions of competition are low or even there is no competition, then the product is not needed by the company. Conversely, if the level of competition is higher, then the product becomes increasingly important in the company.

Supply chain integration in every company in the supply chain is able to affect the performance of all other supply chain members both directly and indirectly and ultimately affect the efficiency of the supply chain. productivity of the entire supply chain, as well as the company's competitive advantage (Al-Kamel et al., 2021; Latuconsina, 2021; Sukati et al., 2012). Supply chain integration focuses on the relationship between suppliers, customers, and the

company itself (Awad & Nassar, 2010; Tarifa-Fernandez & Burgos-Jiménez, 2017), which must be managed properly. How to make suppliers take responsibility for product quality, good and long-term relationships with suppliers and customers, and so that product distribution from upstream to downstream is on time to end users.

Effective and efficient supply chain management requires integration of the entire production process that goes beyond procurement (Saroja & Yadav, 2013), production and logistics activities (Kim et al., 2020). Supply chain integration is becoming very important but previous research shows that there is a lack of understanding regarding supply chain integration in practice (Paul Childerhouse & Towill, 2000; Sahay, 2003). There have been quite a number of studies related to supply chain integration and supply chain agility, adaptability and alignment, but there are still few that link the two in the formation of models. This study aims to identify supply chain management integration models in the automotive industry in Indonesia through supply chain agility, adaptability and alignment.

## II. LITERATURE REVIEW

### A. *Supply Chain Agility*

The ability of the company internally and externally is very important in its relationship with key suppliers and customers to adapt and respond quickly to market changes as well as potential and existing problems (Greeff & Ghoshal, 2004; Teece, 2018). Supply chain agility can be achieved by synergizing various forms of flexibility from all parties in the supply chain (Ariadi et al., 2021; Hoek et al., 2001; Irfan et al., 2019), thereby empowering individual members to respond more effectively to highly volatile markets. Due to the fact that supply chain agility is an externally centered outcome or concept, as a capability, not a competency (Li et al., 2008; Shekarian et al., 2020). Agility is the speed with which a company responds to key supply chain outcome measures (Chan et al., 2017; David M. Gligor et al., 2015), such as reduced manufacturing lead time (Lebosse et al., 2017), increased new product introductions, and increased levels of customer service. Agility is the result of integrating alertness to change (opportunities or challenges) both internally and externally with the ability to use resources to respond to change in a timely and flexible manner (Alzoubi & Yanamandra, 2020). Today's rapidly changing business environment makes enterprise supply chain agility an important factor influencing global business development and strategic ability to deal with change

This agility comes from four sources: organization, technology, people, and innovation (Mathiassen & Pries-Heje, 2006). Supply chain agility is considered an ability (Boubaker et al., 2019; Jermisittiparsert & Kampoomprasert, 2019), but several studies on agility indicate that agility is a competency that measures speed and flexibility (Lai et al., 2021). Agility can also be an advantage in delivering value to customers, dealing with change easily, valuing human knowledge and skills, and forming virtual partnerships. The level of agility of a company's supply chain indicates the strength of the interface between the company and its market. In supply chain agility there are several indicators, namely production time, development cycle time, frequency of new product introductions, level of customization, worldwide delivery capability, level of customer service, delivery reliability, and response to changing market needs (Bindi et al., 2021; David M. Gligor et al., 2015).

### B. *Supply Chain Adaptability*

Changes in business needs and environment require companies to be able to adapt their supply chain strategies in response to the maturity of their products and markets (Chen et al., 2012; Dasaklis & Pappis, 2013). Adaptability is the company's ability to adapt the supply chain design in response to the company's internal and external changes by modifying the supply chain (Kopanaki, 2022; Madhani, 2017). When companies try to improve their supply chain adaptability, several problems will arise such as uncertainty in quality, delivery time and costs (Angkiriwang et al., 2014; Chang & Lin, 2019). Companies are also very likely to feel the need for new suppliers that are more responsive to develop the supply chain base in an effort to reduce uncertainty.

The company's ability to adapt to these changes is carried out by responding to changes in: availability of resources, logistics infrastructure, government and environmental regulations, labor costs and worker skills (Fish, 2015; Tipping & Kauschke, 2016). The dimensions of the growing business climate must be responded to by the company's adaptability. Many government policies related to trade and tariffs both nationally and internationally are changing and increasingly complex. Meanwhile, the emergence of national security issues has increased trade barriers and tax and customs calculations. These changes make adaptation of the company's supply chain very important, because the company must be able to adapt its strategy (Jahre & Fabbe-Costes, 2005). Supply chain adaptability can be enhanced by creating product designs that are flexible and adaptable across different types of markets. The adaptability of the system includes: monitoring the world economy to identify new basic supplies and markets, using intermediaries to build new suppliers and logistics infrastructure, creating flexible product designs, and determining where products stand in terms of technology and product life cycles.

### C. *Supply Chain Alignment*

Alignment is the company's ability to align the interests of all partners in the supply chain with the interests of the company (de Man & Luvison, 2019; Narayanan & Raman, 2004). Integration of information systems throughout the company's supply chain and optimal coordination are important for the supply chain alignment process (Zulkarnain

et al., 2020). Companies must align internally and externally with all supply chain partners. Aligned business functional processes include procurement and purchasing of materials, production processes, marketing, and logistics throughout the supply chain to gain competitive advantage (Power, 2005; Samawi et al., 2019; Saroha & Yadav, 2013).

Efforts to encourage supply chain alignment, such as: (1) system integration and easy access to information on plans, forecasts and sales among supply chain partners (Lotfi et al., 2013), (2) defining the roles and responsibilities of supply chain partners (Ryu et al., 2009), (3) aligning incentives with supply chain partners to maximize partner performance and benefits (Norrman & Naslund, 2019), and (4) share risks, costs and benefits equitably with supply chain partners to improve supply chain performance (Chakraborty et al., 2014; Whitten et al., 2012).

#### D. Supply Chain Integration

Integration is the biggest challenge in supply chain management. The integration that is meant is not only the internal scope of the company, but includes the external scope with all supply chain partners from upstream to downstream (Saeed & Kersten, 2019). Supply chain integration also does not involve a particular dominance, but is the merging of companies and activities in their supply chains through information. Supply chain integration is an implication of close cooperation between buyers and suppliers, joint product development, and development of information systems that facilitate the flow of information (Power, 2005; Prajogo & Olhager, 2012). The key to a company's success in achieving competitive advantage is effective supply chain integration. The purpose of integration between companies with suppliers and consumers is to create and coordinate supply chain processes in a way that is difficult for competitors to imitate (Koufteros et al., 2010). This supply chain integration is based on a division of activities that occur in the supply chain, companies and consumers. Based on the level of structure, supply chain integration is divided into three levels, namely the functional level, internal level and external level, each of which relates to consumer, manufacturing, distribution and purchasing issues (Felea & Albăstroi, 2013). Meanwhile, based on the dimensions that surround it, supply chain integration is divided into consumer integration, information integration, distribution and logistics integration, supplier integration and purchasing integration (Msimangira & Venkatraman, 2014).

Fig. 1. Supply chain integration model (Source: Setiawan & Suhardi (2005), modified by researcher)

The direction of integration in the supply chain is the company's inclination towards suppliers and or consumers. Whereas what is meant by the level of integration is the breadth or narrowness of the company's integration range towards suppliers and or consumers. Some companies decide not to integrate much with consumers and suppliers and thus have a narrow degree of integration, while others integrate broadly with consumers and suppliers following a wide degree of integration. There are companies that integrate in a balanced way both towards suppliers and consumers. However, certain companies are still undergoing one-way integration. Determination of direction and level of integration aims to determine the strategic position of the company. The higher the level of integration, in the sense that the reach to suppliers and consumers is wider, the greater the potential benefits. When companies integrate and act as a single entity, their performance will increase throughout the supply chain.

### III. RESEARCH METHODOLOGY

This research uses deep in descriptive qualitative research through narrative literature review with a case study approach with focus group discussion. This study aims to make a descriptive, systematic, actual and accurate description of the process regarding the facts, characteristics and relationships between the phenomena being investigated. The case study research process is carried out through: (1) developing the concept of determining the case, and designing a systematic data collection, (2) prepare, collect, and analyze data; and (3) designing a supply chain integration model.

The sample which is the unit of analysis in the case study is taken from three companies that are included in the top five companies with market share in Indonesia in January-February 2022 according to Gaikindo, namely PT

ABC, PT XYZ and PT PQR. The selection of these three companies is considered capable of representing the automotive industry in Indonesia because they have a total market share of 61.2 percent. The data collection technique was carried out through a literature study by taking annual reports and sustainability reports of PT ABC, PT XYZ and PT PQR for the last five years, then carried out an analysis related to the development of operating strategies and supply chain strategies that have been carried out by each company.

#### IV. RESULT / FINDING

The COVID-19 pandemic that has hit the world has changed the global order, including major changes in technology, politics, regulations, social, economic, and environmental fields. Prior to the pandemic, the global production system underwent globalization where the production supply chain was spread across various fields to take advantage of specialization, economies of scale, labor supply, proximity to raw materials, and proximity to final markets (Brakman et al., 2020). But with the pandemic, the situation has reversed. Having supply chains spread across the globe carries a critical risk when the flow of goods across countries is bottlenecked (Park et al., 2020).

After the pandemic, various industries will build resilience by building supply chain ecosystems that are more concentrated in the regional and even national scope (Golan et al., 2020), no longer scattered in various countries. The problems that occurred were both in terms of the decline in consumer purchasing power due to the economic crisis to the difficulty of export-import transactions due to health and safety factors between countries during the pandemic (Halimatussadiyah et al., 2020). However, the Industrial sector is still the largest contributor to the national GDP in 2020, which is 17.89%. This figure increased when compared to 2019 of 17.58%. Import export performance in 2020 was a surplus of 14.17 billion US dollars. The realization of investment in the industrial sector in 2020 is Rp. 72.9 trillion. One of the most important industrial sectors in the development of a country is the automotive industry (Saber, 2018). This is due to an increase in the use of cars, an increase in car production and car exports worldwide. Indonesia is the largest motor vehicle market in ASEAN, Indonesia's relatively low Car Ratio of 99 cars per 1000 population indicates the automotive industry has great potential to grow in the future (Fig. 2).

Fig. 2. Motorcycles and Car Sales Volume (Source: Gaikindo (2021), modified by researcher)

The growth of the manufacturing sector in Indonesia in the second quarter of 2021 was supported by the automotive industry. However, the automotive industry still has major challenges in terms of supply chains, especially material supply for both domestic and global needs.

PT ABC, which is one of the automotive companies with the largest market share in Indonesia, currently has a production capacity of two hundred and fifty thousand units of vehicles per year, with a domestic content level ranging from 75%-85% which is an important added value of the company's presence for national industry. The company's products have been exported to eighty countries in Asia-Pacific, Middle East, Latin America, Africa, and the Caribbean. In an effort to increase competitive advantage, PT ABC entered into an alliance with PT XYZ. The two companies began to build an alliance since 1967, in 1998, PT. ABC acquired a controlling stake in PT. XYZ. Since 2004, the two companies have cooperated in vehicle research and development. The collaboration between the two Japanese manufacturers has agreed to make the small car segment the main weapon in its global strategy.

In controlling its supply chain to meet domestic and global needs, PT ABC builds partnerships with local producers by ensuring that all products contribute and add value to the domestic industry. The five types of cars produced already have more than 75% local content and will continue to strive to increase the level of local content by focusing on localization of the upstream industry. PT ABC conducts various competency and expertise development programs for local suppliers to be able to improve product quality that meets company standards in order to be able to face global competition.

PT PQR, which is also a competitor of PT XYZ and PT ABC, will produce a new model car that will be exported to thirty-one countries in the world which are only produced in Indonesia. PT PQR plans to move its component factories from India to Indonesia to increase the local content of models produced in Indonesia and to increase responsiveness to global product demand as a result of the production of the new model.

The three automotive companies in Indonesia carried out a similar strategy, namely increasing cooperation with local supplier partners to increase production while maintaining the spare parts used to always comply with global standards. This strategy will be successful if the company has the main capabilities, namely agility, adaptability and harmony. Supply chain integration both functionally, internally and externally from upstream to downstream needs to be owned by the company to improve the performance of the entire supply chain and achieve competitive advantage.

## V. DISCUSSION

In Indonesia, the automotive industry sector represents industry 4.0 competition, the automotive industry consists of diverse companies, complex product and technological innovation, digitalization in production and service, and increasingly intense global competition. The company will have a regional supplier network to streamline economies of scale, while logistics activities for product distribution and after-sales service are usually carried out by dealers both dependent and independent within national boundaries.

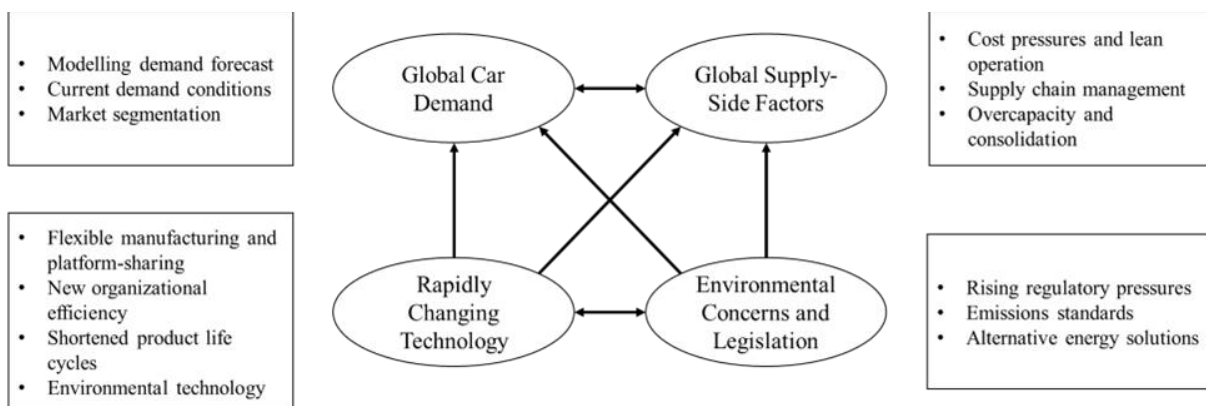

Fig. 3. Automotive industry framework (source: Schlie & Yip (2000) modified by researcher)

The supply chain in the automotive industry is basically the same as the supply chain in other industries. Broadly speaking, the levels of the supply chain in the automotive industry are parts suppliers, manufacturers, dealers, and customers (Gobetto, 2014). There are many complexities experienced in any supply chain. If there are obstacles or problems in one part of the supply chain, it will certainly affect the performance of the supply chain as a whole. Fig. 3 shows the basic supply chain structure in the automotive industry.

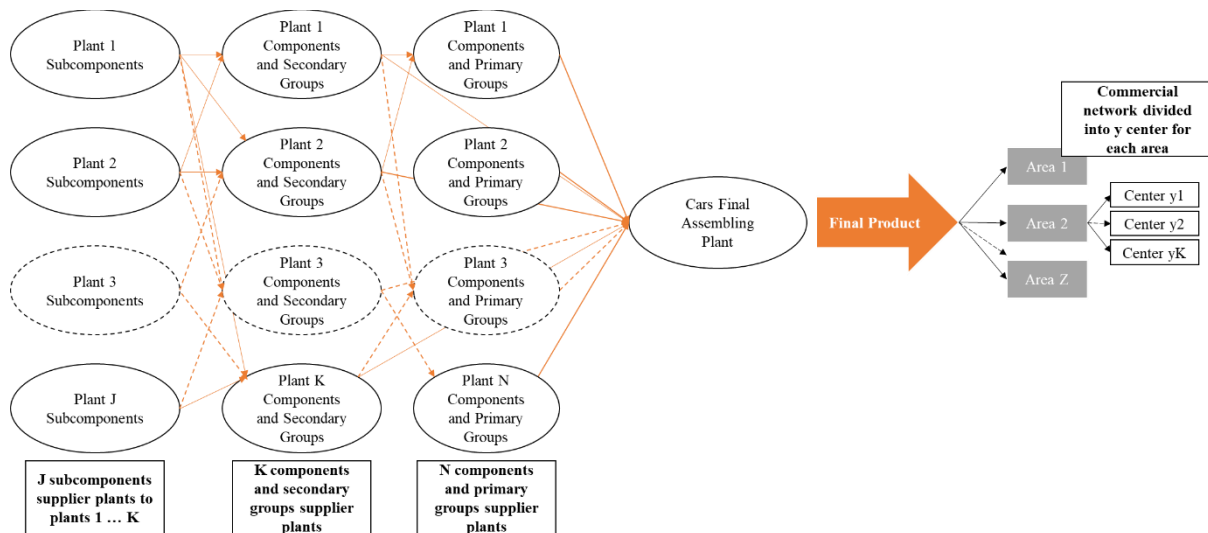

Fig. 4. Supply Chain structure in automotive industries (Source: Gobetto (2014), modified by researcher)

As representatives of the automotive industry in Indonesia, PT ABC, PT XYZ and PT PQR have strived to create a supply chain that is able to respond to market changes that are so fast and unpredictable. The development of the three companies over the last five years based on annual reports and sustainability reports shows an overview of the strategies used by the company in managing its supply chain to become a superior company. Demand and supply fluctuate faster and wider than ever before, including post-pandemic industrial developments requiring companies to be agile and responsive to changes in the business environment. An agile supply chain must respond to a variety of market situations quickly and cost-effectively, not just one of them.

The slow response in launching new products or innovations will cause the company to lose market share. So, it is important for companies to evaluate their business cycles, supply of raw materials to their logistics processes to improve their supply chain performance as a whole. Supply chain agility in the automotive industry can be seen from the ability to sense, flexibility and speed (Eckstein et al., 2014). In the case of PT ABC, the company has quite good dynamic sensing. PT ABC is able to sense short-term changes in technology, competition, demand and supply changes. Understanding and realizing dynamic patterns of change in the market is part of agility, because by understanding market patterns internally and externally, companies are able to optimally scan the environment (Aslam et al., 2018; Lu & Ramamurthy, 2011). Therefore, dynamic sensing is an important element in agility in the automotive industry. Agility also includes the company's ability to flexibly and quickly respond to short-term and temporary changes in the supply chain and the market environment with the existing supply chain (Al Humdan et al., 2020; Li et al., 2008).

Fig. 5. Supply chain agility (Source: Eckstein et al. (2014), modified by researcher)

The three automotive companies in Indonesia are intelligently using an agile supply chain to differentiate their car products from competitors. PT ABC is known for its rapid product innovation, PT XYZ is known for its cost efficiency, while PT PQR is known for its product quality. All three companies have created agile design and supply chain processes. The entry of environmentally friendly cars such as hybrids to pure electrics to Indonesia, was quickly responded by the company. So that currently PT ABC is the pioneer of electrification vehicles in Indonesia and has the most electric-powered product lines.

Supply chain agility in the company can be built through: (1) integration of information systems to partners quickly and continuously to improve market response (Verhoef et al., 2021), (2) developing collaborative relationships with suppliers and customers for business development (La Rocca et al., 2019), (3) making flexible products so that they can produce various types with only substantial differences at the end of the production process (D. M. Gligor, 2013), (4) control the supply of inventories (Kumar et al., 2019), (5) build a reliable logistics system (Suradi et al., 2020), and (6) develop human resource capabilities to carry out various company plans (Saha et al., 2017).

Adaptability describes the strategies that companies need to make their supply chains dynamic, so that they are able to meet changing needs and the rapidly changing environment from time to time. The three companies never stick to the same supply network when markets or strategies change. They continuously adapt their supply chain to suit changing internal and external needs. Adaptation is not an easy process, but it is important to develop in order to provide sustainable benefits. Not only changes in supply and demand, supply chains also face almost permanent market changes caused by economic, social and political conditions, advances in technology and information systems, and changing demographic trends. Companies will not be able to face competition for a long time if they do not adapt their supply chains.

PT ABC's strategic alliance with PT XYZ has an impact on the adaptation of their supply chain. Both companies intelligently adjust supply chains based on their product markets. PT. ABC will focus on technologies related to the environment, safety, user experience and convenience. Meanwhile, PT. XYZ will continue the technology that 'wraps' the vehicle and fuel efficiency technology. PT. ABC and PT. XYZ combines their operations and supply chain in their respective capabilities and technical experience.

PT ABC has expertise in tracking and understanding market trends and geographic preferences, so it can adapt quickly and produce product innovations that are faster than its competitors. Supply chain adaptation may have an impact on increasing costs, but the company is able to adapt products to demand and manage inventory well.

Fig. 6. Supply chain adaptability (Source: Eckstein et al. (2014), modified by researcher)

PT PQR has good structural flexibility in responding to changes in the global market and environment. Companies in the automotive industry must seek to reduce the environmental impact of their products as well as the impact of suppliers throughout their supply chain. PT PQR works closely with all of its suppliers around the world to carry out sustainable initiatives and develop supply chain innovations. The company tries to adapt to the local community and community environment to become a long-term environmental partner. In creating an adaptable supply chain, companies must have the ability to predict and analyze trends, as well as the ability to change the supply chain network in response to market changes (Christopher & Peck, 2004).

Aligning the interests of the company with all partner companies in the supply chain must be done carefully (Vachon et al., 2009). Suppliers, manufacturers, fabricators, to distributors will try to maximize their own interests. So, there must be a common interest between companies in the supply chain to maximize supply chain performance. PT PQR's initiative in aligning its interests is carried out by considering environmental aspects, human rights, safety and social responsibility, as well as implementing fair and transparent business principles. Every supply chain partner involved must follow established rules to build good relationships and increase trust internally and externally (Greeff & Ghoshal, 2004).

The annual meeting program conducted by PT PQR globally to share social trends and provide feedback to suppliers on the results of inspections, is a good effort in aligning the company's strategy and business direction as well as the substance of its initiatives. In addition, the company also gives awards to suppliers who have achieved the best results and fulfill business, social and governance requirements.

The misalignment of interests can lead to chaos in the supply chain network (Akin Ateş et al., 2022; Simangunsong et al., 2012). The problem that often occurs is that suppliers are not able to meet the demand for raw

materials so that the company does not have sufficient inventory to produce cars. Supplier incompetence can also occur due to lack of cost and production capacity. One way that companies can do to align the interests of the company with partners is by defining the terms of the relationship related to the fair sharing of risks, costs and rewards.

Fig. 7. Supply chain alignment (Source: Eckstein et al. (2014), modified by researcher)

All three companies create supply chain alignment in several ways. Alignment starts with aligning business development strategies domestically and globally (Sahay et al., 2006). Strategic alignment is important to ensure that company goals are achieved and supply chain performance is optimal (Queiroz et al., 2020). Furthermore, the alignment of technology and information systems so that all companies in the supply chain can easily access the same business information. The next alignment is related to the alignment of business processes and work processes in the supply chain to increase efficiency, reduce environmental burdens, as well as compliance and risk management in the logistics process. Alignment of individual behavior, which means the company ensures the roles and responsibilities of each partner of the company run well so as to reduce the potential for conflict. It is also necessary to align incentives to maximize supply chain returns and performance. Companies must predict the behavior of supply chain partners and analyze the behavior of competitors.

The strategic alliance between PT ABC and PT XYZ presents a new challenge in integrating their supply chains. Both companies must integrate the information they already have for the benefit of supply chain performance, internal processes are becoming increasingly linked and tied to each other. Supply chain integration is concerned with the integration of functional, internal and external processes by improving communication, partnerships and optimizing cooperation. Supply chain integration also applies new technologies to improve the flow of data and information and to physically coordinate the flow of products between supply chain partners. Functionally, supply chain integration includes the integration of information, processes, quality, and resources.

Fig. 8. Supply chain integration (Source: Alfalla-Luque et al. (2013), P. Childerhouse & Towill (2011), modified by researcher)

In a business environment based on technology, information and networks, the three companies place great strategic importance on supply chain integration. Supply chain integration can help companies reduce inefficiencies in planning, production, manufacturing and distribution activities. Integration can also reduce supply chain risks such as shortages or overstocks, on-time deliveries, and long lead times. Effective supply chain integration will lead to increased profits, expansion of market share, operational efficiency, and effectiveness of corporate governance.

Supply chain performance depends on the ability of supply chain partners to adapt to a dynamic environment. By linking supply chain integration with managing company capabilities in agile, adaptability and alignment (AAA), it

is expected that the company's overall supply chain performance can be further improved. The development of the AAA model and supply chain integration in the automotive industry allows it to be applied to various companies because basically the nature of the supply chain is the same, namely coordinating all product creation activities from upstream to downstream to maximize supply chain performance.

Fig. 9. Triple A and supply chain integration model (Source: modified by researcher)

## VI. CONCLUSION AND RECOMMENDATION

Agility shows the company's ability to respond quickly and responsively to changes, flexibility and efficiency of the supply chain in facing the challenges of the internal and external environment in a dynamic business. Adaptability shows the company's ability to structure supply chain strategies to meet environmental changes and increase excellence. Meanwhile, alignment ensures that the company and all company partners have a uniform vision, mission and strategy as well as incentives from partners to be able to provide mutual benefits and success. The three companies have been working on this AAA capability.

Linking AAA with supply chain integration can give the company a competitive advantage and develop sustainably. The success of the supply chain integration process requires both connectivity and simplification components. Connectivity means the establishment of communication and cooperative relationships between all company partners from upstream to downstream, both internal and external to the company. Simplification means eliminating functions in processes that are less relevant or redundant in business processes to achieve effectiveness and efficiency.

## Impact of the Implementation of Fiscal Decentralization on Poverty Alleviation in Tanggamus Regency, Lampung Province in 2018-2020

Annisa Sekar Kinasih<sup>1</sup> and Muhammad Arif<sup>2</sup>

<sup>1,2</sup> Faculty of Economics and Business, University of Muhammadiyah Surakarta, Surakarta, Indonesia

### Abstract

*This study aims to examine the effect of the Village Fund, the Family Hope Program, and the Smart Indonesia Program on Poverty in Tanggamus Regency, Lampung Province in 2018-2020. Therefore, in an effort to improve the quality of public services, the creation of an increase in the welfare of the community, especially in the fields of health, education, the economy and in order to increase the achievement of the Poverty Level. The data used in this research are secondary data obtained from the Integrated Social Welfare Data, the National Legal Documentation and Information Network, the Central Statistics Agency, the Social Service, and the Education and Culture Office of Tanggamus Regency, Lampung Province. The data analysis used is panel data analysis with Common Effect Model (CEM), Fixed Effect Model (FEM), and Random Effect Model (REM) approaches. Selection of the best model using the Chow test and Hausman test. The results of this research prove that the fixed effect model is the chosen model. Based on the goodness test of the fixed effect model approach, it is proven that the estimated model exists with the value of the determinant coefficient or R-square (R<sup>2</sup>) is 0.6916, this means that 69.16% of the Poverty variable is explained by variations of the three independent variables, the Village Fund, the Family Hope Program, and the Smart Indonesia Program. Based on the goodness of the model (test F) proves the Village Fund, the Family Hope Program, and the Smart Indonesia Program collectively affect Poverty. Based on the effect validity test (test t) it can be seen that partially the Village Fund and the Family Hope Program have a significant effect on Poverty. While the Smart Indonesia Program has no significant effect on Poverty.*

*Keywords— Village Funds; Hope Family Program; Smart Indonesia Program; Poverty*

### I. INTRODUCTION

Poverty is one of the problems that humans always face. The problem of poverty is the same as the age of humanity itself and the implications of the problem can involve all aspects of human life, although it is often not realized that its presence is a problem for the human being concerned. In short, poverty can be defined as a low standard of living, namely the existence of a level of material deficiency in a number or group of people compared to the standard of living generally applicable in the society concerned. (Suliswanto, 2017).

Indonesia as one of the most populous countries cannot escape the problem of poverty. With the increasing poverty rate, the government has implemented various policies to deal with this problem. In Tanggamus Regency itself, government programs have been running, including the Village Fund, social assistance such as the Family Hope Program, and the Smart Indonesia Program. This study aims to see the effectiveness of the fiscal decentralization program through the Village Fund with Regional Poverty in Tanggamus Regency which is spatially located in Lampung Province and it is found that the distribution of the poor is quite high in the Tanggamus Regency area.

This poverty problem has become one of the government's focuses in implementing village fund policies with the main goal being able to alleviate poverty in their respective regions. The Central Bureau of Statistics defines poverty as an economic inability to meet the basic needs of food but not food which can be measured in terms of expenditure. Meanwhile, the poor are people who have an average monthly per capita expenditure below the poverty line.

Fig 1. Percentage of Poor Population per District in Tanggamus . Regency Year 2018-2020 (Soul) (source: Tanggamus in Numbers)

In alleviating poverty in Tanggamus Regency, it is one of the priorities, showing the percentage of poverty in 20 sub-districts in Tanggamus Regency in the 2018-2020 period. It can be seen that the percentage of poverty in sub-districts in Tanggamus district changes from year to year or fluctuates. The highest sub-district in Tanggamus Regency is Klumbayan sub-district in 2020 at 29.76%, where in 2019 it was 6.54%, and in 2018 it was 6.81%. This is due to the fact that the village of Klumbayan sub-district is located in a coastal area where people often work, relying only on one of their indigenous products, such as fishermen and agricultural products.

This area is often flooded and access to this area is quite difficult to reach. Meanwhile, the reduction in the percentage of poverty is focused on the Gisting District, which is 2.47% in 2020, where in 2019 it is 0.52% and in 2018 it is 0.56%. This is because the sub-districts in this village are very advanced from the level of education, health, agriculture, horticulture and tourism, from this it really helps the economy in Gisting District.

In this effort, Tanggamus Regency focuses on three sectors as an effort to reduce poverty, namely the education sector, the health sector and purchasing power. The government's efforts to further reduce poverty are inseparable from various policies, the government continues to encourage economic growth, maintain price stability and create jobs. The government also continues to develop infrastructure in these underdeveloped areas.

With regard to micro, the government provides direct assistance, both food subsidies, cash, and support from health insurance for the poor.

With the increase in the poverty rate, the government has implemented various policies in overcoming this problem with the Village Fund, the Family Hope Program (PKH), and the Smart Indonesia Program (PIP). One of the purposes of using the Village Fund is to finance government administration, development implementation, community development and empowerment. Village Funds are prioritized for village development (Government Regulation Number 60 of 2014).

## II. LITERATURE REVIEW

### A. Poverty Theory

According to Nugroho and Dahuri (2012), poverty is an absolute or relative condition in an area where a person or group of people is unable to meet their basic needs according to the prevailing values or norms. If viewed from the economic aspect, poverty refers to the gap between weak *purchasing power* and the desire to fulfill basic needs.

### B. Village Fund Theory

The distribution of Village Funds came into effect in 2015 as a mandate from Law Number 6 of 2014 concerning Villages. The enactment of Law Number 6 of 2014 introduced the Village Fund as a Transfer Fund from the government to the village through the Regency/City government. The Village Fund began to be allocated in the 2015 Fiscal year with the allocation formula set out in a Government Regulation .

The Ministry of Finance stated that the distribution of Village Funds has a purpose, namely, to improve public services in villages, to alleviate poverty, to advance the village economy, to overcome development gaps between villages, to strengthen village communities as development subjects. Thus, one of the distributions of the Village Fund is to reduce the poverty level.

The Village Fund is given in order to support the implementation of village duties and functions in the administration of government and village development in all its aspects in accordance with the authority it has, Based on Law Number 6 of 2014 the government allocates annual village funds in the APBN which is given to each village as one of the source of village income

H1 : Village Funds have an effect on Poverty

### C. Expected Family Program Theory

According to the Minister of Social Affairs Regulation Number 1 of 2018 concerning the Hopeful Family Program, the family of hope program, abbreviated as PKH, is a program of providing conditional social assistance to poor and vulnerable families and/or someone who is registered in the integrated data of the poor handling program, which is processed by the data center. and social welfare information and are designated as beneficiary families of the Family Hope Program. Distribution of non-cash social assistance explained that the distribution of social assistance is the implementation of poverty reduction programs which include social protection, social security, social empowerment, social rehabilitation, and basic services. Distribution of social assistance provided in the form of money based on the determination of the Social Assistance Provider.

H3: The Family Hope Program has an impact on Poverty

#### D. Smart Indonesia Program Theory

According to the Minister of Education and culture regulation number 10 of 2020 concerning the Smart Indonesia Program, that the Smart Indonesia program is assistance in the form of cash, expansion of access and learning opportunities from the government given to students and students who come from poor or vulnerable families for education costs. .

H4: The Smart Indonesia Program has no effect on Poverty

### III. RESEARCH METHODOLOGY

The population in this study is data on the realization of State Revenue and Expenditure reports for all Regencies/Cities, Tanggamus Regency, Lampung Province. Year 2018-2020. The data used in this research are secondary data obtained from the Regent's Regulation (PERBUP) issued by the National Legal Documentation and Information Network, the Implementing Unit for the Family Hope Program under the auspices of the Social Service, and the Education and Culture Office of Tanggamus Regency, Lampung Province. This study uses a panel data analysis tool to determine the effect of the independent variable on the dependent variable.

#### A. Analysis Tools and Models

This study uses a panel data analysis tool to determine the effect of the independent variable on the dependent variable. With the following econometric model:

$$P_{it} = Q_0 + Q_1 \text{LogVF}_{it} + Q_2 \text{LogFHPP}_{it} + Q_3 \text{LogSIPF}_{it} + S_{it}$$

Information :

$P$	= Percentage of poor people per sub-district (percentage)
$VF$	= Village Fund (rupiah)
$FHPP$	= Family Hope Program Fund (rupiah)
$SIPF$	= Smart Indonesia Program Fund (rupiah)
$\beta_0$	= Constant
$\beta_1, \beta_2, \beta_3$	= Independent variable regression coefficient
$\varepsilon$	= <i>Error Term</i> (error factor)
$i$	= District/District $i$ ( <i>cross section</i> )
$t$	= Year ( <i>time series</i> )

#### B. Variable Operational Definition

##### a. Poverty Percentage

The poverty percentage data used in this study is the percentage of the number of poor people per sub-district in Tanggamus Regency. This data was obtained from the Social Welfare Integrated Data which was processed by the Social Service Office of Tanggamus Regency.

##### b. Village Fund

The Village Fund used in this study is the amount of Village Fund received in each sub-district in Tanggamus Regency. This data is obtained from the Regent's Regulation (PERBUP) issued by the National Legal Documentation and Information Network of Tanggamus Regency.

##### c. Hope Family Program

The Hope Family Program data used in this study is the amount of the Family Hope Program funds received in each sub-district in Tanggamus Regency. This data was obtained from the Implementing Unit for the Family Hope Program under the auspices of the Tanggamus District Social Service.

##### d. Smart Indonesia Program

The Smart Indonesia Program (PIP) data used in this study is the amount of SD and SMP Smart Indonesia Program (PIP) funds received by each sub-district in Tanggamus Regency. This data was obtained from the Department of Education and Culture of Tanggamus Regency

## IV. RESULT/FINDINGS

A. *Estimated Results*

Based on the previous explanation that the Village Fund, Family Hope Program, Smart Indonesia Program in Tanggamus Regency, Lampung Province in 2018-2020 is estimated by panel data regression analysis through the formulation of the econometric model as follows:

$$P_{it} = Q_0 + Q_1 \text{Log}VF_{it} + Q_2 \text{Log}FHPF_{it} + Q_3 \text{Log}SIPF_{it} + s_{it}$$

Information :

- P* = Percentage of poor people per sub-district (percentage)  
*VF* = Village Fund (rupiah)  
*FHPF* = Family Hope Program Fund (rupiah)  
*SIPF* = Smart Indonesia Program Fund (rupiah)  
 $\beta_0$  = Constant  
 $\beta_1, \beta_2, \beta_3$  = Independent variable regression coefficient  
 $\varepsilon$  = *Error Term* (error factor)  
*i* = District/District *i* ( *cross section* )  
*t* = Year ( *time series* )

The estimation results of panel data regression using the *Common Effect Model* (CEM), *Fixed Effect Model* (FEM), and *Random Effect Model* (REM) approaches can be seen in table 1.

A. Table 1 . Panel Data Regression Results

Variable	Regression Coefficient		
	CEM	FEM	BRAKE
C	-17.84561	-231.8612	-19,01980

Log(VG)	7.597972	48.95542	7.882644
Log(FHPF)	4.371303	7.990174	4.554952
Log(SIPF)	-9.302556	-6.961965	-9.577288
$R^2$	0.253600	0.691635	0.258858
Adj. $R^2$	0.213614	0.508283	0.219154
F-statistics	6.342258	3.772170	6.519681
Prob F-statistics	0.000886	0.000184	0.000734

### B. Model Selection

#### Chow test

The Chow test is one of the tests used to choose which model is better in panel data regression, namely between the *common effects* estimation model and the *fixed effect estimation model*. With the following hypothesis:

$H_0$ : the *common effect model* is better than the *fixed effect model*

$H_A$ : *fixed effect model* is better than *common effect model*

The Chow test is carried out by looking at the *p-value*, if the *p-value is significant* < by 5%, it is better to use the *fixed effect model*, but if it is not significant with the *p-value* > by 5%, it is better to use the *common effects models*.

C. Table 2. Chow Test Results

Effects Test	Statistics	df	Prob.
Cross-section F	2.766257	(19.37)	0.0039
Cross-section Chi-Square	53.038703	19	0.0000

Based on Table 2, the results of the Chow test show that the probability value of the Chi-square Cross-section is  $0.0000 < 0.05$ , meaning that the *p-value* is smaller than (0.05) thus rejecting the null hypothesis ( $H_0$ ). and failed to reject the alternative hypothesis ( $H_A$ ). So the conclusion is that the *fixed effect estimation model* is better than the *common effect estimation model*, so the appropriate estimation model to analyze is the *fixed effect model*.

#### Hausman Test

In the initial test of the Chow test, it was found that the *fixed effect the model* is better to use than the *common effect model*, then perform the Hausman test. Hausman test is one of the tests used to compare the right model used in panel data regression, namely between *fixed effects model* or *random effect model*. With the following hypothesis:

$H_0$ : *random effect the model* is better than the *fixed effect model*

$H_A$ : *fixed effect model* is better than *random effect*

Hausman test can be done by looking at the *p-value*, if the *p-value is significant* < then it is better to use the *fixed effect model*, but if the *p-value is not significant* > 0.01 then it is better to use the *random effect model*.

Table 3. Hausman test results

Test Summary	Chi-Sq. Statistics	Chi-Sq df	Prob.
Random cross-section	33.072025	3	0.0000

Based on Table 3, the results of the Hausman test show that the *Cross-section Random probability value* of  $0.0000 < 0.05$ , meaning that the *p-value* is smaller than (0.05) so that it rejects the null hypothesis ( $H_0$ ) and fails to reject the alternative hypothesis ( $H_A$ ). so that the conclusion is that the *fixed effect estimation model* is better than the *Random effect estimation model*, so the appropriate estimation model to analyze is the *fixed effect model*.

Based on the model selection test, both the Chow test and the Hausman test described above, the best and selected model is the *Fixed Effect Model (FEM)*. With the estimation results of *Fixed Effect Model (FEM)* which are presented in table 4.

D. Table 4. Fixed Effect Model . Estimation Results

P = -231.8612 + 48.95542 log(VF) it + 7.990174 log(FHPF) it – 6.961965 log(SIPF)			
	(0.000)	(0.0000)	(0.5285)**
R <sup>2</sup> = 0.691635; DW.-stat = 2.621683; F-Stats. = 3.772170; Prob. F. Stats. = 0.000184			

Source: Central Statistics Agency, Social Service, Education and Culture Office, data processed. **Description**: \*Significant at = 0.01; \*\* Significant at = 0.05; \*\*\*Significant at = 0.10. The number in brackets is the empirical significance (*p-value*) t statistic.

E. Table 5. Effects and Constants of Fixed Effect Model (FEM)

16	So	-20,71229	-252.57349
17	Sumberrejo	8.57226	-223,28894
18	gutter field	-16.10563	-247.96683
19	Ulu belu	-8,70217	-240,56337
20	Wonosobo	-29,42723	-261,28843

#### Model Goodness Test

##### Coefficient of Determination ( $R^2$ )

Based on table 4 shows that the value of the coefficient of determination or R-square ( $R^2$ ) is 0.691635, this means that 69.16% of the Poverty variable is explained by variations of three independent variables, namely the Village Fund, the Family Hope Program and the Smart Indonesia Program . While the remaining 30.87% is explained by other variables outside the model that are not included in the study.

##### Model Existence Test (F-Test)

The model can be said to exist if the entire number of independent variables simultaneously affects the dependent variable. The following is the hypothesis formula for the existence of the research model:

$H_0$ :  $\beta_1 = \beta_2 = \dots = \beta_n = 0$ , the model used does not exist

$H_A$ :  $\beta_1 \neq \beta_2 \neq \dots \neq \beta_n \neq 0$ , the model used exists

The criteria in this test are:

$H_0$ : accepted if the probability or significance of  $F >$

$H_A$ : rejected if probability or significance  $F$

Based on table 4 shows that the probability value of F-statistics is  $0.000184 < 0.01$  so that it rejects the null hypothesis ( $H_0$ ) and fails to reject the alternative hypothesis ( $H_A$ ). So, the conclusion is that the model used exists

or simultaneously the variables of the Village Fund, the Family Hope Program and the Smart Indonesia Program together have an effect on Poverty.

#### *Effect Validity Test (t-test)*

The effect validity test tested the significant effect of the independent variables individually. The effect validity test is the *t test*.  $H_0$  on the *t test* is  $= 0$ . Which means the independent variable to *i* has no significant effect; and its  $H_A 0$ , which means the *i*th independent variable has a significant effect.  $H_0$  will be accepted if the *p value* (*p value*), probability or significant empirical statistic  $t >$ ;  $H_0$  will be rejected if the *p value* (*p value*), probability, or significant empirical statistic *t*.

Table 6. Test the Validity of the Effect of Independent Variables

variable	t-stats	Prob.t	Criteria	Conclusion
VP logs	5.626275	0.0000	< 0.01	Influential
FHPF logs	5.102341	0.0000	< 0.01	Influential
SIPF logs	-0.636234	0.5285	> 0.05	No effect

#### *Interpretation of the Effect of the Selected Model Independent Variables*

Based on the validity test of the influence contained in Table 6, it has been proven that the independent variables that have a significant influence on poverty in Tanggamus Regency, Lampung Province, are Village Funds and Family Hope Program Funds. Meanwhile, the Smart Indonesia Program variable has no significant effect.

Based on the research results, the Village Fund Variable has a probability of 0.0000 which is statistically significant at the degree = 1% (0.01) with a linear-logarithmic relationship pattern. That is, if the Village Fund increases by 1 Rupiah, then Poverty will increase by  $(48.95542 : 100) = 0.4895542$  rupiah. On the other hand, if village funds decrease by 1 Rupiah, poverty will decrease by 0.4895542 rupiah, and the Family Hope Program increases by 1 rupiah, then poverty will increase by  $(7.990174 : 100) = 0.07990174$  rupiah. On the other hand, if the Family Hope Program decreases by 1 Rupiah, then poverty will decrease by 0.07990174 rupiah.

## V. CONCLUSIONS AND RECOMMENDATIONS

Based on the results of the research that has been carried out, it can be concluded that the test results for selecting the best estimator model prove that the *fixed effect model* (FEM) is the chosen model. Based on the goodness of the *fixed effect model* (FEM) approach, it is proven that the estimated model exists with the value of the determinant coefficient or R-square ( $R^2$ ) is 0.691635, this means that 69.16% of the Poverty variable is explained by variations of three independent variables, namely Village Funds, Family Hope Program, and Smart Indonesia Program. While the goodness-of-fit test of the model (test F) proves the Village Fund, the Hope Family Program, and the Smart Indonesia Program collectively affect Poverty. The last is that the effect validity test (*t test*) can be seen that partially the Village Fund and Family Hope Program variables significant effect on Poverty. While the Smart Indonesia Program does not have a significant effect on Poverty.

Based on the effect table and the constant random effect coefficient model, it can be seen that the constant value of each district/city in Tanggamus Regency, Lampung Province, the highest constant value is Pugung Regency. with a value of -267.65984. Meanwhile, the district with the lowest constant value is West Klumbayan Regency with a value of -200,78023. Thus the relationship with the influence of the variable Village Fund, Family Hope Program, and Smart Indonesia Program for Poverty in Tanggamus Regency, Lampung Province, Pugung Regency has a higher poverty rate while West Klumbayan Regency has a lower poverty rate.

This study has several limitations, namely the research period is only 3 years, only using the variables of the realization of the Village Fund, the Hopeful Family Program and the Smart Indonesia Program. The object of research is only the districts/cities in the Ex-Residency of Besuki, East Java province. For further research,

it is expected to increase the time of the research, add the independent variables and the latest data by using different methods and increasing the number of samples by expanding the research area. So it is hoped that the research results will be much better.

## Factors Affecting Income Inequality in West Java Province: A Panel Data Analysis

Khoirul Sidiq<sup>1</sup>, Salma Audiena Alfaizah<sup>2</sup>

<sup>1,2</sup>Muhammadiyah Surakarta University, Economic Development, Faculty of Economics and Business  
Muhammadiyah Surakarta, Sukoharjo, Central Java, Indonesia.

### Abstract

*The purpose of this study is to analyze the effect of poverty level, human development index, population, and GRDP per capita on income inequality in West Java Province during the period 2016-2020. The method used is panel data regression model with the selected model FEM. The results show that only one variable has no significant effect on income inequality, namely population. The poverty rate, GRDP per capita, and the human development index have a significant effect on income inequality in West Java from 2016 to 2020. Therefore, the West Java Provincial Government must pay special attention to variables that have a significant effect on income inequality to reduce the level of inequality.*

*Keywords— Income Inequality; Poverty Level; GRDP, Population HDI; Panel Data*

### I. INTRODUCTION

Indonesia is a country consisting of thousands of islands, the difference in regional characteristics is a consequence that cannot be avoided by Indonesia. This non-uniformity affects the ability to grow which in turn causes some areas to grow rapidly while other areas grow slowly. This growth ability then causes income inequality between regions.

Inequality can be interpreted as an inequality in the distribution of income of a country. This is in accordance with the opinion (Hakiki, 2015), to achieve equitable development in each region, Indonesia is directed at the regional development process where the community is expected to be able to manage existing resources with the cooperation and support of the central government, regional government, and the private sector. . In order to be able to create jobs and stimulate activities in the economic and industrial sectors in their respective regions.

The main goal of development is to create community welfare, where one of the indicators is seen from the even distribution of income. According to Williamson (in Sjafrizal, 2008: 95) in the early stages of economic development, disparities in income distribution will enlarge and be concentrated in certain areas that were initially relatively advanced, for example in industrial development, infrastructure and human resources. Then at a larger growth stage convergence occurs and inequality in income distribution will decrease. The income inequality calculation that is very popularly used by economists is the Gini Ratio Index, because this calculation is sufficient to explain the relationship between high-income population groups and other population groups.

West Java is one of the provinces of Indonesia located on the island of Java, has 9 cities and 18 regencies with an area of about 35,378 km<sup>2</sup>. The diversity of cities and regencies owned by the West Java region makes this region inseparable from the problem of inequality in economic development, following is the Gini Ratio data for West Java for 2016-2020.

Table 1. West Java Gini Ratio Data for 2016-2020

West Java	Gini ratio				
	2016	2017	2018	2019	2020
	0.423	0.403	0.407	0.402	0.403

Data source: BPS

From the data above, it can be seen that the Gini ratio of West Java Province between 2016-2020 still tends to fluctuate even though the difference is not too significant and is still below 0.5 in the medium or moderate category. In 2016 the Gini Ratio was 0.423, which was the highest in the 2016-2020 period and the lowest was 0.402 in 2019. Many problems have resulted in income inequality in West Java Province which tend to remain unchanged from 2016-2020 or 5 years, because indeed the income inequality between regions is a problem in

development that is carried out spatially (spatial planning). The achievement of economic growth cannot overcome the problem of income inequality because of the unequal distribution of income. The uneven development process is due to the fact that there are areas that are experiencing fast growth, while some other areas are experiencing slow economic growth. Each region has different characteristics, therefore not all regions experience progress and development. Regions that do not experience the same progress and development are caused by differences in the results of their resources, the level of mobility of production factors between regions, poverty levels, human resources measured by the Human Development Index (HDI) which differs between regions.

## II. LITERATURE REVIEW

In this study also uses a variety of literature from several previous researchers to strengthen the results of the study, such as research (Laitul Khusnah, 2015) show that DAU, GRDP and Manpower have a significant influence on income inequality. DAU has a negative and significant influence on income inequality, while the GRDP variable is positive and significant on income inequality, there is only one variable that is not significant, namely Educated Workforce. To overcome the problem of income inequality, the government as the holder of authority in policy making must focus on variables that have a significant effect on inequality without ignoring other insignificant variables.

Research (Muhammad arif, Rossy Agustin Wicaksana, 2017) shows that the variables of the Human Development Index (HDI), Economic Growth, Labor have a positive and significant influence on income inequality, while the Population Number variable is not significant because the faster population growth is not matched by the availability of job opportunities so that the unemployment rate also increases, meaning that it will reduce the value of community productivity and in aggregate regionally it will correct the value of people's percapita income to be lower.

Research (Raudhatil Wirda. Z, Fakhruddin, Fitriyani, 2020) on provincial income inequality in Indonesia using independent variables, namely inflation, poverty rate and economic growth, the results show that inflation and poverty level variables have a significant effect on income inequality. significant inflation affects income inequality in a negative direction, meaning that when inflation increases, income inequality will decrease, as well as poverty significantly affects income inequality in a positive direction. This shows that if poverty increases, income inequality will also increase. The impact between poverty and income inequality is influenced by the population. Poor families have a large number of family members. As a result, the economic situation worsens because income inequality also worsens, while economic growth does not significantly affect income inequality because economic growth is needed to improve people's welfare but is not effective in reducing inequality in income distribution.

## III. RESEARCH METHODOLOGY

This study uses a quantitative approach, and also using Multiple Linear Regression Model with panel data, which is a combination of cross section data consisting of 27 districts/cities in West Java Province and time series data from 2016-2020. The dependent variable in this study is income inequality measured by the Gini Index (GI), while for the independent variables there are 4 namely, poverty level (POV), Total Population (TP), Gross Regional Domestic Product (GRDP), Human Development Index (HDI). This study takes the Province of West Java as area to be researched between 2016-2020, all data are sourced from the National BPS and BPS West Java Province. the formula or econometric model can be written as follows :

$$GI_{it} = \beta_0 + \beta_1 LOG GRDP_{it} + \beta_2 POV_{it} + \beta_3 TP_{it} + \beta_3 HDI_{it} + \varepsilon_{it}$$

Where :

GI	= Gini Index
LOGGRDP	= Gross Regional Domestic Product
POV	= Proverty

TP	= Total Population
HDI	= Human Development Index
$\alpha_0$	= constant
$\alpha_1 \alpha_2 \alpha_3 \alpha_4$	= Shows the regression coefficient of the independent variable
$i$	= Shows district/city <i>cross section data</i>
$t$	= Shows the year <i>time series data</i> 2016-2020
$\varepsilon_{it}$	= error component at time t for unit cross section

## IV.RESULT / FINDING

Table 2. The results of panel data estimation using the Common Effect Model (CEM), Fixed Effect Model (FEM), and Random Effect Model (REM)

Table 2. Panel Data Regression Results

Variabel	Koefisien Regresi		
	CEM	FEM	REM
$C$	-0,074041	-0,292204	-0,127224
$LOGGRDP$	0,000803	-0,013404	-0,001892

$HDI$	0,005442	0,010984	0,006575
$R^2$	0,235155	0,651363	0,192595
Adjusted. $R^2$	0,211438	0,549819	0,167559
Statistik $F$	9,915384	6,41455	7,692788
Prob. Statistik $F$	0,00000	0,00000	0,000000

## A. Test Selection of Estimated Model

Chow and test Hausman used for choose the estimated model best between CEM, FEM, and REM. If on Test the selected model Chow is FEM and on Test Selected Hausman model also FEM then the model is estimated best is FEM.

## B. Chow test

Chow test used for determine the estimated model between CEM (PLS) or FEM.  $H_0$  the Chow test states that the estimated model is the *Common Effect Model* (CEM), and  $H_A$  on the Chow Test it's real right that the estimated model is the *Fixed Effect Model* (FEM) with provision if mark probability Prob  $F > 0.05$  then  $H_0$  not rejected with the conclusion that the model was selected *Common Effect Model* (CEM) whereas if indigo probability Prob.  $F < 0.05$  then  $H_0$  rejected with the conclusion that the model was selected *Fixed Effect Model* (FEM).

Table 3. Results Estimate Chow test

Effects Test	Statistics	df	Prob.
--------------	------------	----	-------

Cross-section F	4.729356	(26,103)	0.0000
Cross-section Chi-square	105,276220	26	0.0000

Based on Table 3 looks that results Test Chow Analysis Influencing Factors Inequality Income Province West Java 2016-2020 shows mark prob.F of  $0.000 < 0.05$ , so that  $H_0$  rejected, it can be concluded that the selected model is the *Fixed Effect Model* (FEM) .

### C. Test Hausman

Test Hausman used for determine the estimated model between FEM or REM.  $H_0$  the Hausman test states that the estimated model is the *Random Effect Model* (REM), and  $H_A$  the Hausman test states that the estimated model is the *Fixed Effect Model* (FEM) estimated model with provision if mark probability Prob Chi-Sq  $> 0.05$  then  $H_0$  is not rejected with the conclusion that the model selected *Random Effect Model* (REM) , while if indigo probability Prob Chi-Sq  $< 0.05$  then  $H_0$  rejected with the conclusion that the model selected *Fixed Effect Model* (FEM) .

Table 4. Results Estimate Test Hausman

Effects Test	Chi-Sq. Statistics	Chi-Sq. df	Prob.
Random cross-section	9.236073	4	0.0555

Based on Table 4 looks that results Test Hausman Analysis Influencing Factors Inequality Income Province West Java 2016-2020 shows that mark Prob Chi-Sq of  $0.0555 < 0.10$  so that  $H_0$  rejected. This it can be concluded that the selected model is *Fixed Effect Model* (FEM).

## XIII. DISCUSSION

Table 5. Results Fixed Effect Model (FEM) Estimation

$GI_{it} = -0.292204 - 0.013404 LOG GRDP_{it} + 0.009POV_{it} - 0.0000001.36 TP_{it} + 0.010984HDI_{it}$
(0,0358)** (0,000)* (0,431) (0,000)*
$R^2 = 0.65136$ ; Adj $R^2 = 0.54981$ ; F.Stat = 6.41455; Prob F-Stat = 0.0000

Note: \*Significant at = 0.01; \*\* Significant at = 0.05; \*\*\* Significant at = 0.10; The number in brackets is the probability value of the t statistic.

### D. Coefficient of Determination ( $R^2$ )

The magnitude of the coefficient of determination ( $R^2$ ) the effect of Gross Regional Domestic Product, Poverty, Population, and Human Development Index on income inequality is 0.6513 , meaning that 65.13% of the variation in income inequality variables can be explained by Gross Regional Domestic Product, Poverty, Total Population, and Human Development Index and the remaining 34.87% is influenced by other variables that are not included in the research model.

### E. Simultaneous Significance Test (F Test)

Simultaneous significance test (F-test) was conducted to determine the independent variables affect the dependent variable simultaneously (simultaneously). The hypotheses in the F test are  $H_0$  : The model used does not exist and  $H_A$  : The model used exists.  $H_0$  is rejected if the p value (p-value) of the probability F-Statistics  $< \alpha$ , and  $H_0$  is not rejected if the p value (p-value) of the probability of F-Statistics  $> \alpha$ . Based on Table 4.4, it can be seen that the p value (p-value), probability, or empirical significance of the F statistic is  $0.0000 < 0.05$  so that  $H_0$  is rejected with the conclusion that the model used exists.

Table 6. Effect Validity Test (t Test)

Variable	t- stats	Prob	Alpha	Conclusion
LOGGRDP	-2126856	0.0358	$< 0.05$	Influential significant at = 0.05
POV	5.01646	0.0000	$< 0.01$	Influential significant at = 0.01
TP	-0.78913	0.4318	$> 0.10$	No influential significant

HDI	4.99038	0.0000	< 0.01	Influential significant at = 0.01
-----	---------	--------	--------	-----------------------------------

Based on the effect validity test (t test) for the GRDP variable in the *Fixed Effect Model* (FEM) it has a negative and significant effect on the number of poor people. The GRDP variable has a regression coefficient of -0.01340 with a prob value of 0.0358 which is statistically significant at = 5% (0.05). Based on the effect validity test (t test) for the poverty variable in the *Fixed Effect Model* (FEM) it has a positive and significant effect on the number of poor people. The variable income per capita has a regression coefficient of 0.009857 with a prob value of 0.0000 which is statistically significant at = 1% (0.01). Based on the effect validity test (t test) for the variable human development index on the *Fixed Effect Model* (FEM) it has a positive and significant effect on the number of poor people. The human development index variable has a regression coefficient of 0.01098 with a prob value of 0.0000 which is statistically significant at = 10% (0.10).

Based on the estimation results on panel data, it can be seen that the coefficient value of the GRDP variable has a negative and significant influence on income inequality with a linear-logarithmic model which means that for every 1 percent GRDP increase, income inequality will decrease by 0.0134 percent. The results of this study are in line with research conducted by (Lailatul Khusnah, 2015) which explains that the effect of GRDP on income inequality has a negative and significant effect, which means that the higher the value of the gross regional domestic product, the lower the level of income inequality (gini ratio) and vice versa, the higher the value of the regional gross domestic product. GRDP reflects the success of a region in improving the resources owned or available so that income inequality is reduced.

Based on the estimation results in panel data, it can be seen that the poverty variable has a positive and significant influence on income inequality with a linear-linear model which means that for every 1 percent increase in poverty, income inequality will increase by 0.009857 percent. The results of this study are in line with the research conducted by (Raudhatil Wirda, Z Fakhrudin, and Fitriyani, 2020) who show the results that the effect of poverty on inequality is positive and significant, this shows that when poverty increases, income inequality will also increase. The impact of poverty on income inequality is influenced by population, because basically the majority of poor people have a large number of family members, as a result the economic situation worsens because income inequality worsens.

Based on the estimation results on panel data, it can be seen that the population variable has a negative and insignificant effect on income inequality with a linear-linear model which means that for every 1 person increase in the population, it will reduce income inequality by 0.00000001.36 percent. This is in line with research conducted by (Muhammad Arif, and Rossy Agustin Wicaksani, 2017) which shows that the results of the influence of the population on income inequality have a negative effect, which means that a large number of people does not affect the level of income inequality in East Java Province.

Based on the estimation results in panel data, it can be seen that the human development index variable has a positive and significant influence on income inequality with a linear-linear model which means that each human development index increases by 1 percent, it will increase income inequality by 0.010984 percent. This is in line with the research conducted by (Muhammad arif, Rossy Agustin Wicaksani, 2017). which states that partially the human development index has a positive and significant effect on income inequality. This indicates that if the HDI has increased, the distribution of income has increased. Conversely, if the HDI decreases, the contribution of income will also decrease. The results with a positive and significant influence can be explained that one of the HDI instruments is life expectancy which is a key factor in creating a productive workforce.

## V. CONCLUSION AND RECOMMENDATION

Based on the research that I have done, it can be concluded that there are 3 variables that have a significant effect on inequality in West Java Province, namely, GRDP, Poverty, and the Human Development Index. Meanwhile, the total population leads to a negative and does not significantly affect income inequality.

This research can be a recommendation and reference for the government, especially West Java Province as a policy-making authority in its efforts to overcome the problem of income inequality, first the government must focus on variables that significantly affect income inequality such as improving the quality of human resources, infrastructure, economic governance. community to increase GRDP, secondly do not forget other variables that do not have a significant effect on inequality because the problem of income inequality is a very complex matter and there must be a strong and harmonious relationship between the community and the community. government to achieve equal distribution of income.

This research, there are still many shortcomings and only 4 independent variables were studied to find out how they affect income inequality, there are still a lot of other independent variables that need to be investigated by other researchers and related to income inequality in order to add references in the scientific world as well as a reference for government to address the problem of income inequality.

#### ACKNOWLEDGEMENT

With the completion of this research as a condition for obtaining a bachelor's degree in economics, of course many parties have helped in this research, first and foremost I would like to thank my parents for their prayers, passion and love for me so that it fosters motivation to complete my study as a form of devotion and obligation to carry out the mandate of my parents, secondly to my closest people and friends who have helped in various ways so that my research can be completed quickly, thirdly, a big thank you to Mrs. Salma Audiena Alfaizah.S.E.,M.E. as a supervising lecturer who has provided various knowledge and directions to complete this research, and lastly I would like to thank the previous researchers who have provided reference material in this research and to the national BPS and BPS West Java who have provided data as the variables of this research.

### Abstract

*The purpose of this study was to analyze the implementation of the performance of the Melenia generation of BUMN as for the five aspects of the AKHLAK Model. which stands for Amanah, Competent, Harmonious, Loyal, Adaptive, Collaborative, as protection of Core Values and Core Purpose change operating practices, specific goals and strategic BUMN solutions describe how to Accelerate Culture Transformation, and five aspects of job satisfaction, namely the work itself, work wage income, Careers, Bosses, Colleagues, while the characteristics of the millennial generation have three components: Intentions, Personality and Needs. Melania's generalization expectations of performance become a Beilef Brand, Moral Model, Characteristics of the Millennial Generation and job satisfaction. This research uses a descriptive qualitative approach. go directly to the field, act as observers with content analysis, data collection techniques with structured interviews and FGDs involving 5 participants with age criteria and part of the field of work in the millennial generation from 1980-2002 the subject of the research object is millennial generation employees in state-owned companies. From the results of the research, there are several new discoveries regarding the Implementation of the Moral Belief Brand Model which can be concluded in the aspect of Amanah. Lack of fulfillment of promises and commitments, lack of responsibility for task decisions and actions that do not pay attention to moral and ethical values. Competent aspects of the millennial generation are able to increase self-competence in challenges and changes, lack of helping others to learn. Able to complete the task well. The Harmonious Aspect of the millennial generation really respects other people's backgrounds and can build a conducive work environment. The Loyal aspect of the Melenia Generation does not pay attention to the good name of the Company, does not want to sacrifice for the company to obey the leadership if there is a need. The Adaptive Aspects of the Melenia Generation are in working quickly to adapt, continuing to make improvements following technological developments, in working proactively. Harmonious aspects of the normal millennial generation provide opportunities for colleagues to complete work, are open to working together to produce added value, and can utilize resources for common goals. The research resulted in new discoveries related to the moral belife brand as well as from several characteristics of the millennial generation in the aspect of job satisfaction and it was found that participants showed characteristics that were more concerned with material work values, and work experience had an individual nature of narcissism requiring clear superior direction. Job satisfaction The millennial generation tends to work to complete their own tasks and is not optimal. The level of effort carried out is easily disappointed and avoids risk. lack of work synergy and organizational support. Lack of understanding of the responsibilities of the bureaucracy is felt to be long and hampering.*

*Keywords— Corporate Values AKHLAK Model; Millennial Generation; Job Satisfaction*

## I. INTRODUCTION

The more advanced the development of the world of technology and information, the industrial revolution 4.0 and also the era of society 5.0 the more complex the way to run a business in this era. The way to manage a good and efficient company today is clearly different from the conventional way. This era full of challenges is also known as the VUCA era, an acronym consisting of:

- a. *Volatility*. Regarding things like about two mobile phone brands: Nokia and Blackberry. With the development of technological advances, mobile phones have turned into smartphones. A very drastic change that the two brands failed to follow its development and finally failed to compete and were evicted from the smartphone industry.
- b. *Uncertainty*. No stranger to mobile banking, with the decreasing frequency of customers visiting ATM machines that have been provided by banks. Currently, almost all transaction needs can be completed with a smartphone without knowing the place and time
- c. *Complexity*. Regarding the Go-Jek company, what type of company is it, it's very abstract, I'm sure it will be confusing to answer. neither a bank nor a transportation provider.
- d. *Ambiguity* (ketidakjelasan). Go-Jek's example is a testament to how complex and ambiguous the company is. able to carry out various functions able to compete to be better than the best. With the arrival of the Covid-19 pandemic as well as being one of the actors, the VUCA era is coming faster.(Agustian, 2020)

About how BUMN prepare themselves to face the VUCA era with all its challenges. Can BUMN survive and survive until 2045 when the country is 100 years old? In the midst of a very severe storm, limited vision of the future, requires two very fundamental things. Namely compass and anchor. The compass as the north star helps determine direction, and the anchor is a tool to prevent the ship from being swallowed up storm. In BUMN, the compass is the vision and mission of the BUMN, while the anchor is the core values of AKHLAK. (Agustian, 2020) State-Owned Enterprises (BUMN) have a role as agents to meet the government's needs for independence, prosperity, sustainability, equity, and control the livelihoods of Indonesian citizens. The hope is that BUMN can be managed as accountable professionals. This is a joint commitment as a business entity, which is required to be able to provide added economic value in the form of tax dividends and economy in promoting national development. With the issuance of the Circular Letter of the Minister of State-Owned Enterprises of the Republic of Indonesia Number: SE-7/MBU/07/2020 dated July 1, 2020 concerning the Core Values of Human Resources of State-Owned Enterprises that every State-Owned Enterprise is obliged to implement The Core Values of Human Resources of State-Owned Enterprises as Corporate Culture are the basis for forming the character of human resources within the State-Owned Enterprises, Subsidiaries, and Consolidated Affiliated Companies. become the basic symbol of BUMN behavior. (KataData.com, 2022).

The ministry officially replaced the Core value on July 1, 2020. It is not just an image, it is a form of BUMN transformation. The modern visual core values created by the Ministry of BUMN are part of the commitment to involve millennial generation employees to become good mentors as well as emphasize the BUMN moral values at every step of the BUMN. The strategic role of BUMN in the progress of the nation, the welfare of the people makes this sector very vulnerable to political practices. (KataData.com, 2022). Therefore, the loyalty and credibility of human resources is the key to realizing the function of BUMN. Many employees or even BUMN officials go to prison just because they are related to corruption, collusion and nepotism, this is proof that so far human resources in BUMN have not prioritized morality. Core values Morals as the basis for welcoming the future in 2030 - 2040 Indonesia is predicted to experience a geographical bonus, namely the number of productive age population aged 15 years -64 years more than productive age population under 15 years and above 64 years. in this period the productive age population is predicted to reach 64% of the total population, projected at 297 million people, the maximum benefit of abundant productive age human resources must be balanced with improving the quality of human resources in terms of education and competence, including its relation to morals at work. (Kusnandar, 2021) The Ministry of BUMN established a transparent Talent management system. In terms of occupying a position that has qualified and innovative performance, he is the one who has the right to occupy the position. BUMN in recruiting millennial talent, human resources. Good corporate actions will lead to a reputation and good name as fuel for the organization to remain sustainable and competitively superior. (KataData.com, 2022). In emphasizing human resources, SOEs cultivate an innovative work climate in order to create business opportunities that can make business breakthroughs in the era of the Industrial Revolution 4.0 and also the future era of society 5.0 in order to produce individuals who are capable of competitive competence. (Maulamin et al., 2021). BUMN adapt to changes in managing human resources that can make it easier for BUMN

to produce competent talent in the face of changes in business models in the future that are real to face changes, prepare various future readiness human resource developments to face changes in management, business models. (B. E. Becker & Huselid, 2006)

Core values AKHLAK is the core of the company so that it becomes the mindset that is reflected in all company activities in the belief that the Brand is a connector for other Brand elements. although sometimes abstract, the existence of brand beliefs can inspire internal companies to communicate with employees and the market. (Clifton & Harter, 2019). Every company puts Barnd's belief in a company slogan or tagline. on the practice of Brand beliefs can be reflected directly in the behavior of the Company and employees that are constant and long term. (Baumgarth, 2010)

Core Values AKHLAK are usually applied to human resources, which are company assets that are the main source of the company in carrying out its functions. Thus the company is able to manage and maintain optimally owned human resources in order to achieve company success. (Jim Collins, 2020). Managing and maintaining human resources can be done by considering job satisfaction. Human resources themselves. Job satisfaction is an attitude and role related to aspects of work. Human resources are currently filled with workers in the millennial generation group and Generation Z is defined by (Buzza, 2017) generation born from 1980 to 2002 (Sparks Coburn & J. Hall, 2014) it is recorded that the millennial generation population in Indonesia reaches 34%, meaning that one third of Indonesia's population is the millennial generation at the age of the millennial generation, the most productive age. (Ozcelik, 2015) based on the fact that the millennial generation has a lower level of job satisfaction than the older generation touring. (Rony, 2019) study or Davinsi payment also uses the same thing, many millennials feel the lack of job satisfaction is not appreciated at work. (Schroth, 2019). Job satisfaction is determined based on individual criteria and job characteristics. This is revealed in the individual characteristics of the work situation that determine a person's assessment of what should be in the job. Job characteristics have not been a determinant of the millennial generation's expectations for their future work, the working millennial generation is more willing to get big profits from future jobs than their previous jobs. In addition, the millennial generation refers to evaluating the experiences experienced by the millennial generation. (Madara et al., 2018) said that the millennial generation's expectations for work are influenced by the group that is used as a reference regarding the type of work and its appropriate conditions. Individual characteristic factors consist of behavioral values, personality traits and needs, values are individual beliefs in right and wrong behavior in work goals to be achieved and undesirable. (Papavasileiou & Lyons, 2015). Personality traits such as prominent self-esteem, aspirations as a reference for millennial generation job satisfaction. Self-esteem as a value assumes the extent to which the millennial generation is able to fulfill the requirements for carrying out tasks at work. Needs are everything that is needed to obtain prosperity. (Naim & Lenkla, 2016) Needs are important because individuals will want more work factors which are tools to meet needs in work, the need for awards can be met by various factors, one of which is recognition. (Nachiappan et al., 2014) represent importance in job satisfaction. Millennial generation employees have high job satisfaction and are good at achieving the goals and objectives set by the company. (Childs et al., 2015)

With good job satisfaction owned by millennial generation employees, it is hoped that organizational goals can be achieved. Aspects of the concept of employee job satisfaction is the result of a synergy of a number of factors, namely: (1) The work factor itself (Work itself) This satisfaction can be achieved when the work of the Millennial generation is in accordance with the interests and abilities of the employees themselves. (2) Pay Factor Where the Millennial generation feels that the salary or wages they receive are in accordance with their workload and balanced with other employees who have the same tenure and rank level. (3) Promotion Opportunities Factors Opportunities owned by the Millennial generation to increase their position in the organizational structure. 4) Supervision Factor Millennials feel they have a superior who is able to provide technical assistance and motivation 5) Factors Coworkers Millennials are satisfied with their coworkers who are able to provide technical assistance and social encouragement. (García et al., 2019b).

The character of the millennial generation brings knowledge on aspects of work to become a criterion for job satisfaction for the millennial generation. This study will explore how the core values of the AKHLAK model. The character of the millennial generation and job satisfaction criteria. There are several previous studies related to the problem of this research, namely the performance of the millennial generation, previous research by. (Jang & Juliana, 2020) performance on millennial generation loyalty, using descriptive and verification methods. Research conducted by. (Kriswinahyu, 2020) which focuses on the influence of Generation Y organizational culture and performance on OCB (*Oragniztions Chitizship Behavior*). Researcher by (García et al., 2019a) the influence of organizational support commitment and performance as a factor in the work of the millennial

generation. Research by (Schwatka et al., 2020) performance factors in generation Y jobs at Bank BCA. (Sparks Coburn & J. Hall, 2014) on the contribution to the level of performance how satisfied millennials are at work. (Pintaningdyah, 2017) also tries to uncover the effect of performance on millennials in Thailand. (Khadijah, 2019) Millennial generation performance in Malaysian multinational companies. (Noermijati et al., 2020) the influence of the performance of the millennial generation in Colombia. (Kim & Choi, 2018) the company's hallmark on performance and commitment by the millennial generation. (Ling et al., 2018) the perceived performance of the millennial generation in the nursing field. Based on several studies above, the performance of the millennial generation can be influenced by several factors at the level of maturity. The research above uses a lot of quantitative research methods to test the effect of some of the literature reviews above, there are several updates that can be done in this research to explore and assemble the implementation of the core values of the AKHLAK Model, the job satisfaction criteria itself in the millennial generation where previous research has proven more factors that influence job satisfaction for the millennial generation. Based on the novelty, the researcher is interested in exploring the implementation of the core values of BUMN AKHLAK. Characteristics and criteria as a measure of millennial generation job satisfaction. With the implementation of BUMN AKHLAK and certain characteristics in the millennial generation. The novelty of this research will use a qualitative methodology with the object and subject of millennial generation workers in BUMN. Collecting research data using semi-structural interviews and FGD. The method used is research data analysis in the form of qualitative content analysis analyzing data in the form of text and clarified in certain categories with job satisfaction criteria in research focusing on job satisfaction aspects related to the core values of the AKHLAK Model in BUMN.

## II. LITERATURE REVIEW

### A. AKHLAK BUMN

AKHLAK become the basis for a successful achievement of the BUMN design to establish a world-class reputation. The reputation of BUMN companies is very important to achieve. Moreover, President Jokowi gave the mandate so that BUMN have a good reputation in the eyes of national and international. Borrowing a management science approach, (B. Becker & Gerhart, 1996) that the formation of strategies for success begins with human resources (*resource*), (*action*), and (*intent*). In this case reputation becomes the goal (*intent*) the creation of a good organizational process (*action*), begins from AKHLAK (*resource*). A simple strategy formation is arranged in BUMN Indonesia, specifically BUMN, lots of smart and great people. But smart and great is not enough. Because capability alone is not enough. Capabilities must be in line with competence as the basis is behavior, this is where morality is the basis of competence. (*core competency*) must be owned by all employees of the millennial generation BUMN. *Core competency* coated *core capability* namely talent, intellectual can form a strong foundation based on human resources. (Marcus Buckingham & Curt Coffman, 2021) Human resources are the main key for organizations to achieve competitive advantage. With AKHLAK good millennial generation employees BUMN starting from the highest level to the lowest level, becomes a driving factor for good corporate behavior.

Loyalty and credibility of Human Resources (HR) as the key to realizing the function of BUMN. There are already many employees or even officials BUMN went to prison for corruption, collusion and nepotism (KKN). The practice of 'deposit' in BUMN, to the existence of a 'facilitator' in carrying out various projects. This is proof that human resources in BUMN have not prioritized morals. Now, BUMN are internalizing core values AKHLAK in all state-owned companies, all subsidiaries and even consolidated affiliated companies. Core values or new culture

AKHLAK it is an acronym for: Amanah, Kompeten, Harmonis, Loyal, Adaptif, dan Kolaboratif. process of finding AKHLAK also carried out by conducting an inventory of all core values owned by 108 companies BUMN (Agustian, 2020)

The results of research on all of these core values, SOEs found that in fact the core values were different. Sometimes a company calls it trust, while in other companies it calls it trust or honest, all that really is Amanah. One company calls it professional, another company calls it excellent, superior, smart, all of which means competent. what is the belief that if all employees BUMN work with good morals then BUMN will be able to make an optimal contribution to the nation with a good image, it fits if it is used as an acronym for core values

AKHLAK.

- a. Amanah: Hold fast to the trust given
- b. Kompeten: have the ability to work, always learn in developing capabilities
- c. Harmonis: Harmony, caring for each other and respecting differences
- d. Loyal: Dedicated and prioritizing the interests of the nation and state
- e. Adaptif: Continue to innovate, enthusiastic in moving, facing change
- f. Kolaboratif: Building a synergistic collaboration. (Maulamin et al., 2021)

#### The Character of the Millennial Generation Raises Expectations on Job Satisfaction Aspects

The term millennial was first defined by Howel when a child was born in 1982 entering preschool (Sparks Coburn & J. Hall, 2014). Merriam Webster, Millennial is a term derived from the word millennium, which is the period of a thousand years or people born between the 1980s and 1990s. millennial generation born between 1982 and 2002 (Ertas, 2015) sources about the year of the millennial generation there are differences between them, but it can be concluded that the millennial generation is the generation born from 1982 to 2002. The millennial generation is often also called generation Y which is an abbreviation in English, namely "youth"(Schroth, 2019)

The millennial generation is a generation that was born together with technological developments with different characteristics compared to other generations. The characteristics of the millennial generation can be explained through their values, personality traits and needs, (Childs et al., 2015) The millennial generation has values that are believed to be guidelines for behavior, values that are believed to focus on values that are important for the millennial generation in the workplace. The values in the workplace that are believed by the millennial generation are material ones such as wages, status, promotions and benefits as work priorities (Buzza, 2017) The millennial generation considers free time more important outside of work, compared to other generations (Madara et al., 2018). Overall, the millennial generation is more concerned with material things in their work. The millennial generation has inherent personality traits that distinguish it from other generations, namely individualism and narcissism (Naim & Lenkla, 2016) explaining the individualism of the millennial generation makes him focus on the rights of his own desires. There is an advantage with the individualism of the millennial generation, namely in treating others individually, it does not involve racial or gender actions in socializing (Andrade & Westover, 2018). Millennials' narcissism makes you feel special. Narcissism has a bad side, which is a lack of soft skills needed to work in organizations. Millennials tend to criticize with anger and blame others for failure (Clifton & Harter, 2019). as with individualists, narcissism also has the advantage that it makes them feel confident, visionary and friendly meaning this trait will fit when made a leader (Clifton & Harter, 2019; Nabyła, 2016)2012). In addition to their values and personality traits, the characteristics of the millennial generation have a need for feedback from superiors (Muliawati, Triyana & Frianto, 2020). In the workplace, the millennial generation really needs feedback and wants to be given clear directions in solving problems and tasks. Millennials are used to giving feedback, so that the millennial generation thinks that their boss or supervisor at work will act dynamically. evaluation to improve performance (Rony, 2019), Millennials need good feedback more than being negative. Millennials are afraid that this will affect their self-esteem (Madara et al., 2018)., The millennial generation needs certainty in the work structure and direction, always directed to seek approval and reinforcement, so that in the workplace it can lead to a tendency to always seek direction and guidance from superiors. These characteristics raise the millennial generation's expectations for their work. These expectations are considered unrealistic and disproportionate to their abilities and skills (Andrade & Westover, 2018). The study assessed that these expectations were acceptable and quite realistic.

The millennial generation has certain characteristics that can lead to expectations in the world of work, including job satisfaction. Expectations are individual beliefs and beliefs regarding things that should happen in certain conditions (Schroth, 2019) Parents of the millennial generation treat and educate with a culture that is easy and instant so that certain characteristics can be attached to the millennial generation from the beginning of life, the millennial generation is treated special, spoiled and even doesn't get rejected, banned by parents, teachers or adults (Madara et al., 2018). It forms their seemingly limitless self-esteem (Nur khotimah 2020). too selfish (Childs et al., 2015) Traits such as high self-esteem and narcissism can lead to higher expectations at work (Sparks Coburn & J. Hall, 2014) During the growth period of the millennial generation observing the values applied by parents when working, the Baby Boomers Generation applies the importance of Loyalty, commitment at work in the hope of obtaining success, the millennial generation observes what the Baby Boomers generation applies as parents in their work (Salim, 2021) This value is also important in implementing the expectations of the millennial generation.

The millennial generation has expectations in the world of work, the millennial generation's expectations are considered too high and unrealistic because of the imbalance between abilities and expectations of their own abilities. (Papavasileiou & Lyons, 2015). Having high expectations in work that makes the millennial generation want to always look for jobs that can provide everything they want such as flexibility, high wages, get promoted in a short time (Salim, 2021). The millennial generation wants a promotion within a short period of about 15 months after entering work (Childs et al., 2015). The millennial generation expects to have good bosses who are able to communicate openly and positively (Khadijah, 2019). The millennial generation wants to have a variety of challenging and flexible tasks. And given the freedom to complete the work (Salim, 2021). Although the millennial generation is known to have high expectations on work, it is possible that the millennial generation has realistic expectations, revealing that the millennial generation has realistic expectations of wages when work is the first thing. Expectations that are based on important aspects of work related to job satisfaction, promotions, leadership, work wages, co-workers and the nature of the work itself, thus the expectations expressed by the millennial generation can be used as a series of millennial generation job satisfaction criteria. (Schroth, 2019).

*B. Job Satisfaction*

Job Satisfaction is a positive assessment of the work and work experience that a person feels. Job satisfaction in this study, measured using the following dimensions:

- a. Work itself (Work itself) Millennials assume job satisfaction can be achieved if the work is in accordance with the interests and abilities itself.
- b. Rewards (Pay) Millennials feel that the salary or wages they receive are in accordance with the burden
- c. work and balanced with the same period of work and rank level
- d. Promotion Opportunities The Millennial generation has the opportunity to increase their position in the organizational structure
- e. Supervision Millennials want to have a superior who is able to provide technical assistance and motivation.
- f. Millennial Generation Coworkers are satisfied with their coworkers who are able to provide technical assistance and social encouragement. (Jang & Juliana, 2020)

Fig 1.

III. RESEARCH METHODOLOGY

In this study, the author uses the constructivism paradigm, "The constructivism paradigm is based on general thoughts about theory" (Creswell, 2013) Theories produced by researchers and constructivist theories are based on non-objective ideas and are constructed through a process of interaction between groups, communities and cultures. indicators as the basis for conducting research. The approach used in this study is a qualitative approach chosen because it is in accordance with the paradigm and problems chosen by the author. Qualitative research is research that examines quality, activities, situations, or materials with a strong emphasis on thorough descriptions in describing the details of everything that happens in a particular activity or situation.(Creswell, 2013)

As a social science research method that collects and analyzes data in the form of words (oral and written) human actions. (Creswell, 2013) The author does not attempt to calculate or quantify the qualitative data that has been obtained, thus does not analyze the figures. The method used is a descriptive qualitative approach. Research goes directly to the field, acting as an observer. This research is descriptive by describing and making a description of the Implementation of the AKHLAK Model Model. Characteristics and job satisfaction of the millennial generation of BUMN. The subject and object of the research is a millennial generation employee who is actively working at the working age of 25-35 years correspondent 5 millennial generation employees. In accordance with the purpose of writing this research, namely to modify the implementation of the AKHLAK Model on the job

satisfaction of the millennial generation of BUMN. Meanwhile, the object in this study is the Ministry of BUMN. Data collection techniques used interviews and FGDs, both using Zoom and online. Test the validity of the data in qualitative research includes testing, credibility, transferability, dependability, and confirmability (Creswell, 2013) Triangulation processing method.) says triangulation in credibility testing is checking data from various sources at various times. source triangulation, data collection technique triangulation, and time engulfed Source, Technique and Time. (Creswell, 2013).

#### IV. RESULTS / FINDING

##### A. *Literature Study Result*

###### 1. *Core Values Model AKHLAK BUMN Amanah*

For the millennial generation of BUMN, it is difficult to do in their daily work habits, they feel that trust is important for their future progress, which must enter into their thoughts and work behavior as integrity, sincerity, consistency, and trustworthiness. The millennial generation of BUMN in fulfilling promises and commitments is very important. The millennial generation of BUMN does not want a bad reputation for fear of not being trusted, but in reality it is sometimes difficult to do this in the world of work. Likewise in being responsible for tasks, decisions, and actions taken such as arriving late to the office, working half-heartedly and prioritizing the pay, not completing assignments on time do not carry out the direction of the leadership, as a result the targets achieved are below expectations. The millennial generation adheres to moral and ethical values, sometimes the millennial generation likes to mumble when working, working with only "sincere" intentions, aka the goal is full, often baper in the office usually due to dating, and other problems outside of work in developing themselves very much. both because of the amount of information and knowledge that is easily available today. When building good relationships with other people, they interact very quickly online but in a direct manner it is still lacking and rigid, millennials are always dissatisfied with what they get at work. Always accept new things or challenges, work with variations, don't want to do the same thing.

###### 2. *Kompeten*

The millennial generation understands in increasing self-competence to answer the ever-changing challenges in every job, as in helping others learn is still lacking because of individualism in work but they have the belief that helping others can be a source of additional income, and assumes the people being taught have not of course become rivals, maybe even become partners. They sometimes complete tasks with good quality depending on their quality or mood, There will be a point when they feel very bored with the current life which results in a lack of performance shown at work.

###### 3. *Harmonis*

The millennial generation in terms of harmony at work is often perceived which results in misinformation, that's natural. Because the name one organization can happen, but if there is a problem they try and are less able to solve the problem. In work rights, when you get a job outside of your daily work, it still gives a negative impression. resulting in conflict disputes, this is the most common. The millennial generation respects other people's backgrounds and does not compare everyone in the work environment.

###### 4. *Loyal*

The millennial generation in work related to the value of Loyalty they can maintain the good name of fellow employees, leaders, BUMN, and the State but in everyday work Employees never want to have an opinion, do not dare to say agree or disagree. Obedient only when seen. Does not respect office rules. Not liking and loving his work, willingness to make sacrifices to achieve a bigger goal is still lacking because it is an individual who puts his own interests first, especially the interests of the needs of daily life. They are very relatively obedient to the leader as long as it does not conflict with law and ethics. The millennial generation likes leaders who are able to motivate and inspire employees, Give sincere appreciation and praise, which means making others feel important to be honest and have integrity, dare to admit mistakes, and really listen and respect opinions. Listening with the ear and listening with the heart are different, when listening with the heart, then you really empathize.

5. *Adaptif*

For the Adaptive millennial generation, namely Innovation, Enthusiasm for change, and Proactive the millennial generation in working Quickly adapting to be better (do not think satisfied but always try to be better). The millennial generation at work can continuously make improvements following technological developments, and act proactively. But they fail to understand the change and its implications. Melanian generation has tolerance for change

6. *Kolaboratif*.

The millennial generation in terms of collaboration, namely the willingness to work together and synergize for better results, is less felt due to its individualistic nature. Plus the behavior. Millennials at work Provide opportunities for all parties to contribute, Open in working together to generate added value. They can drive the use of various resources for a common goal. In working together, you don't see someone's background.

B. *Job Satisfactions*

The work factor itself for employees of the millennial generation of BUMN, the quality of work that has expertise in the IT field is important, due to the demands of a job completion system using IT based. The millennial generation is able to complete their tasks. The millennial generation in responding to their main duties and responsibilities, still lacks understanding so that in completing work assignments they become less professional, which results in maladministration and obstacles in completing work. For them, there is no systematic socialization with integrity in order to provide an understanding of the importance of organizational values and how to implement them in their daily work behavior. The millennial generation is still individualistic in their work.

The millennial generation does not understand or do not master the existing tupoksi related to their work, on the other hand there is also a millennial generation who has the habit of procrastinating work, there is still a lack of personal awareness to discipline and complete work effectively and efficiently. The millennial generation's low work motivation is caused by the need to increase welfare and refers to wages. The millennial generation in accelerating the completion of work assignments is still lacking due to their seriousness in working at will. Due to the lack of accountability and transparency in job descriptions between fields and daily work responsibilities, they still do what they like in their job duties. The millennial generation in terms of working time and attendance is often late in arriving so that the working hours are erratic, sometimes they come home late at night to complete their work assignments. In terms of the work system that. too complicated and takes a long time millennials are very selective in choosing a job and usually they avoid and choose jobs that are interesting, new and have challenges. In the work of the millennial generation, it is still not systemized according to the applicable rules, they move what is in front of them and are accepted, so that's what they do first, resulting in the system at work being slow to complete a complete job.

The millennial generation can adjust the main tasks of the organization, but in the main tasks of their work they work individually, because the millennial generation or the main tasks of the organization want to advance the organization. The millennial generation at work and their satisfaction feels the lack of coordination meetings and continuous work evaluations, so it is natural that their work responsibilities in personal work take precedence over work in the form of teams or organizational fields. The millennial generation in the job description of their respective job responsibilities already has a list of jobs according to their job achievements, as well as the connection between working the millennial generation working alone and individually, lack of togetherness. Melania generation in working individually, so that individuals work less optimally in this regard and become selfish in their own work. The millennial generation often makes mistakes in work contracts so that it affects the volume of work weight, for the millennial generation there are new and challenging jobs that they immediately take without thinking about the length of the impact. They tend to take risks when decisions are short on time which is their authority, in job satisfaction there is still overlapping of responsibilities and unclear instructions so that there is still behavior to avoid duties and responsibilities at work, the millennial generation assumes that all jobs must have risks for them. It's a normal thing, so that when they work and are still not firm enough, they take decisions or policies every time that hinders the target work that should be accomplished.

The millennial generation in their burdens and responsibilities, if there are activities in their unit or field, they usually look for safety and avoid risks. They prefer jobs that match their hearts or preferences and also new challenging jobs with new risks of responsibilities that are still not described. The millennial generation assumes that because work activities have been carried out in accordance with SOP and job descriptions and so they already

know what the risks will be and what needs to be done is to manage these risks, which will be accepted by the team, the field group, not their individual. on the importance of values that support work culture and lack of responsibility for the main tasks and functions. Their lack of understanding of this causes each individual to have unclear duties and responsibilities because the melianial generation lacks an understanding of organizational values, so that the melianial generation in interpreting the soul of the Corps has not been maximized, resulting in not feeling like they have the soul of the BUMN. the responsibility of the melianial generation is still the lack of comprehensive personal socialization about the value of BUMN and the lack of awareness of the millennial generation towards the concern of BUMN organizations. For the millennial generation, although socialization has been carried out and in textbooks, there are already clear guidebooks distributed to them, but in implementation it cannot be fully implemented because there is no understanding or lack of ability to carry out things that have become the provisions of applicable regulations and also carrying out herring activities have been carried out by the leadership every morning. The current condition of the melianial generation is required to work multitalented, have high integrity, master information.

However, implementation in organizations often lacks Human Resources even though BUMN are built based on prototypes based on decisions issued on the basis of government law. Therefore, as a logical consequence of the millennial generation, one of them is to provide support for making commitments and work achievement targets. Related the workplace for the melianial generation is too far from where they live, and even having to be separated from their family results in often being late for office attendance as well as problems with focusing at work. The millennial generation considers that their work is often delayed because the tasks given overlap due to lack of human resources, there are still many additional tasks and protocol activities so that the main tasks are disrupted. And for work attendance, be present at the time of entering working hours at 08.00 WIB. The melianial generation still lacks personal and non-organizational awareness to complete work effectively and efficiently, in group work it is still not dynamic at work. In terms of work, the millennial generation is used to procrastinating even though they already have a motto AKHLAK.

Rewards for Employees The millennial generation of BUMN considers the need to improve facilities and infrastructure to support work so that they can complete their duties and responsibilities. For the millennial generation, it is considered necessary to have additional honors at all levels or work positions such as work allowances, health in order to support the smooth running of activities that have been programmed, such as in terms of providing additional honorariums and improving health services and the need to improve welfare such as work allowances, job allowances, housing, official vehicles and other facilities. Employees of the millennial generation of BUMN need an adjustment in salaries and work benefits based on the current needs index, especially for the level of staff level, in order to minimize the gap in the provision of job responsibilities that exist between staff and structural/functional officials. They consider that the reward for submitting and receiving the bureaucratic process related to additional wages or honorariums is a long and cumbersome process. Employees of the Generation of State-owned Enterprises for inadequate salaries or allowances are not evaluated in comparison to their needs, competencies and daily living needs. The millennial generation of BUMN employees in terms of assignment allowances, transportation and official travel are still lacking for transportation needs and food costs at work. All activities require a clear and adequate budget, especially for supporting facilities for the implementation of work tasks both within the city and to the region, the promotion opportunity factor. To improve health services, the necessities of life and transportation are not optimal because the infrastructure is still minimal. Budget assignment to regions already there but still not good for the cost of lodging, transportation and meals. For the level of salary and honorarium still use the old rules so that they are still outdated and not updated, no new rules have been issued. Employees of the millennial generation of BUMN, current welfare, especially office allowances, are still lacking. Employees of the millennial generation of BUMN consider that there is still a lack of welfare related to official homes, official vehicles and personnel security. The absence of official residences and transportation equipment for employees to pick up and drop, especially for those who live far from the office. Employees of the millennial generation of BUMN consider the performance allowances between structural or functional staff and officials to be very different, so this is what causes a decrease in morale and job satisfaction. Employees of the millennial generation of BUMN feel that at this time welfare is quite adequate, but for support in work, it needs addition and rejuvenation.

Employee Promotion Opportunity Factors The millennial generation of BUMN is related to career development and education, it is in accordance with the quality and quantity of work carried out by each employee, the procedures and requirements are too difficult and long. All activities require a clear and adequate budget, especially for supporting facilities for the implementation of work tasks both within the city and to the region, the promotion opportunity factor. According to the employees of the millennial generation of BUMN, there are still

employees who are placed in one position that is not in accordance with their competence. There are still many employees who are 50 and 60 years old, where current conditions require them to understand and carry out activities related to the use of technology or IT because there are still many who are ignorant of technology, which is different from the millennial generation of BUMN employees who are fluent in using technology and understand the use of technology and IT. in support of carrying out their work duties. Due to the fact that there are still employee positions that are not in accordance with the expertise possessed because taking office takes time. The old one was because finally employees who were aged 50 years and over who served as leaders both structurally and functionally. This resulted in the interest of the Millennial Generation Employees of BUMN declining because they had to wait a long time to become leadership officials due to the work process.

The millennial generation of BUMN employees in terms of careers related to education, further development facilities for career paths are determined by education because they have to carry out their level of education so they have to spend money and time to support their positions and ranks. In the career process, there is still an official who occupies his current position but does not have expertise in that field, because the position must be filled immediately so that it seems forced. Or the position is occupied by a person close to the leadership so that the job is held by an honorary or contract employee. Employees of the millennial generation of BUMN in their careers when officials place certain positions, both structural and functional, must pass several requirements. However, when carrying out many activities that do not fulfill formally related to education, on the other hand there are positions that must be filled immediately, eventually many officials whose competencies are not in accordance with the positions they occupy. The existence of vacant positions is due to the requirements. Lack of formal competency certification staff. Lack of personnel in the fields that are in accordance with their positions so that they are less able to control that, lack of understanding of duties and responsibilities and individualism factors. There is still a long time and bureaucracy to move up the career level, which is felt by the millennial BUMN employees. There is still an unequal distribution of personnel in every field and department. For employees of the millennial generation of BUMN, in terms of career, there is no position and there is still a lack of socialization about understanding how to do it in terms of career paths. In career-related work activities in terms of position determination, it has not been assessed by achievement. In the work and career path process, human resources are adequate, but there are certain positions that are vacant so that the work of the vacant position is covered by other officials so that there is a term double job.

Supervision for Employees The millennial generation of BUMN believes that there are still leaders who always dictate the work of their subordinates, they are not given the trust of their subordinates, and in their work are orders without explaining and practising, leaders are still not firm in making decisions and do not dare to reprimand their subordinates and provide sanctions both formal and informal. there are still leaders who appoint certain people to complete work that contains resilience and avoids risk responsibility in completing the work. Leaders in placing personnel positions are very subjective, not based on the competence of the person, but even for factors of closeness and friendship. For employees of the millennial generation of BUMN, there are still leaders or superiors who tend to only command and sometimes the orders are not clear, so the staff will explain and perceive it themselves. There are also leaders of discipline and responsibility as well as visionary managers. There are still leaders who do not or do not understand their duties and responsibilities so that they have a unclear vision of goals. There is still a leader, what he says is not the same as what he does. There is a leader who deserves to be made a adapila pantan who only reprimands and orders his subordinates. Employees of the millennial generation BUMN are happy to see the behavior of the leader living a simple life but not being stingy with his subordinates or members of his work team. Employees of the millennial generation of BUMN leaders already have the principle of leading by heart, even though they have high strength and power, but there are still some who still don't understand power management. Leaders in making decisions lack coordination so that the results are less than optimal and tend to have errors. There are still leaders who are afraid to make decisions to advance the organization. An employee of the millennial generation of BUMN stated that the current leader has passed the fit and proper test and assessment, there should be no more leaders who are less assertive and afraid to make decisions and avoid the risks of their work responsibilities.

The Co-Worker Factor The millennial generation of BUMN is related to co-workers, there are still employees or co-workers who take over their authority which is not their authority. The placement of employee personnel is not evenly distributed so that sometimes it hampers the harmony of teamwork and the arena of ignorance or inability to carry out their work responsibilities. There is still work that should be done in teams but is done individually in making SPM decisions, this results in less than optimal work results and tends to have errors. In colleagues, it is necessary to increase work synergy and work behavior that supports each other between all fields and departments even though each section has a different work pattern. In coworkers doing work

assignments, there is still overlapping responsibilities which are reinforced by unclear job completion directions, so that coworkers are still looking for safety and avoiding risky job responsibilities. work assignments are not completed due to the absence of coworkers for reasons of being far away and not having transportation costs to attend the office. In the case of co-workers, if there are colleagues or personnel who are passionate about innovating in their work and helping to coordinate fellow fields and departmental units in doing team work, there are still those who highlight negative things such as projects and others that generate more money for individual benefits. . At the time of determining the work program plan, budget, etc., there is a system in which work targets must be submitted together in terms of access to different fields or departments which cannot be completed directly. In carrying out the main duties of co-workers, they continue to carry out work with good teamwork so that the achievement of work is quite good and solid. In co-workers, there is inequality in human resources in the organization, resulting in inefficiency in the main tasks and work being carried out, the cause of which is the lack of human resources and the lack of competence in human resources, resulting in inequality of human resources which results in inequality in working with co-workers.

## V. CONCLUSION AND RECOMMENDATION

Based on the results of the research and discussion that have been described previously, the authors obtain the results as for some of the conclusions put forward with the core values of the BUMN AKHLAK Model, the characteristics of the millennial generation and job satisfaction are as follows:

- a. There are research findings related to the core values of BUMN AKHLAK. The value of trust for employees of the millennial generation of BUMN in fulfilling promises and commitments is considered very important because they are afraid of not being trusted with their reputation but in reality it is sometimes difficult to do at work. Likewise in being responsible for tasks, decisions, and actions taken late to the office. moral and ethical values sometimes the millennial generation in carrying out work is carried out depending on the situation and conditions at that time, the millennial generation is related Competent understands in increasing self-competence to answer the ever-changing challenges in terms of work, as in helping others learn is still lacking due to the nature of individualism in work. The millennial generation in terms of harmony at work often has perceptions that result in misinformation. Millennial generation in work related to values Millennial generation loyalty can maintain the good name of fellow employees, leaders, BUMN, and the State but in everyday work it is still lacking, because it is related to individual interests and needs. For the millennial generation Adaptive is Innovation, Enthusiasm for change, and Proactive the millennial generation in working Quickly adapting to be better. The millennial generation in terms of collaboration, namely the willingness to work together and synergize to produce better results, is less felt due to the nature of its individualism and narcissism, overconfidence, which is too high and sometimes does not match its expectations in the real world.
- b. There are research findings related to the characteristics of the millennial generation in job satisfaction. The work factor itself for employees of the millennial generation of BUMN, the quality of work that has expertise in the IT field is important, due to the demands of a job completion system using IT based. The millennial generation is able to complete their task. Rewards for Employees The millennial generation of BUMN considers the need to improve facilities and infrastructure to support work so that they can complete their duties and responsibilities. For the millennial generation, it is considered the need for additional honors at all levels or work positions such as work benefits, health in order to support the smooth running of activities. Employee Promotion Opportunity Factors The millennial generation of BUMN is related to career development and education, it is in accordance with the quality and quantity of work carried out by each employee, the procedures and requirements are too difficult and long. Supervision for Employees The millennial generation of BUMN believes that there are still leaders who always dictate the work of their subordinates, they are not given the trust of their subordinates, and in their work they are commanded without explaining and practising, leaders are still not firm in making decisions. The Co-Worker Factor The millennial generation of BUMN is related to co-workers, there are still employees or co-workers who take over their authority which is not their authority. The placement of employee personnel has not been evenly distributed so that sometimes it hampers the harmony of teamwork.

**Analysis of Economic Gap Between Districts in Bali Province in 2017-2021**Fatin Amalina<sup>1</sup><sup>1</sup>Muhammadiyah Surakarta University: Economic Development, Faculty Of Economics and Business Muhammadiyah Surakarta, Sukoharjo Central Java, Indonesia**Abstract**

*The purpose of this study was to determine the development of economic disparities between districts in Bali Province in 2017-2021. The research used in this study is a quantitative research using secondary data type panel data. The results of this study indicate that only one variable that has no significant effect on economic inequality is GRDP. Labor Force Participation Rate, Human Development Index and Minimum Wage have a significant effect on economic inequality in the province of Bali in 2017-2021.*

Keywords— Economic Inequality (Gini Index); Labor Force Participation Rate (LFPR); Minimum Wage; Human Development Index (IPM) and GRDP

**I. INTRODUCTION**

Economic inequality has become a common problem in a country, both developed and developing countries. The issue of economic disparities between regions has become a global phenomenon. Indonesia is one of the developing countries that has not been able to achieve financial stability. One of them is seen in the unequal distribution of people's income. If everyone gets the same share of the economy's production, payment is distributed perfectly evenly (Rahardja & Marunung, 2008). The impact of the occurrence of economic inequality can be a positive impact or a negative impact. The positive effects of economic inequality is that it can encourage other less developed regions to be able to compete and increase economic growth so that prosperity will be achieved. The negative impacts of economic inequality include economic inefficiency, weakening social stability and solidarity, and high inequality will be seen as unfair (Todaro, 2004). This negative impact will become a development problem in creating community welfare.

Noegroho and Soelistianingsing (2007), said that inequality also often occurs significantly in the province itself. Disparities between regions arise due to development that is concentrated at one point. Various programs developed to bridge the gap, both in terms of income distribution and regional disparities, have not produced significant results. In fact, development policies that are carried out to encourage economic growth can increase the gap in both income distribution and regional disparities.

As one of the regions with a fairly high distribution, Bali also experiences inequality in the acceleration of development between regions. The development carried out in the region aims to increase the income per capita of the people and catch up with the lagging economic growth compared to other regions. Since the Law on Regional Autonomy, districts throughout Indonesia have been trying harder and harder to develop their territories, which handed over autonomy down to the district/city level.

Table 1 Bali Gini Ratio Data For 2017-2021

province	Gini Ratio				
Bali	2017	2018	2019	2020	2021
	0,384	0,3774	0,3662	0,369	0,378

Data source BPS Bali Province

In table 1, it can be explained that the Gini index for the province of Bali for the last five years, namely 2017 to 2021, shows results that are still fluctuating, where the highest Gini index number in 2017 was 0.384 and then decreased in 2018 by 0.3774 then dropped again in 2019 of 0.3662 meaning that in these three years the development of the Bali Province Gini Index has shown good result because it is decreasing. Still this downward trend did not last long in 2020, the Bali Province Gini Index has increased by 0.369 and will continue in 2021 by 0.378. The data also shows that the Gini index for the province of Bali is still relatively low because it is still below 0.5 but has not shown a consistent trend towards significant development from year to year.

## II. LITERATURE REVIEW

### A. *The Effect of Gross Regional Domestic Product on Economic Disparities*

Previous research conducted by (Kurniati Mansyur1, et al., 2021) "Analysis of the Effect of Economic Growth, Investment and Government Expenditure on Inequality in Regional Development of South Sulawesi Province." The results of this study show that GDP is not significant to inequality. This is in accordance with the theory put forward by Todaro (2013) that in the early stages of economic growth, inequality tends to worsen, and in the next step, inequality will improve, but at one time there will be an increase in disparity again and finally down again.

### B. *The Effect of Labor Force Participation Rate (LFPR) on Economic Gap*

Previous research conducted by (Riri Hana Salsabila, 2022) "Analysis of the Effect of Mining Activities, Road Length, Landfill, and Minimum Wage on Regional Inequality in Kalimantan Island in 2014-2019" and (Rara Min Arsyillah, 2019) "Analysis of the Role of Education and Employment Against Inequality in Indonesia's Income Distribution (Case Study of 34 Provinces in Indonesia 2013-2017)". This study indicates that the level of labour force participation is positively and significantly related to the inequality of income distribution in 34 provinces in Indonesia. The results of this study are under research that states that the level of labor force participation has a positive and significant effect on income inequality. As the number of working-age population increases, the number of workers in the workforce increases. An increased labour force participation rate is predicted to be able to increase the resulting output with the assumption that an increase in productivity levels accompanies an increase in the number of works. If the work produced increases along with the increase in productivity, it would be able to increase income and reduce income inequality.

### C. *The Effect of Human Development Index on Economic Gap*

Previous research conducted by (Aliyah izza pradipta and Riko setya wijaya, 2022) "Factors Affecting Income Inequality through Economic Growth in the Province of the Special Region of Yogyakarta", and (Maria Agape, et al., 2022) "Analysis of the Effect of Microfinance Institutions and the Index Human Development Against Income Inequality in Indonesia. Research result can be explained that during the years 2007 – 2021, the human development index did not have a significant effect on income inequality. This means that with the increase in the human development index in Yogyakarta Province, inequality will decrease.

### D. *The Effect of Minimum Wage on Economic Gap*

Research conducted by (Rosita Juliana, Aris Soelisty, 2019) "Analysis of the Effect of Economic Growth, Population, Pad, IPM, and MSE on Inequality in Banten Province" and (Alifia Nadia Tsamara, Agus Suman, 2021) "Analysis of the Effect of Agglomeration, Infrastructure, Minimum Wage, Number of Working People, and Human Development Index on Inequality of Income Distribution Between Regencies/Cities of East Java". The results of the MSE research have no significant effect on inequality. The structure of the Javanese workforce is dominated by the agricultural, plantation, forestry, hunting and fishing sectors, most of which are casual workers and not under contract, so the impact of the minimum wage policy cannot be felt. Then workers in the non-industrial sector must accept the result of the continued increase in the price of basic needs so that workers cannot meet their basic needs. This phenomenon makes the minimum wage which was initially expected as a solution to, become one of the causes of inequality in income distribution.

## III. RESEARCH METHODOLOGY

To determine the magnitude of the influence of an independent variable on the dependent variable, this study used a Multiple Linear Regression model with panel data. The dependent variable in this study is economic inequality as measured by the Gini Index (GI), while for the independent variables there are 4 namely GRDP, Labor Force Participation Rate (LFPR), Human Development Index (HDI) and Minimum Wage. This study takes the Province of Bali as the area to be studied between 2017-2021. The analytical tool used in this research is panel regression analysis, with a model estimation as follows:

$$GR = \beta_0 + \beta_1 LFPR_{it} + \beta_2 LOGMW_{it} + \beta_3 HDI_{it} + \beta_4 LOGGRDP_{it} + \varepsilon_{it}$$

Where the description is :

*GR* : Gini Ratio / Economic Gap (Index Number)

*LFPR* : Labor Force Participation Rate (Percent)

*MW* : Minimum Wage (Percent)

<i>HDI</i>	: Human Development Index (Index)
<i>GRDP</i>	: Gross Regional Domestic Product (Percent)
$\varepsilon$	: Error Term
$\beta_0$	: Constant
$\beta_1 \dots \beta_4$	: Independent Variable Coefficient
<i>i</i>	: Region (7 districts/cities in the province of Bali)
<i>t</i>	: Year (2017-2021)

## IV. RESULT / FINDING

Table 2. The result of panel estimation using the Common Effect Model (CEM), Fixed Effect Model (FEM), and Random Effect Model (REM)

Table 2. Panel Data Regression Results

## V. DISCUSSION

The GDP variable has a regression coefficient of 0.000609 which has no significant effect, with a probability value of  $t$  of  $0.9325 > (0.1)$ . The GDP variable does not affect the Gini ratio in the province of Bali in 2017-2021. The results of the cross section panel data estimation using the Fixed effect model method shows that the GDP variable has an insignificant effect on the Gini ratio in Bali Province in 2017-2021. This is by previous research conducted by (Kurniati Mansyur1, et al., 2021) "Analysis of the Effect of Economic Growth, Investment and Government Expenditure on Inequality in Regional Development of South Sulawesi Province." The results of this study show that GDP is not significant to inequality. This is under the theory put forward by Todaro (2013) that in the early stages of economic growth, inequality tends to worsen, and in the next step, inequality will improve, but at one time there will be an increase in disparity again and finally down again.

The labor force participation rate variable has a regression coefficient of 0.003448, which has a significant effect, with a probability value of  $t$  of  $0.0033 < (0.01)$ . The labor force participation rate variable affects the Gini ratio in the province of Bali in 2017-2021. The results of the cross section panel data estimation using the Fixed effect model method show that the GDP variable has a significant influence on the Gini ratio in Province Bali in 2017-2021. This is under previous research conducted by (Riri Hana Salsabila, 2022) "Analysis of the Influence of Mining Activities, Road Length, Landfill, and Minimum Wage on Regional Inequality in Kalimantan Island in 2014-2019" and (Rara Min Arsyillah, 2019) "Analysis of the Role of Education and Employment on the Inequality of Income Distribution in Indonesia (Case Study of 34 Provinces in Indonesia 2013-2017)". The results of this study indicate that the level of labour force participation is positively and significantly related to the inequality of income distribution in 34 provinces in Indonesia. The results of this study are in accordance with research which states that the level of labour force participation has a positive and significant effect on income inequality. As the number of working age population increases, the number of workers in the workforce increases. An increased labour force participation rate is predicted to be able to increase the resulting output with the assumption that an increase in the number of workers is accompanied by an increase in productivity levels. If the output produced increases along with the increase in productivity, it will be able to increase income and reduce income inequality.

The human development index variable has a regression coefficient of -0.001542 which has no significant effect, with a probability value of  $t$  of  $0.8979 > (0.1)$  then the percentage reduction variable has no effect on the Gini ratio in the province of Bali in 2017-2021. Based on the results of the cross section panel data estimation using the Fixed effect model method, it shows that the GDP variable has an insignificant effect on the Gini ratio in Province Bali in 2017-2021. This is in accordance with previous research conducted by (Aliyah izza pradipta and Riko setya wijaya, 2022) "Factors Affecting Income Inequality through Economic Growth in the Province of the Special Region of Yogyakarta", and (Maria Agape, et al., 2022) Analysis of Institutional Influence Microfinance and Human Development Index of Income Inequality in Indonesia. The results of the research can be explained that during the years 2007 – 2021, the human development index does not have a significant effect on income inequality. This means that with the increase in the human development index in the Province of Yogyakarta, inequality will decrease.

The minimum wage variable has a regression coefficient of -0.035083 which has no significant effect, with a probability value of  $t$  of  $0.6525 > (0.1)$  then, the minimum wage variable has no effect on the Gini ratio in the province of Bali in 2017-2021. The results of the cross section panel data estimation using the Fixed effect model method shows that the GDP variable has an insignificant effect on the Gini ratio in Province Bali in 2017-2021. This is under previous research conducted by (Rosita Juliana, Aris Soelisty, 2019) "Analysis of the Effect of Economic Growth, Population, Pad, IPM, and MSE on Inequality in Banten Province" and (Alifia Nadia Tsamara, Agus Suman, 2021) "Analysis of the Influence of Agglomeration, Infrastructure, Minimum Wage, Number of Working People, and Human Development Index on Inequality of Income Distribution Between Regencies/Cities of East Java". The results of the MSE research have no significant effect on inequality. The structure of the Javanese workforce is dominated by the agricultural, plantation, forestry, hunting and fishing sectors, most of which are casual workers and not under contract, so the impact of the minimum wage policy cannot be felt. Then workers in the non-industrial sector must accept the result of the continued increase in the price of basic needs so that workers cannot meet their basic needs. This phenomenon makes the minimum wage, initially expected as a solution, become one of the causes of inequality in income distribution.

The constant value of each Regency/City in the Province of Bali in 2017-2021 is known. About the influence of the independent variable on the dependent, there is a Regency/City with the Gini ratio with the highest intensity, namely Klungkung Regency with a constant value of 1.083591, which means that when all independent variables are considered missing or zero, the Gini ratio in the Regency/City of Bali of 1.083591. The second is Badung

Regency, with a constant value of 1.074719, which means that when all independent variables are considered missing or zero, the Gini ratio in Badung Regency/City is 1.074719. Finally, the lowest area is Bangli Regency/City, with a constant value of 0.973991, which means that when all independent variables are considered missing or zero, the Gini ratio in Bangli Regency/City is 0.973991.

## VI. CONCLUSION AND RECOMMENDATION

From the results of the study, it can be concluded that based on the data processing that has been carried out, it is stated that 3 independent variables do not significantly affect the economic gap in the province of Bali in 2017-2021, namely, Gross Regional Domestic Product (GRDP), Human Development Index (HDI), Minimum Wage, meanwhile there is only one variable that has a significant effect, namely the Labor Force Participation Rate (LFPR).

This research indeed aims to find out how much influence the variables of Gross Regional Domestic Product (GRDP), Human Development Index (HDI), Minimum Wage, and Labor Force Participation Rate (LFPR) have on economic inequality in the province of Bali in 2017-2021. From the results discussed previously, it can certainly be a recommendation, for the Bali provincial government as the authority in making policies to alleviate and overcome the problem of economic inequality. Therefore, the government must focus on increasing the development of variables that have a significant effect on economic inequality without forgetting other variables that do not have a substantial impact in data.

This research is not perfect, and there are still many shortcomings at the same time becomes a recommendation for further researchers to look for other variables to find out how much influence they have on income inequality so that it will add research references to be used as a reference for the government in policy-making.

## ACKNOWLEDGEMENT

The preparation of this International Journal cannot be separated from the support of various parties. The author is very grateful for what the author has achieved during the process of making this journal. First, the writer would like to thank Allah SWT, who has given the strength to get to this point. Second, the author would like to thank both parents who have supported them mentally and morally during the 4 years of study that the author underwent. Third, the authors would like to thank the Advisory Lecturer, Ms. Lecturer Sitti Retto Faridatussalam, S.E., M.M, who has helped and guided the writer in working on this journal from beginning to end. And lastly, the writer would like to thank my friends, someone special and the class of 2018 friends who have struggled together to get a bachelor's degree with many obstacles that they have been through.

Finally, the author hopes this journal can be helpful for all of us and become input for developers in the world of education.

### Abstract

*The internet is one gateway for the emergence of various technologies that can support human life to be more effective and efficient. One example is digital trade. Digital trade has a very positive impact on Indonesia's economic growth, however there are no integrated regulations or policies between sectors to be able to develop digital trading in Indonesia. Therefore, in this study, a normative juridical analysis will be carried out using primary and secondary legal materials based on a conceptual approach and legislation or other research by formulation of the problem using the latest regulation in Indonesia such as Undang-Undang Cipta Kerja. In addition, this research will also conduct benchmarking on digital trading systems in several other countries. Several points analyzed in this study include the role of the government in digital trade, mapping existing regulations, and the digital trading system. The result from this research is that the institutional arrangement regarding Indonesian digital trading can be carried out using the approach previously carried out in Korea where the Ministry of Trade can collaborate with several organizations to create digital trade in Indonesia, starting from organizations that deal with foreign trade, domestic trade, MSMEs, and economic digitization. However, in its implementation, related institutions must continue to follow the existing regulations that apply in Indonesia in accordance with the mapping regulation.*

*Keywords— Digital Commerce; e-commerce; law*

---

### I. INTRODUCTION

The internet is one example of the results of information and communication technology development. Based on data from the Indonesian Internet Service Provider Association (APJII), in 2019-2020, Indonesia was one of the countries with the most significant growth in the number of internet users globally, with an increase of 8.9% [1]. One example of how many internet users will impact the digitization of the Indonesian people is in the trade sector. Based on data from We are Social, many people use the internet to find items to buy with a percentage of 93%, opening a retail store online at 90%, and online shopping at 88% [2]; this affects the Gross Domestic Product (GDP) and the number of jobs in Indonesia. The Oxford Economics report states that a one percent increase in mobile penetration will add \$640 million to Indonesia's GDP and create 10,700 jobs by 2020 [3]. Therefore, the Indonesian government has carried out several activities that support the digital economy in Indonesia, including the Go Digital and Go Global MSME programs. MSMEs themselves contribute 97% of the current total workforce and can collect up to 60.42% of the total investment. However, the lack of utilization of e-commerce in trade transactions in Indonesia resulted in low export capabilities, which only reached 14.37% of total exports [3].

The digitization process will undoubtedly involve various parties, such as technology owners and policymakers. The policies contained in the regulations will always be the main issue, mainly if they apply new technology, but what must be considered is how the Government and related parties can formulate adaptive rules. The government has an essential role in digital trade in Indonesia. Currently, there are no integrated regulations or policies between sectors to be able to develop digital trading in Indonesia. Previously, research was conducted on the urgency of updating digital trade regulations using normative juridical analysis methods. This study explained that the ITE Law had not technically regulated consumer protection [4].

Furthermore, there is a policy brief regarding the development and regulation of e-commerce in Indonesia, which aims to support the growth of e-commerce in Indonesia in line with technological innovation [5]. Therefore, this analysis will discuss the scope of government authority in digital trade based on the current law. This research will use a normative juridical method. Thus, the government is expected to be able to formulate and develop policies that are effective, adaptive, and responsive in managing digital trade.

## II. LITERATURE REVIEW

### A. Definition of Trade

Trade is exchanging goods or services through market mechanisms that involve consumers and producers [6]. In act Number 7 of 2014, the definition of trade is the arrangement of activities related to transactions of goods or services within the country and beyond national borders to transfer rights to goods or services to obtain compensation or compensation [7]. Based on the scope, trade has two, namely foreign trade and domestic trade. Trade has nine business models [8]. They are Business to Business (B2B), Business to Consumer (B2C), Consumer to Consumer (C2C), Consumer to Business (C2B), Business to Government (B2G) or known as Business to Administration (B2A), Government to Consumer (G2C) or Government to Citizen, Consumer to Government (G2C), Government to Business (G2B), and Government to Government (G2G) [8].

### B. Digitization

Digitization is converting from the physical form into bits, where the bits contain information units. Digitization can also represent changing the physical structure of printed documents into digital documents [9]. Advances in technology today lead to rampant digital transformation. Digital transformation can be influenced by several factors, for example, the current COVID-19 pandemic. The existence of a pandemic has caused the government to issue regulatory rules related to changing face-to-face activities to online. Other factors are changes in the competitive landscape, changes in consumer behavior and expectations, and changes to the digital form of the industry, where the use of digital platforms and the internet is a must if the industry is to survive [10]. The following are the positive and negative impacts of digitization. The positive impact from digitization are increase distribution channels, ease and convenience for digital platform users, increase productivity and efficiency for more innovative and lower cost, and the creation of data integration. The negative impact from digitization are reducing HR dependency, increase inequality and creating new marginalization, job opportunities are getting smaller, The service sector will be more developed than the manufacturing sector, and Digitization that is not properly prepared can potentially increase forests which can lead to an economic crisis [10].

### C. Digital Trading

Based on sources from the Organization for Economic Co-Operation and Development (OECD), digital trade means trade sent digitally, both internationally and nationally. Meanwhile, according to the World Trade Organization (WTO), digital trading has become inherent in society because it makes it easy to access tricky markets daily. There are five business models in digital commerce. Such as Marketplace connects sellers and buyers in one digital place, Advertising connects advertisers with digital media owners, Infomediary connects consumers with curated information that is specific and valuable, Utility/On-Demand is a business model where the cost is adjusted to the service used, and Subscription is a business model that charges consumers a specific fee for using the services offered. Trading done conventionally is undoubtedly different from that done digitally. The characteristics of digital trading include:

Table 1. Digital trading characteristics

Characteristics	Value
High Connectivity	The use of digital technology to connect several parties in digital commerce will lead to higher connectivity, this will make interactions between partners and customers easier.
No geographic limitations	With digital trade, physical boundaries do not become a barrier to trade, so digital trade can support global trade.
Low switching costs	Customers can switch businesses at lower costs due to low disbursement costs through accessible and comparable information.
Transparency of customer behavior	Digital commerce can help merchants to know their consumer behavior through the data they have. The amount of data obtained can affect the accuracy of the analysis.
Low transaction fees	In digital commerce the costs for customer transactions are low because there are reductions in certain things such as coordination costs and geographic barriers

Vulnerable to price discrimination	Price discrimination in digital trade will arise if digital businesses charge different prices based on the wishes of their consumers. In this case, the company can collect more and better information about the characteristics of consumers.
------------------------------------	--

## D. Trade-related Regulations

The following are some of the laws that regulate digital trade, including The Act No. 19 of 2016 concerning Information and Electronic Transactions, The Government Regulation No. 80 of 2019 concerning Trading Through Electronic Systems, The Ministry of Trade Regulation No. 50 of 2020 regarding Provisions for Business Licensing, Advertising, Guidance, and Supervision of Business Actors in Trading Through Electronic Systems, The Act No. 11 of 1965 concerning the Stipulation of Government Regulation in Lieu of Act No. 5 of 1952 concerning Amendments to Act No. 2 PRP of 1960 concerning Warehousing (State Gazette of the Republic of Indonesia of 1962 No. 31) became Act No. 2 of 1981 concerning Legal Metrology, The Act No. 3 of 1982 concerning Mandatory Company Registration, The Act No. 7 of 1994 concerning Ratification of the Agreement Establishing The World Trade Organization, The Act No. 32 of 1997 concerning Commodity Futures Trading, The Act No. 8 of 1999 concerning Consumer Protection, The Act No. 9 of 2011 concerning the Warehouse Receipt System, The Act No. 7 of 2014 concerning Trade, The Government Regulation No. 7 of 2021 concerning Empowerment of Cooperatives and Micro, Small and Medium Enterprises, The Government Regulation No. 29 of 2021 concerning the Implementation of the Trade Sector, The Act No. 20 of 2008 concerning Micro, Small and Medium Enterprises, The Act No. 8 of 1999 concerning Consumer Protection.

## III. RESEARCH METHODOLOGY

In this study, an analysis of the scope of government authority in digital trade will be carried out based on current regulations using normative juridical research methods. The normative juridical research method is research conducted using primary and secondary legal materials normative based on a conceptual approach and legislation or other research by the problem formulation. The first stage will be a literature study. Materials or data used in literature studies came from primary and secondary legal materials. Primary legal materials consist of the 1945 Constitution of the Republic of Indonesia, Government Regulations, and Ministerial Regulations. Secondary legal materials came from studies of research results, books, scientific journals, jurisprudence, and other library materials that discuss electronic-based government systems. To analyze primary and secondary legal materials using qualitative methods with the triangulation method. The triangulation method is comparing existing data or information in different ways. The author interviewed one of the resource persons who worked in the government agency of the ministry of trade to discuss digital trade. A comparative study of secondary data related to digital trade regulation in several countries was also conducted to understand the forms of law and institutions. Thus, the Government is expected to be able to formulate and develop policies that are effective, adaptive, and responsive in managing digital trade.

## IV. RESULT/FINDING

### A. Terms of Digital Commerce and Digital Economy

There are other forms of trade development, namely digital trading or trading in the state or through electronic systems. In practice, every business actor who trades goods or services using an electronic system is required to provide complete and correct data or information. Selling through electronic systems is included in the category of electronic system operations. Certain conditions must follow in its implementation, including electronic system operations required to register both in public PSE and private PSE. The process of the electronic system must meet the reliability certification standards in meeting the technology standards used. The operation of the electronic system must meet regulatory standards regarding data and personal data protection standards.

In the regulation, no regulation defines digital trade. Still, there is already a similar approach in existing laws, namely trading through electronic systems as regulated in Act Number 7 of 2014 concerning trade and Presidential Regulation Number 80 of 2019 concerning Trading Through Electronic Systems ( PMSE). In PMSE, they traded through a new world order, namely cyber, using the internet network. This new world order will certainly have an impact on related regulations. With trade carried out by the parties involved, the object of trade and other arrangements will impact the applicable law. The law applies to the place, and mechanism of trade carried out in a cyber world that is not visible to the naked eye.

## *B. Digital Trading Benchmark Analysis*

Digital trade has been made before in several countries with various policies that apply in their respective countries. Digital commerce in Indonesia has yet to find a bright spot regarding the procedures and institutional forms. While learning material about digital trade in several countries that have implemented digital commerce first, benchmarking can be done to obtain input information regarding the systematic implementation of digital commerce in their country. The benchmarking shows whether the systematic development of digital trade in several countries had previously been implemented in Indonesia or not. Australia, South Korea, Malaysia, and Singapore choose to benchmark countries in this study. The reason for selecting these countries is the similarity of the system of government or systematic regulation adopted in Indonesia.

### *1. Australia*

Digital trade is under the supervision of the Department of Foreign Affairs and Trade (DFAT) precisely at the Ministry for Trade, Tourism, and Investment. Australian Trade and Investment (Austrade) is a unique agency under DFAT that has duties in conventional trade and digital trade and reports directly to the Ministry for Trade, Tourism, and Investment. DFAT has the task of working with international partners and other countries to address global challenges, increase trade and investment opportunities, protect international rules, maintain regional stability and assist Australian Citizens overseas. Australia has several e-commerce negotiation agreements and discussions regarding trade. One of the agreements, the World Trade Organization (WTO), contains commitments relevant to e-commerce, namely the Trade Facilitation Agreement (TFA).

### *2. South Korea*

Korea has promoted establishing a digital technology-based paperless trading system by 2020. In this context, Korea uses a mix of definitions from “trade automation,” “electronic trade,” and “digital trade” to “electronic commerce,” which refers to all types of online transactions. The Ministry of Trade, Industry, and Energy (MOTIE) is committed to providing a foundation for economic growth by combining efforts to fulfill various responsibilities in trade, investment, industry, and energy. Small business actors in Korea are under the supervision of the Ministry of SME and Startups (MSS). Both MOTIE and MSS have affiliations with several organizations to promote trade in Korea. The Korea Fair Trade Commission also regulates digital trade in Korea. In the regulation, there is a provision that anyone who sells products or services using telecommunication services must comply with the rules of the Fair Trade Commission. In addition, online businesses must also comply with the requirements under the Personal Information Protection Act (PIPA) when collecting, using, or transferring personal data online.

### *3. Malaysia*

The Ministry of International Trade and Industry (MITI) is the Ministry of Malaysia responsible for international trade, industry, investment, productivity, small and medium enterprises, development of financial institutions, halal industry, automotive, steel, and strategic trade. In November 2020, the National Council on Digital Economy and Fourth Industrial Revolution were formed under the management of the prime minister and the highest government to decide policies, implement, and monitor digital strategies and economic initiatives that drive the digital transformation agenda in Malaysia. MITI has several institutions, namely Malaysia External Trade Development Corporation (MATRADE), Malaysian Investment Development Authority (MIDA), Malaysia Productivity Corporation (MPC), Malaysian Industrial Development Finance Berhad (MIDF), Malaysia Automotive Robotics and IoT Institute (MARii), Malaysia Steel Institute (MSI), SIRIM, EXIM Bank (Export-Import Bank of Malaysia Berhad), Position Standard Malaysia, and InvestKL. In terms of trade, MATRADE is responsible for establishing Malaysia as a competitive and globally renowned trading nation. MITI has several institutions and works together in carrying out their respective main tasks to overcome gaps and discrepancies in the problems faced in the industry. In addition, it can also improve the capabilities and competencies of available human resources. Institutions that have the main task in trading, such as MIDA, MATRADE, and InvestK, also continue to promote trade and investment activities through various digital platforms.

### *4. Singapore*

The Ministry of Trade and Industry (MTI) Singapore has cooperation agreements with several countries to build digital trade and increase the country's economic value. Through the Digital Economy Agreement (DEA)

with critical partners, Singapore hopes to develop an international framework to promote interoperability of standards and systems that support businesses, particularly SMEs, through digital commerce and electronic commerce. DEA aims to lower operating costs, increase business efficiency, and create more accessible access to foreign markets. To build opportunities for companies in the digital economy, the government, through MTI, the Ministry of Communication and Information (MCI), and IMDA, collaborated in negotiations with key partners for DEA. IMDA aims to build a competitive and sustainable media Infocom industry, developing Singapore as a core for media content, services, and applications while cultivating the seeds of technological innovation and fostering collaboration between local and multinational companies in the sector.

By doing benchmarking on digital trade, lessons learned will be obtained, which will be discussed for approaches and risk mitigation in preparing the implementation of trade institutions in Indonesia, including:

- a. In advancing digital commerce, the Australian government has several agreements and negotiating discussions regarding e-commerce. The government works closely with the ministry to discuss digital trade or digital economy policies. The single window facility in Australia helps make it easier for Australian businesses to enter foreign markets. The Indonesian government can consider using a single-window to cut the bureaucracy for licensing trade administrations abroad.
- b. The South Korean government has several organizations ranging from ministries to startups that focus on trade, with this approach that the contribution of startups can support the growth and development of SMEs in Indonesia healthily.
- c. MITI Malaysia has several institutions that oversee the management of the prime minister and the highest government to decide policies, implement, and digital monitor strategies and economic initiatives that drive the digital transformation agenda in Malaysia. By taking this approach in the preparation of institutions in Indonesia, there is an increase in cooperation in implementing the export of goods and services to foreign countries through e-commerce to increase the value of the Indonesian economy.
- d. Singapore also has DEAs with several countries to promote interoperability of standards and systems and support businesses, particularly SMEs, to engage in digital commerce and electronic commerce. By taking this approach, Indonesia not only focuses on increasing digital trade transactions but also prepares optimal human resources to maximize and accelerate digital trade.

### *C. The Government's Role in Accelerating Digital Trade in Indonesia*

It is necessary to pay attention to digital trading positions in the regulatory aspect. So that their roles and duties are essential to be discussed, including:

#### *1. Institutions and organizers that regulate digital commerce*

The digital trade regulation approach can be through PMSE regulation. In Government Regulation Number 80 of 2019 concerning PMSE, trade can be completed by several parties, namely business actors, consumers, individuals, and state administrative agencies, following laws and regulations. PMSE also has domestic and foreign business actors consisting of PMSE organizers (platform organizers, traders, and intermediary providers). However, it is necessary to pay attention to domestic and foreign business actors in PMSE operators because it is necessary to distinguish between PMSE actors and digital trade. After all, the definition of digital trade is broader than the scope of PMSE. However, digital trade is part of the legal environment and trade ecosystem from a regulatory perspective. There are several parties whose functions in making digital trade regulations. They are The existence of the government as a maker of trade governance and policy, The presence of a regulator who becomes the judge or executive in the digital trading system, The existence of business actors who are the organizers of digital trade, and The existence of consumers as a user or affected by digital commerce.

The four parties in the digital trade ecosystem have their respective duties and functions, referring to several regulations in Indonesia. The Act No. 38 of 2009 concerning State Ministries explains the government. From rules, the Role of the government is the president where the compiler of governance and regulations in digital trade. However, the ministry will help the task, which has responsibilities in the regulatory environment of trade law. For this reason, it is necessary to look at the regulations regarding the Presidential Decree regarding the Ministry of Trade. Let's look at the duties and functions of the Ministry of Trade. The Ministry of Trade has roles and responsibilities in regulating, compiling governance and regulations, and fostering the legal environment of the entire trade process. Although it does not explicitly mention the legal environment of trading through the

electronic system, *mutatis mutandis* has become the duty and function of the Ministry of Trade because the regulation of the trading system through the electronic system has been stated in Law Number 7 of 2014 concerning trade in articles 65 and 66. The rule says that the minister is the ministry that carries out government functions in the trade sector. Therefore, be born Government Regulation Number 80 of 2019 concerning Trading Through Electronic Systems (PMSE).

## 2. Regulation about Data

Presidential Regulation Number 39 of 1999 concerning One Indonesian Data (SDI) telling about data. In practice, data on digital commerce is both physical and electronic. Electronic data is data in electronic form, which is not limited to writing, sound, pictures, maps, designs, photographs, Electronic Data Interchange (EDI), and electronic mail. In Government Regulation Number 71 of 2019 concerning the Implementation of Electronic Systems, the data structure consists of strategic data and non-strategic data. Data regulation in digital trade needs to be regulated, including the definition of data, data types, data retention, interoperability, organizational structure, data as electronic evidence in court, and data centers. Presidential Regulation Number 71 of 2019 manages data types, data structures, data retention, and personal data. Government Regulation Number 80 of 2019 concerning PMSE regulates the retention of financial and non-financial data, how to transfer PMSE data between platforms and between countries, and personal data in PMSE. Data interoperability has not been regulated in Indonesian regulations, even though it is essential to implement digital trade, where data between one service and another, whether private or public, can be cross-connected and shared.

## 3. Regulations on licensing in Digital Trading System

Government Regulation Number 5 of 2021 concerning Risk-Based Licensing states, "A business license is a legality granted to business actors to start and run their business or activities. A risk-based business license is based on the level of business activity risk". The risk-based business license has stages: an essential permit and a technical permit. If the process is declared complete, the business actor can carry out licensing through one door, One Single Submission (OSS). The OSS licensing system is the responsibility of BKPM/Ministry of Investment and permits will be issued according to the ministry authorized to publish them. This licensing system makes it very easy for digital trading system operators because the charged ministry issues permit a more accessible mechanism—supervision of the licensing system only from one door through a digital platform. However, implementing this licensing system must be supported by a reliable electronic system and data center by the standard data interoperability mechanism between digital trade actors.

## 4. Mapping of Existing Regulations on Digital Trade

The mapping of regulations regarding digital trade can be seen in the table below.

Table 2. Regulation mapping.

Regulation	Information
UU No.11 tahun 2008 tentang Informasi dan Transaksi Elektronik (UU ITE)	An electronic Transaction is a legal action carried out using a computer, computer network, or other electronic media. So broadly speaking, these regulations intersect with the implementation of digital trade because digital trade is a transaction that uses electronic media.
UU No. 19 Tahun 2016 tentang Informasi dan Transaksi Elektronik	
PP No. 71 Tahun 2019 tentang Penyelenggaraan Sistem elektronik	Digital trade includes implementing an electronic system so that it must comply with applicable laws in its implementation.
UU No. 36 Tahun 1999 tentang Telekomunikasi	Telecommunications operations must have a permit from the central government. Telecommunications operators consist of: operation of telecommunication network consisting of fixed network and mobile network
PP No. 52 tahun 2000 tentang Penyelenggaraan Telekomunikasi	The operation of telecommunications services consists of essential telephony services, value-added telephony services, and multimedia telephony services.
PP No. 53 tahun 2000 tentang Frekuensi dan Satelit	In its implementation, transactions in digital trade will use telecommunications networks or services, so there must be permission from the central government regarding telecommunications providers.
PP No. 46 tahun 2021 tentang Postel siar	

## Sustainable Collaboration in Business, Information and Innovation 13<sup>Th</sup> 2022

PM Kominfo Nomor 5 tahun 2021 tentang Penyelenggaraan Telekomunikasi

UU No. 7 tahun 2014 tentang Perdagangan      Trading through the electronic system is part of the trading system regulated in the Trade Law.

PP No. 80 tahun 2019 tentang Perdagangan Melalui Sistem Elektronik      The parties, by the provisions of the legislation, can conduct PMSE. In working PMSE, complying with data regulations related to data types, personal data, and data retention is mandatory.

PM Kemendag No. 50 Tahun 2020 tentang Ketentuan Perizinan Usaha, Periklanan, Pembinaan, dan Pengawasan Pelaku Usaha Dalam Perdagangan Melalui Sistem Elektronik      This regulation focuses on the provisions of business licensing, advertising, coaching, and supervision of business actors for business actors involved in digital trade.

UU No. 11 tahun 2020 tentang Cipta Kerja      The derivative regulations of Law No. 11 of 2020 regarding omnibus law related to digital trade include: PP No. 29 tahun 2021 tentang Penyelenggaraan Bidang Perdagangan, PP No. 5 tahun 2021 tentang Penyelenggaraan Perizinan Berbasis Risiko, Peraturan Pemerintah Republik Nomor 6 Tahun 2021 Indonesia Penyelenggaraan Tentang Perizinan Berusaha di Daerah, Peraturan Pemerintah Republik Indonesia Nomor 7 Tahun 2021 Tentang Kemudahan, Perlindungan, Dan Pemberdayaan Koperasi Dan Usaha Mikro, Kecil, Dan Menengah, PP No. 46 tahun 2021 tentang Pos, Telekomunikasi, dan Penyiaran..

UU No. 23 tahun 2014 tentang Pemerintahan Daerah      Digital Trade or PSME is part of the trade, a government affair regulated in UU No. 23 Tahun 2014 pasal 12.

UU No. 8 tahun 1997 tentang Dokumen Perusahaan      Based on the regulation, the retention of company documents is ten years. It has the same meaning as participating companies selling through digital commerce.

UU No. 43 tahun 20 tentang Kearsipan      The parties who join in digital trade must comply with these regulations to ensure civil rights protections.

UU No. 8 tahun 1999 tentang Perlindungan Konsumen      The regulation also applies to consumers who buy products or services through digital commerce.

UU No. 5 tahun 1999 tentang Larangan Praktek Monopoli dan Persaingan Usaha Tidak Sehat      These regulations are needed to avoid monopolistic practices and unfair business competition between players or sellers in digital trade.

UU No. 30 tahun 1999 tentang ADR dan Arbitrase      The resolution of disputes or differences of opinion in digital trade can be through a disputed approach outside the court.

UU No. 28 Tahun 2007 tentang Ketentuan Umum dan Tata Cara Perpajakan      These regulations are needed to know the procedures for digital trade taxation rules.

UU No. 36 Tahun 2008 tentang Perubahan Keempat Atas UU Nomor 7 Tahun 1983 tentang Pajak Penghasilan      The regulation on PPH and who is a taxpayer in digital trade needs to be defined by adjusting the legislation's provisions.

UU No.40 tahun 2007 tentang Perseroan Terbatas      The procedure for establishing a Limited Liability Company includes that more than one person founded the company, and the responsibility of the founders is limited to the shares paid up.

UU No 3 tahun 1982 tentang Wajib Daftar Perusahaan      Mandatory Company Registration explains that the purpose and nature of Mandatory Company Registration are to record correct information materials from a company and constitute an official source of information for all interested parties.

UU Nomor 7 tahun 1994 tentang Pengesahan *Agreement Establishing The World Trade Organization*      Ratify the Agreement Establishing The World Trade Organization, which is the reference in the regulation and governance of trade and digital trade.

## Sustainable Collaboration in Business, Information and Innovation 13<sup>Th</sup> 2022

UU Republik Indonesia Nomor 17 Tahun 2006 Tentang Perubahan Atas Undang-Undang Nomor 10 Tahun 1995 Tentang Kepabeanan	To support the smooth flow of goods, increase the effectiveness of supervision over the traffic of goods, and optimize the prevention and prosecution of smuggling, clearer regulations are needed to implement digital trade customs.
UU Republik Indonesia Nomor 10 Tahun 1998 Tentang Perubahan Atas UU Nomor 7 Tahun 1992 Tentang Perbankan	The economic sector, including banking, needs policy adjustment, especially with the proliferation of digital wallet systems facilitating the digital trading process.
UU No 21 tahun 2011 tentang Otoritas Jasa Keuangan (OJK)	OJK functions to organize an integrated regulatory and supervisory system for all activities in the financial services sector, including adjustments to the payment system for digital trade.
Perpres No 39 tahun 2019 tentang Satu Data Indonesia	The facilities available on Satu Data Indonesia are used for smooth digital trade.
Perpres 95 tahun 2018 tentang SPBE	Infrastructure The electronic-based government system consists of a national data center, intra-government network, and service liaison facilities.
UU No. 39/2008 tentang Kementerian Negara	A presidential law consists of Regulations regarding the functions and duties of state ministries and ministers as assistants to the president.
PM Kominfo No 5 tahun 2020 tentang Pendaftaran PSE Lingkup Private	Digital trade registration can use regulating procedures for registering the operation of an electronic system of private scope.
PM Kominfo No 20 tahun 2016 tentang Perlindungan Data Pribadi	There are Settings regarding personal data, deletion, and transfer of personal data because consumers of digital commerce need guarantees that personal data is not misused.
<b><i>PM Kominfo No. 1 Tahun 2021 tentang Perubahan Kedua atas PM Kominfo Nomor 13 Tahun 2019 tentang Penyelenggaraan Jasa Telekomunikasi</i></b>	Digital trade includes telecommunications services, so there need to be adjustments to regulations.
<b><i>PM Kominfo No. 5 Tahun 2015 tentang Registrar Nama Domain Instansi Penyelenggara Negara</i></b>	<b><i>Regulations on implementing agencies for domain name registrars in Indonesia.</i></b>
<b><i>PM Kominfo No. 23 Tahun 2013 tentang Pengelola Nama Domain</i></b>	Settings about the .id domain name registry agency

---

### V. CONCLUSION

This analysis concludes that the institutional arrangement of Indonesia's digital trade can do with the approach that has been done previously in Korea. Judging from the system of government, Korea has the same system of government as Indonesia, namely presidential. The ministry that handles trade in Korea, both digital and conventional, has affiliations with organizations or institutions that focus on helping businesspeople to advance their business so that trade in Korea can also increase. In addition, Korea has made many agreements with various developed and developing countries to expand the market and establish business cooperation. So, Indonesia can take this approach where the Ministry of Trade can collaborate with several organizations to create digital trade in Indonesia, starting from organizations that deal with foreign trade, domestic trade, MSMEs, and economic digitization. However, in its implementation, related institutions must continue to follow the existing regulations that apply in Indonesia in accordance with their respective placements and portions.

### VI. RECOMMENDATION

The recommendation for the future is that the division of tasks and responsibilities of the types of digital trade in Indonesia to government stakeholders can be more evident. Ultimately, every element of digital commerce will have a segmented intersection with several government institutions, which will impact the approach to implementing regulations about digital trade in Indonesia.

## Perceived Fear Of COVID-19, Enjoyment, and Subjective Norms Effect Towards Intention to Use Online Grocery Shopping in Indonesia

Abi Satrio Pramono<sup>1</sup> and Daniel Tumpal Hamonangan Aruan<sup>2</sup>

<sup>1,2</sup>Faculty of Economic and Business, Universitas Indonesia, Jakarta, Indonesia

### Abstract

*This paper aims to empirically analyze which factors contribute the most between fear of COVID-19, subjective norms, and enjoyment towards consumers' behavioral intention to use online grocery shopping (OGS) during COVID-19 pandemic in Indonesia, using the Technology Acceptance Model as the framework. COVID-19 pandemic causes restrictions on several activities impacting retail sector, which is believed to increase the growth of OGS services. It's unclear which factors contribute the most towards the growth, while past research showed that both enjoyment and subjective norms have significant and positive towards the behavioral intention to use OGS. This research will enrich the study of OGS by introducing the fear of COVID-19 variable. Fear of COVID-19 was known to have influence towards GoogleMeet and telemedicine acceptance but none on OGS services. 297 valid responses were collected using online questionnaire with instruments based on existing TAM literature. Structural and measurement models are evaluated using the PLS-SEM method with smartPLS software. The findings show that enjoyment contributes the most to the behavioral intention to use OGS analyzed by the path coefficient. Perceived usefulness and subjective norms also have a significant positive relationship towards the behavioral intention, whereas perceived fear of COVID-19 did not. This might be due to the already low number of COVID-19 cases and high vaccination rates. These findings are summarized, and managerial implications for online OGS providers are discussed in which enjoyment need to be enhance for OGS applications.*

*Keywords – Enjoyment; Fear of COVID-19; Online Grocery Shopping; Subjective Norms; TAM*

---

### I. INTRODUCTION

From the first case of COVID-19 in Indonesia in March 2020, the Indonesian government has imposed several policies to restrict society movement such as PSBB and PPKM (CNN, 2021), thus impacting market and retail sectors due to the decrease operational time which causing the difficulty for the society members to gather their daily grocery needs (Simanjuntak, 2021). COVID-19 pandemic is still evolving with the new variant of concerns such as Delta and the newer Omicron variants (Wang & Powell, 2021). One of the strategies used by the Indonesian government to reduce the Omicron variants transmission is by imposing policy for their district head to coordinate with the retailers and to enforce the usage of PeduliLindungi application (Kemendagri, 2021).

The policy imposed by the government is believed to increase the growth of e-commerce sectors mainly on the online grocery shopping (OGS) service which were predicted to have a Gross Merchandise Value growth of 400% in 2020 by Redseer and also an increase of 11% of Indonesian which using OGS to get their daily needs from the research of Facebook and Bain&Company (Eloskari, 2020). OGS is defined as an online platform that sells food and other daily groceries needs (Asti et al., 2021). Research showed that COVID-19 cases trends may impact consumers' preference to directly shop at the supermarkets (Grashuis et al., 2020).

Academic researches to learn about consumer intention and adoption to use OGS have already been done in many countries and models such as TPB (Akar, 2021; Brand et al., 2020; Piroth et al., 2020) and TAM (Chin & Goh, 2017; Driediger & Bhatiasevi, 2019; Shukla & Sharma, 2018). TAM explanatory power could be stronger by modifying and adding other variables to the model (Keen et al., 2004). COVID-19 pandemic increases the fear of individuals to go directly shop at supermarkets due to the anxiety to have close contact with others and the closed air circulation (Sit, 2021). Past research also found that technology users were using technology not only for better performance they got but also the enjoyment they feel when using that technology (To & Trinh, 2021). In COVID-19 context, subjective norms have a strong effect towards behavioral intention and behavior relevant to COVID-19 for individuals compared to previous study before pandemic (Fischer & Karl, 2022). COVID-19 pandemic is a global problem where collective behavior is still a major solution to minimize the number of cases and the severity of COVID-19 (Khanh & Tran, 2021). With the growth of technology there are also risk that might be occurred to the users. There are seven types of risks that might happened during online grocery shopping, with performance risk and financial risk as the top two risks (Guru et al., 2020). Those risks might hinder the usefulness of the technology.

This research should be beneficial to OGS service providers for them to better understand what is the main factor consumers' use their service and to strategize during and after pandemic. Other than that, this study could be the baseline for other researchers on OGS during COVID-19 pandemic. The objective of this research is to

empirically analyze which factors contribute the most between individuals' fear of COVID-19, subjective norms, and enjoyment to the intention to use online grocery shopping during pandemic in Indonesia using TAM framework. The other objective of this study is to confirm the relationship of TAM hypotheses and its antecedents from previous literature with online grocery shopping as the technology during COVID-19 pandemic in Indonesia. Since the pandemic is still an ongoing global issue and dynamically changes, this study will be done cross-sectionally due to time constraint on author's end.

## II. LITERATURE REVIEW

### A. *Online Grocery Shopping*

Online grocery shopping (OGS) or e-grocery is a type of e-commerce that enables their user to buy the food materials and daily groceries online (Asti et al., 2021). Most of the time the process to buy the groceries is in the website or application from the OGS service provider itself (Driediger & Bhatiasevi, 2019). OGS benefit comes from the time and money saving and also the easiness to get and to check the availability of products (Blitstein et al., 2020). While the drawbacks of using OGS is there is not any information we get from directly touching the product that we will buy, thus creating one of the reason someone not using OGS (Kühn et al., 2020). In USA, there are shift in consumer behavior on grocery shopping in which 68% of consumers buy their groceries online since March 2020, 43% of consumers bought groceries online twice or more in a month, and 81% of the consumers said that they will keep on using OGS even after the pandemic ended (Stecyk, 2020).

The 2020 annual report from Research and Markets showed that the global market size of online grocery shopping estimated around US\$ 198.5 Billion and will reach to US\$ 550.7 Billion on 2027 with 15.7% CAGR (Research and Markets, 2020). Specifically in Indonesia, there was a 30% increase of online grocery shopping users in 2020 and also increase on the service provider due to COVID-19 pandemic (Meirandari, 2021). Indonesian online grocery shopping growth rate was higher than several Asian countries such as Hong Kong, Malaysia, Singapore, Thailand, Philippines, Taiwan and Japan but lowered than Vietnam and India from 2014 until 2019 with 0.3% market penetration (Consultancy.asia, 2021). The examples of online grocery shopping service providers in Indonesia currently are HappyFresh, Sayurbox, KeSupermarket, Hypermart, GoMart, GrabFresh and others (Eka, 2020).

### B. *Technology Acceptance Model*

The Technology Acceptance Model or TAM was first introduced by Davis in 1989 and since then TAM has been tested and developed by other researchers to become a proven theoretical model to understand and explain individual behavior towards the implementation of a technology (Legris et al., 2003). According to Davis (1989), a person's intention to use a technology will be influenced by the attitude of the person and is directly and indirectly influenced by perceived usefulness (PU) and perceived ease of use (PEOU). TAM itself is an adaptation of the theory of reasoned action (TRA) which was introduced by Fishbein & Ajzen in 1975 to explain and predict the behavior of a person in certain situations. While both PU and PEOU are important variables in TAM but some researchers argue that there's the need to add another variables in order to have stronger explanatory power (Legris et al., 2003).

TAM has been used on past researches in order to predict individuals' intention to use technology such as on online grocery shopping (Chin & Goh, 2017; Driediger & Bhatiasevi, 2019; Putri, 2021; Shukla & Sharma, 2018), food delivery services (Song et al., 2021), education sector regarding the Google Meets adoption in COVID-19 pandemic (Al-Marouf et al., 2020, 2021), banking sector regarding Indian mobile payment and e-wallet (Chawla & Joshi, 2019; Flavian et al., 2020) as well as healthcare sector (Elahi et al., 2021; Kamal et al., 2020; Zhang & Zaman, 2020).

### C. *Perceived Fear of COVID-19*

COVID-19 pandemic create an increase on research regarding fear and technology adoption in many perspective and sectors across the world (Al-Marouf et al., 2021). Fear can be in many form such as anxiety and the lack of skill and experience that may impact individuals to use new technology (Al-Marouf et al., 2020). Ahorsu et al. (2020) saw that COVID-19 pandemic gives fear and anxiety to individuals around the world and develop the fear of COVID-19 scale (FCV-19S) that can be used to measure individuals fear of COVID-19. The scale itself has 7 indicators with unidimensional scale which has strong power of measurement (Ahorsu et al., 2020). The FCV-19S has been translated to many languages, with Bahasa Indonesia as one of the examples (Mohd Kassim et al., 2020).

Past studies regarding fear of COVID-19 relation towards technology adoption has been done on healthcare sector that explores the individuals' intention to use Whatsapp and telemedicine. The study showed that WhatsApp

was an easy, secure and practical to use for telemedicine purpose during region lockdown period in India (Elahi et al., 2021; Jakhar et al., 2020).

#### *D. Enjoyment*

Enjoyment refer to the extent how is an activity that use computers technology is enjoyable on it's own and not due to any performance consequences that may anticipated (Davis et al., 1992). Enjoyment is an example of intrinsic motivation, namely doing an activity without any other encouragement other than the process of doing the activity itself (Davis et al., 1992). Several past studies have been done regarding enjoyment effect towards individuals' intention to use a technology such as in banking sector (Bashir & Madhavaiah, 2015), retail sector (Chin & Goh, 2017; Driediger & Bhatiasevi, 2019), and telecommunication sector (Dickinger et al., 2008).

#### *E. Subjective Norms*

Subjective Norm was a construct that originated from Theory of Reasoned Action (TRA) on how other person's perception is deemed important by an individual that have an impact on how they behave or not (Fishbein & Ajzen, 1975). The TRA theory was further developed by Ajzen into Theory of Planned Behavior (TPB) by adding perceived behavioral control variable together with attitude and subjective norms variables as determinants of individuals intention to behave that will affect individuals actual behavior (Ajzen, 1985).

According to a meta-analysis of 83 samples from 31 countries that looked at the effects of attitude, subjective norm, and perceived behavioral control on a person's intentions to behave and individual behavior in relation to COVID-19, the perceived behavioral control variable had the strongest effect. In the context of COVID-19, the study discovered that subjective norms also give a substantial link to a person's desire to behave, which differs from earlier studies that showed subjective norms to be weak predictors of behavior. This demonstrates that there is a desire to establish strong social standards in order to combat COVID-19 (Fischer & Karl, 2022).

#### *F. Perceived Risk*

Perceived risk is defined as a characteristic and measure of uncertainty or consequence which occurred to the consumers when considering a purchase decision (Cox & Rich, 1964). There are seven types of risk that may occur to users when doing online shopping which are financial risk, performance risk, time-loss risk, social risk, psychological risk, physical risk, and source risk (Guru et al., 2020). Risk can be found by users when using technology in form of site or application in many sectors such as OGS, mobile tourism, mHealth, e-wallet and others (Deng et al., 2018; Driediger & Bhatiasevi, 2019; Meyta Dewi et al., 2021; Park & Tussyadiah, 2017).

Previous study showed various results for perceived risk relationship towards perceived usefulness. Perceived risk has a negative and significant relationship towards perceived usefulness (Li & Huang, 2009; Lu et al., 2005) while non-significant relationship found on OGS study in Indonesia (Putri, 2021).

#### *G. Hypotheses Development*

There are 4 important variables in TAM framework, which are PU, PEOU, attitude, and behavioral intention to use technology. PU is defined as how someone believed that using certain technology will increase their performance and PEOU is defined as how someone believed that using certain technology doesn't need huge effort (Driediger & Bhatiasevi, 2019). Previous study showed that PEOU have strong significant positive relationship towards PU in OGS context due to the assumption from the consumer that the easier technology can be used the more benefit that the technology can give (Driediger & Bhatiasevi, 2019; Shukla & Sharma, 2018; Sreeram et al., 2017). Attitude can be defined as positive or negative feeling of an individual about using OGS to buy their groceries (Shukla & Sharma, 2018). In online grocery shopping context, PU and PEOU is known to have a significant positive relation towards attitude and attitude itself also have the same relation towards the intention to use an online grocery shopping. The more useful and easy to use technology will create a positive feeling towards the technology for an individuals' thus it will increase their intention to use that technology (Loketkrawee & Bhatiasevi, 2018; Shukla & Sharma, 2018). Previous research also found that PU directly affecting individuals' intention to use a technology, in which if a technology deemed to be useful by individuals' the higher their intention to adopt that particular technology. It was supported in educational (Al-Marouf et al., 2020, 2021), banking (Chawla & Joshi, 2019; Flavian et al., 2020), and retail sector in online grocery shopping (Shukla & Sharma, 2018; Sreeram et al., 2017).

**H1:** Perceived Ease of Use (PEOU) is positively related to the Perceived Usefulness (PU) in online grocery shopping usage

**H2:** Perceived Usefulness (PU) is positively related to the Attitude in online grocery shopping usage

**H3:** Perceived Ease of Use (PEOU) is positively related to the Attitude in online grocery shopping usage

**H4:** Perceived Usefulness (PU) in online grocery shopping positively related to the Intention to Use of online grocery shopping

**H5:** Attitude in online grocery shopping positively related to the Intention to Use of online grocery shopping

People are afraid and anxious of becoming infected with COVID-19 in public places such as public transportation, shops, and restaurants due to the COVID-19 pandemic (Gerhold, 2020). Uncertainty, health anxiety and fear to lose important persons are some forms of fear from COVID-19 (Ahorsu et al., 2020). Previous research showed that perceived fear of COVID-19 significantly related to PEOU and intention to use technology in education sector. The study prove that GoogleMeet technology can overcome the fear of COVID-19 and enabled the students to learn without worry (Al-Marouf et al., 2020, 2021). Another research argued that perceived fear of COVID-19 positively related towards PU and PEOU of a telemedicine technology, a person who have a higher fear of COVID-19 will perceive that the telemedicine is useful and easy to use during the pandemic (Elahi et al., 2021). Some researchers also found that fear of COVID-19 will enhance the subjective norms in using Google Meet as a method of learning and also to get COVID-19 vaccine (Al-Marouf et al., 2020; Yahaghi et al., 2021).

**H6:** Perceived Fear of COVID-19 (PF) is positively related to the Perceived Usefulness (PU) in online grocery shopping usage

**H7:** Perceived Fear of COVID-19 (PF) is positively related to the Perceived Ease of Use (PEOU) in online grocery shopping usage

**H8:** Perceived Fear of COVID-19 (PF) is positively related to the Subjective Norm in online grocery shopping usage

**H9:** Perceived Fear of COVID-19 (PF) in online grocery shopping is positively related to the Intention to Use of online grocery shopping

Enjoyment in this research is defined as the extent to which a user perceives online grocery shopping to be enjoyable (Driediger & Bhatiasevi, 2019). Enjoyment is found to be positively related towards PU, PEOU and intention to use a technology such as internet banking and mobile wallet (Bashir & Madhavaiah, 2015; To & Trinh, 2021). Enjoyment was also one of the antecedents used in online grocery shopping research in Thailand which proven to have a significant positive relation towards PU and PEOU (Driediger & Bhatiasevi, 2019). Enjoyment will give the user motivation to spend more time on the technology and they can explore more thus gaining more benefit and easiness from the technology (Moon & Kim, 2001).

**H10:** Enjoyment is positively related to the Perceived Usefulness (PU) in online grocery shopping usage

**H11:** Enjoyment is positively related to the Perceived Ease of Use (PEOU) in online grocery shopping usage

**H12:** Enjoyment in online grocery shopping is positively related to the Intention to Use of online grocery shopping

Subjective norm is defined as “individual perception that someone who is important for them think that the individual should or not behave” (Fishbein & Ajzen, 1975). Subjective norm is known to have a positive relation towards PU and the intention to use a technology (Venkatesh & Davis, 2000). A meta-analysis study showed that there is a need of word-of-mouth in order to increase the technology adoption in the society (Schepers & Wetzels, 2007). Individuals will adopt technology when they feel that someone who is important in their environment thinks that the technology is useful (Driediger & Bhatiasevi, 2019).

**H13:** Subjective Norm (SN) is positively related to the Perceived Usefulness (PU) in online grocery shopping usage

**H14:** Subjective Norm (SN) in online grocery shopping is positively related to the Intention to Use of online grocery shopping

Perceived risk is defined as “combination of performance risk (getting a bad quality product), time risk (not getting the groceries in a timely manner), and privacy risk (personal information and payment security) when using online grocery shopping” (Driediger & Bhatiasevi, 2019). Previous research showed that perceived risk have a negative relationship towards PU in technology acceptance (Park & Tussyadiah, 2017). The higher risk that might occurred to the users, the lower user will perceive the technology to be useful.

**H15:** Perceived Risk is negatively related to the Perceived Usefulness (PU) in online grocery shopping usage

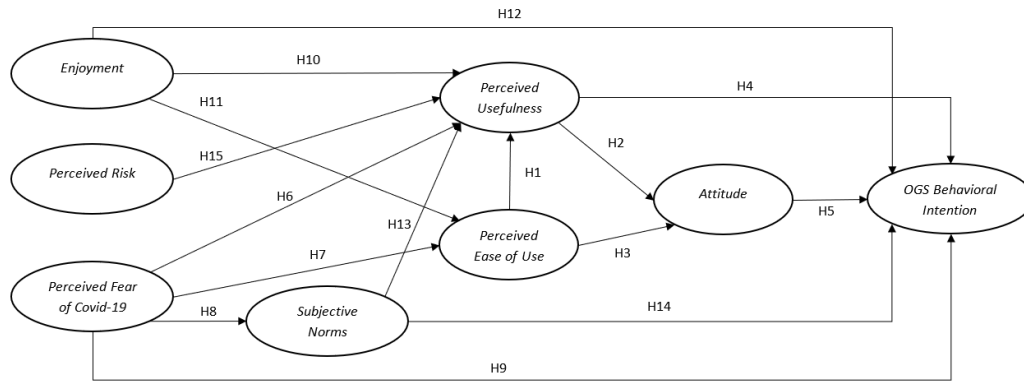

Fig. 1. Research Model Structure (Source: Author’s personal modification from Shukla & Sharma (2018), Driediger & Bhatiasevi (2019), and Al-Marroof et al. (2020))

### III. RESEARCH METHODOLOGY

This research uses a quantitative research method in order to confirm the hypotheses built previously. The primary data will be taken by an online survey to the individual in Indonesia who used online grocery shopping during COVID-19 pandemic period and over 18 years. The age restriction is due to the majority of e-commerce transaction in Indonesia is done by 18-35 years old users (Muazam, 2020). 35 years old and above is still included on the scope of this study due to their behavior of doing groceries for their family as well as older age was associated to higher COVID-19 mortality risk (Surendra et al., 2021). The measurement items for this study will use from existing literatures, this is done in order to ensure the validity of the measurement items. There are 3 indicators using a reverse scored items typed in italic on Table 1.

Table 1. Instrument Development

Variables	Indicators	Source
Perceived Usefulness	I believe that the use of an OGS will make my grocery shopping more effective	(Pettersson & Frohlike, 2015 in Shukla & Sharma, 2018)
	I believe that the use of an OGS will make my grocery shopping more convenient	
	I think that I would save time by using OGS for grocery shopping	
	I believe that, in general, using OGS for grocery shopping would have been useful	
Perceived Ease of Use	It is easy to purchase grocery through OGS	(Pettersson & Frohlike, 2015 in Shukla & Sharma, 2018)
	It is easy to learn how to purchase through OGS	
	It is easy to use OGS	
Attitude	I think it would be easy to use OGS application and site for grocery shopping	(Fishbein & Ajzen, 1975 in Shukla & Sharma, 2018)
	I believe it would be advantageous to use OGS in my grocery shopping process	
	I think it would be a good idea to use OGS when shopping for groceries	
OGS Behavioral Intention	I think it would be positive to be able to use OGS when shopping for groceries	(Al-Rahimi et al., 2013 in Shukla & Sharma, 2018)
	I intend to keep using OGS for buying groceries in the future	
	I intend to increase the use of OGS in the future	
Enjoyment	I intend to recommend my friends to use OGS for grocery shopping in the future	(Childers et al., 2001 in Driediger & Bhatiasevi, 2019)
	OGS is fun for its own sake	
	OGS is making me feel good	
	<i>OGS is boring</i>	
	OGS is exciting	
	OGS is enjoyable	
	<i>OGS is uncomfortable</i>	
OGS is interesting		

Variables	Indicators	Source
Perceived Fear of COVID-19	I am most afraid of coronavirus-19 It makes me uncomfortable to think about coronavirus-19 My hands become clammy when I think about coronavirus-19 I am afraid of losing my life because of coronavirus-19 When watching news and stories about coronavirus-19 on social media, I become nervous or anxious I cannot sleep because I'm worrying about getting coronavirus-19 My heart races or palpitates when I think about getting coronavirus-19	(Mohd Kassim et al., 2020)
Subjective Norm	Members of my family think that it is a good idea to buy the groceries via the internet Most of my friends and acquaintances think that shopping groceries via the internet is a good idea People who influence my behavior think that I should buy groceries online People who are important to me think that I should buy groceries online	(Driediger & Bhatiasevi, 2019)
Perceived Risk	I am concerned with the payment security aspects of OGS I am concerned with the privacy of my information provided when using OGS I am concerned with the punctuality of the delivery time of OGS I am concerned with the quality of the products delivered when ordering from OGS <i>I am confident over the security aspects of internet banking in Indonesia</i>	(Driediger & Bhatiasevi, 2019)

Source: Data processing result

The minimum number of respondents for this research is 185 respondents from the rule of thumb 5-10 respondents for each indicator used for measurement (Jöreskog & Sörbom, 1993). The items will be measured using a six-point Likert scale in order to avoid the error of central tendency (Cooper & Schindler, 2014). The survey will be made in two parts, with the first part consisting of questions about the demographics of the respondents and some descriptive questions related to the behavior of the respondents. Some of the demographic questions that will be asked are gender, age, monthly income, latest education, and domicile. While behavioral questions that will be asked to respondents are related to vaccination, individual behavior during the COVID-19 pandemic and others. The second part is the core part of the survey which contains statements which are indicators of each variable used in the study.

The sampling approach used in this study will be non-probability sampling, which means that the sample population will not be drawn at random. This was done because data from the complete population in this study was not possible to gather. Because there are various conditions that prospective respondents must meet before taking out the survey, the selection element chosen is restricted. Thus, the sampling method used is purposive sampling with the type of judgment sampling, due to the sample members must meet the criteria first to be able to become respondents. The data collection taken on April-May 2022, when most of COVID-19 variant is Omicron variant in Indonesia. This research gathered 315 respondents in which only 297 valid data responses can be used for the data analysis after the data cleaning and preprocessing.

For the main test, the data analysis will be done in 2 parts. The first part will be a descriptive analysis for the first part of survey which include the demographic and behavioral question while the second part will test the measurement model and structural model in order to test the hypotheses using the partial least squared – structural equation modeling (PLS-SEM) method using SmartPLS 3 software. PLS-SEM will be used due to its consideration as the best method to use when the main goals of the research is to explore existing literature, its power to analyze complex model, its ability to analyze the model as whole, and giving concurrent analysis for both the measurement model and structural model (Barclay, D., Thompson, R., dan Higgins, 1995; Goodhue et al., 2012; Hair et al., 2017; Urbach & Ahlemann, 2010). Measurement model will be evaluated by analyzing internal consistency (Cronbach's alpha & composite reliability), convergent validity (indicator reliability & AVE), and discriminant analysis while structural model will be evaluated by analyzing coefficients of determination ( $R^2$ ), predictive relevance ( $Q^2$ ), size and significance of path coefficients (Hair et al., 2017).

## IV. RESULT / FINDING

Pretest was done as the first step before main test in order to find problems related to content, wording, and questionnaire sequencing (Cooper & Schindler, 2014). Before pretesting begin, wording test was done to 5 respondents in order to make sure the meaning of each indicator is not lost in translation by asking the respondents to translate back the indicators to its original language. The result of the wording test shown that the indicators are not deviate from its original source meaning. The pretest was done to 40 respondents and showed a great reliability and validity results; thus, all the measurement indicators were taken for the main test.

As per the guidance from Hair et al., (2017) the first part to assess PLS-SEM results is to evaluate the measurement models. Since all the indicators used in this research are reflective measurement models, we need to evaluate the Internal Consistency (Cronbach's Alpha, Composite Reliability), Convergent Validity (Average Variance Extracted), and Discriminant Validity using HTMT which is more superior to the other traditional method of fornell-larcker criterion and cross loadings (Hair et al., 2017). The descriptive statistic of the samples and the measurement model evaluation result can be seen on Table 2.

Table 2. Descriptive Statistics of the Samples

Respondent characteristics (n=297)	Frequency	Percentage
<b>Gender</b>		
Male	111	37%
Female	186	63%
<b>Age</b>		
18-25	60	20%
26-33	133	45%
34-41	51	17%
42-49	22	7%
50-57	8	3%
>57	23	8%
<b>Latest Education</b>		
High School	26	9%
Bachelor	205	69%
Master	62	21%
Doctorate	4	1%
<b>Income</b>		
<IDR 500.000	7	2%
IDR 500.000 – IDR 1.000.000	9	3%
IDR 1.000.001 – IDR 5.000.000	35	12%
IDR 5.000.001 – IDR 10.000.000	59	20%
>IDR 10.000.000	145	49%
Housewife	26	9%
Not Working	16	5%
<b>COVID-19 Infection</b>		
Infected	134	45%
Not Yet Infected	163	55%
<b>OGS Usage Frequency</b>		
1-2 times/month	150	51%
3-5 times/month	116	39%
>6 times/month	31	10%

Source: Data processing result

Table 3 and Table 4 showed the result of measurement model evaluation. The Cronbach's Alpha, Composite Reliability and AVE for all variables exceed the minimum cut-off needed which are 0.7, 0.7, and 0.5 respectively. The discriminant validity shown by using HTMT ratio also give a good result in which all the correlations are not exceeding 0.85 which means a discriminant validity has been established between two reflective constructs. The outer loadings results show that PR.5R has a low value of loadings of under 0.4 thus need to be removed from the analysis (Hair et al., 2017).

The second part of PLS-SEM analysis is structural model evaluation. In order to evaluate the structural model, several analyses will be done which are Inner VIF to assess multicollinearity,  $R^2$  measure,  $Q^2$  measure, and the size and significance of path coefficient for the hypothesis testing. The multicollinearity assessed with Inner VIF value between variable which shows value ranging from 1.000 – 2.291. All VIF values is under the maximum threshold of 5 thus collinearity is not an issue on this research.

The next assessment is to assess  $R^2$  and  $Q^2$  value.  $R^2$  value needs to be minimum of 0.20 in order to be considered high due to the consumer behavior context of the research (Hair et al., 2017). Predictive relevance is evaluated using  $Q^2$  value in which any value larger than 0 indicating that the exogenous variable has a predictive relevance for the endogenous variable.  $Q^2$  value can be attained by using blindfolding with 7 as the distance as the default (Hair et al., 2017). Table 5 show the  $R^2$  value result for each endogenous latent variabel

Table 5. Evaluation of Structural Model

Variable	$R^2$	Adjusted $R^2$	P-value	$Q^2$
ATT	0.387	0.383	<0.001	0.295
INT	0.573	0.566	<0.001	0.443
PEOU	0.164	0.159	<0.001	0.13
PU	0.472	0.462	<0.001	0.318
SN	0.068	0.065	<0.01	0.047

Source: Data processing result

Based on Hair et al. (2017), consumer behavior research with  $R^2$  value of 0.2 and above is already considered as high. Thus, Behavioral Intention to Use OGS, Attitude, and PU variables are satisfying and significant by statistics. The  $Q^2$  value also show above 0 value for all the endogenous variables which means all the variables have predictive ability.

The next assessment for the structural model evaluation is by assessing the size and significance of path coefficient. This research used bootstrapping for the hypothesis testing as per Hair Jr et al. (2017) standard which use 5,000 subsamples, BCa Bootstrap as the confidence interval method, 5% significance. 1-tailed test is used on this research since the hypothesis building on this research is directional research hypotheses (Cho & Abe, 2013). The results of the hypothesis testing in this research show that 11 out of 15 hypotheses were tested positive and significant as per previous literature while 4 hypotheses belong to the Perceived Fear of COVID-19 and Perceived Risk were not supported. The full result of the path coefficient and hypothesis testing result can be seen on Figure 2. Black colored arrow indicates supported hypotheses, while red stripe arrow indicates rejected hypotheses.

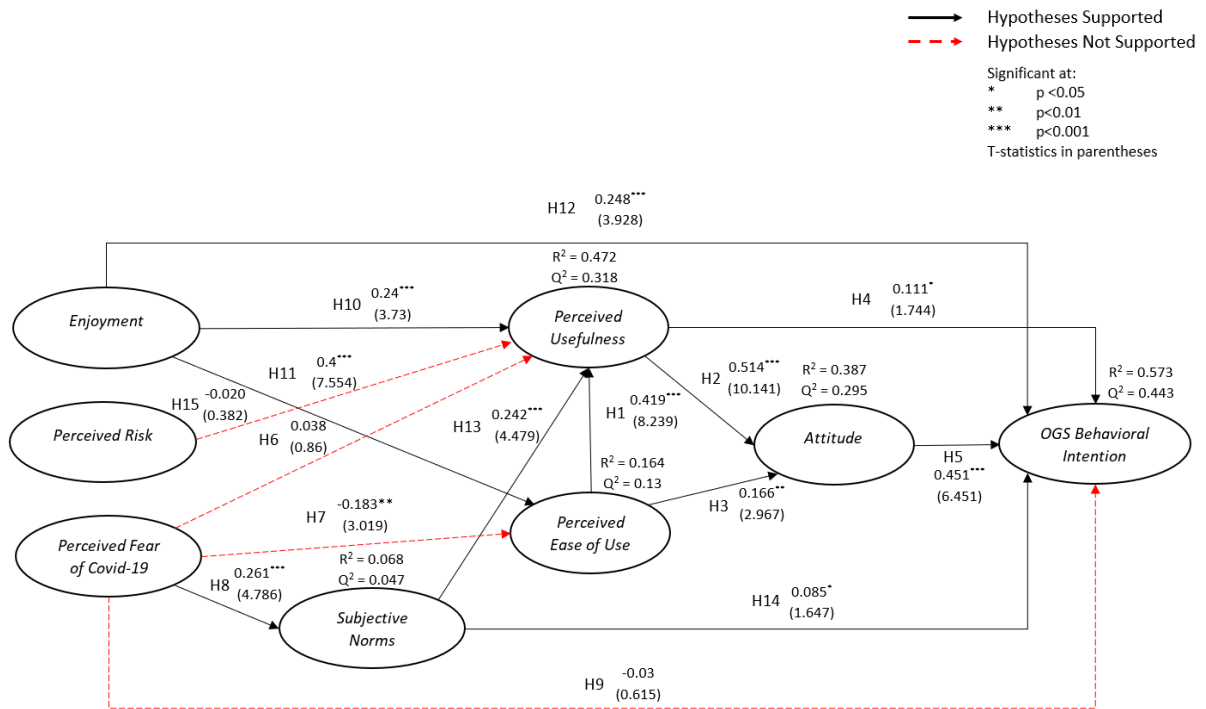

Fig. 2. Path model & hypotheses testing results (Source: Author’s Personal Data)

V. DISCUSSION

Based on the hypothesis testing, there are 11 supported hypotheses and 4 not supported hypotheses as shown on Table 6.

Table 6. Summary of hypotheses testing

Hypothesis	Relationship	Supported
H1	PEOU → PU	Yes
H2	PU → ATT	Yes
H3	PEOU → ATT	Yes
H4	PU → INT	Yes
H5	ATT → INT	Yes
H6	PF → PU	No
H7	PF → PEOU	No
H8	PF → SN	Yes
H9	PF → INT	No
H10	ENJ → PU	Yes
H11	ENJ → PEOU	Yes
H12	ENJ → INT	Yes
H13	SN → PU	Yes
H14	SN → INT	Yes
H15	PR → PU	No

Source: Data processing result

Hypothesis 1 showed that PEOU has positive and significant towards PU during COVID-19 pandemic in Indonesia ( $\beta = 0.451$ ,  $p$ -value  $<0.001$ ). This result is consistent with previous OGS studies done in India and Thailand (Driediger & Bhatiasevi, 2019; Sreeram et al., 2017). This means when individual perceives using OGS is free from effort, the more they perceived OGS to be useful OGS for them.

PU also has a positive and significant relation towards the Attitude to use OGS ( $\beta = 0.514$ ,  $p$ -value  $<0.001$ ) thus Hypothesis 2 was also supported on this research. This result is similar with the current finding on the OGS acceptance study in India and Australia (Chien et al., 2003; Shukla & Sharma, 2018). This result showed that the more OGS is perceived to be useful by an individual, that individual will have a positive attitude towards it. The respondents of this research have high mean-value of 5.043 on the Perceived Usefulness variable which they said that the ability to be able to continue shopping while reducing the risk of infected by COVID-19 makes them have a positive attitude towards OGS.

Attitude to use OGS was also influenced positively and significantly by PEOU ( $\beta = 0.166$ ,  $p$ -value  $<0.01$ ) making Hypothesis 3 also supported. The same result also shown by previous OGS study in India and Australian in which the easier OGS is perceived to be used by an individual, they will also have a positive attitude towards it (Chien et al., 2003; Shukla & Sharma, 2018). Most of the respondents on this research shared their key reason to use OGS during COVID-19 pandemic, the practicality to use OGS is the most voted reason for the to use OGS thus supporting H3 hypothesis.

Hypothesis 4 showed that PU has a direct positive and significant relation towards individual behavioral intention to use OGS during COVID-19 pandemic in Indonesia ( $\beta = 0.111$ ,  $p$ -value  $<0.05$ ). This result means that when consumers feel that using OGS is beneficial for them, the more likely for them to use OGS for shopping. This result was also found on past OGS literature in Thailand and India (Driediger & Bhatiasevi, 2019; Shukla & Sharma, 2018).

Individual attitude to use OGS also showed a positive and significant relationship towards individual behavioral intention to use OGS thus supporting Hypothesis 5 ( $\beta = 0.451$ ,  $p$ -value  $<0.001$ ). Attitude is directly influencing individuals behavioral intention since an individual will only have intention to do some behavior for what they consider as positive (Fishbein & Ajzen, 1975). This result also found on previous OGS study in India (Shukla & Sharma, 2018).

While most of the Perceived Fear of COVID-19 variable were found not significant, there is a positive and significant relationship between individuals fear of COVID-19 and Subjective Norms ( $\beta = 0.451$ ,  $p$ -value  $<0.001$ ) thus supporting Hypothesis 8. This result was coincide with previous research that individual fear towards COVID-19 influenced the subjective norms on their behavior or when adopting technology during this COVID-19 pandemic (Al-Marroof et al., 2020; Yahaghi et al., 2021). Collectivism culture in Asia is one of the reason on how fear of COVID-19 influence subjective norms (Kim & Hong, 2021).

Hypothesis 10 was also supported in which there is a positive and significant relationship between Enjoyment and PU when using OGS during COVID-19 pandemic in Indonesia ( $\beta = 0.24$ ,  $p$ -value  $<0.001$ ). The same relationship can be found on previous literature regarding OGS acceptance in Thailand and USA (Driediger & Bhatiasevi, 2019; Ha & Stoel, 2009). Enjoyment is influencing individuals' perceived usefulness when using OGS due to the more they enjoy using the technology, the more time they spent thus receiving many benefits from the technology (Moon & Kim, 2001; Venkatesh & Davis, 2000).

Enjoyment was also found to have a positive and significant relation towards PEOU which support Hypothesis 11 ( $\beta = 0.4$ ,  $p$ -value  $<0.001$ ). This result coincide with other technology acceptance such as OGS in Thailand and mobile wallet technology (Driediger & Bhatiasevi, 2019; To & Trinh, 2021). Enjoyment can increase consumers time on the technology thus increase their experience and make them feel less effort when using the technology (Venkatesh, 2000).

Individual behavioral intention to use OGS was also found to be influenced positively and significantly by Enjoyment which support Hypothesis 12 ( $\beta = 0.248$ ,  $p$ -value  $<0.001$ ). This means the more consumers enjoy using OGS, the more they intent to use OGS. This finding can also be found on other technologies such as mobile games, SVOD, and mobile wallet (Lestari & Soesanto, 2020; Nguyen, 2015; To & Trinh, 2021). This relationship also impacted due to hedonic aspect from OGS application or website when used by individuals.

Hypothesis 13 was supported, Subjective Norms has positive and significant relationship towards PU ( $\beta = 0.242$ ,  $p$ -value  $<0.001$ ). This result coincide with previous research in which same relationship was also found in Google Meet technology during COVID-19 pandemic (Al-Marroof et al., 2020). This relationship could be driven by internalization effect which is representing individual tendency to interpret information from someone who is important as an evidence of reality (Schepers & Wetzels, 2007).

Subjective Norms also have a positive and significant relationship towards individuals' behavioral intention to use OGS thus supporting Hypothesis 14 ( $\beta = 0.242$ ,  $p$ -value  $<0.001$ ). Same result can be found on Google Meet and OGS adoption during COVID-19 (Al-Marroof et al., 2020; Al Amin et al., 2021). The relationship was also supported due to compliance effect (Schepers & Wetzels, 2007).

The positive and significant effect of Perceived Fear of COVID-19 was not found towards PU ( $\beta = 0.038$ ,  $p$ -value = 0,195), PEOU ( $\beta = -9.183$ ,  $p$ -value  $<0.01$ ) and individuals' intention to use OGS ( $\beta = -0.03$ ,  $p$ -value = 0.269). These results are not in line with previous researches where those relationship was found to be positive and significant on e-

health, Google Meet, and food delivery mobile application (Al-Marroof et al., 2020; Elahi et al., 2021; Puriwat & Tripopsakul, 2021). There can be several reasons on why different results is found. The fear of COVID-19 in Indonesia might be already low for individuals since 99% of the respondents has been vaccinated twice or more, previous research showed that vaccination can reduce fear and anxiety caused by COVID-19 (Babicki et al., 2021; Karayürek et al., 2021). Meta-analysis research also found that consumers used OGS services during COVID-19 pandemic is not because they think OGS is beneficial for them, but it is more likely because the COVID-19 pandemic situation that forced them to adopt the services. The difference on the technology itself might be the cause of this result, in which using OGS is more difficult than using Google Meet. The last reason might be due to there are still another option beside on using OGS to shop, which in Indonesia traditional market and retail store is still open during the restriction period.

Perceived Risk was shown to have a negative and non-significant relationship towards PU ( $\beta = -0.020$ ,  $p\text{-value} = 0,382$ ). This result coincides with previous literatures regarding OGS usage in Thailand and Indonesia (Driediger & Bhatiasevi, 2019; Putri, 2021). Meta-analysis research in context of OGS usage during COVID-19 pandemic also shown the non-significant relationship between Perceived Risk and Perceived Usefulness. This relationship might happen due to OGS users already familiar and trust towards OGS technology proven from the increase of online transaction generally (Frank & Peschel, 2020). The non-significant result might also due to the different risks are held more important by OGS users during COVID-19 pandemic which are psychological risk and physical risk (Iriani & Andjarwati, 2020).

## VI. CONCLUSION AND RECOMMENDATION

This research objectives are to analyze on which factor which factors contribute the most between fear of COVID-19, subjective norms, and enjoyment to the behavioral intention to use OGS during pandemic in Indonesia using the TAM framework and also to confirm the relationship of TAM variables on the same context. The results show that enjoyment has the highest size of path coefficient towards behavioral intention to use OGS, more than subjective norms and the non-significant relationship with perceived fear of COVID-19. All the TAM variables and hypotheses were accepted on this research, confirming the robust framework of TAM from the previous literatures and also expanding the theoretical contributions of TAM used in OGS technology and during COVID-19 pandemic in Indonesia.

The findings of the study show that there is non-significant relationship between perceived fear of COVID-19 towards perceived usefulness and behavioral intention to use OGS. This result might shift the attention of OGS service provider to focuses on the others significant variables towards the behavioral intention to keep using OGS before and after COVID-19 pandemic.

The increase on perceived usefulness and perceived ease of use were believed to also increase the positive attitude of users' which will lead to the increase of behavioral intention to use OGS. Thus, it's important for OGS provider to search on how to increase both usefulness and ease of use. Service provider should make sure their OGS application and site were user friendly to be used by all ages to increase the ease of use. Usefulness of OGS can be further improved by giving the additional information of the products sold such as country of origin, nutrition, and ingredients list.

Subjective norms were also found to have a positive and significant relationship towards perceived usefulness and behavioral intention to use OGS. This finding means that it's important for OGS provider to sustain a positive image of OGS and their brand which will be shared through positive words of mouth from one person to another person. Referral program can also give benefit to OGS users' and help them spread positive WOM towards OGS.

Enjoyment was found to have the highest effect towards behavioral intention to use OGS more than subjective norms and perceived fear of COVID-19, thus OGS service provider must learn on how to increase the enjoyment of OGS. One way to increase the enjoyment of online shopping was by creating a promotion in a form of flash sale in which was already found to increase the enjoyment when online shopping (Vannisa et al., 2020).

There are some limitations found on this research. First, this research is cross-sectional research which means the data was only taken in single point of time. Meanwhile, COVID-19 pandemic is changing dynamically overtime due to its uncertain factor. The results of the research will be more comprehensive when it's done using longitudinal data collection in order to found the effect of COVID-19 fear overtime. This research also has a concentrated samples mainly on Greater Jakarta area. This research tries to capture the phenomenon country-wide, but only 20% of the respondents came from outside Greater Jakarta. Future research should try to gain more representative areas outside of Java Island and it will be better if all of the areas in Indonesia has even distribution in order to gain a country-wide results. Last, this research tries to understand the impact of COVID-19 fear as the antecedents of TAM variables. Future research could explore the possibility of COVID-19 fear as moderating variables.

## Predicting Employee Burnout Rate Using Neural Network

I. Hanif<sup>1</sup> and A. Subroto<sup>2</sup>

<sup>1,2</sup>Faculty of Economics and Business, Universitas Indonesia, Jakarta, Indonesia

### Abstract

*Burnout refers to a psychological reaction to chronic work stress. The phenomenon of burnout is undoubtedly a phenomenon that companies must overcome because it may adversely affect productivity and employees' desire to resign from their job. This study aims to predict employees with high burn rates and analyze all the possible factors influencing employee burnout amid the COVID-19 pandemic. Several factors were analyzed, including the type of company, job positions, work-from-home (WFH) schemes, mental fatigue score, and working hours per day. Based on the application of the neural network method, 92.2% of the burnout variance can be explained by the input variable, with the level of mental fatigue and working hours per day variables significantly influencing burnout. The neural network is re-applied with these two variables and can still explain 91.9% of the burnout variance. Employers can use this research to predict the burnout rate faced by employees and enrich previous studies regarding burnout prediction.*

*Keywords—Burnout prediction; neural network; COVID-19*

---

### I. INTRODUCTION

Burnout refers to a psychological reaction to chronic work stress. What is noteworthy is that the importance of burnout as a social problem was identified by practitioners and social commentators long before the focus of systematic studies by researchers (Maslach et al., 2001). According to Maslach and Susan E. Jackson (1986), burnout that occurs in workers can be defined in three main aspects, including emotional exhaustion where workers feel that the psychological level is no longer able to contribute, the growth of a cynical attitude towards clients, and the tendency of workers to judge themselves negatively.

According to Garton (2017), the psychological and physical problems of employees caused by burnout cost an estimated \$125 billion to \$190 billion annually in United States. The burnout phenomenon is certainly a phenomenon that must be overcome by the company because it has a negative influence on productivity and the desire of employees to resign (Rashad & Rosari, 2020). A model developed by Ganster and Rosen (2013) designed through multidisciplinary and employee health concerns the identification of psychological intervention processes that link stress exposure to health. This model identifies the process faced when someone experiences stress. Primary AL processes are symptoms that have a psychological impact such as fear to physiological anxiety such as cortisol and psychosomatic symptoms such as sleep disturbances and fatigue. Secondary AL processes are changes in body systems including the immune system such as immunoglobulin to reactive proteins, the cardiovascular system such as blood pressure and metabolic systems such as the effect on body mass index (BMI) to insulin levels. Finally, the Tertiary AL Process is an impact on health that affects the end point of the disease, for example diabetes to heart disease, psychological disorders such as depression to bipolar disorder, to extreme level, death.

Analysis through a big data approach can be carried out to assist in understanding the conditions correctly so that it can help make business decisions more measurably. Data-driven terminology is a terminology that is already rooted in every decision taken today. With data, phenomena can be described clearly. Modern companies are widely aware of this, not only for commercial purposes but also for non-commercial purposes. For this reason, data mining needs to be carried out in order to gain insight into the processes needed and can have an overview of phenomena that occur in the future. Quoted from The Wall Street Journal article by Julia Angwin, it is said that 'Storing and studying people's daily activities, even those that seem mundane, have become commonplace without exception'. Some of the points described are what motivated the authors to conduct research to predict burnout in the COVID-19 pandemic era with a big data analysis approach.

Several studies have been conducted regarding the prediction of burnout with a big data approach and the incidence of burnout during the COVID-19 pandemic. Arokkiya Mary and Jabasheela (2018) conducted a comparison using several machine learning techniques to predict the incidence of depression, anxiety and stress in students in Saudi Arabia in relation to the activity of playing video games with neural networks that have the best accuracy. Lee (2020) made a prediction for the incidence of burnout by 1,000 health workers using the neural network classification method. Zhernova et al. (2020) using the Maslach Burnout Inventory (MBI) as the basis for early detection of burnout, then modeling is made so that it can predict 70% of burnout events. This final project is expected to enrich previous studies by broadening the research perspective by analyzing working conditions in the pandemic era to predict burnout levels that occur in employees and analyze the dominant factors that influence burnout levels with a big data analytics approach using the neural network method. It is expected that employers can predict the potential for burnout that will occur to their employees and have a good picture of what factors have a high influence on burnout.

## II. LITERATURE REVIEW

### A. Burnout

The term burnout was first introduced by Freudenberger (1974). Burnout is a condition where workers feel failed, exhausted, or feel very tired caused by spending excessive energy, strength, and self-resources on themselves. Symptoms of burnout itself can vary and have a different level of severity in each person who experiences it. Physical signs that occur in someone who is burnout include feeling tired, prolonged flu, headaches, indigestion, and difficulty sleeping. Meanwhile, behavioral signs that usually occur are difficulty controlling emotions, looking easily frustrated, crying, and screaming.

Based on a study conducted by Wigert and Agrawal (2018) on 7,500 full-time employees, 23% of them experience burnout quite often at work with 44% of them also experiencing it at a lower frequency. Employees who burnout are 63% more likely to take sick leave and 2.3 times more active to look for a new job. Although there are also employees who choose to stay, in general they usually have 13% lower self-confidence. Broadly speaking, burnout has a major impact on company performance.

### B. Stress Management Theory

Job Demand-Control Theory (JDC) states that work related can result from the interaction between several psychological job demands related to workload such as cognitive and emotional demands, interpersonal conflict, and job control related to decision authority and skills (Robert A., 1979). Cooper and Palmer (2003) developed a model based on the response to the HSE Executive's (2001) call for dealing with work-related stress and stress risk assessment. This model explores the impact related to stress or sources of stress faced by employees at work. Symptoms of acute stress also appear, where these symptoms are related to organizations as well as individuals. Negative outcomes are described for the physical and mental health of individuals, but beyond this, results are presented as financial losses for individuals and organizations.

The Yerkes-Dodson law (Yerkes & Dodson, 1908) explains the empirical relationship between pressure and performance. This law states that performance can be increased by physiological or mental stimulation, but only up to a point. When the arousal level becomes too high, performance will decline. Follow-up studies by (Gwyer, 2017) relating to nervous system excitability levels also provide us with a framework within which we can increase or decrease unhelpful excitability levels through therapeutic interventions. This application helps to determine which intensity is optimal to achieve the best performance (Fig. 1).

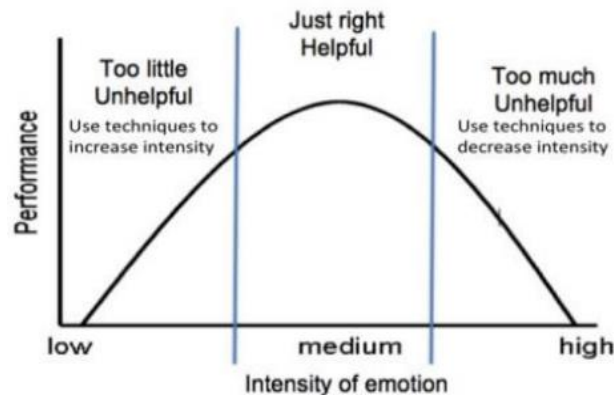

Fig. 1 Yorkees and Dodson law application (Gwyer, 2017)

### C. The Use of Data in Decision Making

Many success stories come from choosing the right decisions using data. The use of the data itself can be used on all functional elements of the company, ranging from human resource analysis, decision making related to finance, production operations, and marketing. The use of the data itself is not only used in the commercial sector, but also exists in the non-commercial sector such as government and open communities.

Decision making with data analysis is known as data-driven decision making (DDD). The results of a study by Erik Brynjolfsson, Lorin Hitt, and Heekyung Hellen Kim (2011) show that companies that adopt DDD have higher productivity and output, at 5-6%. Currently, DDD has been implemented in an automated form, where at certain functions and scales in the company, decisions are made from logic that has been built by data science. The finance and telecommunications industries were early adopters of DDD in the 1990s. In that year, many companies in the finance and telecommunications sector implemented a fraud control decision system. This has had a significant impact on the industry. Today, it can be seen that the implementation of automated DDD has been carried out on a larger scale, such as in automatic recommendations from Amazon and movies from Netflix (Provost & Fawcett, 2013).

#### D. Knowledge Database Discovery (KDD)

Knowledge discovery in database (KDD) data mining is a process where an analysis will be carried out on existing data sources to gain an in-depth understanding of a phenomenon that occurs. KDD data mining itself begins with data selection, then data cleaning is carried out to clean the data before proceeding to the transformation stage so that the data mining process can be carried out to find out patterns or predict phenomena that may occur and then become input for managers to take a strategic approach to deal with phenomena. which exists.

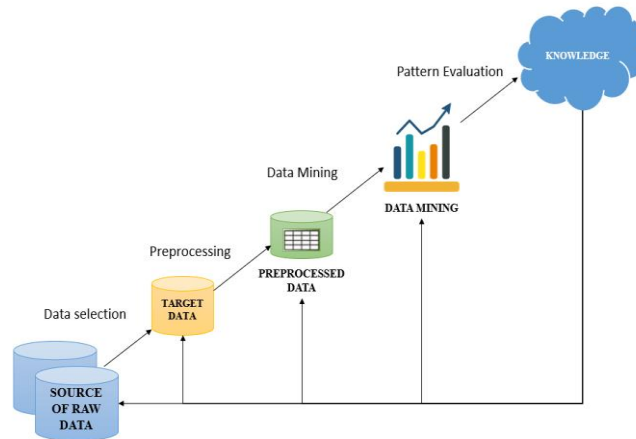

Fig. 2 Knowledge Database Discovery Process (Evans, 2015)

### III. RESEARCH METHODOLOGY

This study aims to predict employee burnout levels in the COVID-19 pandemic era and formulate which variables have a major influence on employee burnout levels. The analysis is done by using the neural network method, namely by applying it to the training data. The results of this study can be used by the company's Human Resources (HR) function as one of the considerations for strategic approaches in dealing with job stress. Furthermore, the results of the study can predict which employees have a tendency to have high levels of stress. In addition, with the help of Olden's algorithm, it can be explained which variables have a high influence on employee burnout levels.

The analysis was carried out using the R application, which is one of the most popular statistical calculation tools. R is a software environment for statistical computing as well as graphing. R has the ability to process and run on various UNIX, Windows, and MacOS platforms. R's ability to perform statistical and graphic computations is supported by various types of packages, ranging from packages that provide R's ability to visualize data to data modeling. These packages were developed by various practitioners and the R user community.

#### A. Data Selection

Data collection is the initial stage of analysis through a big data approach. Data can be obtained from various sources and selected based on the 5V element to get the desired results. The data used is published by HackerEarth. The data contains information regarding burnout levels for employees in the COVID-19 pandemic era along with other information including the type of company industry, gender, position held, amount of working time per day, and the level of mental fatigue of employees (Table 1).

Table 1. Variable on dataset

No	Variable	Definition	Feature	Value	Variable type
<b>Predictors</b>					
1	Gender	Employee' gender	Gender	Male or Female	Character
2	Company type	Type of company where the employee is working	Company_Type	Product or Service	Character
3	Whether the companies applying WFH	Information regarding whether the companies applying WFH	WFH_Setup_Availabl e	Yes or No	Character
4	Designation	Level of employment	Designation	1-5	Numeric (discrete)

5	Working hour per day	Working hour spent daily	Resource_Allocation	1-10	Numeric (discrete)
6	Mental fatigue score	Mental fatigue score provided by employee	Mental_Fatigue_Score	1-10	Numeric (continuous)
<b>Target</b>					
7	Level of burn rate	Level of burnout experienced by employee	Burn_Rate	0-1	Numeric (continuous)

### B. Data Preprocessing

Data in the context of real-world data usually cannot be directly used for analysis. Often, the available datasets are messy, uneven, overly complex, and inaccurate. The process of cleaning and tidying the data so that the data can be used for algorithm analysis is called data pre-processing. Some of the main activities in the data pre-processing process as described by Evans (2015).

### C. Data Mining

Generating knowledge in the context of data mining can translate into discovering new and valuable patterns, relationships, and trends in data that is useful to users. Data mining as a process involves, in essence, data collection and selection, data pre-processing, data analysis itself including visualization of results, interpretation of findings, and application of knowledge. Findings from the data mining process can be distinguished descriptively, where knowledge is represented in the form of models that describe patterns and relationships in the data, while predictive where knowledge is represented in predictions of future conditions, trends and relationships (Schuh et al., 2019).

- **Descriptive Analytics**

Data is usually tabular and often has a large amount so that an analysis is needed to describe it in the form of comprehensive information. The term descriptive analysis refers to the use of data to understand past and current business performance to assist in decision making (Evans, 2015). This process usually involves visualization techniques so that the information contained in the data can be conveyed to the audience to describe any phenomena or events that can be described by the data held. It is the process of presenting data, usually in large quantities, to provide insight to serve as a basis for better decision making. Data visualization improves the quality of decision making, provides managers with better analytical skills, and improves collaboration and information exchange. Data visualization also provides an effective way of communicating data at all levels of the business and also reveals patterns and correlations in the various variables presented

- **Neural Network**

Neural network is a machine learning algorithm which is the most important part of deep learning. Neural network is a powerful algorithm in the world of computer science and artificial intelligence (AI). The application of neural networks is quite popular as in speech recognition or in image recognition. This algorithm works as the structure of the human brain works by having neurons connected to one another. The basic idea of the neuron model is that the input,  $\mathbf{x}$ , together with the bias,  $b$ , weighted by,  $\mathbf{w}$ , is a vector of values, that is,  $\mathbf{x} \in \mathbb{R}^n$  and  $\mathbf{w} \in \mathbb{R}^n$  with  $n \in \mathbb{N}$  corresponding to the dimensions of the input. The sum of these terms, i.e.,  $z = \mathbf{w}^T \mathbf{x} + b$  forms the argument of the activation function,  $\phi$ , which gives the output of the neuron model (Emmert-Streib et al., 2020). Neural network works through neurons that are interconnected and work independently. Each neuron consists of input value, weight, bias (threshold) and output

$$y = \phi(z) = \phi(\mathbf{w}^T \mathbf{x} + b) \quad (3.3)$$

Where:

$\mathbf{w}$  = weight

$\mathbf{x}$  = input

$b$  = bias

In building a neural network architecture, neurons must be connected to each other. Feedforward architecture is the simplest architecture where all neurons between layers are connected to each other. In general, the depth of the FFNN indicates the number of non-linear transformations between the separator layers, while the dimension of the hidden layer, i.e. the number of hidden neurons, is referred to as the network width. The amount of depth of the FFNN architecture is debatable, but architectures with more than two hidden layers are generally categorized as deep feedforward neural networks (Bengio, 2009).

Once the input layer is defined, further weights can be assigned. These weights help determine the importance of a particular variable, with the larger variable contributing more significantly to the output compared to the other

inputs. All inputs are then multiplied by their respective weights and then added up. After that, the output is passed through an activation function that determines the output. If the output exceeds the given threshold value, the neuron will be activated and forward the data to the next layer. This results in the output of one neuron being the input of the next neuron. The application of the neural network in this study was carried out with a combination of the number of layers and neurons without referring to the rule of thumb the number of layers and neurons in the application of the neural network.

Neural network is an algorithm that is able to learn complex patterns. Neural network applications can continue to grow along with the increasing number of adequate training data. Neural network is very suitable to be used as a method if you have a large amount of data and can continue to grow over time. According to a study conducted by Pu et al. (2019), when compared to other traditional machine learning methods, neural networks can achieve a higher learning rate even though the performance obtained is not as fast as traditional machine learning

- Olden Method

The weight value that connects the variables in the neural network algorithm describes the relationship between variables. The weights determine the relative effect of the information processed by the neural network. Certain input variables that have a low correlation to the response variable will have their contribution suppressed by weights. On the other hand, input variables that have a large positive or negative influence will be regulated by weight.

A method proposed by Garson (1991) and also Goh (1995) identifies the relative importance (high association) of input variables in a single response variable in the supervised neural network by constructing weights on the neural network. Furthermore, a similar method was developed by Olden et al. (2004) which consistently produces better performance. Olden method calculates the variable contribution as the product of the raw hidden input and hidden-output connection weights between each input and output neuron and adds up the products in all hidden neurons. The advantage of this approach is that the relative contribution of each connection weight is maintained, both in terms of magnitude and sign, which is different from Garson's algorithm which only considers absolute quantities. The relative importance of the input variables can be determined by identifying all the weights connected to each neuron. All existing weights are calculated for each input neuron and scaled relative to other inputs so that the value of each input variable describes the relationship with the response variable.

#### D. Neural Network Evaluation

- Performance Evaluation

In assessing performance on predictions with regression, there are three commonly used metrics, namely the coefficient of determination, Root Mean Square Error (RMSE) and Mean Absolute Error (MAE). Basically, this metric calculates how much the resulting prediction differs from the actual value. Chicco et al (2021) summarize the equations of several regression metrics including:

##### I. Coefficient of Determination

Measuring how much variability of the dependent variable can be explained by the predictor variable:

$$R^2 = \frac{RSS}{TSS} = 1 - \frac{\sum_{i=1}^n (y_i - \hat{y}_i)^2}{\sum_{i=1}^n (y_i - \bar{y})^2} \quad (3.4)$$

##### II. Root Mean Square Error

RMSE is calculated by the sum of the squares of the prediction errors which is the real output minus the predicted output and then divided by the number of data points. This provides an absolute number of how far the predicted result deviates from the true value.

$$RMSE = \sqrt{\frac{\sum_{i=1}^n (\hat{y}_i - y_i)^2}{n}} \quad (3.5)$$

##### III. Mean Absolute Error

MAE is similar to MSE, but MAE takes the absolute value of the prediction error. Formula 6 shows how the MAE value is determined.

$$MAE = \sum_{i=1}^n \frac{|y_i - \hat{y}_i|}{n} \quad (3.6)$$

- Variable Relative Importance

The weight value that connects the variables in the neural network algorithm describes the relationship between variables. The weights determine the relative effect of the information processed by the neural network. Certain input variables that have a low correlation to the response variable will have their contribution suppressed by weights. On the other hand, input variables that have a large positive or negative influence will be regulated by weight. A method proposed by Garson (1991) and also Goh (1995) identifies the relative importance (high association) of input variables in a single response variable in the supervised neural network by constructing weights on the neural network. Furthermore, a similar method was developed by Olden et al. (2004) which consistently produces better performance. Olden's method calculates the variable contribution as the product of the raw hidden input and hidden-output connection weights between each input and output neuron and adds up the products in all hidden neurons. The advantage of this approach is that the relative contribution of each connection weight is maintained, both in terms of magnitude and sign, which is different from Garson's algorithm which only considers absolute quantities. The relative importance of the input variables can be determined by identifying all the weights connected to each neuron. All existing weights are calculated for each input neuron and scaled relative to other inputs so that the value of each input variable describes the relationship with the response variable

#### IV. RESULT / FINDING

##### A. Data Selection

The study begins with the selection of data to be used in the study for further analysis of each variable. The dataset contains employee surveys to employee burnout levels. In this research, information is extracted by finding what factors or variables can affect the level of burnout experienced by employees, so it will be useful for the company to define which employees have a tendency to have a high level of burnout.

##### B. Data Preprocessing

- Data Cleaning

The initial stage before data processing is the analysis of abnormalities in the dataset. Data that is an outlier, error, coding error, corrupt, missing, or abnormal can be discarded because it is considered not to have useful information. After the dataset is imported into the R environment, the dataset can be read perfectly without any row errors. Furthermore, the missing values were analyzed whether they provide significant information or can be discarded. From the results of checking for missingness on the dataset, there are a total of 3% of variables that have null/not available (missing values) values, due to its small proportion, all missing values will be discarded from dataset.

- Data Transformation

After analyzing the dataset, the next process carried out is the data pre-processing process. In accordance with the information displayed during the introduction of the dataset, the data type of each variable is not uniform so that a transformation stage is needed on the dataset which is a subset of the pre-processed data. The transformation steps are carried out on the variables Gender, Company\_Type, and WFH\_Setup\_Available which are variables with character types. Furthermore, this variable is transformed into a numeric variable through coding until all variables have the same data type.

##### C. Data Mining

Correlation is a statistical measure of the strength of the relationship between the relative movement of two variables. The values range between -1.0 and 1.0. A negative correlation value means that two variables have an opposite relationship where if one variable decreases the value of the other variable increases, while if it is positive, the two variables tend to move in the same direction. Table 2 shows that Mental\_Fatigue\_Score has the largest correlation coefficient of 0.944 and followed by Resource\_Allocation of 0.855, Designation of 0.736, and WFH\_Setup of 0.307, Company\_Type and Gender have a negative and low correlation with values of -0.043 and -0.144 respectively.

Table 2. Predictor variable correlation to target variable

No	Feature	Correlation	P-Value
1	Gender	-0.1565766	0.0000
2	Company_Type	-0.005903766	0.4209
3	WFH_Setup_Available	0.3071684	0.0000
4	Designation	0.7364116	0.0000
5	Resource_Allocation	0.8550048	0.0000
6	Mental_Fatigue_Score	0.9443886	0.0000

##### D. Evaluation

The data that has passed the pre-processing process is then ready to be processed for learning. Training data will be used as learning by the FFNN algorithm. The implementation of the neural network is done with the NeuralNet package available on R. The target variable is Burn\_Rate and the rest is assigned as an input variable. FFNN will study the existing patterns in the data and weight each neuron. FFNN consists of hidden layers, where each hidden layer has a number of neurons. Variations in the number of layers and neurons will be considered as the basis for choosing which combination of the number of layers and neurons has the best accuracy. The combination is done with 1 hidden layer tested with 1 to 4 neurons and 2 hidden layers with a combination of 2 neurons in the first layer and 1 neuron in the second layer, 3 neurons in the first layer and 2 neurons in the second layer, and finally 4 neurons in the first layer and 3 neurons in the second layer. After the learning process is complete, then the performance is validated by test data. The application of the neural network is carried out repeatedly with a combination of the composition of the training and test data before finally evaluating and analyzing whether it has consistency in the resulting accuracy.

Table 4. Result of Neural Network

Number of hidden layer	Neuron	Neuron	Splitting:Test 70:30				Processing time
			R <sup>2</sup>	MAE	MSE	RMSE	
1	1		0.919	0.0457	0.00314	0.05605	00:01:02
1	2		0.919	0.04558	0.00313	0.05596	00:00:55
1	3		0.92	0.04555	0.00312	0.05588	00:03:59
1	4		0.92	0.04554	0.00312	0.05586	00:07:16
2	2	1	0.92	0.04557	0.00312	0.05585	00:02:12
2	3	2	0.919	0.04569	0.00315	0.05614	00:09:10
2	4	3	0.922	0.0448	0.00297	0.05451	00:10:44

The addition of the number of hidden layers and neurons proves that both parameters have a positive impact on the performance of the neural network. Of the several learning schemes carried out, 2 hidden layers with variations of 4 neurons in the first hidden layer and 3 neurons in the second hidden layer gave the best performance with a coefficient of determination of 0.922 with MAE, MSE, and RMSE values respectively 0.4448, 0.00297 and 0.05451. The application time of the neural network also increases with the increasing number of neurons in the FFNN architecture.

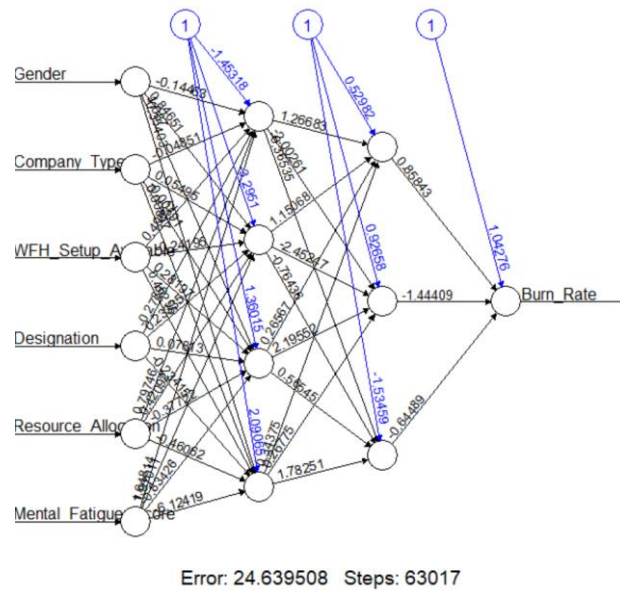

Fig. 3 Burnout rate prediction FFNN architecture

Several parameters are used in assessing the performance of neural network regression, including R<sup>2</sup>, mean absolute error (MAE), mean square error (MSE), and root mean square error (RMSE). These parameters assess the extent to which the input variables can describe the output variables and the extent to which predictions deviate from the actual data. With the composition of splitting data of 80:20, the result of R<sup>2</sup> shows a value of 0.92, which means that the input variable can explain 92% of the target variable. Furthermore, MAE, MSE, and RMSE are respectively 0.045692, 0.003008844 and 0.054852932. Variations in data splitting also show that the neural network has a good level of consistency, although the composition of the values of the evaluation parameters has very small changes.

Table 5. Revalidate neural network performance

Skema <i>splitting</i>		Neural network		
<i>Training</i>	<i>Test</i>	R <sup>2</sup>	MAE	RMSE

60	40	0.926	0.044781	0.05462
70	30	0.922	0.0448	0.05451
80	20	0.92	0.045692	0.054853

Making perfect predictions is almost impossible to do. In addition to the limitations of the algorithm's capabilities, often the available data does not really have the desired consistency so that the occurrence of errors or prediction errors is still very likely to occur. Fig. 4 shows the comparison of the predicted value of the neural network with the actual value carried out using testing data, where the diagonal line shows the actual value of the Burn\_Rate value, while the red dots represent the predicted value of Burn\_Rate. The distance between the red dot and the diagonal line is an error encountered when making predictions. The farther the distance between the predicted value generated by the neural network and the actual value, the worse the quality. On the other hand, the closer to the actual value and the more similar the pattern to the actual value, the better the performance. Neural network has a distance that tends to be close to the data point regression line.

Fig. 4 Predicted and actual y value

## V. DISCUSSION

To see the contribution of each input variable to the predicted value generated by the natural network, it is necessary to analyze the contribution of each variable using the method developed by Olden (2004). This analysis can be done using the NeuralNetTools package available in the R software. This package able to provide insight into the relative importance of each input variable. From the results of the analysis conducted, the mental fatigue score is a variable that has a dominant influence with a relative importance value of 25, then the resource allocation variable is 12, while other variables have a minor contribution compared to the previous two variables.

Fig. 5 Variable relative importance

From the application of the neural network that has been done, two variables, namely Mental Fatigue Score and Resource Allocation, contribute more dominantly than other variables. Furthermore, a comparison will be made by using the two most dominant input variables to see if the two variables are predictors that can produce performance that is not much different. Comparisons were made by sampling 5,000 rows of data and using the FFNN method with the same number of hidden layers and neurons. The scenarios carried out include:

- Scenario I: Gender, Company Type, Designation, WFH Setup Available, Resource Allocation, and Mental Fatigue Score
- Scenario II: Allocation and Mental Fatigue Score

The results in Table 6 show that scenario I produces the highest coefficient of determination at 0.922 with MAE, MSE, and RMSE values which are respectively 0.04478, 0.00298, and 0.05462. Scenario II which uses two variables produces a coefficient of determination of 0.919 with the lowest MAE, MSE, and RMSE values with values of 0.04525, 0.00306, and 0.05537, respectively.

Table 6. Comparison between different input variable scenarios

Burnout formula	Neuron combination 4:3				
	Splitting		Evaluation		
	Train	Test	R <sup>2</sup>	MAE	RMSE
<b>Scenario I:</b> Gender + Company_Type + WFH_Setup_Available + Designation + Resource_Allocation + Mental_Fatigue_Score	60	40	0.926	0.044781	0.05462
	70	30	0.922	0.04480	0.05451
	80	20	0.92	0.04569	0.05485
	90	10	0.919	0.04523	0.05526
<b>Scenario II:</b> Resource_Allocation + Mental_Fatigue_Score	60	40	0.919	0.04525	0.05537
	70	30	0.918	0.046	0.05636
	80	20	0.917	0.0463	0.05659
	90	10	0.919	0.04536	0.05541

Scenario I with six input variables showed better results than scenario II. However, scenario II, with the input variables of mental fatigue score and resource allocation, can still produce a coefficient of determination of up to 0.919 and is quite close to what is produced in scenario I also with RMSE and MAE values that are not closely monitored.

## VI. CONCLUSION AND RECOMMENDATION

The phenomenon of burnout often occurs in many companies, but it is undetected and difficult to predict, resulting in material losses that result in health and mental and non-material conditions such as losing the company's best talents. This can actually be done by studying the patterns that exist in employees who experience high burn rates and applying a neural network to predict which employees have the potential to experience burnout. Based on the results of the research that has been done, several conclusions can be drawn including:

1. FFNN architecture gives the best results in predicting burn rate with  $R^2$ , RMSE, and MAE values of 0.922, 0.05462, and 0.04478 respectively.
2. The architecture with the best performance results from a combination of two hidden layers with a 4:3 neuron combination. In its application, the performance of the neural network has increased with the increase in the number of neurons, but along with that, the implementation time has also increased.
3. The level of mental fatigue and daily working hours are variables that have a dominant influence on the neural network, while the other variables tested have a low contribution.
4. Mental fatigue and daily working hours are two predictor variables that can be used to measure the burnout rate experienced by employees.

Employees who experience burnout have a bad impact not only on the physical and mental health of the employee, but also for the company. Burnout can have an impact ranging from reduced employee productivity to the emergence of various health problems that can be suffered due to negative emotions that affect the body's work system. For this reason, it is necessary to make adjustments or various strategic approaches by the company to overcome the bad possibility of burnout. Having an overview of the level of burnout experienced by employees is something that employers should have or related functions that regulate it, in this case the function of human resources (HR) in the company, by knowing the level of burnout experienced, the company can take a strategic approach and more measurable to those who may experience burnout. This study illustrates that measuring the level of burnout is possible and can be used as a basis for overcoming burnout.

From a series of analyzes that have been carried out, various factors are analyzed in relation to the occurrence of burnout and then the application of a neural network is carried out so that companies can predict the burnout rate that employees have the potential to experience. Should, with the ability to predict the burn rate of employees, companies can manage the workload so that the burn rate experienced does not have a negative impact on employees and ensure that their employees can have optimal performance as the application of the Yorkes-Dodson law. Those who have a burn rate in the range of 0 – 0.33 can be given an additional load so that the potential performance is more optimal, while those who have a burn rate of 0.34 – 0.66 can be said to have a normal load and those who have a burn rate above 0.66 are already alarm for certain approaches to avoid burnout.

Based on the application of the neural network, the level of employee fatigue and working hours are the factors that have the greatest influence on the burnout rate. Both of these factors should be a concern for the company, especially the human resources (HR) function to prevent the adverse effects that may occur if it causes burnout. Companies must of course consider the possibility of excessive fatigue on all employees so that employees avoid the negative effects of negative emotions. The sources of excessive thought burden should be handled and analyzed so that employees can work with good and healthy performance. The working hours per day spent by employees also have a significant influence, where the more hours spent per day, the higher the burn rate experienced. Based on the data presentation, employees who work more than seven hours tend to have experienced a negative level of burn rate.

This study also shows that mental fatigue and working hours are good predictors in measuring the burn rate experienced by employees. In this case the input that can be given to the company is to pay more attention to the workload that is owned by each employee, all employee work should be quantified in the form of time that must be spent per day so that it can be adjusted whether the workload given is appropriate for each employee. The big data analysis approach can be used by employers in mapping the level of stress that employees may experience. The level of prediction accuracy can also be continuously improved along with continuous learning on the neural network.

### **Abstract**

*Electronic money or e-money is a new means of payment that is following the current developments. Many people have been proven to have used e-money for their daily activities. This is supported by the very practical nature of e-money and better public security. In connection with the rapid use of e-money, this will lead to various impacts, one of which is inflation, while the amount of e-money in circulation will be more than the amount circulating in the community. This study aims to determine the effect of inflation, money supply, and interest rates on the development of e-money circulating in Indonesia from 2013-2021. The study was conducted using quantitative methods and using secondary data to be taken from available official websites. The variables used in this study are e-money, inflation, the money supply, and interest rates. The analytical method used in this research is multiple linear regression analysis. Based on the results of data analysis and discussions that have been carried out in this study regarding the effect of inflation, the amount of money in circulation, and interest rates on electronic money circulating in Indonesia in 2013-2021 it can be said that the independent variables affect the related variables, namely inflation, the amount in circulation and interest rate.*

*Keywords— e-money, inflation, interest rates, money supply*

---

### **I. INTRODUCTION**

The role of the financial sector has a major influence in developing Indonesia's economic growth facilities. Along with the times, the financial sector, especially banking, will experience rapid progress. This is evidenced by the emergence of innovation in the field of technology. The easier the technological innovation that can be achieved by the community, the faster the changes in the financial sector will be.

Money in Indonesia only has currency and demand deposits, but now electronic money (e-money) is starting to develop. Electronic money is said to be a relatively new payment compared to APMK (Card-Based Payment Instruments), which are debit cards, credit cards, and ATM cards. The emergence of electronic money which is relatively new in Indonesia basically, started with APMK. In 2009, electronic money (e-money) was separated from the APMK and regulated in a Bank Indonesia Regulation.

The regulation of electronic money is relatively less selective than the APMK because it follows the nature of electronic money in which the deposit system is compared to the amount and transactions. Currently, the development of e-money is higher than other APMK (Card-Based Payment Instruments). This may be related to public practices and security in terms of payments, such as the addition of an e-money application in collaboration with Bank Indonesia.

The growth of electronic money will not have many obstacles, one of which can trigger inflation in the community. This is because the amount of electronic money circulating in the community is greater than cash flow, so it can increase or decrease an item. In addition, electronic money can affect the amount of money in circulation but can be controlled by the government with regulations.

### **II. LITERATURE REVIEW**

Researchers who are used as references in the form of previous research related to the influence of inflation, the amount of money in circulation, and interest rates on e-money circulating in the research that has been done the

previous. The effect of e-money on inflation has no significant effect on the relationship between e-money and inflation. (Zunaitin et al, 2017)

According to (Permatasari Khairunisa, 2020) E-money hurts harms the velocity of money, this is because e-money transactions carried out by the public cause *ceteris paribus*. E-money does not affect interest rates. This is because e-money transactions carried out by the public are direct payment transactions, so they do not use interest rates in the payment process.

The function of the bank as an intermediary for financial intermediaries that channel funds to the public and the function of returning these funds to support national economic development. In this regard, banking significantly affects technology. Technological developments such as card-based payment instruments and electronic banking can reduce transaction costs and increase service speed substantially (Aprianto & Khairunisa, 2013).

E-money and debit transactions have a significant effect on the money supply, e-money transactions hurt and harm interest rates where the BI Rate and BI 7days repo are used as desires that affect the transmission of savings interest rates and interest rates. (Lintangsari, et al, 2018)

According to (Rahmayuni, Siti 2019) e-money and e-commerce affect inflation so this can be used as a policy for Bank Indonesia to anticipate rising inflation rates. According to (Nur et al., 2019) non-cash transactions are increasingly being used in terms of transactions because they are more practical, easy, and fast. Non-cash transactions affect the amount of money circulating in the community and can lead to inflation so it can be concluded that non-cash transactions have a positive and significant effect on the money supply and inflation can strengthen the relationship of non-cash transactions to the money supply.

### III. RESEARCH METHODOLOGY

This research data uses secondary data in the form of inflation, money supply, interest rates, and the amount of electronic money circulating in Indonesia from 2013-2021. Secondary data has been carried out or processed through surveys conducted by certain agencies. The data sources that support this research are the Central Statistics Agency and Bank Indonesia. The data analysis technique used is quantitative with multiple linear regression analysis. The multiple linear regression model can be expressed as follows:

$$Y = \beta_0 + \beta_1 X_1 + \beta_2 X_2 + \beta_3 X_3 + \varepsilon \quad (1)$$

Where the description is :

Y = E-Money

$\beta_0$  = Constant

$\beta_1 \dots \beta_3$  = Independent Variable Regression Coefficient

$X_1$  = Inflation

$X_2$  = Money Supply

$X_3$  = Interest Rate

$\varepsilon$  = Error

## V.DISCUSSION

The inflation variable has a regression coefficient of 0.255284 which has no significant effect, with a probability value of  $t$  of  $0.1813 > (0.1)$ , then the inflation variable does not affect e-money in Indonesia in 2013-2021. Based on the results of the research on data estimation using the OLS (Ordinary Least Square) method, it shows that the inflation variable has no significant effect on E-Money circulating in Indonesia from 2013-2020. Inflation is a general and continuous increase in prices over a certain period of time. The results of this study are in accordance with previous research conducted by (Mifta Qoirun Nisa Arifin1, Shanty Oktavilia, 2020) "Analysis of the Use of Electronic Money in Indonesia". shows that inflation has no significant relationship with e-money. Inflation has a positive and insignificant impact on electronic money transactions, both in the short and long term. That's because of the demands of the community to continue to supply the necessities of life even though prices have

increased, in this case, the condition of the community still assumes that the increase in the price of goods or services is still affordable by their income.

The money supply variable has a regression coefficient of 10.85076 which has a significant effect, with a probability value of  $t$  of  $0.0059 < (0.01)$ , the money supply variable has an effect on e-money in Indonesia in 2013-2021. Based on the results of research on data estimation using the OLS (Ordinary Least Square) method, it shows that the money supply variable has a significant influence on E-Money circulating in Indonesia in 2013- 2021. The definition of the money supply in a narrow sense (M1) that money supply is purchasing power that can be used directly for payments, can be expanded to include payment instruments that are "closer" to money, for example time deposits and saving deposits. ) at the banks. The results of this study are in accordance with previous research conducted by (Chintia Ariani Putri P. Eko. Prasetyo, ) "The Effect of Money Supply, Counterfeit Money, and Economic Growth on E-Money Transactions" and (Mifta Qoirun Nisa Arifin1, Shanty Oktavilia, 2020) "Analysis of the Use of Electronic Money in Indonesia", The results show that the money supply has a significant positive effect on electronic money transactions in Indonesia. The increase in electronic money transactions is also accompanied by an increase in the amount of money circulating in the community. This is because there are still many people who use cash, which is then transferred to electronic money.

The interest rate variable has a regression coefficient of 0.017830 which has no significant effect, with a probability value of  $t$  of  $0.4501 > (0.1)$ , then the interest rate variable does not affect e-money in Indonesia in 2013-2021. Based on the results of research on data estimation using the OLS (Ordinary Least Square) method, it shows that the interest rate variable has no significant effect on E-Money circulating in Indonesia from 2013- 2020. Interest rates are monetary indicators that have an impact on several economic activities, which will influence investment decisions which in turn affect economic growth and will affect the value of money circulating in the community. The results of this study are by following previous research conducted by (Maratus Zahro, Rika Rahayu, 2021) "The Value of E-Money Transactions in Indonesia Using the Markov Switching Method" and (Mifta Qoirun Nisa Arifin1, Shanty Oktavilia, 2020) "Analysis of the Use of Electronic Money in Indonesia". The results show that interest rates do not affect E-Money. Short-term yields and long-term interest rates have an insignificant negative effect on electronic money. Interest rates affect cash handling, but because the application of electronic money payments is limited, people still tend to allocate their funds to the money market without reducing consumption in the goods market.

## VI. CONCLUSION AND RECOMMENDATION

Based on the results of data analysis and discussions that have been carried out in this research regarding the effect of inflation, the amount of money in circulation, and interest rates on e-money circulating in Indonesia from 2013-2021, it can be concluded that the independent variables can influence the related variables, namely inflation, the money supply, and interest rates. In this study, two independent variables have no significant effect on e- money circulating in 2013-2021, it is inflation and interest rates. Meanwhile, there is only one variable that has a significant effect, namely the money supply of e-money circulating in Indonesia from 2013-2021. From the results discussed earlier, of course, it can be a recommendation, including Bank Indonesia has the task of socializing the use of e-money to the public. The use of e-money is expected to create a tendency for people to use non-cash transactions in the future. The importance of money for a country's economy causes the government to maintain a stable inflation rate in the future.

## ACKNOWLEDGEMENT

The authors of this international journal cannot be separated from the support of various parties. The writer would like to thank Allah SWT who has given the strength to get to this point. Second, the author would like to thank both parents who have provided good mental and moral support during the lecture process. Third,

the authors would like to thank the Advisory Lecturer Ms. Lecturer Sitti Retno Faridatussalam, S.E., M.M who has helped and guided the author in working on the journal from beginning to end. Finally, the authors would like to thank someone special and friends who helped the process of this research to get a bachelor's degree, and the author hopes that this journal can be useful to others

## Cluster Prioritization in Advanced Metering Infrastructure Strategic Implementation Planning

Erny Anugrahany<sup>1</sup> and Athor Subroto<sup>2</sup>

<sup>1,2</sup>Faculty of Economics and Business, Universitas Indonesia, Jakarta, Indonesia

### Abstract

*Adopting new technology in the organization's business process requires a strategy that considers both technical and non-technical aspects. As the biggest electricity provider in Indonesia, PLN continuously adapted to technology in facing business challenges by implementing the Advanced Metering Infrastructure (AMI). Due to the AMI complex system, a large number of customers in Indonesia, and the need for a massive investment, it is impossible for PLN to roll out the system to all customers at the same time, so PLN needs a strategy to prioritize the location that becomes a target of this system implementation it can lead to an optimal project result. study aims to analyze and propose a cluster prioritization in implementing Advanced Metering Infrastructure using Fuzzy Analytical Network Process (FANP). This method has been widely used in decision-making, but the study in a massive investment with this scope of the project remains limited. The analysis will consider factors that influence the migration process so the strategy can lead to an effective and efficient process. This was accomplished by literature review, followed by in-depth interviews with experts involved in the AMI implementation plan in Indonesia and analyzed using FANP to get the cluster prioritization. From the early result, a location with high use of power is preferred for implementation, followed by locations with the highest potential use of product beyond kWh. The result aligns with the goal of this technology adoption to create an added value for company goods and services which leads to a lean, efficient electric power management business process and improves the company's revenue.*

---

### I. INTRODUCTION

Technology plays a major role and is closely linked to business operations. The use of technology in a process is related to how the technology enhances value in the process of creating or providing goods or services (Slack & Lewis, 2020). Current technology developments have triggered the fourth industrial revolution, which has occurred in new business models. This technology's advancement has an impact on organizations that seek to adapt and utilize new technological advancements (Singh, Rathore, & Park, 2019). Several examples of digital innovation exist, including the use of an integrated IT system for business operations, digital payment mechanisms, or the use of smart devices to improve company business processes. Digital innovation has an impact on an organization's strategic and operational levels (Abdulkader, Magni, Cillo, & Micera, 2020). This enhances a variety of areas, including the electric power system. The use of the smart grid in power systems is an example of these technological advancements. A smart grid is a power grid that is designed to improve the efficiency and reliability of electricity production and distribution by leveraging advances in information and communication technology (Guan & Guan, 2020). Sensors should be installed in various parts of the system during smart grid implementation. The meter reading system is a sensor that plays a significant role. A Smart Grid meter reading system should not only be able to measure energy transactions but also include additional features and functions to optimize the smart grid's performance.

AMI is an integrated system consisting of a smart meter, communication network, and data management system that enables two-way communication between utilities and customers (World Bank Group Energy and Extractives Global Practice Group South Asia Region (SAR), 2018). As an electricity provider in Indonesia, PT PLN (Persero) carries out operational activities covering the fields of generation, transmission, and distribution to serve a variety of customer groups. As with other companies, PT PLN (Persero) is also innovating and adapting to technological changes to meet stakeholders' requirements. One of PT PLN's (Persero) initiatives is to adopt Advanced Metering Infrastructure technology in the electricity system in Indonesia. This program aligned with the company's need to be agile and adapt to technological developments (PT PLN (Persero), 2020). The advantages of advanced metering infrastructure provide various potential improvements for utility operational activities in providing electricity services for all customers (World Bank Group Energy and Extractives Global Practice Group South Asia Region (SAR), 2018). Implementation of Advanced Metering Infrastructure (AMI) in the existing system faces several challenges related to a lack of system support equipment, high investment costs,

and system migration (World Bank Group Energy and Extractives Global Practice Group South Asia Region (SAR), 2018). Advanced Metering Infrastructure (AMI) is a new technology with a complex system therefore, integrating this Advanced Metering Infrastructure (AMI) technology into the power system will require a massive investment. With a large number of customers, PLN must prioritize strategy considering many factors both technical and non-technical aspects, as well as the impact on the organization.

This study aims to analyze an impactful set of criteria and sub-criteria in implementing advanced metering infrastructure using FANP which has been widely used in decision-making (Azzat, 2018), (Mirahmadi, Attafar, & Ketabia, 2018), (Shardeo, Patil, & Madaan, 2020), but the study uses Fuzzy Analytical Network Process (FANP) in a massive investment within this project's scope. This Analytical Network Process (ANP) method is a development of the Analytical Hierarchy Process (AHP) method by correcting the Analytical Hierarchy Process (AHP) deficiency in which the Analytical Hierarchy Process (AHP) dependencies between criteria are not taken into account even though a criteria with other criteria often has a relationship with one another (Saaty, 2004), and fuzzy sets used to overcome the problem of uncertainty and incomplete or non-specific data in helping decision-making (Mirahmadi, Attafar, & Ketabia, 2018). Those criteria are then used to propose a cluster prioritization possibility that becomes the Advanced Metering Infrastructure (AMI) implementation target, ensuring that the migration strategy leads to an effective and efficient process.

## II. LITERATURE REVIEW

### A. Operation Strategy

Operations activities play a vital role in the business processes of a company. The operation is an activity that involves managing the company's resources as well as a series of processes that result in the production of goods or services (Slack & Lewis, 2020). According to Slack & Lewis (2020), Strategic decisions which affect the achievement of company objectives and include long-term planning of the company's business processes are involved in carrying out these operational activities. Operations strategy can also be defined as a broad decision that determines the company's long-term capabilities from each operation activity, and it is developed while taking market conditions and operating resources into account (Slack & Lewis, 2020). There are four perspectives in determining operating strategy, a namely top-down perspective where the operation strategy is able to interpret higher-level strategy, the Market Requirement Perspective where choosing strategic decisions the company must be able to meet market needs, and bottom-up perspective which prepares the company's operation strategy based on experience or lessons learned from the daily activities carried out by the company, and the last perspective is operation resources where the operation strategy is able to build or improve the operation capabilities of an organization (Slack & Lewis, 2020).

### B. Process Technology Strategy

Technology is critical and cannot be separated from business operations. The application of technology in a process is related to how technology adds value in the process of creating or providing goods or services (Slack & Lewis, 2020). New technology adoption frequently necessitates triggers because it usually requires integration and takes a long time to implement due to the costs and impact of implementing the updating technology into the company or organization. Technical feasibility, improvement of the company's strategic capabilities, operational benefits, labor market dynamics, social and regulatory acceptance, costs, and other non-cost resources are all major considerations when making a decision to implement new technology (Slack & Lewis, 2020) (Wulandari & Ferry, 2021) (Hall & Khan, 2003) Decision-making related to the application of new technology involves a number of factors that are taken into account, including technical aspects, or Human Resources skills such as what is needed, the number of resources needed in this case what is meant by resources (people, facilities, time, and so on), financing for new technology implementation, and the last is related to whether the operation of the new technology can cope with changing resource requirements (Slack & Lewis, 2020). Several other sources mention a number of factors that influence the adoption of new technologies, and the factors are listed in Table I below based on some of the existing literature.

Table 1. Impactful Factors in Adopting New Technology

### C. Electricity Transaction In Indonesia

PT PLN (Persero) manages the operation of generation, transmission, and distribution as an electricity provider in Indonesia. The Indonesian electricity system serves various groups of customers who are divided into tariff groups depending on the power limit installed in accordance with the rules guiding electricity tariffs in Indonesia, which are regulated in the Regulation of the Ministry of Energy and Mineral Resources (MEMR) (Kementrian Energi dan Sumber Daya Mineral, 2016). Energy transactions between PLN and customers require the use of a Meter, which records electricity consumption over a set period of time and is sufficient in both prepaid and post-paid types. For post-paid meter customers, the result of the meter's reading of electricity consumption is then used to continue the billing process. The amount of electrical energy that prepaid customers can use is determined by the transaction's nominal amount paid in advance. Meter readings on electricity consumption are also used as a basis for load planning, both in daily operations and long-term system planning, as well as to measure network shrinkage caused by increased load on the electric power system and non-technical losses caused by electricity theft (PT PLN (Persero), 2020).

### D. Advanced Metering Infrastructure

An example of digital transformation in electricity utility is the use of the smart grid, an electricity network that uses advances in information and communication technology to improve the efficiency and reliability of electricity production and distribution (Guan & Guan, 2020). Smart grid is a big concept with the use of Advanced Metering Infrastructure as a part of it. Advanced Metering Infrastructure (AMI) is an integrated system that enables two-way communication between utilities and customers, with meters, Head End Systems (HES), communication infrastructure, and Meter Data Management System (MDMS) as the minimum infrastructure requirements for the system (World Bank Group Energy and Extractives Global Practice Group South Asia Region (SAR), 2018).

Smart meters are the most important component of the Advanced Metering Infrastructure (AMI) system with the functions to measure electrical energy consumption, display notifications and many other additional features that help utility to manage the energy transaction. The Advanced Metering Infrastructure (AMI) system employs a Data Concentrator Unit (DCU), which serves as a gateway between the smart meter and the Head End System (HES). HES is a 2-way communication metering system component that collects and stores all meter recording data, alarms, and some other information from other devices below for further transmission to the MDMS that will collect and stores meter measurement data and processes it into information that utilities can use in accordance with business processes (World Bank Group Energy and Extractives Global Practice Group South Asia Region (SAR), 2018). In this integrated system, communication networks play a major role in the successful deployment and operation of data transmission (Teng, Chao, Liu, & Huang, 2018). Utilities, in general, use a variety of communication technologies that are chosen and implemented based on location, customer density, network configuration, and geography (Mangunkusumo, Surya, Jintaka, & Tambunan, 2021).

### E. Fuzzy Analytical Network Process

The Analytical Network Process (ANP) is one of multi-criteria measurement methods that generate the relative priority scale from absolute numbers that are individual ratings or from actual measurements that are normalized to relative forms that are also included in the fundamental scale of absolute numbers (Saaty, 2004). ANP is the

development of the Analytical Hierarchy Process (AHP) method in correcting the deficiency in the AHP due to uncalculated dependencies between criteria, despite the fact that one criterion often has a relationship with other criteria (Esen, Hatipoğlu, Cihan, & Fiğlali, 2017). The Fuzzy Analytical Network Process is a development of the ANP method that uses a triangular fuzzy scale to overcome decision-making that is considered non-objective by ANP, as shown in Table 2 (Esen, Hatipoğlu, Cihan, & Fiğlali, 2017) (Nouri, Esbouei, & Antucheviciene, 2015).

Table 2. Fuzzy Linguistic Scale

### III. RESEARCH METHODOLOGY

A qualitative method with a descriptive research design is applied in this research to obtain information about the system implementation plan then the result will become inputs to formulate decision making in prioritizing clustering alternative strategies with the following steps as shown in Figure 1. This research stage begins with the formulation of problems related to identifying the factors that give an impact and must be considered in deciding cluster prioritization alternatives for implementing Advanced Metering Infrastructure in Indonesia. This was achieved through a literature review, followed by in-depth interviews with experts involved in AMI implementation planning in Indonesia. Requirements for Experts chosen in the Advanced Metering Infrastructure implementation planning were experts who have very good knowledge in electricity business process, have knowledge in smart grid, have a very well informed about advanced metering infrastructure and are directly involved in AMI Implementation planning. In-depth interviews not only to make sure about the set of factors that influences AMI implementation in Indonesia but also the alternative strategy that will be conducted in the system migration.

The information that was obtained from the previous step will be processed in Analytical Network Process modelling using the Super Decision application. This software is commonly used as a support in decision making that implement Analytical Hierarchy Process and Analytical Network Process. The next step of this study is determining the level of importance of each criterion related to other criteria and alternatives by using a pairwise comparison questionnaire that becomes one of the Super Decision features, this questionnaire is then distributed to experts who qualified with the requirements who were directly or indirectly involved in the implementation plan of Advanced Metering Infrastructure in Indonesia, who have an understanding of electrical energy transactions business process and having enough knowledge in smart grid and regulation related to this implementation process.

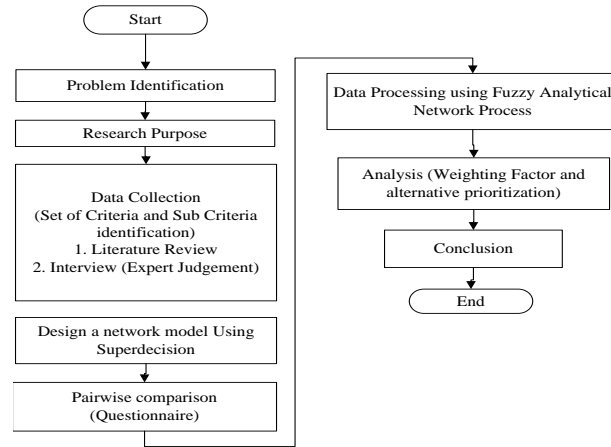

Fig.1. Research Methodology

The expert judgments need to pass the consistency test with the conditions for CR 0.1, where the CR value is calculated using the following equation: (Esen, Hatipoğlu, Cihan, & Fiğlali, 2017) (Nouri, Esbouei, & Antucheviciene, 2015).

$$CI = (\lambda_{max} - n)/(n-1) \quad (1)$$

$$CR = CI/IR \quad (2)$$

With

- CI = Consistency Index
- $\lambda_{max}$  = Maximum Eigen Value
- n = number of elements
- CR = Consistency Ratio
- IR = Index Ratio

The linguistic numbers from expert judgment are then converted into fuzzy numbers according to Table 2. After transform the questionnaire result to fuzzy linguistic scale, then it will continue with fuzzy aggregate value and geomean calculation that carried out with the following equation: (Esen, Hatipoğlu, Cihan, & Fiğlali, 2017) (Nouri, Esbouei, & Antucheviciene, 2015).

$$\tilde{A}^* = [\tilde{a}^*_{ij}] \quad (3)$$

with

$$\tilde{a}^*_{ij} = \tilde{a}_{1ij} \times \tilde{a}_{2ij} \times \tilde{a}_{3ij} \dots \tilde{a}_{kij} / k \quad (4)$$

From the results of the geomean calculation, the fuzzy synthesis calculation is then carried out with the following equation: (Esen, Hatipoğlu, Cihan, & Fiğlali, 2017) (Nouri, Esbouei, & Antucheviciene, 2015).

$$S_i = \sum_{j=1}^m M_{gi}^j \times (\sum_{i=1}^n \sum_{j=1}^m M_{gi}^j)^{-1} \quad (5)$$

$$\sum_{i=1}^n \sum_{j=1}^m M_{gi}^j = (\sum_{i=1}^n l_i, \sum_{i=1}^n m_i, \sum_{i=1}^n u_i) \quad (6)$$

Calculation of the fuzzy synthesis value, the vector value and the defuzzification ordinate (d'), as well as the normalization of the vector weights, are carried out using the following equation: (Esen, Hatipoğlu, Cihan, & Fiğlali, 2017) (Nouri, Esbouei, & Antucheviciene, 2015).

$$V(M2 \geq M1) = \begin{cases} 1, & \text{if } m2 \geq m1 \\ 0, & \text{if } l1 \geq u2 \\ \frac{l1 - u2}{(m2 - u2) - (m1 - l1)}, & \text{others} \end{cases} \quad (7)$$

$$d'(A_i) = \min V(S_i \geq S_k) \quad (8)$$

$$d(A_n) = d'(A_n) / \sum_{i=1}^n d'(A_n) \quad (9)$$

## IV. RESULT

Based on the literature review, adopting new technology especially Advanced Metering Infrastructure needs to consider the following factors such as: Knowledge, Skill, Meter technology readiness, DCU and HES Technology Readiness, MDMS Technology Readiness, Application Software Readiness, Testing, Existing Meter Technology, Communication Media, Security and Privacy, Investment Cost, Installation Cost, Return on Investment, Institutional Investment, Access to Capital, Schedule, Labor Management, Governance and Regulation, Features and System Capability, Customer Group, Location, Customer Acceptance, Vendor Availability, Vendor Delivery Capability, Vendor involved, Price, Supplier Customer service, and Product (World Bank Group Energy and Extractives Global Practice Group South Asia Region (SAR), 2018), (McHenry, 2013), (Abdulla, 2015), (Jenkins, 2020), (Khalid & Khan, 2014).

The list of identified criteria was then confirmed through in-depth interviews with the expert and found 3 criteria were said to be irrelevant. In addition, there are additional 7 criteria that are considered have significant impact in the Advanced Metering Infrastructure implementation planning. Related to the governance and regulation were suggested to made in detail which includes regulations related to Domestic Content Level, Metrology and Communication Frequency. The identified criteria from literature review and in-depth interview are then grouped and simplified as shown in Table 3.

Table 3. Set of Identified Criteria and Sub-Criteria

Criteria	Sub Criteria	Code
Human Resource	Knowledge	A11

Source: author's data processing result

By in-depth interviews with experts, revealed alternative strategy that is used in implementing AMI is using a cluster approach because Advanced Metering Infrastructure is an integrated system and relies on communication as a media to transfer data, so in order to get an optimum result, it must be migrated per cluster. With the large number of customers in Indonesia, a prioritization needs to be carried out with the clustering condition alternatives as follows:

1. Clustering based on the number of customers at a certain location

This option is accomplished by examining the number of customers in a given location. Because Advanced Metering Infrastructure is an integrated system, locations with a larger number of customers will be more optimal than locations with a small number of customers.

2. Clustering based on high losses that occur at certain locations.

The objective of implementing the Advanced Metering Infrastructure system is to reduce the cost of managing electricity bills while increasing the reliability of electricity supply. The use of this system is that there is no need for resources to be issued for the detection of tampering that occurs in the meter, and the detection of abnormal conditions can be done more quickly, which will also have an impact on system losses. So, an option for clustering is to look at the location with the highest level of losses and then fixing it with the Advanced Metering Infrastructure system.

3. Clustering based on System Average Interruption Duration Index (SAIDI) and System Average Interruption Frequency Index (SAIFI) at certain locations

In addition to reducing losses, one effort to improve electricity supply reliability is to reduce the System Average Interruption Duration Index (SAIDI) and the System Average Interruption Frequency Index (SAIFI). As a result, clustering is expected to perform by prioritizing locations with high SAIDI and SAIFI, because the benefits of the Advanced Metering Infrastructure system include allowing for accelerated detection of abnormal conditions, increasing the accuracy of forecasting electricity consumption, and accelerating fault recovery actions with accurate and real-time detection, leading to a reduction in SAIDI and SAIFI.

4. Clustering based on the number of meters that must be replaced (related to the service life) at certain locations

One of the focuses in prioritizing the implementation of the Advanced Metering Infrastructure system in Indonesia is related to the need to replace the kWh meter. The priority for replacing the kWh meter is based on three things, including related to the recalculation rules for kWh meters that have been used for 10 years for electronic kWh and 15 years for electromechanical kWh, replacement of first-generation prepaid meters which expire in 2024 and are based on kWh meters which must be replaced due to age or damage. This is the basis for the clustering strategy carried out in the implementation of the Advanced Metering Infrastructure system.

5. Clustering based on electrical energy consumption at certain locations

The aim of adopting new technology, in this case the Advanced Metering Infrastructure system in the Indonesian electricity system, is to accommodate the need for more efficient business processes and to increase company revenue. As a result, one alternative to prioritization is to consider the amount of electrical energy consumed in a particular location.

6. Clustering based on the potential use of services beyond kWh at certain locations

To encounter the challenges of technological advancement and increase company revenue, PT PLN (Persero) seeks to expand its business by offering products/services other than electrical energy while remaining focused on its core business of supplying and managing electricity in Indonesia. Beyond kWh products include internet services for electricity customers and electrical installation repair services. Other than kWh products may also be developed (PT PLN (Persero), 2022). One of the strategies for optimizing the sophistication of Advanced Metering Infrastructure technology is to implement the AMI system for locations with the potential to use products other than kWh.

The network model shown in Fig.2. represents the interdependence of each criterion and the strategic options that have already been identified through a literature review and in-depth interviews process. This model constructed using Super Decision Software.

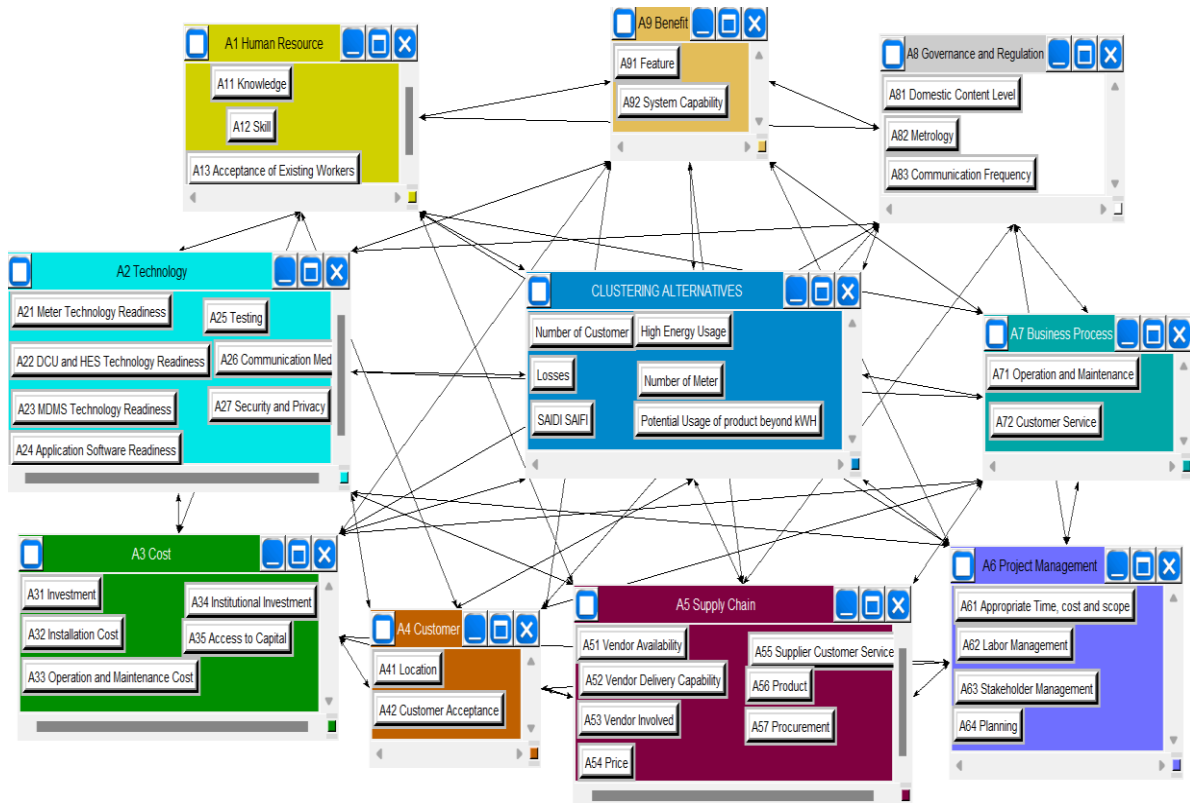

Fig. 2. Advanced Metering Infrastructure Network Model  
Source: Author Modeling Design using Super Decision

By the following steps as mentioned in research methodology, the weights factor for each criterion and sub-criteria are revealed as shown in Fig.3 and Table.4. Based on Fig.3, it can be seen that the most influential criteria in the implementation of the Advanced Metering Infrastructure system are the Regulations and Regulations Criteria (0.1679), then followed by the Cost Criteria (0.1364), Benefit Criteria (0.1294), Technology Criteria (0.1062), Business Process Criteria (0.1027), Supply Chain Criteria (0.0990), Customer Criteria (0.0956), Human Resource Criteria (0.0929) and the last one is Project Management criteria (0, 0689).

Fig 3. Final Weight of Impactful Criteria in Implementing Advanced Metering Infrastructure  
Source: author's data processing result

According to Table 4, sub criteria knowledge (A11), meter technology readiness (A21), investment cost (A31), Location (A41), Vendor availability (A51), Appropriate time, cost and scope (A61), Operation and maintenance (A71), Domestic Content Level (A81), and Features (A91) are the most important sub-criteria compared to other sub-criteria.

Table 4. Final Weight of Sub-Criteria

Code	Weight	Code	Weight
A11	0.048	A51	0.024
A12	0.045	A52	0.020
A13	0.000	A53	0.019
A21	0.023	A54	0.016
A22	0.021	A55	0.010
A23	0.018	A56	0.009
A24	0.017	A57	0.001
A25	0.014	A61	0.026
A26	0.010	A62	0.022
A27	0.003	A63	0.015
A31	0.051	A64	0.006
A32	0.039	A71	0.103
A33	0.031	A72	0.000
A34	0.016	A81	0.116
A35	0.000	A82	0.052
A41	0.096	A83	0.000
A42	0.000	A91	0.129
		A92	0.000

Source: author's data processing result

Regarding criteria and sub-criteria as well as the alternatives with the relation as shown in Fig.2, clustering prioritization it is highly recommended to consider the location with the highest power usage with the percentage of weighting factor 17.07%, continue with the location with high potential use of beyond kWh product with the percentage of weighting factor 16.89% and location with the highest losses 16.84%. Cluster with the highest number of customer and highest ratio of SAIDI and SAIFI become the next priority with the percentage of weighting factor for each alternative is 16.46% and the last priority is cluster with the highest number of meters that must be replaced with the weighting factor 16.29%. This rank of cluster prioritization is shown in Fig. 4.

Fig 4. Rank of Cluster Prioritization  
Source: author's data processing result

The next analysis performed in this study is a sensitivity analysis for the cost criteria. This is done to determine the extent of the change in the choice of alternative strategies if the weight of the cost criteria changes, or in this case, whether the weight of the cost criteria decreases or increases. This sensitivity test is performed by adjusting

each weight from 0.1 to 0.5. When one of the nine criteria weights is changed, the weights of the remaining eight criteria change as well, as shown in Table 5 below

Table 5. Simulation of Changes in Criteria Weights refer to Changes in Cost Criteria

Criteria	Analysis Result	Weighting Factor				
		A3=0.1	A3=0.2	A3=0.3	A3=0.4	A3=0.5
A1	0,09	0,10	0,08	0,07	0,06	0,05
A2	0,11	0,11	0,10	0,09	0,07	0,06
A3	0,14	0,10	0,20	0,30	0,40	0,50
A4	0,10	0,10	0,09	0,08	0,06	0,05
A5	0,10	0,10	0,09	0,08	0,07	0,05
A6	0,07	0,07	0,06	0,05	0,04	0,02
A7	0,10	0,11	0,09	0,08	0,07	0,06
A8	0,17	0,17	0,16	0,15	0,13	0,12
A9	0,13	0,13	0,12	0,11	0,10	0,08
	1,00	1,00	1,00	1,00	1,00	1,00

Source: author's data processing result

Data processing based on the simulation results of changes in the weight of the criteria in Table 6 affects changes in the alternative choices of clustering prioritization strategies with results as shown in Table 6 below.

Table 6. Alternative Weight Changes Due to Changes in Cost Criteria

A3 Weight Simulation	Number of Customer	Losses	SAIDI SAIFI	Power Usage	Number of Meter	Beyond kWh Potential Customer
A3=0.136	0,165	0,168	0,165	0,171	0,163	0,169
A3=0.100	0,165	0,168	0,165	0,171	0,163	0,169
A3=0.200	0,165	0,168	0,164	0,170	0,164	0,169
A3=0.300	0,165	0,168	0,164	0,170	0,165	0,169
A3=0.400	0,165	0,168	0,163	0,169	0,166	0,170
A3=0.500	0,165	0,167	0,162	0,168	0,167	0,170

Source: author's data processing result

Based on Table 6, reducing the cost weight to 0.1 or 10% does not cause any change in the alternative clustering options for the implementation of Advanced Metering Infrastructure. The priority of clustering has changed in increasing the cost weight to 0.4 or an increase of up to 40%, from initially focusing on the clustering approach with locations that have high electricity consumption as the first priority. Then it turns to the second alternative, with the first alternative being a location with a high potential for using products beyond kWh. More clearly the change in prioritization can be seen in Figure 5.

Figure 5. Graph of Change Sensitivity Test on Cost Criteria Weight  
Source: author's data processing result

With the high costs of implementing Advanced Metering Infrastructure, businesses understandably want a faster and larger return. This is difficult to achieve by simply focusing on or running business as usual without making full use of existing technology to innovate and add value to the products/services offered to customers. Products beyond kWh, as previously stated, are services provided by PLN that are not related to its core business

of providing electricity. These services include telecommunications, installation, and innovation opportunities in the provision of other products and services. Changes to the criteria, according to the considered criteria, will affect the alternative choices made for prioritizing clusters, which are the main targets in the implementation of Advanced Metering Infrastructure. Significant changes in the criteria will also affect the weights on other criteria.

## V. DISCUSSION

In adopting new technology in the company's operations, it is necessary to consider in various ways including the costs required for implementing the technology, whether the expenses incurred are worth it with the benefits and value-added provided by the technology to the supply process. goods and services. The adoption of this new technology also needs to consider a number of risks that will be faced by the company, especially related to system readiness. For this reason, it is necessary to conduct a feasibility study before the company implements the new system into operations. The strategy set by the company in achieving its objectives also needs to consider the company's external conditions to better meet the stakeholders' expectations and requirements (Slack & Lewis, 2020). With a large number of customers and an area targeted for implementation, absolutely cost become a consideration in deciding a strategic planning for implementing the AMI system throughout Indonesia. In this case, cost refer to the investment costs for a set of AMI systems, the installation or migration costs of existing systems to AMI systems, and the operational and maintenance costs that will be incurred after the AMI system is implemented in Indonesia's electricity system. The most important cost consideration is the investment cost that must be prepared by PLN because the Smart meter price was higher than the conventional ones, and this system required the use of any other device to effectively operate. Additional information that we got in the In-depth interview was that The Meter Data Management System to be used in the plan to implement an advanced metering infrastructure system in Indonesia's electricity system is the result of development carried out by PLN and its subsidiaries so that the features to be used are in accordance with the company's objectives. But it will become an issue at the same time because PLN has to make sure about this system's readiness. From the analysis conducted on the criteria and sub-criteria identified as influencing factors in the implementation of Advanced Metering Infrastructure, it shows that governance and regulations are things that need to be considered in this implementation plan, this is closely related to the position of PT PLN. (Persero) as a State-Owned Enterprise so that every business process carried out must comply with the rules and policies that apply in Indonesia. The next aspect is related to costs that need to be considered in the light of the implementation plan for the Advanced Metering Infrastructure will require large costs which if not managed properly, it is feared will affect the sustainability of the company's business.

The implementation of Advanced Metering Infrastructure is carried out with a geographical clustering approach because this system relies heavily on communication networks and uses IoT in its operations, so this geographical clustering approach provides several benefits in optimization. Customers who are in the same cluster tend to have the same habits and preferences (Kumar & Zaveri, 2018) so that PLN as a service provider can gain insight from the managed data for service optimization in the cluster. Another benefit is that this clustering helps in gathering information that occurs on the communication network efficiently for further distribution or processing (Vuković, Kordić, & Jevtić, 2016). This clustering can be determined by considering several characteristics and based on the analysis carried out, the cluster that becomes a priority in the Advanced Metering Infrastructure implementation plan is a cluster with high electricity consumption. By prioritizing the implementation of Advanced Metering Infrastructure for clusters with high electricity consumption, several things need to be considered, including knowledge of human resources involved in the migration process as well as in their future operations, related to the readiness of the system's technology, investment cost spent to prepare the AMI infrastructure with specifications, quality, quantity and timeliness by the PLN plan, as well as the need to ensure the stages in the migration plan to the implementation of the AMI system are under applicable regulations and governance. Customers with high use of electrical energy tend to have high requirements and expectations for the quality of service they get from service providers, in this case, PLN. The existence of abnormal conditions or disturbances in the system due to an unprepared system will have an impact on the accuracy of energy meter transaction readings which will then pose a risk of complaints and loss in company revenue. To provide excellent service, a reliable system is needed, and this can be obtained through effective and efficient operations and routine maintenance activities so that the risk of disturbance can be early detected and can be immediately mitigated so this will not lead to greater losses. Through operations and maintenance activities carried out, an organization can also detect improvement opportunities for continual improvement.

## VI. CONCLUSION AND RECOMMENDATION

Based on the research that has been done, it can be concluded that through analysis using the Fuzzy Analytical Network Process (FANP) the most influential criteria in determining the Advanced Metering Infrastructure implementation strategy in the electricity system in Indonesia are governance and regulation criteria then followed by cost criteria, benefit, technology, business process, supply chain, customer, human resources and the last is project management criteria. The analysis also shows that the most influential sub-criteria of the human resource criteria is knowledge, the most influential sub-criteria of the technology criteria is the readiness of meter technology, the most influential sub-criteria of the investment cost criteria, the sub-criteria that the most influential of the customer criteria is location, the most influential sub-criteria of the supply chain criteria is the availability of vendors. For project management criteria, the most influential is the suitability of time, cost and scope. As for the criteria for business processes and regulations and regulations, the sub-criteria that have an effect are operation and maintenance and regulations related to TKDN. sub-criteria of the most influential benefit criteria in the implementation of the Advanced Metering Infrastructure strategy are the features available from the system.

From the 6 (six) alternatives cluster to prioritize Advanced Metering Infrastructure, clusters with high power usage are the first priority, followed by clusters with high potential use of products beyond kWh, clusters with high losses. Cluster with the highest number of customers and highest number of SAIDI SAIFI are at the same level and the last priority is the cluster with the highest number of meters that must be replaced.

Based on the sensitivity analysis, changes made to the weight of the criteria that affect the implementation of Advanced Metering Infrastructure will affect other criteria and affect the choice of alternative clustering prioritization that will be made for the migration of conventional electrical energy transaction systems with Advanced Metering Infrastructure technology.

The priority alternatives proposed in this work are options that can be initiated during the advanced metering infrastructure system's implementation stage. In its application, determining the clustering priority strategy based on the results of this prioritization must still take into account other conditions or aspects that were not well captured in this research due to limitations in the research's deployment. More sources and respondents from different backgrounds, such as academics, practitioners, and other relevant stakeholders, can be obtained in the in-depth interview and survey stages, allowing for more varied insights and perspectives.

## ACKNOWLEDGEMENT

We acknowledge the support received from PLN Representatives who have been willing to be involved as respondents in this study

### **Abstract**

*In today's business, there are many things that can affect the purchase of a product, both caused by internal factors of the company and from the company's external environment, coupled with the development of social media and the use of smartphones, electronic word of mouth (e-WOM) is also developing and it's everywhere. and with the increasingly widespread use of the internet also affects consumer behavior in fulfilling their daily needs. This makes e-commerce companies compete to improve their services, one of which is Shopee. This study aims to determine the effect of E-WOM and consumer risk perceptions on purchasing decisions with consumer trust as a mediating variable from the shopee marketplace. This study uses primary data derived from questionnaires distributed to consumers who have transacted at the shopee market place in the city of Serang. In this study, the structural equation model (SEM) analysis technique was used. The results obtained are that the first E-WOM has a significant effect on Shoppe customer trust with a value of 3.667, while for customer perception it has a significant effect on Shoppe customer trust with a value of 2.654. However, E-WOM does not have a significant effect on consumer purchasing decisions in the Shoppe marketplace, customer perceptions also have no significant effect on consumer purchasing decisions in the Shopee marketplace.*

**Keywords**— *Electronic Word of Mouth (E-WOM; Market Place; Consumer Trust; Risk Perception; Purchase Decision*

---

### **I. INTRODUCTION**

With the development of social media and the use of smart phones, electronic word of mouth (e-WOM) is growing and everywhere (King, Racherla & Bush, 2014; Okazaki, 2009; Zhang, Abound Omran, & Cobanoglu, 2017). Unlike WOM (word of mouth), e-WOM allows customers or consumers to receive real time information. Internet technology has changed many people's lifestyles, be it for learning, work and in terms of online shopping. With the development of technology and more advanced information affect consumer behavior. Quoted from Kanuk and Schiffman's opinion that consumer behavior is the behavior displayed by customers in buying, searching, using, evaluating services and products offered or provided by sellers or manufacturers. This consumer behavior plays a very important role in the decision-making process in purchasing (Haryanto & Yunita, 2012). By understanding consumer behavior is something that can influence decision making (Zulfa and Hidayati, 2018). Changes in consumer behavior are very evident in today's modern age because consumers want something quick and easy. A person who wants to buy an item does not need to leave the house anymore, but simply with applications, internet and gadgets. This phenomenon occurs because the development of technology called the internet is able to affect everyday life. Especially at the time of the covid 19 pandemic that hit the whole world and Indonesia, making people carry out their activities at home so that the transmission of this virus can be avoided.

As marketing and trade advice has recently been much talked about, this discussion has led to electronic commerce, in particular to commerce through the internet, the vision of electronic commerce or e-commerce. As quoted from Ghaisani & Purbawati research, 2020 which takes McLeod's opinion that e-commerce is a user of communication networks and computers and later computers are used in business processes. Marketplace is part of E-Commerce, which is a new concept in buying and selling goods or services through the internet or can also be called online. According to data published by Hootsuite and we are Social, Indonesia is one of the countries with the most e-commerce users in the world.

Fig 1. 10 Countries With The Highest E-Commerce Users 2021

Based on the data above, there are 88.1 percent of internet users aged 16-64 years in Indonesia who use e-commerce to transact buying products in recent months. According to data from Bank Indonesia from 2017 to 2020, the value of transactions in eCommerce reached Rp 266.3 trillion. In Indonesia there are several online marketplaces, among others: Lazada, BukaLapak, Tokopedia, Shopee, and others.

Quoted from [Republika.co.id](https://republika.co.id) Shopee became the top online shopping platform in Indonesia in the first half of 2021, this is seen from the total number of app downloads and total monthly active users based on the research results of the mobile app market research company App Annie. In research iPrice reported in the second quarter of this year shopee is included in the leading platform in terms of visitors, which is 126.99 million page visitors per month.

Based on a survey that has been conducted that the purchase decision on the marketplace is currently influenced by several factors, including risk perception, E-WOM and consumer confidence. Quoted from research Luthfiyatillah et al (2020) and Eriza (2017) that E-WOM has a significant effect on purchasing decisions. Meanwhile, according to Paramita and Wijaya (2014) in his research stated that E-WOM has no significant effect on purchasing decisions. According to Bobby E (2019) stated the relationship of trust and risk perception contributed to the purchase decision at shopee. Hidayat and Zulfa (2018) argue that trust has a significant influence on purchasing decisions.

Based on the development of previous research and combined with current research, the authors conducted a study to determine the effect of E-WOM, risk perception on consumer purchasing decisions with consumer trust as a mediating variable from the Shopee marketplace, which will be updated later. In the case study, the researchers took research subjects from the people of Serang City who had made transactions at Shopee. This research has theoretical benefits and practical benefits. Theoretically, this research provides empirical evidence regarding consumer behavior, especially the factors of purchase decisions in transactions on the marketplace platform. While the practical benefit is that the research results are expected to be taken into consideration in decision making by the new marketplace management so that they are able to improve the performance of the marketplace in order to achieve company goals.

## II. LITERATURE REVIEW

E-WOM or Electronic Word of Mouth was created with the internet, which is a new paradigm in WOM communication. E-WOM communication is a positive, neutral, or negative statement from potential, actual, and former consumers regarding products, services, brands or companies that are available to many people and institutions via the internet. Consumers can provide opinions, reviews and comments about products through weblogs, discussion forums, review websites, e-bulletin board systems, newsgroups, social networking sites (Kietzmann & Canhoto, 2013).

Perception of risk quoted from research by Zulfa & Hidayati (2018) "perception of risk as an uncertainty faced by consumers when they cannot predict the consequences in the future as a result of purchasing decisions made". In online transactions, the buying process is not direct, so you only see the item through the image without touching it. In the perception of risk can also determine someone in making purchasing decisions. If the perception of high risk will cause someone to be afraid to transact online, and vice versa. The emergence of concerns for transacting through the marketplace include: fear of being deceived, unsatisfactory, confusing ordering systems and sometimes long shipping or delivery.

According to Tjiptono (2011), if consumers trust a company, they will prefer to make repeated purchases and provide valuable personal information to the company.

Meanwhile, online purchasing decisions according to Peter & Olson (2014) are electronic exchanges that help consumers find information, shop and browse sites on the Internet. In carrying out purchasing activities, consumers will carry out stages including choosing a product, choosing a brand, choosing a store or seller, then the amount to be purchased, the time of purchase and the method of payment. When making consumer purchasing decisions, several factors can not be separated, including: convenience, trust, perception of risk that will occur in purchasing decisions.

In this study E-WOM plays an important role in consumer behavior. According to Eriza's research (2017), Word of Mouth can affect several conditions of consumers or customers, including: attitudes, awareness, perceptions, behaviors and intentions. What is meant by behavior in this study is how consumers behave or consumer actions in making decisions to buy a product that begins with consumer interest in goods or products and services.

H1: Electronic Word of mouth (E-WOM) has a significant effect on shopee marketplace purchasing decisions

While the risk perception variable has a significant effect on purchasing decisions, according to research conducted by Nasution et al (2020). So that the hypothesis is formulated:

H2: Risk perception has a significant effect on purchasing decisions of Electronic Word of Mouth in the shopee market place.

Zulfa & Hidayati (2018) state that when consumers trust a company, they will make repeated purchases and will usually share this information with others. In this study, Zulfa & Hidayati stated that trust has a significant influence on consumer purchasing decisions. So that the hypothesis is obtained as follows:

H3: Trust has a significant effect on Shopee marketplace purchasing decisions.

For consumer trust, Kotler and Keller (2016) state that consumer trust depends on several inter-organizational and interpersonal factors, which consist of integrity, honesty, policy and perceived competence by the company. And in research conducted by Aisyah & Engriani (2019), Alfian & Utami (2019) stated that E-WOM has a significant influence on trust.

H4: Electronic Word of Mouth has a significant effect on purchasing decisions with trust as a mediating variable in the shopee marketplace.

The relationship of trust and risk perception has a fairly strong relationship and risk perception has a greater effect than trust on purchasing decisions according to research conducted by Sari & Hawignyo (2021).

H5: Risk perception has a significant effect on purchasing decisions with trust as a mediation in the Shopee marketplace.

Based on the literature review and the development of the hypothesis, the research model is as follows:

Fig 2. Research Model

### III. RESEARCH METHODOLOGY

In this study the primary data collection technique was carried out by distributing questionnaires to community respondents in the city of Serang using google form, and to determine the respondents it was done by purposive sampling technique.

The conditions used include:

1. People of Serang City and aged 17 years and over
2. Have a login account on the shopee marketplace
3. Have made a purchase transaction on the shopee marketplace.

In the framework of thought in Figure 1 is a research according to the level of explanation. Which explains the position of the variables studied and how the relationship between the variables with one another. The variables studied in this study include:

1. Electronic Word of Mouth (E-WOM) which is the main information communication channel. This affects the short-term and long-term decisions of consumers to buy products. The indicators in this research include: economic incentives, social benefits, e-WOM content, valence of opinion, advice seeking, and e-WOM intensity.
2. Perceived risk is the uncertainty that consumers face if they cannot predict the consequences of their purchasing decisions. According to research conducted by Latifah & Retno (2018), the indicators include: consumer anxiety, product delivery risk, financial risk, and product risk.
3. Consumer trust is the glue that allows companies to trust others in organizing and using resources effectively in creating added value. In the research of Heryenzus & Sulistiowati (2018), quoting from Mowel and Minor, there are four indicators, namely: Consistency, compensation for losses, reputation, security guarantees and user safety.
4. Consumer purchasing decisions are stages of consumer behavior in making decisions whether individuals, groups and organizations in choosing, using, buying goods, services or experiences to satisfy their needs and desires. The indicators include: product selection, brand selection, channel selection, timing of purchase, number of purchases and what method will be used, quoted from the opinion of Kotler & Keller (2016).

In this study, it is a latent variable or construct, meaning a variable that cannot be measured directly. So there are several latent variables that are measured by statement indicators in the form of a Likert scale (Isgiyarta & Yudha, 2015). The measurement instrument for statements using a Likert scale, there are five levels, including: 1. Strongly Disagree, 2. Disagree, 3. Neutral, 4. Agree, 5. Strongly Agree.

Meanwhile, the data processing and analysis technique used in this study is SEM analysis which is a statistical technique of a combination of factor analysis and regression analysis which aims to be able to test the relationships between variables that exist in a research model, both between indicators and indicators. with the construct or the relationship between constructs, according to research by Afsar et al., (2013). Wicaksono et al (2012) argues that

the SEM used is a covariance-based SEM (CB-SEM) that performs intercorrelation or frees indicators to correlate with each other with indicators or latent variables. The process of processing the data using statistical software AMOS and SPSS.

IV. RESULT / FINDING

The questionnaire used in the study was 257 respondents. The respondent's profile consists of gender, age, has a shopee account, and has transacted on the shopee market space. Based on the results of data processing, it was found that 123 respondents were male and 134 respondents were female. Meanwhile, 90 respondents were aged between 17-22 years, 50 respondents were 23-28 years old, 80 respondents were 33-37 years old and 37 respondents were over 38 years old. For account ownership, all respondents have an account at shopee, and they have made online transactions in the shopee marketplace. Descriptions of respondents can be seen in the graphic image below:

Fig 3. Respondent gender

Figure 4. Description of Respondent Age

Normality testing is carried out statistically by calculating the skewness value of the data presented in table 1.

Table 1. Data Normality Test Results

Variabel	min	max	skew	c.r.	Kurtosis	c.r.
----------	-----	-----	------	------	----------	------

Y1	2.000	5.000	-.226	-1.464	-.514	-1.673

Multivariate					160.338	45.319

Source: data processing (2022)

Based on the data in Table 1, it shows that of the 17 research indicators, only five indicators are not normally distributed because the coefficient value in the c.r column is greater than  $\pm 2.58$  at 0.01 significance and 12 indicators are normally distributed. This indicates that some data from respondents are not normally distributed. And for the formation of a fit model, it will be carried out in the next stage of analysis with a process of modifying indicators.

One way to detect outliers multivariately is to use the Mahalanobis distance. For the Mahalanobis distance each observation can be calculated and will show the distance of an observation from the average value of all variables in a multidimensional space. The multivariate outlier test was carried out using the Mahalanobis distance criterion at the  $p < 0.001$  level. The Mahalanobis distance is evaluated at degrees of freedom equal to the number of indicators used in the study, which are 17 indicators. So that all data which have Mahalanobis distance more than 2 ( $17, 0.001 = 40,791$ ) are multivariate outliers.

The calculation of the Mahalanobis distance is found in the output of the analysis using AMOS 24. Based on the print-out farthest from the thr centroid (Mahalanobis Distance), there are several observations that show symptoms of outliers with the Mahalanobis d-squared greater than the required Mahalanobis distance. However, in the subsequent analysis, the outlier symptoms found in the observations were not eliminated and were analyzed by modifying the indicators to form a fit.

Reliability test is used to determine the level of consistency of respondents in answering questions. The reliability test is seen in the Cronbach's Alpha value with the provision that the value limit is  $> 0.7$  (Taber, 2018). Calculation of Cronbach's Alpha latent variables in this research is seen in the table below.

Variabel Laten	Cronbach's Alpha	Reliabilitas
E-WOM	0,805	Reliabel
Persepsi Resiko	0,815	Reliabel
Kepercayaan	0,848	Reliabel
Keputusan pembelian	0,898	Reliabel

Source: data processing (2022)

The first basic stage in the SEM analysis technique is the measurement model stage. The measurement model is used to measure the dimensions that make up a factor. Due to the relationship with a factor, the research confirms whether the indicator variables used can confirm a factor. Or confirmatory factor analysis reflects a measurement model where the observed variable defines the construct or latent variable. The critical ratio (C.R) 1.96 indicates that the indicator is validly measuring what should be measured in the model presented, according to Sukwadi et al (2013). The next step is testing confirmatory factor analysis on the standardized estimates of the model.

The test is carried out by looking at the results of the standardized regression weight in the AMOS program output table, as shown in the table below. If there is an estimate value of the indicators that have a

significance level of  $\leq 0.40$ , the indicator cannot describe the construct. The data processing of respondents' answers into a model which is the initial structural model in the figure using the AMOS 24 program, can then be compiled a Regression Weight table ( Loading Factor) Measurement Model and Standardized Regression Weights as follows (Badgaiyan & Verma, 2015).

Table 3. Standardized Regression Weights &amp; Regression Weights

			<i>Estimate</i>	<i>C.R.</i>
X1.5	<---	EWOM	.735	
X1.4	<---	EWOM	.624	8.954
X1.3	<---	EWOM	.517	7.476
X1.2	<---	EWOM	.783	10.922
X1.1	<---	EWOM	.748	10.568

Source: data processing (2022)

Table 3 shows the C.R value for all indicators in accordance with the required C.R value, where the value of C.R must be 1.96, which means that the five indicators of the Electronic Word of Mouth (E-WOM) construct are valid for measuring what should be measured in the Electronic Word of Mouth (E-WOM) construct. the model presented. And based on table 3, it is explained that all indicators meet the requirements for an estimate value above 0.4. So it clearly describes a construct.

The next step will be to measure partially the risk perception construct. The measurement of the validation of the risk perception construct indicators is shown in table 4 below.

Table 4. Standardized Regression Weights &amp; Regression Weights

			<i>Estimate</i>	<i>C.R.</i>
X2.5	<---	Persepsi Resiko	.770	
X2.4	<---	Persepsi Resiko	.765	11.152
X2.3	<---	Persepsi Resiko	.542	7.974
X2.2	<---	Persepsi Resiko	.742	10.857
X2.1	<---	Persepsi Resiko	.577	8.508

Source: data processing (2022)

Table 4 above shows that the C.R value for all indicators is in accordance with the predetermined C.R value, where the C.R value must be  $\geq 1.96$ . This means that the three indicators of the risk perception construct have been able to validly measure what should be measured in the model presented. Based on Table 4, it can be explained that all indicators have met the estimated value requirements above 0.4. So it can describe a construct. Furthermore, researchers measure partially the construct of consumer confidence. For measuring the validity of the indicators of consumer confidence, see the table below:

Table 5. Standardized Regression Weights &amp; Regression Weights

			<i>Estimate</i>	<i>C.R.</i>
Y4	<---	Kepercayaan konsumen	.751	
Y3	<---	Kepercayaan konsumen	.674	10.178
Y2	<---	Kepercayaan konsumen	.803	12.035
Y1	<---	Kepercayaan konsumen	.830	12.288

Source: data processing (2022)

The table above shows the C.R value for all indicators in accordance with the required C.R value, where the C.R value must be  $\geq 1.96$ . This means that the three indicators of the belief structure are possible valid measures of what should be measured in the presented model. Based on Table 5, it can be explained that all indicators meet the requirements for an estimated value above 0.4. so that it can describe a buying decision construct.

The next step or stage is to partially measure the purchase decision construct. For measuring the validity of the indicators, it can be seen in table 6 below.

Table 6. Standardized Regression Weights &amp; Regression Weights

			<i>Estimate</i>	<i>C.R.</i>
Z1	<---	Keputusan Pembelian	.892	
Z2	<---	Keputusan Pembelian	.892	19.781
Z3	<---	Keputusan Pembelian	.797	16.298
Z4	<---	Keputusan Pembelian	.766	15.163
Z5	<---	Keputusan Pembelian	.628	11.292

Source: data processing (2022)

Table 6 shows the C.R value for all indicators that match the required C.R value, where the C.R value must be the same as the required C.R value  $\geq 1.96$ . This means that the five indicators of the purchasing decision structure are validly measuring what should be measured in the model presented. Based on table 6, it can also be explained that all indicators meet the requirements for an estimate greater than 0.4. So it can describe a construct.

After measuring the indicators for each construct, the next step is to measure the validity of all indicators simultaneously. This can be seen in table 7 below

Table 7. Standardized Regression Weights &amp; Regression Weights

			<b>Estimate</b>	<b>C.R</b>
X1.5	<---	E-WOM	.762	
X1.4	<---	E-WOM	.29	9.513

Source: data processing (2022)

Table 7 shows the C.R value for all indicators that match the required C.R value, where the C.R value should be 1.96. This means that the 17 indicators of the model can validly measure what should be measured in the model presented. And the next step in this research is to test confirmatory factor analysis. Confirmatory factor analysis tests were performed under standard estimation conditions. The test is carried out by looking at the normalized regression weights in the output table using the AMOS program, as shown in table 7. Even though there is an estimated significance index of  $\leq 0.40$ , the indicator does not describe the construct. From the results of the data output, it can be explained, where almost all indicators have passed the estimated value requirements above 0.4

#### A. Structural Model Test Results

After the model is analyzed using confirmatory factor analysis, where we know that each variable can be used to determine the latent structure, after that the model can be analyzed. SEM model testing is done on the Goodness of Fit index. One of the test tools, namely Chi square is very sensitive to the size of the sample. The chi-square value is a test tool to measure the overall fit. The chi-square results need to be overcome, one of which is the use of the Root Mean Square of Approximation (RMSEA) test that is independent of the sample size used.

RMSEA is a close fit test. Therefore, the extra fit test is realistic when compared to the close fit test, because it is more realistic to measure the level of model application to the data. In addition to RMSEA, the Goodness of Fit Index (GFI), Tucker Lewis Index (TLI) is also highly recommended because this index is not sensitive to sample size and is less influenced by the complexity of a model. The results of the structural equation analysis of the model are shown as follows.

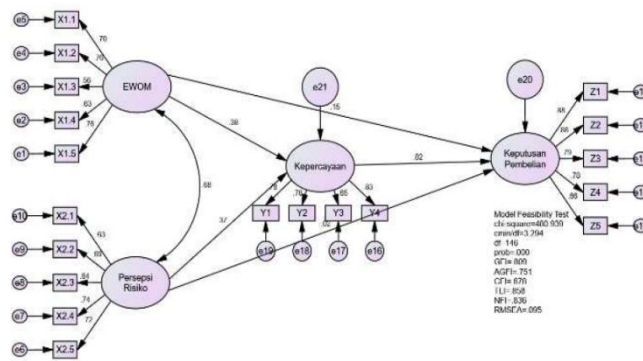

Fig 5. Results of Structural Equation Analysis on model 1

From the results in the figure above, it can be explained that model 1 which is the initial structural model of the research model does not fit because of the insufficient probability is 0.000 and does not meet several other criteria. Therefore, model 1 needs to be modified model. The results of the model modification are shown by the model image below.

Fig 6. Results of Structural Equation Analysis on Model 2

Table 8. Evaluation of the Goodness of Fit Criteria in the Structural Equation Model

Goodness of Fit Index	Cut-off Value	Model2	Keterangan
X2- Chi- Square	Diharapkan nilai lebih kecil	49,299	Baik
Significance Probability	≥ 0,05	0,104	Baik
CMIN/DF	≤ 2,00	1,298	Baik
GFI	≥ 0,90	0,965	Baik
AGFI	≥ 0,90	0,940	Baik
TLI	≥ 0,95	0,989	Baik
CFI	≥ 0,95	0,993	Baik
RMSEAI	≤ 0,08	0,034	Baik

Based on the data in Table 8, the chi-square value obtained with model 2 is 49.298 and the probability is 0.104. Because the probability value is greater than 0.05, it can be called a fit model. Based on the GFI and AGFI indices, we can see that the model scores are above 0.90, including 0.965 and 0.940, respectively. This score is well received in the category and meets the requirements. The TLI and CFI indexes are also eligible because the values of the two indices in Model 2 are greater than 0.95, namely 0.989 and 0.993, respectively. From the CMIN/DF index, we can see that the index value of model 2 is  $\leq 2.00$ . That is 1298. The RMSEA index of the model is less than 0.08, which is 0.034. According to Putra et al's research(2019), it can be concluded, although both models can be said to be fit.

V. DISCUSSION

Table 9. Regression Weights

	Estimate	S.E	C.R	P
<u>Kepercayaan</u> ←EWOM	.517	.141	3.667	***
Kepercayaan ← risk perception	.232	.088	2.654	.008
<u>Keputusan_Pembelian</u> ←EWOM	.184	.109	1.690	.091
<u>Keputusan_Pembelian</u> ← risk perception	.089	.064	1.366	.172
<u>Keputusan_Pembelian</u> ← Kepercayaan	.639	.081	7.868	***

Sumber : pengolahan data (2022)

The value of the standardized regression weight coefficient between the E-WOM variable and the confidence variable is 0.517 and C.R is 3.667 with a probability of 0.000 less than 0.05 or  $p < 0.05$ . This means that the EWOM variable has a significant effect on the shopee marketplace trust variable. These results are in accordance with research conducted by Alfian & Utami (2019), Aisyah & Engriani (2019), Aprilia et. al. (2019)

The value of the standardized regression weight coefficient between the risk perception variable and the confidence variable is 0.232 and C.R is 2.654 with a probability of 0.008 less than 0.05 or  $p < 0.05$ . This means that the risk perception variable has a significant effect on the market place shopee trust variable. These results are in accordance with research conducted by Firdayanti (2012), Jayantari & Seminary (2018).

For the value of the standardized regression weight coefficient between the E-WOM variable and the purchasing decision variable of 0.184 and C.R of 1.690 with a probability of 0.091  $> 0.05$ . This means that the E-WOM variable has no significant effect on the purchasing decision variables in the Shopee Marketplace.

The standardized regression weight coefficient value between the risk perception variable and the purchasing decision variable is 0.089 and the C.R value is 1.366 with a probability of 0.172  $>$  from 0.05. Which states that the risk perception variable has no significant effect on purchasing decisions at Shopee

And for the standardized regression weight coefficient between the Trust variable and the purchasing decision variable, it is 0.639 and C.R is 7.868 with a probability of 0.000  $< 0.05$ . This means that the trust variable has a significant effect.

## VI. CONCLUSION AND RECOMMENDATION

Based on the research that has been done, it can be concluded that E-WOM has a significant effect on shopee marketplace trust, risk perception has a significant effect on shopee marketplace trust, EWOM variable does not significantly affect shopee marketplace purchasing decisions, risk perception does not significantly affect Shopee marketplace purchasing decisions and trust have a significant effect on the shopee marketplace trust variable.

For the theoretical implications of the results of this study, namely the E-WOM factor and risk perception have a significant effect on the trust of the shopee marketplace. This can prove empirically about the theory of factors that influence the trustworthiness of a marketplace. For the factors that influence the purchase decision of the shopee marketplace, only the trust factor has a significant effect on purchasing decisions and can provide empirical evidence on the theory of the relationship of trust with marketplace purchasing decisions. Meanwhile, the factors of E-WOM and risk perception still have insignificant influence on marketplace purchasing decisions, so that it becomes the basis for re-doing empirical evidence studies on E-WOM relationship theory and risk perceptions on future marketplace purchasing decisions.

The practical implications of the results of this study are that the marketplace management should pay more attention to the relationship between trust factors and marketplace purchasing decisions relationship of E-WOM factors, risk perception on the trust of a marketplace in managing a marketplace so that it can compete with similar competitors and to achieve company goals, especially during this pandemic and in the era of change/disruption towards the digital economy.

From the results of this study, it is hoped that other researchers in the future in the future to carry out other similar studies to examine other factors that influence purchasing decisions by using other analytical methods and integrating relationship research purchasing decisions with customer loyalty.

## ACKNOWLEDGEMENT

Thanks to the author's promoter team, Prof. Ginta Ginting, Dr. Etty Puji L and Dr. Tika Arundina who have provided direction, guidance and support in this research process in an effort to fulfill my dissertation requirements. Thank you to the contact person who has helped in the data collection process in Serang City,

Banten. Thank you to all parties involved who cannot be mentioned one by one so that this article can be completed.

### Abstract

*This study aims to explain the influence of industry type, company size, profitability and environmental performance on environmental disclosure. Researcher used GRI Standards to measure environmental disclosure. Based on research phenomenon, there were environmental damage because of company activities, as happened in PT. Semen Indonesia, Tbk. and PT. Aneka Tambang Tbk. Researcher found inconsistent research results over independent variables to dependent variable. The population of this research were Kompas 100 Index Companies listed in 2019-2021. Purposive sampling used in this study as method sampling so that there were thirty companies selected as sample. Researcher used panel regression with SPSS Software to process data. Based on research result, industry type, profitability and environmental performance had positive significant effect on environmental disclosure. In contrast, company size had negative not significant effect on dependent variable used in this research. Suggestion for further researchers to use different independent variables and a longer research period so that significant research results are obtained.*

*Keywords— disclosure; performance; profitability; size; type.*

### I. INTRODUCTION

Environment issues had become critical issues nowadays. One of significant issues is increased carbon emissions in 2021. As reported by katadata.com, in 2021 carbon emissions was the highest in history, it can be seen in Fig. 1. This graph was emissions from energy-burning and industry activity from 2001-2021. It described that carbon emissions got decreased because of human activity restrictions during pandemic Covid-19 in 2020. Nevertheless, it climbed in 2021 when human activities restrictions loosened.

Fig.1 Carbon Emissions from Energy Burning and Industry Activities Globally 2001-2021 (Source: *Emisi Karbon Global Meningkat Pada 2021, Tertinggi Sepanjang Sejarah, 2022*)

Industry activities not only give an impact on carbon emissions but also damage the sea and mangrove ecosystems. It happened on the East Halmahera coast. Based on (*Operasi PT Antam Cemari Pesisir Halmahera Timur, 2021*), PT. Aneka Tambang, Tbk. was one of the companies that pollute the coast of Kota Maba, East Halmahera because of its operational activities. Mining activity has been going for a long time on this coast. Most of society's lands have been converted into mining locations at there. During 25 years this company dredged the

island, several damages occurred. Starting from clean water unreachable, polluted seas, coral reefs, and mangroves have disappeared. The impact of industrial activity also occurred in Tuban, East Java in 2020. PT. Semen Indonesia exploded mines around residential areas. This action gave negative effects on society like air pollution and blasting vibration. As reported (*Keluhkan Aktifitas Tambang Semen Indonesia, Warga Ring Satu Demo Pemkab Tuban*, 2020), society held demonstrations in front of the region government society to convey demands.

Based on the phenomenon that has been narrated, the purpose of this study is to examine the influencing factors of environmental disclosure in Indonesia. Independent variables that were used by researcher were a type of industry, company size, profitability, and environmental performance. Research in environmental disclosure has expanded currently, however, there were inconsistent outcomes on previous research, so that this study still interesting to research with different sample from the other research. Researcher determined companies listed in Kompas 100 index as sample because these companies are preferred company determined by an independent institution which has good volume of trading transaction in the Indonesia Stock Exchange.

Legitimacy theory becomes a grand theory in this study suggested by (Dowling & Pfeffer, 1975). This theory focused on interaction between company and society. A company as a legal entity requires recognition for its existence. A company activity should be in accordance with social values in society where the company is located. As result, a company's objective can involve and give advantages in society. Stakeholder theory is also appropriate in this study. Stakeholders are individuals or organization must be served by company and they can come from internal or external company. There are several company stakeholders that have important concern, including public, government, community, shareholders and others (Freeman & McVea, 1984). Environmental disclosure is one form company efforts to acquire legitimation from society. This is important for company because society is one of external stakeholders which is very powerful as consumer of the company.

Environmental disclosure is a voluntary disclosure for listed companies in Indonesia. Even though it only voluntary, this disclosure gave important impact for companies. This activity can improve good image to companies and contribute to supporting implementation of Sustainability Development Goals (SDGs) indirectly. As it is known, United Nations formulated seventeen development goals which to be achieved in 2030. Some of development goals focused in environment, such as SDG No. 6 for clean water and sanitation, SDG No. 7 for affordable and clean energy, SDG No. 13 for climate change, SDG No. 14 life below water, and SDG No. 15 life on land. By doing research in environmental disclosure, researchers realized the role of accounting in contribute achieving SDGs. Accounting help companies to disclose their non-financial performance so that companies can show how their contribution for environment. This disclosure will be one of consideration for shareholders doing investment.

## II. LITERATURE REVIEW

Environmental disclosure offered company to keep and protect stakeholders around company, especially society and its surroundings. However, not all companies notice this behavior. In general, company with significant impact on environment has to disclose substantially beside company with minor impact. This study used GRI Standard as measurement of environmental disclosure, for detail in Table 1. Based on (Dewi & Yasa, 2017) and (B. Maulana & Baroroh, 2020) research, industry type has a positive effect on environmental disclosure. Type industry is classified into high and low profile. Companies with high profile have a significant effect on the environment so that they acquire pressure from stakeholders, like the government and society to do the best performance. Companies classified as high profile are oil mining, chemical, forest, paper, automotive, aviation, agribusiness, tobacco and cigarette, food and beverage, engineering, health, and also transportation. In contrast, low-profile companies don't obtain compulsion as substantial as high-profile companies afterward they don't notice environmental disclosure well. Low profile companies involve several sectors, such as construction, bank and financing, medical equipment suppliers, retailers, textile, personal, and household products (Sembiring, 2005). On the other hand, different outcomes research came from (Putri & Wahyuningrum, 2021). Type of industry showed no effect on environmental disclosure.

Dissimilar research result found in company size as independent variable. (Dewi & Yasa, 2017; B. Maulana & Baroroh, 2020) found that company size had positive significant influence on environmental disclosure. Large company disclose extensive information to reduce conflict. Large companies will have more substantial cost than small companies. This is because large companies tend to have a higher public demand for information than small companies. There was inconsistent result from (Okafor et al., 2022) which used quoted oil and gas firms in Nigeria as sample for a period of thirteen years spanning from 2008 to 2020. There was a significant negative effect between company size and environmental disclosure. Small companies in Nigeria disclose more in their report than larger companies.

Upcoming independent variable used in this study is profitability. Profitability used to estimate company ability to make a profit. (Dewi & Yasa, 2017) inspected profitability as an independent variable and detect that profitability had no influence on environmental disclosure. Study from (Kurniawan, 2019) found similar result because company with high profitability did not used their profit to improve their environmental disclosure. In contrast, study from (G. A. C. N. Sari et al., 2018) and (B. Maulana & Baroroh, 2020) observed different outcome. (G. A. C. N. Sari et al., 2018) used mining and plantation sector companies listed in Indonesia Stock Exchange and PROPER 2013 to 2017 and concluded that profitability gave negative and significant influence on environmental disclosure. On the other hand, (B. Maulana & Baroroh, 2020) found that profitability had positive significant positive influence on environmental disclosure. Environmental performance is the following independent variable. Inconsistent research outcome was from (Dewi & Yasa, 2017; A. Maulana et al., 2021; G. A. C. N. Sari et al., 2018) research. (A. Maulana et al., 2021) explained that if there is an increase or decrease in environmental performance, it will not be followed by a change in environmental disclosure. Nevertheless, this study is not in line with research conducted by (Dewi & Yasa, 2017) and (G. A. C. N. Sari et al., 2018) which observed that the better the environmental performance where the environmental disclosure is also getting better.

To accomplish the objectives in this study, the following hypothesis were formulated and tested in Fig.2 with details:

- H<sub>1</sub>: There is significant effect between industry type, company size, profitability and environment performance to environmental disclosure of Kompas 100 Index Companies 2019-2021
- H<sub>2</sub>: There is positive significant effect between industry type and environmental disclosure of Kompas 100 Index Companies 2019-2021
- H<sub>3</sub>: There is positive significant effect between company size and environmental disclosure of Kompas 100 Index Companies 2019-2021
- H<sub>4</sub>: There is positive significant effect between profitability and environmental disclosure of Kompas 100 Index Companies 2019-2021
- H<sub>5</sub>: There is positive significant effect between environmental performance and environmental disclosure of Kompas 100 Index Companies 2019-2021

Table 1. Environmental Disclosure Items

GRI Standard	Disclosure
GRI 301: Materials	301-1 Materials used by weight or volume
	301-2 Recycled input materials used
	301-3 Reclaimed products and their packaging materials
GRI 302: Energy	302-1 Energy consumption within the organization
	302-2 Energy consumption outside of the organization
	302-3 Energy intensity
	302-4 Reduction of energy consumption
	302-5 Reductions in energy requirements of products and services
GRI 303: Water and Effluents	303-1 Interactions with water as a shared resource
	303-2 Management of water discharge-related impacts
	303-3 Water withdrawal
	303-4 Water discharge
	303-5 Water consumption
GRI 304: Biodiversity	304-1 Operational sites owned, leased, managed in, or adjacent to, protected areas and areas of high biodiversity value outside protected areas
	304-2 Significant impacts of activities, products and services on biodiversity
	304-3 Habitats protected or restored
	304-4 IUCN Red List species and national conservation list species with habitats in areas affected by operations
GRI 305: Emissions	305-1 Direct (Scope 1) GHG emissions
	305-2 Energy indirect (Scope 2) GHG emissions
	305-3 Other indirect (Scope 3) GHG emissions
	305-4 GHG emissions intensity
	305-5 Reduction of GHG emissions
	305-6 Emissions of ozone-depleting substances (ODS)

	305-7 Nitrogen oxides (NOx), sulfur oxides (SOx), and other significant air emissions
GRI 306: Waste	306-1 Waste generation and significant waste-related impacts
	306-2 Management of significant waste-related impacts
	306-3 Waste generated
	306-4 Waste diverted from disposal
	306-5 Waste directed to disposal
GRI 307: Environmental Compliance	307-1 Non-compliance with environmental laws and regulations
GRI 308: Supplier Environmental Assessment	308-1 New suppliers that were screened using environmental criteria
	308-2 Negative environmental impacts in the supply chain and actions taken

### III. RESEARCH METHODOLOGY

This study used panel regression in this method. Population used in this research are companies listed in Kompas 100 Index in 2019-2021. Sampling used in this method is purposive sampling. Purposive sampling is sampling which researcher determine several criteria, as follows:

1. Company listed in Kompas 100 Index in 2019-2021
2. Company published Sustainability Report in 2019-2021

Sample in this study is 30 companies with 90 observation data, see Table 2. This study implemented content analysis which researcher used Annual and Sustainability Report to recognize and analyze text. There is no direct participation from researcher in this study. Dependent variable used in this study is environmental disclosure. Researcher used disclosure score from Global Reporting Initiative (GRI) Standard. Operational definition variable used in this research can be seen in Table 3.

No	Criteria	Number of Samples
1	Companies listed in Kompas 100 Index in 2019-2021	68
2	Companies which did not publish Sustainability Report in 2019-2021	(38)
	Research Samples	30
	Research Period (2019-2021)	3
	Observation Data	90

Source: Processed by Researcher (2022)

Table 3. Operational Definition Variable

Variables	Definition	Indicator	Scale
Environmental Disclosure (Y)	Environmental disclosure include performance related to biodiversity, environmental compliance such as waste and impact of product and service (Kurniawan, 2019)	$ED = \frac{\text{Items Disclosed}}{\text{Items Environmental Disclosure GRI Standard}}$ (Dewi & Yasa, 2017)	Ratio
Type of Industry (X <sub>1</sub> )	Type of industry classified to high and low profile (Sembiring, 2005)	1 = classified to environmentally sensitive industry 0 = classified to environmentally not sensitive industry	Nominal
Company Size (X <sub>2</sub> )	Company size can be seen from total assets, total sales, average total sales and average total assets (Dewi & Yasa, 2017)	$CS = \log(\text{total asset})$ (Ohidoa et al., 2016)	Ratio
Profitability (X <sub>3</sub> )	Profitability is a measure of financial performance can be used in making environmental disclosure (A. Maulana et al., 2021)	$P = \frac{\text{Earnings After Tax}}{\text{Total Asset}}$ (B. Maulana & Baroroh, 2020)	Ratio
Environmental Performance (X <sub>4</sub> )	Environmental performance is performance company in creating a good environmental (G. A. C. N. Sari et al., 2018)	Refers to PROPER rating= 1 = very bad (black) 2 = bad (red) 3 = good (blue) 4 = very good (green) 5 = the best (gold) (Kementerian Lingkungan Hidup, 2016)	Ordinal

Source: Processed by Researcher (2022)

IV. RESULT / FINDING

Researcher used SPSS to process data. Data in this research is data panel which combine time series and cross section data. Before testing the hypothesis, the researcher conducted a classical assumption test. In classic assumption test data panel, researcher used multicollinearity and heteroscedasticity. Multicollinearity used to verify correlation between independent variables used in this study. Based research result in Table 4, VIF value less than 10, so it can be concluded that there were no multicollinearity symptoms. Ideal data should homogen, it means data distribute constant. It can be seen from Fig. 3 that there was no heteroscedasticity data used in this research.

Table 4. Multicollinearity Result

Variables	VIF Result
TYPE (X1)	2,072
SYZE (X2)	1,168
PROF (X3)	1,191
ENV (X4)	2,277

ANOVA (F Test)			0,000	
R Square			0,224	

Source: SPSS Output (2022)

Table 5 show the result of F, T and adjusted square test. F test used ANOVA in SPSS with result  $0,000 < 0,05$ , then it can be concluded that there is effect simultaneously between type of industry, company size, profitability and environmental performance on environmental disclosure with companies listed in Kompas 100 index as sample. Researcher used B value and Sig. value to determine the effect of independent variable on dependent variable, as follows:

1. Type of industry (X1) has B value 0,149 and sig. 0,000, so that type of industry has positive significant effect on environmental disclosure
2. Company size (X2) has B value -0,018 and sig. 0,067, it can be concluded that company size has negative not significant effect on environmental disclosure
3. Profitability (X3) has B value 1,191 and sig. 0,002, so that profitability has positive significant effect on environmental disclosure
4. Environmental performance (X4) has B value 0,037 and sig. 0,000, it can be concluded that environmental performance has positive significant effect on environmental disclosure

On the other hand, in measuring the ability of test model in explaining variation of independent variables, researcher used R Square and the result is 0,224. It means that independent variables used in this study can explain dependent variables in 22,4% while the residual (77,6%) explained by other variables out of study.

## V. DISCUSSION

In this study, it was found that the type of industry has a significant positive effect on environmental disclosure, this shows that the industries listed in the Kompas 100 index are high-profile companies where these high-profile companies are certainly the center of attention because of the involvement of stakeholders who need tools. effective communication through environmental disclosures. These companies disclose more activities carried out in the interest of environmental disclosure compared to similar companies with a lower profile so that the operating activities carried out are considered to have a positive and significant impact on environmental disclosure. The results of this study support the results of research that has been done previously (Chan et al., 2014; Hasnia & Rofingatun, 2017; Purwanto, 2011; Reverte, 2008; Widiastuti et al., 2018).

Furthermore, for the company size variable, it was found that company size had a negative and insignificant effect on environmental disclosure. In this case, it shows that the larger the size of the company, the fewer items are disclosed in environmental disclosures. Companies that are sampled in this study are high profile companies whose profiles are known to have quite large company sizes. Large companies tend to minimize their environmental reporting by reducing the items presented in environmental disclosures. The results of this study are not in line with previous research (Amalia, 2013; Aslan & Sigalı, 2016; Bangun et al., 2016; Branco & Rodrigues, 2008; Chan et al., 2014; Dewi & Yasa, 2017; B. Maulana & Baroroh, 2020; Purwanto, 2011; Reverte, 2008; R. A. Sari, 2012; Solikhah & Winarsih, 2016; Widiastuti et al., 2018). However, the results of this study are in line with research conducted by Okafor, et.al 2022 which found that company size harms environmental disclosure.

The profitability variable is known to have a significant positive effect on environmental disclosure based on the results of research that has been carried out in this study. The company's profitability shows the company's ability to generate profits in a period that can describe the company's performance. In this study, it can be concluded that the higher the company's profitability, the higher the environmental disclosure it does. This can be seen through the company's good performance, the obligation for environmental disclosure of the company will also increase, on the contrary when the company's performance is reflected through the low profitability of a

company, it will reduce the level of environmental disclosure made. The results of this study are not in line with previous research conducted by (Ardi & Yulianto, 2020; Dewi & Yasa, 2017; Kurniawan, 2019; G. A. C. N. Sari et al., 2018) which found that profitability did not affect environmental disclosure.

In this study, the environmental performance variable is known to have a significant positive effect on environmental disclosure. This explains that the better the company's environmental performance, the higher the level of environmental disclosure it does. High-profile companies are required to build a positive image related to the environment to maintain the sustainability of the company so environmental performance is considered very important to support environmental disclosures that must be carried out by companies. The results of this study are in line with the research conducted by (Putra & Utami, 2017) which found that environmental performance affected environmental disclosure, but this research is not in line with the research conducted by (A. Maulana et al., 2021) which finds that environmental performance does not affect environmental disclosure.

## VI. CONCLUSION AND RECOMMENDATION

Based on the results of the tests that have been carried out, it can be concluded that the type of industry, company size, profitability and environmental performance simultaneously give effect on environmental disclosure with companies listed on the Index 100 as a sample in 2019 to 2021. In partial, industry type, profitability and Environmental performance has a significant positive effect but firm size has no significant negative impact on environmental disclosure. The research model explains that the independent variable used is able to explain the dependent variable by 22.4% and the remaining 77.6% are outside the study. This study has limitations in the number of samples and the independent variables used. The researcher gives suggestions to further researchers to use different independent variables and a longer research period so that significant research results are obtained.

## **Influence of World Oil Prices, Corruption Perception Index, and Foreign Debt on Indonesia's Tax Revenue**

Muhammad Rafi Muzakki<sup>1</sup>, Maulidiyah Indira Hasmarini<sup>2</sup>

<sup>1,2</sup>Economic Development, Muhammadiyah Surakarta University

### **Abstract**

*Taxes are mandatory contributions to the state owed by a person or entity of a coercive nature under the Act. Taxes are levies that are prerogatives. Increased tax revenues are an indicator of rising economic activity in a country. The study aims to estimate the influence of world oil prices, corruption perception indexes, and foreign debt on tax revenues in Indonesia during 1996-2021 using the Ordinary Least Square (OLS) regression analysis. The results showed that world oil prices and corruption perception indexes had a positive effect on tax revenues. While foreign debt has no effect on tax revenues. The government is expected to maximize loan funds from abroad to carry out infrastructure development to support the national economy, so that in the end the economy can grow and national tax revenues increase. In addition, the government should focus more on eradicating corruption in Indonesia. The process of corruption that harms the community is feared to reduce their enthusiasm in paying taxes. In addition, the use of foreign debt or loans is expected to be maximized in order to stimulate the national economy and increase tax revenues.*

*Keywords— World Oil Prices, Corruption Perception Index, Foreign Debt, Tax Revenue*

---

## **I. INTRODUCTION**

Economic development is a continuous process in its efforts to create economic growth and prosperity for the people of a country. Economic development itself includes equitable distribution of infrastructure supporting economic activities as well as improving the quality of the population or human capital. In developing countries such as Indonesia, the government will always strive for development to spur the national economy and catch up with other countries. In the development process, the government will need very large funds to realize it, one of the sources of development funds is taxes, so exploring the potential to increase national tax revenues is very necessary. (Sinambela & Rahmawati, 2019).

Tax is a levy which is a prerogative. According to Law number 28 of 2007 concerning general provisions and taxation procedures, tax is a mandatory contribution to the state owed by an individual or entity that is coercive under the law, with no direct compensation and is used for state purposes for an amount of - the great prosperity of the people. The increase in tax revenue is expected to have a positive impact on economic growth. This is because by increasing taxes on state income, economic activity will be stimulated, so that many new jobs will be created. In addition, state facilities and infrastructure can be fulfilled in the hope of accelerating economic growth to achieve population prosperity (Marita & Saurdana, 2016).

According to the official report of the Indonesian Ministry of Finance in 2022, national tax revenues in 2021 will increase by 4.2 trillion rupiah. This means that this value has increased by 10% compared to the previous year. The increase in national tax revenues was due to the economic recovery after the economic crisis due to the Covid-19 pandemic. Increasing national revenue has become the main focus of the government in order to meet the need for development. Thus, the factors that affect national tax revenues need to be considered and analyzed in depth.

Indonesia is one of the largest crude oil producing countries in the world and is a member of the Organization of the Petroleum Exporting Countries (OPEC). Oil is one of the important factors in life, especially in the industrial sector because it is a strategic energy source to ensure the development of modern industry and distribution in the economy. Oil price fluctuations in international markets are always considered as economic indicators throughout the world, so any changes in oil prices always affect every economic activity in Indonesia. If the price of oil increases, the country will receive more foreign exchange because the payment for export transactions uses foreign currency which increases foreign exchange. Thus, tax revenue will also increase when income by these entrepreneurs also increases (Mawarni & Widiasmara, 2018).

Realization of tax revenue can also be affected by the level of corruption that occurs. Corruption is one of the actions that can hinder development and economic growth because the funds that should be used in carrying out development are deducted in value and go into private pockets, so that the results of development are not as expected, both in terms of function and resilience. In addition, corruption in the direct taxation sector has also

occurred. Corruption in national taxation is also synonymous with bribery cases in various lines of government whose goal is that tax-burdened people can pay taxes that are not in accordance with the provisions of the applicable law. This will affect state tax revenues and make people no longer trust the government and will think twice when they are required to pay taxes (Sartika et al., 2019).

Tax revenue is also closely related to the foreign debt policy imposed by a country. According to Gazali et al. (2019) foreign debt can be used as a source of financing for the government budget and the economic budget. The limited funds owned by the government in carrying out development can also be resolved by borrowing funds from abroad, so that domestic development can continue and economic activities can run more efficiently and the desired economic growth can be achieved. With the increase in the national economy, it is hoped that tax revenues can also be increased (Insanu & Purwanti, 2020).

Based on the background that has been described, the purpose of this study is to estimate the relationship between Indonesia as a world oil exporting country and the problems of corruption and foreign debt policies carried out by the government to analyze its effect on tax revenue in Indonesia.

## II. LITERATURE REVIEW

Tax is one of the obligations to surrender part of the wealth to the state treasury due to a situation, event, and act that gives a certain position, but not as a punishment, according to the regulations set by the government and can be forced, but there is no direct state reciprocal service. To maintain general well-being. Taxes have a significant role in the life of the state, especially development. Taxes are a source of state income in financing all required expenditures, including expenditures for development (Cahyani & Noviari, 2019).

Oil is one of the strategic sources of energy to ensure the development of modern industry and the economy. Oil price fluctuations are always considered as a barometer of the economy around the world, so any changes in oil prices are always a hot issue to be discussed in political and economic circles in every country. Fluctuations in oil prices in the international market in principle follow the generally accepted axioms in a market economy, where the prevailing price level is largely determined by the supply and demand mechanism. Indonesia is one of the oil exporting countries, so if there is a spike in oil prices on the international market, it will have an impact on the Indonesian economy (Nova, 2020).

Corruption is still a hot global issue that never ends to be discussed and debated. Corruption is considered a major challenge in fighting poverty and achieving public welfare because of its impact on the economy and economic development of a country. The corruption perception index is used as an indicator to measure the level of corruption using a scale of 0 to 100, where a value of 0 indicates that the country is very corrupt and a value of 100 indicates that the country is very clean (Lutfi et al., 2020).

Foreign debt is debt owned by the government to foreign parties both bilaterally and multilaterally through export credit facilities, commercial, leasing, and state securities as one of the government's efforts to meet development financing. However, the interest expense in payment of this loan also needs to be considered so that in the future it does not hamper the economy and the government can continue to carry out development so that tax revenue can be increased (Santana & Adiyadnya, 2017).

Isnanto et al. (2021) analyzed the relationship between state revenues, especially income taxes in the structure of the state revenue and expenditure budget from several external factors such as inflation, the rupiah exchange rate against the United States dollar, interest rates, and Indonesian crude oil prices in 2005-2019, using Ordinary Least Square regression analysis (OLS). The results in this study state that the exchange rate of the rupiah against the dollar has a positive effect on income tax, while the price of Indonesian crude oil, interest rates, and inflation have no effect on income tax.

Siahaan (2020) in his research stated that the decline in people's income and the impact of the Covid-19 pandemic on the economy greatly affected taxation, one of which was income tax. Income tax is a tax imposed on income received or earned by individual taxpayers or corporate taxpayers in one tax year. Therefore, the Indonesian government has implemented tax incentives for taxpayers affected by Covid-19. The government provides tax incentives with the aim of reducing the economic impact of the Covid-19 pandemic.

Mebratu et al. (2020) analyzes tax revenues in Sub-Saharan African countries using panel data over the period 2000-2018. The results in this study indicate that trade openness, the value of production in the agricultural sector, foreign debt policy, population growth, corruption, and GDP per capita affect tax revenues. Okon (2018) states that the low ratio of income to gross domestic product of Nigeria makes this country's tax revenue less than the maximum and lags far behind developed countries or other developing countries.

### III. RESEARCH METHODOLOGY

The type of data used is secondary data, including world oil prices, the corruption perception index, foreign debt, and tax revenues in Indonesia during the years 1996-2021. This variable is expressed in units of Million US\$. The data was obtained through the Indexmundi and World Bank Data sites which have been re-checked against data sourced from the Indonesian Central Statistics Agency to ensure the accuracy of the data used.

The dependent variable in this study is the total tax revenue expressed in units of million US\$. Meanwhile, the independent variables used are the world oil price expressed in units of \$/barrel, the corruption perception index, and Indonesia's foreign debt. This study will examine the effect of world oil prices, corruption perception index, and foreign debt on tax revenue in Indonesia during 1996-2021 using Ordinary Least Square (OLS) regression analysis. The analytical tool used is a modification of the article Okon (2018) with the following equation:

$$TAX_t = \beta_0 + \beta_1 OIL_t + \beta_2 CPI_t + \beta_3 DEBT_t + \varepsilon_t \quad (1)$$

where:

<i>TAX</i>	= Total tax revenue
<i>OIL</i>	= World oil price
<i>CPI</i>	= Corruption perception index
<i>DEBT</i>	= External debt
$\varepsilon$	= Error term
$\beta_0$	= Constant
$\beta_1 \dots \beta_3$	= Regression coefficient of independent variable
<i>t</i>	= Year <i>t</i>

The estimation stages of the econometric model will include: estimation of econometric model parameters: classical assumption testing which will include multicollinearity detection, residual normality detection, heteroscedasticity detection, autocorrelation detection, model specification test, model goodness test, and validity test of the influence of independent variables.

### IV. RESULT / FINDING

The estimation results of the econometric model and its complementary tests are summarized in Table 1:

Table 1. Econometric Model Estimation Results	
$TAX_t = 19731,99 + 106,36 OIL_t + 1523,64 CPI_t + 0,02 DEBT_t$	
(0,0903)***	(0,0080)* (0,5293)
$R^2 = 0,842$ ; DW = 1,644; <i>F</i> statistic = 39,088; Prob. <i>F</i> = 0,000	
Diagnostic Test:	
(1) Multikolinieritas ( <i>VIF</i> )	$OIL = 1,376$ ; $CPI = 7,886$ ; $DEBT = 6,946$
(2) Normalitas Residual (Jarque-Bera)	JB(2) = 2,222; Prob. JB(2) = 0,329
(3) Autokorelasi (Breusch-Godfrey)	$\chi^2(3) = 3,318$ ; Prob. $\chi^2(3) = 0,345$
(4) Heteroskedastisitas (White)	$\chi^2(9) = 20,122$ ; Prob. $\chi^2(9) = 0,017$
(5) Linieritas (Ramsey RESET)	$F(2, 20) = 3,430$ ; Prob. $F(2, 20) = 0,052$
Source: EViews output, processed. Note: *Significant at $\alpha = 0.01$ ; **Significant at $\alpha = 0.05$ ; ***Significant at $\alpha = 0.10$ . The number in brackets is the statistical empirical probability <i>t</i>	

The results of the classical assumption test show that the probability value in the residual normality test shows that the residual data distribution of the model is estimated to be normal. In the autocorrelation test, the statistical significance value of  $\chi^2$  in the BG test, there is no autocorrelation in the model. In the heteroscedasticity test there is no heteroscedasticity in the estimated model. In the model specification test, the model specification is estimated to be precise or linear.

The suitability statistic shows that the model exists, as can be seen from the empirical probability F statistic, which is 0.000 ( $< 0.01$ ), so that together world oil prices, corruption perception index, and foreign debt affect tax revenues. The R<sup>2</sup> value of 0.842 means that 84.2% of the variation in tax revenue can be explained by variations in world oil, the corruption perception index, and foreign debt.

Separately, the world oil price variable and the corruption perception index have a significant effect on tax revenue with empirical probabilities  $t$  of 0.090 ( $< 0.10$ ) and 0.008 ( $< 0.01$ ). Meanwhile, the foreign debt variable was found to have no effect on tax revenue, because it has an empirical probability  $t$  of 0.529 ( $> 0.10$ ).

The world oil price variable has a regression coefficient of 106.36. This means that world oil prices have a positive effect on tax revenues. The pattern of the relationship between this variable and tax revenue is linear, so that if the world oil price increases by 1 dollar per barrel, the national tax revenue will also increase by 106.36 million US\$. The corruption perception index variable also has a positive regression coefficient of 1523.637. That is, the corruption perception index has a positive effect on tax revenue. The relationship pattern to realize the corruption perception index and tax revenue is linear, so if the corruption perception index is 1 index, then the national tax revenue will also increase by 1523.637 million US\$.

## V. DISCUSSION

Based on the results of the validity of the effect ( $t$  test), world oil prices were found to have a positive effect on tax revenue. Payments for transactions in the international market using dollars further increase oil export revenues, the tendency of the strengthening of the United States dollar currency is also considered an advantage for crude oil exporting countries such as Indonesia. Moreover, if the world oil price also increases, it will directly increase the tax revenue obtained because the income of entrepreneurs also increases from the increase in world oil prices. This result is in line with the findings Isnanto et al. (2021) who found that rising world oil prices could increase income taxes.

The regression results in this study state that the corruption perception index has a positive effect on tax revenue. Corruption can indeed hinder the development process. However, this action can also facilitate licensing in various developments and economic activities, so that the time used can be shortened and all activities are carried out immediately. Of course, this is not good for the continuity of the national economy. It is necessary to reform the government structure so that acts of corruption can be reduced or even eliminated. The results of this study are in line with research Sari (2020) which states that perceptions of corruption affect tax revenue in Indonesia.

The results of this study state that foreign debt has no effect on tax revenues. Most of the foreign debt incurred by the government during this research period went directly to major infrastructure development posts in Indonesia, such as the construction of commuter liner lines and the construction of toll roads. This means that the process will take a long time and will not be felt in the near future, so that the size of the government debt does not affect national tax revenues. Similar results found by Bambang et al. (2021) who found that foreign debt had no effect on economic growth and tax revenue in Indonesia.

## VI. CONCLUSION AND RECOMMENDATION

Tax is a mandatory contribution to the state owed by an individual or entity that is coercive under the law. Taxation plays an important role in the comparative political economy called globalization and if tax revenues increase, it can be said that the economy in the country is developing and its national income is also increasing. This study aims to estimate the effect of world oil prices, corruption perception index, and foreign debt on tax revenue in Indonesia. Based on the results of the regression using Ordinary Least Square (OLS), the effect validity test shows that world oil prices and the corruption perception index have a positive effect, while foreign debt has no effect on Indonesia's tax revenues in 1996-2021. Based on the research results, the government should focus more on eradicating corruption in Indonesia. The process of corruption that harms the community is feared to reduce their enthusiasm in paying taxes. In addition, the use of foreign debt or loans is expected to be maximized in order to stimulate the national economy and increase tax revenues.

## **Influence of World Oil Prices, Corruption Perception Index, and Foreign Debt on Indonesia's Tax Revenue**

Muhammad Rafi Muzakki<sup>1</sup>, Maulidiyah Indira Hasmarini<sup>2</sup>

<sup>1,2</sup>Economic Development, Muhammadiyah Surakarta University

### **Abstract**

*Taxes are mandatory contributions to the state owed by a person or entity of a coercive nature under the Act. Taxes are levies that are prerogatives. Increased tax revenues are an indicator of rising economic activity in a country. The study aims to estimate the influence of world oil prices, corruption perception indexes, and foreign debt on tax revenues in Indonesia during 1996-2021 using the Ordinary Least Square (OLS) regression analysis. The results showed that world oil prices and corruption perception indexes had a positive effect on tax revenues. While foreign debt has no effect on tax revenues. The government is expected to maximize loan funds from abroad to carry out infrastructure development to support the national economy, so that in the end the economy can grow and national tax revenues increase. In addition, the government should focus more on eradicating corruption in Indonesia. The process of corruption that harms the community is feared to reduce their enthusiasm in paying taxes. In addition, the use of foreign debt or loans is expected to be maximized in order to stimulate the national economy and increase tax revenues.*

*Keywords— World Oil Prices, Corruption Perception Index, Foreign Debt, Tax Revenue*

---

## **I. INTRODUCTION**

Economic development is a continuous process in its efforts to create economic growth and prosperity for the people of a country. Economic development itself includes equitable distribution of infrastructure supporting economic activities as well as improving the quality of the population or human capital. In developing countries such as Indonesia, the government will always strive for development to spur the national economy and catch up with other countries. In the development process, the government will need very large funds to realize it, one of the sources of development funds is taxes, so exploring the potential to increase national tax revenues is very necessary. (Sinambela & Rahmawati, 2019).

Tax is a levy which is a prerogative. According to Law number 28 of 2007 concerning general provisions and taxation procedures, tax is a mandatory contribution to the state owed by an individual or entity that is coercive under the law, with no direct compensation and is used for state purposes for an amount of - the great prosperity of the people. The increase in tax revenue is expected to have a positive impact on economic growth. This is because by increasing taxes on state income, economic activity will be stimulated, so that many new jobs will be created. In addition, state facilities and infrastructure can be fulfilled in the hope of accelerating economic growth to achieve population prosperity (Marita & Saurdana, 2016).

According to the official report of the Indonesian Ministry of Finance in 2022, national tax revenues in 2021 will increase by 4.2 trillion rupiah. This means that this value has increased by 10% compared to the previous year. The increase in national tax revenues was due to the economic recovery after the economic crisis due to the Covid-19 pandemic. Increasing national revenue has become the main focus of the government in order to meet the need for development. Thus, the factors that affect national tax revenues need to be considered and analyzed in depth.

Indonesia is one of the largest crude oil producing countries in the world and is a member of the Organization of the Petroleum Exporting Countries (OPEC). Oil is one of the important factors in life, especially in the industrial sector because it is a strategic energy source to ensure the development of modern industry and distribution in the economy. Oil price fluctuations in international markets are always considered as economic indicators throughout the world, so any changes in oil prices always affect every economic activity in Indonesia. If the price of oil increases, the country will receive more foreign exchange because the payment for export transactions uses foreign currency which increases foreign exchange. Thus, tax revenue will also increase when income by these entrepreneurs also increases (Mawarni & Widiasmara, 2018).

Realization of tax revenue can also be affected by the level of corruption that occurs. Corruption is one of the actions that can hinder development and economic growth because the funds that should be used in carrying out development are deducted in value and go into private pockets, so that the results of development are not as expected, both in terms of function and resilience. In addition, corruption in the direct taxation sector has also occurred. Corruption in national taxation is also synonymous with bribery cases in various lines of government

whose goal is that tax-burdened people can pay taxes that are not in accordance with the provisions of the applicable law. This will affect state tax revenues and make people no longer trust the government and will think twice when they are required to pay taxes (Sartika et al., 2019).

Tax revenue is also closely related to the foreign debt policy imposed by a country. According to Gazali et al. (2019) foreign debt can be used as a source of financing for the government budget and the economic budget. The limited funds owned by the government in carrying out development can also be resolved by borrowing funds from abroad, so that domestic development can continue and economic activities can run more efficiently and the desired economic growth can be achieved. With the increase in the national economy, it is hoped that tax revenues can also be increased (Insanu & Purwanti, 2020).

Based on the background that has been described, the purpose of this study is to estimate the relationship between Indonesia as a world oil exporting country and the problems of corruption and foreign debt policies carried out by the government to analyze its effect on tax revenue in Indonesia.

## II. LITERATURE REVIEW

Tax is one of the obligations to surrender part of the wealth to the state treasury due to a situation, event, and act that gives a certain position, but not as a punishment, according to the regulations set by the government and can be forced, but there is no direct state reciprocal service. to maintain general well-being. Taxes have a significant role in the life of the state, especially development. Taxes are a source of state income in financing all required expenditures, including expenditures for development (Cahyani & Noviari, 2019).

Oil is one of the strategic sources of energy to ensure the development of modern industry and the economy. Oil price fluctuations are always considered as a barometer of the economy around the world, so any changes in oil prices are always a hot issue to be discussed in political and economic circles in every country. Fluctuations in oil prices in the international market in principle follow the generally accepted axioms in a market economy, where the prevailing price level is largely determined by the supply and demand mechanism. Indonesia is one of the oil exporting countries, so if there is a spike in oil prices on the international market, it will have an impact on the Indonesian economy (Nova, 2020).

Corruption is still a hot global issue that never ends to be discussed and debated. Corruption is considered a major challenge in fighting poverty and achieving public welfare because of its impact on the economy and economic development of a country. The corruption perception index is used as an indicator to measure the level of corruption using a scale of 0 to 100, where a value of 0 indicates that the country is very corrupt and a value of 100 indicates that the country is very clean (Lutfi et al., 2020).

Foreign debt is debt owned by the government to foreign parties both bilaterally and multilaterally through export credit facilities, commercial, leasing, and state securities as one of the government's efforts to meet development financing. However, the interest expense in payment of this loan also needs to be considered so that in the future it does not hamper the economy and the government can continue to carry out development so that tax revenue can be increased (Santana & Adiyadnya, 2017).

Isnanto et al. (2021) analyzed the relationship between state revenues, especially income taxes in the structure of the state revenue and expenditure budget from several external factors such as inflation, the rupiah exchange rate against the United States dollar, interest rates, and Indonesian crude oil prices in 2005-2019, using Ordinary Least Square regression analysis (OLS). The results in this study state that the exchange rate of the rupiah against the dollar has a positive effect on income tax, while the price of Indonesian crude oil, interest rates, and inflation have no effect on income tax.

Siahaan (2020) in his research stated that the decline in people's income and the impact of the Covid-19 pandemic on the economy greatly affected taxation, one of which was income tax. Income tax is a tax imposed on income received or earned by individual taxpayers or corporate taxpayers in one tax year. Therefore, the Indonesian government has implemented tax incentives for taxpayers affected by Covid-19. The government provides tax incentives with the aim of reducing the economic impact of the Covid-19 pandemic.

Mebratu et al. (2020) analyzes tax revenues in Sub-Saharan African countries using panel data over the period 2000-2018. The results in this study indicate that trade openness, the value of production in the agricultural sector, foreign debt policy, population growth, corruption, and GDP per capita affect tax revenues. Okon (2018) states that the low ratio of income to gross domestic product of Nigeria makes this country's tax revenue less than the maximum and lags far behind developed countries or other developing countries.

### III. RESEARCH METHODOLOGY

The type of data used is secondary data, including world oil prices, the corruption perception index, foreign debt, and tax revenues in Indonesia during the years 1996-2021. This variable is expressed in units of Million US\$. The data was obtained through the Indexmundi and World Bank Data sites which have been re-checked against data sourced from the Indonesian Central Statistics Agency to ensure the accuracy of the data used.

The dependent variable in this study is the total tax revenue expressed in units of million US\$. Meanwhile, the independent variables used are the world oil price expressed in units of \$/barrel, the corruption perception index, and Indonesia's foreign debt. This study will examine the effect of world oil prices, corruption perception index, and foreign debt on tax revenue in Indonesia during 1996-2021 using Ordinary Least Square (OLS) regression analysis. The analytical tool used is a modification of the article Okon (2018) with the following equation:

$$TAX_t = \beta_0 + \beta_1 OIL_t + \beta_2 CPI_t + \beta_3 DEBT_t + \varepsilon_t \quad (1)$$

where:

<i>TAX</i>	= Total tax revenue
<i>OIL</i>	= World oil price
<i>CPI</i>	= Corruption perception index
<i>DEBT</i>	= External debt
$\varepsilon$	= Error term
$\beta_0$	= Constant
$\beta_1 \dots \beta_3$	= Regression coefficient of independent variable
<i>t</i>	= Year <i>t</i>

The estimation stages of the econometric model will include: estimation of econometric model parameters: classical assumption testing which will include multicollinearity detection, residual normality detection, heteroscedasticity detection, autocorrelation detection, model specification test, model goodness test, and validity test of the influence of independent variables.

### IV. RESULT / FINDING

The estimation results of the econometric model and its complementary tests are summarized in Table 1:

Table 1. Econometric Model Estimation Results	
$TAX_t = 19731,99 + 106,36 OIL_t + 1523,64 CPI_t + 0,02 DEBT_t$	
(0,0903)***	(0,0080)* (0,5293)
$R^2 = 0,842$ ; DW = 1,644; <i>F</i> statistic = 39,088; Prob. <i>F</i> = 0,000	
Diagnostic Test:	
(6) Multikolinieritas ( <i>VIF</i> )	$OIL = 1,376$ ; $CPI = 7,886$ ; $DEBT = 6,946$
(7) Normalitas Residual (Jarque-Bera)	JB(2) = 2,222; Prob. JB(2) = 0,329
(8) Autokorelasi (Breusch-Godfrey)	$\chi^2(3) = 3,318$ ; Prob. $\chi^2(3) = 0,345$
(9) Heteroskedastisitas (White)	$\chi^2(9) = 20,122$ ; Prob. $\chi^2(9) = 0,017$
(10) Linieritas (Ramsey RESET)	$F(2, 20) = 3,430$ ; Prob. $F(2, 20) = 0,052$
Source: EViews output, processed. Note: *Significant at $\alpha = 0.01$ ; **Significant at $\alpha = 0.05$ ; ***Significant at $\alpha = 0.10$ . The number in brackets is the statistical empirical probability <i>t</i>	

The results of the classical assumption test show that the probability value in the residual normality test shows that the residual data distribution of the model is estimated to be normal. In the autocorrelation test, the statistical significance value of  $\chi^2$  in the BG test, there is no autocorrelation in the model. In the heteroscedasticity test there is no heteroscedasticity in the estimated model. In the model specification test, the model specification is estimated to be precise or linear.

The suitability statistic shows that the model exists, as can be seen from the empirical probability F statistic, which is 0.000 ( $< 0.01$ ), so that together world oil prices, corruption perception index, and foreign debt affect tax revenues. The R<sup>2</sup> value of 0.842 means that 84.2% of the variation in tax revenue can be explained by variations in world oil, the corruption perception index, and foreign debt.

Separately, the world oil price variable and the corruption perception index have a significant effect on tax revenue with empirical probabilities  $t$  of 0.090 ( $< 0.10$ ) and 0.008 ( $< 0.01$ ). Meanwhile, the foreign debt variable was found to have no effect on tax revenue, because it has an empirical probability  $t$  of 0.529 ( $> 0.10$ ).

The world oil price variable has a regression coefficient of 106.36. This means that world oil prices have a positive effect on tax revenues. The pattern of the relationship between this variable and tax revenue is linear, so that if the world oil price increases by 1 dollar per barrel, the national tax revenue will also increase by 106.36 million US\$. The corruption perception index variable also has a positive regression coefficient of 1523.637. That is, the corruption perception index has a positive effect on tax revenue. The relationship pattern to realize the corruption perception index and tax revenue is linear, so if the corruption perception index is 1 index, then the national tax revenue will also increase by 1523.637 million US\$.

## V. DISCUSSION

Based on the results of the validity of the effect ( $t$  test), world oil prices were found to have a positive effect on tax revenue. Payments for transactions in the international market using dollars further increase oil export revenues, the tendency of the strengthening of the United States dollar currency is also considered an advantage for crude oil exporting countries such as Indonesia. Moreover, if the world oil price also increases, it will directly increase the tax revenue obtained because the income of entrepreneurs also increases from the increase in world oil prices. This result is in line with the findings Isnanto et al. (2021) who found that rising world oil prices could increase income taxes.

The regression results in this study state that the corruption perception index has a positive effect on tax revenue. Corruption can indeed hinder the development process. However, this action can also facilitate licensing in various developments and economic activities, so that the time used can be shortened and all activities are carried out immediately. Of course, this is not good for the continuity of the national economy. It is necessary to reform the government structure so that acts of corruption can be reduced or even eliminated. The results of this study are in line with research Sari (2020) which states that perceptions of corruption affect tax revenue in Indonesia.

The results of this study state that foreign debt has no effect on tax revenues. Most of the foreign debt incurred by the government during this research period went directly to major infrastructure development posts in Indonesia, such as the construction of commuter liner lines and the construction of toll roads. This means that the process will take a long time and will not be felt in the near future, so that the size of the government debt does not affect national tax revenues. Similar results found by Bambang et al. (2021) who found that foreign debt had no effect on economic growth and tax revenue in Indonesia.

## VI. CONCLUSION AND RECOMMENDATION

Tax is a mandatory contribution to the state owed by an individual or entity that is coercive under the law. Taxation plays an important role in the comparative political economy called globalization and if tax revenues increase, it can be said that the economy in the country is developing and its national income is also increasing. This study aims to estimate the effect of world oil prices, corruption perception index, and foreign debt on tax revenue in Indonesia. Based on the results of the regression using Ordinary Least Square (OLS), the effect validity test shows that world oil prices and the corruption perception index have a positive effect, while foreign debt has no effect on Indonesia's tax revenues in 1996-2021. Based on the research results, the government should focus more on eradicating corruption in Indonesia. The process of corruption that harms the community is feared to reduce their enthusiasm in paying taxes. In addition, the use of foreign debt or loans is expected to be maximized in order to stimulate the national economy and increase tax revenues.

## Prediction of Financial Distress from Transportation Sector Companies in South East Asia using SMOTE Support Vector Machine

Amanda Rizki Bagasta<sup>1</sup>, Zaäfri Ananto Husodo, Ph. D<sup>2</sup>

<sup>1,2</sup> Faculty of Economic and Business: dept. of Management, University of Indonesia, Depok, Indonesia

### Abstract

*The topic of predicting company's financial difficulties has become important topic in detecting the risk of a company's bankruptcy. Some research showed that machine learning such as SVM, Neural Network, and Random Forest provide better performance in predicting financial distress compared to traditional methods such as Altman and Merton. This paper proposes a financial distress prediction using binary variable which is useful for warning creditors or investors of the risk of bankruptcy. Therefore, we applied prediction model for 203 transportation sector companies in Southeast Asia from 2019 to 2020 using a SMOTE Support Vector Machine and Gaussian (RBF) in order to handle imbalanced data. Experimental results show that this method can produce accuracy and evaluation performance above 90% and find that Profitability Ratio as the most affected feature attributes in the classification results. We hope that it can stimulate more research on predicting financial distress by utilizing the application of Artificial Intelligence.*

*Keywords— Accuracy; Classification; Financial Distress; Financial Ratio; Support Vector Machine*

---

### I. INTRODUCTION

Financial distress is a financial condition of companies which is indicated by the company's liquidity and inability to pay its obligations. Forecasting financial distress of companies has been widely studied and applied both in education and practitioners. From a managerial perspective, financial distress prediction beneficial for timely warning and decision making to various stakeholders such as creditors, management, investors, employees, shareholders and other interested parties. Likewise, as the unstable economic environment affected from the covid-19 pandemic situation, enterprises must be alert the increasing risk of falling into financial distress before it reaches the stage of bankruptcy because management tend to become aware of the distressed situation when it is too late to revive the company (Mahtani & Garg, 2018). Local government should be alert of failing company that might affect the banking industry and eventually to the whole financial system. Therefore, efficient prediction of financial distress required for corporate to prevent bankruptcy which categorized from the accuracy and confusion matrix of the method.

Experts have developed several models for financial distress prediction using financial ratios or other variables from financial statement. Initial studies generally use applied statistical methods such as Altman (1968), Merton (1974), and Springate (1978), which were considered as milestones. However, some experts still criticized these methods could not predict symptoms of financial failure accurately. These traditional methods are using statistical method with assumption of linearity, normality, and independence among predictor variables (Hua et al., 2007). In actual, data for prediction contains a more complex and non-linear problem to solve. Characteristic of financial distress prediction variables in real world could contains missing values, imbalance data, and in a large amount. With the rapid development of technology, some research appears to predict financial distress by utilizing artificial intelligence (AI). Several methods using machine learning approach have been proposed and are able to achieve higher accuracy in early detection of financial distress, such as SVM (Shin et al., 2005), Neural Network (Paule-Vianez et al., 2020), and Random Forest (J. Huang et al., 2017). Previous research by Vieira by comparing several machine learning methods for prediction, including Logistics, Artificial Neural Networks, Multilayer Perceptron (MLP), Support Vector Machines (SVM) and AdaBoost M1 which uses predictive data from Diane, a large database containing financial records of small and medium-sized French companies and research results show that Support Vector Machines achieve the best performance, with a total accuracy of 93.17% in predicting the failure of French MSME companies (Vieira et al., 2009).

However, most of the financial distress studies used a balanced data set. On the actual financial data, distressed company finances are only a small part of the total companies in all industries. Although several studies use proportional samples and high overall accuracy, the same model that used on an unbalanced sample will result in overestimation of the financial distress prediction (FDP) model. Study to predict diabetes using the PIMA Indian Diabetes Data Set, showed that the combination of the SMOTE technique and the SVM method formed the best

model in balancing the data set and classification with an accuracy of 83.12% (Mesquita et al., 2021). Nevertheless, both statistical traditional method and artificial intelligence models have their own strength and weakness. Statistical method used fewer variables predictors but incapable in complex and non-linear type of data, meanwhile artificial intelligence able to give better performance but required more variables predictor and running time (Sun et al., 2021).

Prediction of a company's financial distress with financial ratios has been handled by several models, early studies generally used statistical methods such as multiple discriminant analysis (Altman, 1968), logistic regression (Canbas et al., 2005), and multiple regression to predict multiple business failures which used by Banks or Credit Institutions. However, most of the research on prediction of financial distress uses a balanced proportion of class samples. Meanwhile, on the actual data of finance, financially depressed companies only accounted for a small part of the total companies in all industries. Therefore, the contribution of this research is to present the importance of using balanced data through a combination of the SVM method with the SMOTE technique. The author chooses the SMOTE-Support Vector Machine method because there is no research that discusses bankruptcy prediction using transportation sector companies in Southeast Asia. The researcher also analyzes the effectiveness of SVM through the accuracy of the method with input data of companies in Southeast Asia.

This paper proposed financial distress prediction of transportation sector companies listed in the South East Asia using SMOTE Support Vector Machine, as this method successfully applied in complex and non-linear data issue. Implementation of kernel function is considered as the core part of SVM because kernel will also affect the outcome or on the accuracy and confusion matrix (Wu et al., 2016). Thus, in this paper, we will use the Gaussian RBF (radial basis function) kernel function to obtain multidimensional kernel function. Through this research, we hoped that applied SVM can be proven that this method is outperformed compared to other prediction.

## II. LITERATURE REVIEW

Financial distress prediction has become a significant research interest due to the COVID-19 pandemic, especially in corporate finance. Financial difficulty is a situation of a company in a state of financial crisis in which companies cannot fulfill their obligations and might have consequences of bankruptcy. The terms that are used to describe financial distress are “failure,” “insolvency,” “bankruptcy,” or “default”. Apart from these terms used, this is defined as a situation where the company faces a low cash flow state. Early studies identified that financial distress prediction is related to the values of financial ratios of failing and non-failing firms. These studies found several models using financial ratios analysis in assessing the performance of companies.

Altman specifies that multiple discriminant analysis (MDA) is an applicable statistical technique and has been proven to be used in several actual case studies related to financial distress prediction (Altman, 1968). The Z-Score model using profitability, liquidity, and solvency ratio is considered a milestone to predict financial distress companies because this model must qualify the assumption of normality. Other models have been developed to evaluate financial distress using Ohlson's model, a multi factor financial formula. This model used nine financial ratios and unlike This model used nine financial ratios, and unlike Altman's research using only 66 firms, Ohlson includes more than 2000 firms to achieve better accuracy (Ohlson, 1980). In addition, because the assumption of normality from the multiple discriminant analysis mitigates the employment of dummy independent variables, Ohlson uses two dummy variables to emphasize whether the company has a net loss. Although Ohlson's model used more variables than the prior model, Ohlson stated that achieving significant improvement may require additional predictors.

As the explanation given about the limitation of several traditional research, the author finds that there are no significantly most important predictors in predicting financial distress. Considering several studies that cite different predictors, there is no evidence of which ratio or variable is most efficiently used in all industries and companies. Previous research applying Altman and Ohlson's model to Logistics and Shipping Industries concludes that ROA is the most significant financial ratio as a predictor (Woo et al., 2021). Nevertheless, another finding in this research is that the approach for assessing the state of financial distress in an industry must consider the market's location. The US and EU market has different factors that affect these two markets, similarly in other markets worldwide. Therefore, the objective of this study is to examine significant financial ratios in assessing financial distress from the ASEAN market.

### A. Merton Distance to Default (DD) Model

Merton's model is based on the Black-Scholes model of option pricing for assessing the probability of default. This model links the company's probability of default and asset structure (capital) using its equity value, the nominal value of its debt, and equity volatility (Merton, 1974). This model assumes that the company has a zero-coupon bond to be repaid. If the asset value company ( $A$ ) is less than the debt ( $D$ ), then the company will be considered default and the value of equity becomes 0. Otherwise, if the value of the company's assets ( $A$ ) is greater than the debt ( $D$ ) which must be repaid in period  $t$  assuming  $t$  is one year, then the company will pay the debt and the value of equity becomes 0. Merton model generates equity value by modifying the Value of the Black-Scholes Call Option using the following equation

$$E_T = A N(d_1) - De^{-rT}N(d_2) \quad (1)$$

where  $E_T$  is the market value of the firm's equity and  $r$  is the risk-free rate.  $N(\cdot)$  is the cumulative normal distribution function for  $d_1$  and  $d_2$ , given by,

$$d_1 = \frac{\ln\left(\frac{A}{D}\right) + \left[r + \frac{1}{2}\sigma_A^2\right]T}{\sigma_A\sqrt{T}}, \quad d_2 = d_1 - \sigma_A\sqrt{T} \quad (2)$$

Under the Merton DD Model assumption, as volatility of equity is categorized as an unobservable value, hence the volatilities of the firm and its equity are related by

$$\sigma_E = \frac{\partial A}{\partial E} N(d_1) \sigma_A \quad (3)$$

By solving equation (2) and (3), the Distance of Default can be calculated using the following equation

$$DD = \frac{\ln\left(\frac{A}{D}\right) + \left[r - \frac{1}{2}\sigma_A^2\right]T}{\sigma_A\sqrt{T}} \quad (4)$$

While DD defined as the normalized distance between the firm's asset ( $A$ ) and the face value of firm's debt ( $D$ ), Probability of Default (PD) is the  $\pi_{\text{merton}}$  and can be re-written as follows (Bharath & Shumway, 2008)

$$PD = N(-DD) = N\left(-\left(\frac{\ln\left(\frac{A}{D}\right) + \left[r - \frac{1}{2}\sigma_A^2\right]T}{\sigma_A\sqrt{T}}\right)\right) \quad (5)$$

(6)

This study uses Merton DD Model to generate dependent variables for prediction because the model considers volatility, which this determinant becomes important for predicting financial distress in the crisis of the last couple of years due to pandemic.

### B. Financial Distress Prediction Developments

Subsequently, with the advanced progress of computer technology, multivariate models using machine learning techniques based on Artificial Intelligence have been prosperously used for financial distress prediction. These methods proved to be more accurate in handling nonlinear data and selecting higher features for predicting financial distress. Several machine learning techniques to solve the problem included Neural Network (NN) (Raghupathi et al., 1991), Decision Tree (Sun & Li, 2008), Random Forest (Yeh et al., 2014), and others. Support Vector Machine is considered one of the machine learning techniques to overcome explanatory nonlinear data and stability problems compared to statistical models, among other models that might solve the problem.

Support Vector Machine performs classification using hyperplane for differentiating nonlinear data. SVM constructs a hyperplane that maximizes the margin between classes, called optimal hyperplane (see figure 1). In real data cases, characteristics of finance financial data are often highly biased, resulting in misclassification errors. Hence, the SVM algorithm plotting each data item from features space to  $n$ -dimension (where  $n$  is the

number of features of data) using slack variables ( $\xi_i$ ) and kernel function ( $K(x)$ ) to prevent overfitting. Where  $w$  defined as margin or the distance between two points nearby the hyperplane, called support vectors, and  $C$  as the parameters. The optimization problem of SVM is summarized as the following equation (Cortes & Vapnik, 1995)

$$\min_{w,b} \frac{1}{2} \|w\|^2 + C \sum_{i=1}^N \xi_i \tag{7}$$

with constraint of

$$y_i(w \cdot \phi(x_i) + b) \geq 1 - \xi_i, \quad i = 1, 2, 3, \dots, N \tag{8}$$

where  $\xi_i > 0$  and  $\phi(x_i)$  defined as the feature map for the kernel function. Using the Radial Based Function (RBF) kernel, the kernel function satisfies  $K(x_i, x_j) = \langle \phi(x_i), \phi(x_j) \rangle$ . Hence solving equation (6) and (7) using Lagrange optimization, the optimal hyperplane decision function is generated to predict a testing data based on the sign of the solution value

$$f(x_t) = \text{sgn} \left( \sum_{i \in N_S} \alpha_i^* y_i K(x_i, x_j) + b^* \right) \tag{9}$$

where if  $f(x_t) > 0$  or positive then it concludes that the class label of  $x_t$  is  $y_t = 1$  but if  $f(x_t) < 0$  or negative then it concludes that the class label of  $x_t$  is  $y_t = -1$ .

However, Support Vector Machine depend on the "quality" of the data set that used for the development of the classification model resulting a model that is not formed to read unbalanced data patterns (Demidova & Klyueva, 2017). Classification model on an unbalanced data set often considering data from the majority class and ignoring the minority class which can result in type I and type II misclassification. The Synthetic Minority Over-Sampling Technique (SMOTE) is an over-sampling method that was first proposed by Chawla and colleagues in 2002 with an oversampling approach, namely replacing some of the majority data that is close to minority characteristics into minority labels. This method forms synthetic samples by selecting random points along the line segment and linking the  $k$  closest neighboring minority classes (Chawla et al., 2002). Where minority sample denoted as  $x_i, i = 1, 2, \dots, N$  and  $x_j, j = 1, 2, \dots, N$  is one of  $k$  closest neighbor with  $x_i$ . Then, a new minority "synthesis" sample will be generated using the following equation (Sun et al., 2014)

$$x_{\text{new}} = x_i + \text{rand}(0,1) \times (x_j - x_i) \tag{9}$$

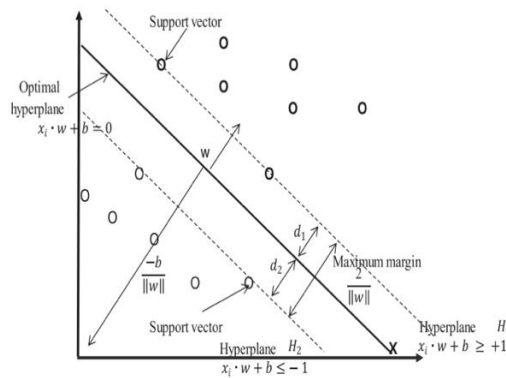

Fig. 1. The Architecture of a Typical Support Vector Machine. (Colff & BrÜMmer, 2019)

For this study, financial ratio from several companies will be provided along with the financial characteristics of each company, categorized as non-distress (healthy) or distress company. This data will be translated into binary, 1 for financially healthy companies and -1 for companies with financial distress that might possibly experience bankruptcy in the future. The prediction data will be compared with the actual class of companies to calculate the model's accuracy. Then, we deploy SMOTTEENN SVM to build a more predictive collaboration.

### III. RESEARCH AND METHODOLOGY

#### A. Data Collection and Processing Techniques

The purpose of this research is to predict a company's probability of default based on variables that can affect financial distress using historical financial ratio data. The data set that we employ is provided from secondary data sourced from financial statement data of transportation sector companies in Southeast Asia in 2019 and 2020. The sampling method used is purposive sampling, which is a sampling technique in which researchers select data based on unique characteristics or experiences, attitudes, or perception (Cooper & Schindler, 2014). We select samples that fulfill criteria and then select significant variables for prediction model that are shown in Table 1. Hence this study composed of 203 Companies and 10 financial ratios from 2019 and 2020.

Table 1. Transportation and Logistics Company Sampling Criteria.

Number	Criteria	Non-Criteria Population	Total Population
1	Southeast Asia	-	11 Countries
2	Southeast Asian company listed on Thomson Reuters Eikon	5 Countries	5361 Companies from 6 Countries (Indonesia, Malaysia, Filipina, Singapura, Thailand, Vietnam)
3	Southeast Asian company from the Transport sector listed on Thomson Reuters Eikon	5071 Companies	290 Companies
4	<b>Number of companies with complete variables for Merton's method calculation</b>	<b>87 Companies</b>	<b>203 Companies</b>

(Processed by author, 2022)

After that, we apply pre-processing with the intention of preparing and transforming the raw data into efficient data that can be used for the next stage of data processing. This step consists of data cleaning and data imputation. In order to eliminate noise data and outlier, we apply data cleaning the characteristics of missing values above 10% in every feature. Then, we apply the process of filling missing data by estimating the value of a certain pattern or constraint using the 'Multiple Imputation by Chained Equations' (MICE) method.

#### B. Construction of Financial Distress Prediction Model

In this study, we apply Merton Model in dataset to calculate the Probability of Default that will be represented by 0 for companies with PD of above 10% and 1 for companies with PD of below 10%. This research will classify category of companies with default and non-default probabilities uses the Distance of Default (DD) and Probability of Default (PD) with reference of calculation from Löffler and partner (Löffler & Posch, 2007). The result showed that using 10% threshold PD, there are 30 samples labeled as probability of distress company for 2019 and 26 samples labeled as probability of distress company for 2019 out of the total population.

Finally, we construct 10 different financial ratios and splitting data into two subsets arbitrarily from 10% to 90% data training, respectively (see Table 2). Then we apply Support Vector Machine without SMOTE for comparison and using 10%-90% of data training to build the model. Data balancing techniques will be carried out using SMOTE on the initial unbalanced data. The addition of the number of minority samples will be found through a number of k neighbors from the minority data and the formation of a more balanced dataset. After classifying using SVM using data that has been previously balanced and evaluating the performance of the model to be compared with the model formed from previous machine learning.

Table 2. Definition of financial ratios variables.

Category	Variable	Definition
Profitability	Return On Asset	$\frac{\text{Net Income}}{\text{Total Assets}}$
	Return on Equity	$\frac{\text{Net Income}}{\text{Total Shareholders' Equity}}$
	Net Profit Margin	$\frac{\text{Net Income}}{\text{Revenue}}$
Solvability	Debt Ratio	$\frac{\text{Total Debt}}{\text{Total Assets}}$

	Debt to Equity Ratio	$\frac{\text{Total Debt}}{\text{Total Equity}}$
	Equity Ratio	$\frac{\text{Total Equity}}{\text{Total Assets}}$
<b>Liquidity</b>	Current Ratio	$\frac{\text{Current Asset}}{\text{Short – term liabilities}}$
	Quick Asset Ratio	$\frac{\text{Current Asset – Inventories}}{\text{Short – term liabilities}}$
	Total Asset Turnover	$\frac{\text{Sales}}{\text{Total Assets}}$
<b>Activity</b>	<b>Account Receivable turnover</b>	$\frac{\text{Sales}}{\text{Average Receivable}}$

(Processed by author, 2022)

### C. Experimental Design

In order to obtain model for financial distress prediction, we proceed calculation of probability of default as the dependent variable using Merton Model. There are 203 sample data including 30 distress companies and 173 healthy companies in 2019, and 26 distress companies and 177 healthy companies in 2020. To enhance the reliability of experimental results, we compare the classification model by dividing the sample data into two types, including training set and testing set, respectively. The partition of the sample data obtaining different accuracies and confusion matrix. In this experiment, we used Gaussian RBF kernel as the kernel function of the prediction model considering its good performance. Classification method in this study is using the e1071 package at RStudio, then we evaluate the performance of the model using confusion matrix. The flowchart depicting the Support Vector Machine algorithm and evaluating the performance of the model is shown in Figure 2.

The next step, we compare and analyze support vector machine model with addition of balancing data model in this paper. By adding SMOTE for balancing dataset, then applying Support Vector Machine method in the balanced data to see the classification model formed using balanced data. The data balancing technique with SMOTE method is using the performanceEstimation packages on RStudio. We prove that SMOTE has become efficient model to build balance dataset by comparing accuracies and confusion matrix.

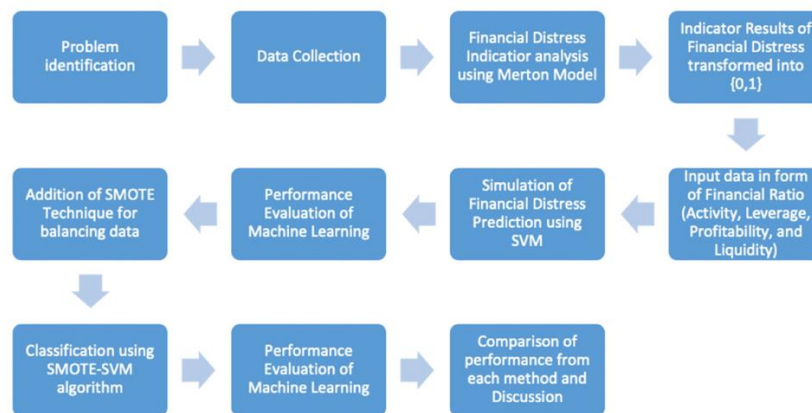

Fig. 2. SVM Financial Distress Prediction Model with Kernel Function. (Author's Result, 2022)

## IV. RESULT / FINDING

### A. Calculation of Probability of Default

To classify company's probability of default as the dependent variable, we conduct calculation using Merton Model that elaborated in Construction of Financial Distress Prediction Model section. Referred to previous research, there is no PD Merton constraint statement that can be used as a boundary for the classification of default and non-default companies. Based on working paper conducted by Tudela and Young in 2003, this study measures the PD percentage threshold for the company's default classification by comparing the types of classification errors if the PD threshold used is between 5%, 10%, 15%, 20%, and 30%. Research has found that the use of a threshold

of 10% produces the simplest Type I error and Type I error (Tudela & Young, 2003). Therefore, this study used 10% as threshold.

Table 3. Descriptive Statistics Variable Probabilty of Default (PD)

Year	N	Min	Max	Mean	Stand. Deviation	Distress Company	Non-Distress Company	Percentage Distress Company
2019	203	0.00%	61.28%	4.27%	9.30%	30	173	14,78%
2020	203	0.00%	56.79%	3.86%	8.80%	26	177	12,8%

(Processed by author, 2022)

Based on the calculation, the average probability of a company's default is 4.26% in 2019 and has decreased in 2020, which is 3.86% as stated in table 3. Also showed from the total number of distress company show that the data obtained have the characteristics of imbalance data. In 2019, companies categorized as distress (dummy variable – 0) were 30 companies or 14.78% of the total sample of companies, while in 2020, companies categorized as distress (dummy variable – 0) were 36 companies or 12.8% of total sample of companies. Therefore, the proportion of data that is not 1:1 indicates the sample of this study is not balanced. This will have an impact on the evaluation of the Support Vector Machine's performance will not be optimal because the model that is formed tends to be inaccurate in predicting the minority class. Therefore, this study will add the SMOTE technique as a data balancing method and add the Support Vector Machine method which will be discussed in the next section.

#### B. Importance of Balancing Data Method

In this study, the data classification of distress and non-distress companies simulated using Support Vector Machine without using data balancing. This simulation uses the e1071 package available at RStudio by using several parameters, namely the kernel used is RBF (Gaussian), the C parameter used is the C-Classification type and the cost of constraint breaking parameter is 10. The program trial uses a gradual percentage of training data, starting from 10%, 20%, and so on data training up to 90%. Tables below give comparison of accuracy and performance evaluation obtained from 2020 and 2019 using Support Vector Machines with Gaussian functions.

Table 4. Accuracy and Performance Evaluation of Support Vector Machine in 2020

Data Training (%)	Sampel Training	Sampel Testing	Accuration (%)	No Info Rate (%)	Recall (%)	Precision (%)	Specificity (%)	f1-score (%)
10	21	182	87.91	87.36	4.34	100	4.34	8.33
20	42	161	87.58	87.58	5.00	50	50	9.09

80	163	40	77.5	85.00	0.00	0.00	0.00	NA
90	184	20	85.00	85.00	33.33	50.00	33.33	40.00

(Processed by author, 2022)

Based on the tables below, the best accuracy obtained in 2020 are 89.47% and in 2019 it is 85.00% by using training data of 90%. This reflects more data training in forming a predictive model will help machine learning to build best model for classification. The main issue from result above is the model fails to predict for data in the False Negative category. The model misclassified financial ratio data which in actual conditions is classified as positive for financial difficulties and the data is classified as negative for financial difficulties. This explained by the No Information Rate that is greater than or equal to the accuracy, meaning that the model formed is not significant. The model fails to classified the False Negative variable because this data characterized as imbalance data. This also showed from the f1-measure evaluation which provides an overview of the model's performance in predicting unbalanced data while the results of this evaluation table give an error result. Therefore, this research will apply the SMOTE technique to balance the data and followed by the SVM classification.

Table 6. Accuracy and Performance Evaluation of Support Vector Machine with addition SMOTE Technique

Tahun	Data Training (%)	Data Training (0)	Data Training (1)	Akurasi (%)	No Info Rate (%)	Recall (%)	Precision (%)	Specificity (%)	f1-score (%)
2020	90	96	144	96.25	0.6	96.87	93.93	96.87	95.38
2019	90	108	162	93.33	0.6	89.18	93.26	89.81	91.15

(Processed by author, 2022)

For a comparison, we apply the SMOTE technique as a method for data balancing. We use of several parameters, namely "perc.over = 3" or commonly used for SMOTE oversampling, "k = 10", and "perc.under = 2" or commonly used for SMOTE undersampling. This method is often called as SMOTTEENN or SMOTE technique which applies the oversampling method (SMOTTE) and undersampling method (SMOTE-ENN). After we obtain the balance data, the Support Vector Machine classification method was applied. Below is the level of accuracy and performance evaluation obtained from data classification of distress and non-distress companies using Support Vector Machines with Gaussian function as a comparison. In 2020 the classification model produces an accuracy of 96.25% while in 2019 the classification model produces an accuracy of 93.33% if we apply the SMOTTEENN technique before the SVM classification method.

In this study, feature prediction is also applied to determine the level of importance and the degree of influence of each variable that used for classification. The purpose of using the variable importance is to be considered for further research to predict financial distress using significant financial ratios. In addition, the use of the variable importance can be considered to be applied before classifying data so that the results of features that have no effect can be dropped first considered with other ratios or variables. The data used to see the importance of each feature uses data that is new or that has been imputed using MICE Random Forest. Furthermore, using the Random Forest Package in R Studio, a summary of the results of the importance of features can be seen in table 4.9

Fig. 3. Variable Importance Results of all financial ratios. (Author's Result, 2022)

## V. DISCUSSION

Basically, this study proves that the use of the SVM method and the SMOTE technique is able to predict company bankruptcy in resolving the characteristics of unbalanced data and missing values as seen from the accuracy value and performance evaluation above 90%. This research is different from previous research

because the Support Vector Machine (SVM) is a machine learning method based on optimization, resulting in SVM being able to overcome the characteristics of data with high outliers and the machine's ability to map data to higher n dimensions. Therefore, SVM produces better classification accuracy, different from other classification methods such as discriminant analysis which uses the assumption of multicollinearity as a separator in non-linear subspaces, making it difficult to deal with data with high outliers (Obi, 2017). Previous study that predicts stock price movements proves that the SVM model outperforms compared to linear discriminant analysis through a comparison of the accuracy value and the results of the evaluation of the performance of the model that formed from SVM (W. Huang et al., 2005).

By quantitatively comparing the experiment using Support Vector Machine and addition of SMOTE technique for initial samples, we obtained findings that is described as follows:

1. First of all, we apply traditional method using Merton Model to obtain classified samples as distress and non-distress company. In the process of classifying, we found that non-distress company are dominant in 2019 and 2020 with proportion of 14,78% and 12,8%, respectively. We conclude that most company is financially healthy and real-time data tend to has characteristics of imbalance data. This showed the importance of using machine learning in real life data, as this method resolve well the imbalance, non-linear, and other characteristics of data.
2. We also apply different percentage of data training in our SVM to illustrate the most significant use of percentage. The experiment results that 90% of data training produce highest accuracy while other performance evaluation showed insignificant and unstable result seen from Recall, Precision, Specificity, and F1-Score. To some extent, this indicates that the highest percentage usage of data training will produce a better model for financial distress prediction. Although the result gives an acceptable accuracy, the Recall, Precision, Specificity, and F1-Score are not showing a significant result. Meaning that the model is able to recognize the non-distress company but relatively poor to recognize the distress company. Therefore, it is not expected to use traditional Support Vector Machine for imbalance data FDP.
3. We then improve the traditional SVM using additional data balancing methods, SMOTE Technique. The result show that the accuracy and performance evaluation build a significant model and smaller error in classification. This can be seen from the accuracy which is much greater than the No Information Rate. The results of the performance evaluation using Recall, Precision, Specificity, and F1-Score also produce values above 90%. Therefore, SMOTE SVM method is significant for Financial Distress Prediction.
4. There were several predictive variables to be considered, therefore the selection of significant variables is very important in classification. Profitability ratio produces the highest level of importance, which is 8.23 for the Net Profit Margin ratio and the activity ratio produces the lowest level of importance, which is 2.62 for the Asset Turnover ratio. A positive level of importance for each feature means that all features remain positively correlated to the classification variable and are suitable for use. However, for better classification model results and performance evaluation, you can consider changing the activity ratio with other variables that can be used as predictors.

## VI. CONCLUSION

This study focused on applying machine learning to classify company with financial distress and non-financial distress. We compared quantitatively two methods by using a balancing technique before applying SVM and a traditional SVM. This study uses 203 transportation sector companies in Southeast Asia by evaluating the accuracy, Recall, Precision, Specificity, and F1-Score. Based on the results and discussion in the previous section, it is basically proven that the use of machine learning methods is better in predicting company bankruptcy than classical methods such as Altman, Merton, etc. because it can solve data problems with data characteristics of missing values and unbalanced data.

The simulation generate accuracy above 80% without using data balancing techniques. Although the accuracy shows good performance, other performance evaluations such as Recall, Precision, Specificity, and F1-Score show that model produces errors in the minority class classification. Higher accuracy results were produced

in 2020 compared to 2019, this was due to fewer missing values in 2020 than in 2019. The characteristics of data that used in this simulation also categorized as unbalanced data. The composition of companies with financial difficulties is only below 15% per year when compared to the total company as a whole. This triggers the results of machine learning accuracy and performance that are not optimal in classification and require data balancing techniques. The addition of the SMOTE technique results in higher accuracy, which is above 90% per year. The results of the performance evaluation using Recall, Precision, Specificity, and F1-Score also produce scores above 90%. The use of predictor variables is also important in improvising the model formed by machine learning. Based on the results of the calculation of the variable importance, the profitability ratio is a financial ratio whose function is significant knowing the level of importance of each variable used and the most influential for classification. While the activity ratio produces the lowest level of importance.

Based on this study, there are several limitations in this study. First, the data processing requires the author to use imputed data, while this method tends to affect the accuracy of the model formed. In addition, this also results in a reduction of predictor features that used for classification. However, this has been overcome by the author through the implementation of the data imputation method at the data pre-processing stage. Results showed that compared to 2019 which has more missing values than 2020, the accuracy and performance evaluation of the 2020 model year is better than 2019. Nevertheless, both models are still within acceptable accuracy limits. Second, the input variable for the classification uses only 10 features from several categories of financial ratios, while there are many variables that affect the probability of a company's bankruptcy to be considered.

This research is expected to contribute with topic of prediction of financial distress, especially in the use of data that is very closely related to the character of the data in the real financial world, namely unbalanced data and missing values. Therefore for the development of further research can be conducted through considering to improve the performance of the SVM and SMOTE by selecting more predictor features or other variables that affect the probability of a company's financial distress, considering to use of feature selection in the data before machine learning simulations, such as using the Chi Square method, Fisher Score, and considering to apply simulation using other methods of machine learning as a comparison with SVM methods, such as Random Forest, KNN, and so on.

## Indonesia Pension Fund Asset Allocation During Financial Market Uncertainty

### Due to Covid-19 Pandemic

Rahmi Bunga Anggraini S, Si<sup>1</sup> and Zaafrri Ananto Husodo, Ph.D<sup>2</sup>

<sup>1,2</sup>Faculty of Economic and Business, University of Indonesia, Jakarta, Indonesia

#### Abstract

*Aging populations and the low growth and interest rate environment have weighed heavily on retirement savings arrangements. Covid -19 pandemic will certainly compound those challenges for pension fund, as we expect interest rates and investment returns to stay low for some time. This study applies Markowitz's mean-variance optimization method (MVO) for Indonesian pension fund asset allocation. This study also using Black-Litterman model as comparison and complement the Markowitz's. The historical return and risk data used in this study are obtained from daily bond and stock indexes of Indonesia also 1-week Jakarta Interbank Offered Rate (JIBOR). This study shows that the asset allocation composition using Black-Litterman generates higher expected return and Sharpe Ratio than MVO model. Therefore, asset allocation suggested to Dana Pensiun Bank Indonesia (DAPENBI) as one of the biggest Indonesian pension fund and others who has same risk appetite, is the optimum weight using Black-Litterman model.*

*Keywords— Asset allocation; Black-Litterman; Covid-19; Mean-Variance Optimization; Pension fund*

---

#### I. INTRODUCTION

Pension fund assets exceeded USD 35 trillion at end-2020, still increasing during COVID-19 in almost all countries (OECD, 2021). Pension funds also achieved positive investment returns in most reporting countries in 2020 including Indonesia. In other hand, aging populations and the low growth and interest rate environment have weighed heavily on retirement savings arrangements. Pension funds in most countries, including Indonesia are facing safe payment crisis. Pension fund ability to maintain and increase the value of pension funds through diversified investment in capital market become an important thing. Covid -19 pandemic will certainly increase and complicate those challenges, as we expect interest rates and investment returns to stay low for some time.

Moreover, Indonesia pension fund specifically face additional challenges than other countries such as limited investment outlet since the financial deepening is still in progress. In general, pension fund asset allocation consists of stocks, government bonds, corporate bonds, mutual fund and cash including term deposit and short-term bills. High financial market uncertainty during Covid-19 pandemic enforced the pension fund globally to adjust their return target and risk appetite to ensure their investment safe and liquid enough, including Indonesian pension fund.

Dana Pensiun Bank Indonesia (DAPENBI) is one of pension funds in Indonesia that has Asset Under Management (AUM) more than IDR 10 trillion. It also faces same challenge with others pension fund in Indonesia especially the limited investment outlet that could provide return that could fulfill the liabilities. For now, DAPENBI invest in some liquid asset such as term deposit, government bonds, corporate bonds, mutual funds and stocks that listed in Indonesia Stock Exchange (DAPENBI, 2016). The fund managed by DAPENBI are assets that are separated from Bank Indonesia's asset as the founder. It is collected from participant contributions and Bank Indonesia's contribution as employer. The performance of pension fund managed by DAPENBI can be assessed from the financial statements announced every end of each year.

This study applies Markowitz (1952) mean-variance optimization method (MVO) to construct the optimum asset allocation with some minimum return constraints for DAPENBI as a pension fund who has minimum return to maintain the purchasing power. MVO is at the core of modern portfolio theory. However, in practical implementation, estimation errors could lead to extreme portfolios (Idzorek, 2007). This study also applies Black and Litterman (1992) model to construct optimum portfolio to compare with MVO model to find out which model is more suitable for longer term investor such as pension fund.

In actual fact, the Black-Litterman model has numerous advantages. First, it has been used in the situation of the modern portfolio theory to integrate the view of the investors and the uncertainties in the expected returns and also the correspondent covariance matrix which the standard statistical models usually ignore them. Second, it

also enables investor not only to take into account the historical data but also to include the prior information like the experts' experience. This knowledge should help to make the portfolio more reasonable and well-diversified based on the pure statistical portfolio optimization methods (Trichilli et al., 2020).

Some studies using Black-Litterman model in Indonesia to construct optimum investment portfolio during Covid-19 pandemic period. Research by Subekti et al. (2022) aims to demonstrate portfolio modeling, which leads to Sharia compliance in encountering crises because of COVID-19. The authors proposed adapt Black-Litterman model to Sharia-compliant stock portfolio. Another research held by Yosmar et al. (2021) tries to determine the stock portfolio with the Black-Litterman model using company data listed in the LQ45 stock index from January 2020 to June 2020. Those studies determined optimum portfolio limited in one class asset which is stock portfolio only. Therefore, this study aims to construct investment portfolio using multi asset classes including stocks, bonds, mutual fund and cash with both Markowitz and Black-Litterman Model.

## II. LITERATURE REVIEW

Asset liability management (ALM) and liability driven investment (LDI) strategies are usually adopted to guide pension fund managers in relation to strategic allocation in asset classes that should compose their investment portfolios and to the liquidity needed in each period, but not specifying in which assets to allocate resources from among the infinity of assets available in the financial market (Paula & Iquiapaza, 2021).

Portfolio optimization has been extensively studied in the theoretical and the empirical financial literature. Among the techniques of portfolio optimization, the Modern Portfolio Theory was first introduced through the canonical model of portfolio choice. In fact, Markowitz (1952) suggested that investors should focus on selecting portfolios on the basis of their overall risk-reward characteristics. This asset allocation could help pension fund to find the optimum asset allocation to fulfill the hurdle rate of the liabilities.

Even though MVO is at the core of modern portfolio theory but in practical implementation, estimation errors could lead to extreme portfolios. The Black-Litterman asset allocation model is a sophisticated portfolio construction method that overcomes the problem of unintuitive, highly-concentrated portfolios, input-sensitivity, and estimation error maximization (Black & Litterman, 1992; Idzorek, 2007). Idzorek (2007) on his research gives some insights from the relatively few works on the model and also, he provides step-by-step instructions that enable the reader to implement this complex model. After having attempted to many of the articles about the Black-Litterman model, none of the relatively few articles provide enough step-by-step instructions for the average practitioner to derive the new vector of expected returns.

The Black-Litterman model uses a Bayesian approach to combine the subjective views of an investor regarding the expected returns of one or more assets with the market equilibrium vector of expected returns on the prior distribution to form a new and mixed estimate of the expected returns. The Black-Litterman model could create stable and mean-variance efficient portfolios. This model is based on an investor's insights, which could overcome the problem of input-sensitivity that usually faced while using the Markowitz model. The most important input in mean-variance optimization is the vector of expected returns which provided by investor. However, Best and Grauer (1991) demonstrate that a small increase in the expected return of one of the portfolio's assets can force half of the assets from the portfolio.

Investing using the Black-Litterman model becomes very intuitive that the weight increases as the investor becomes more bullish on the view, and the magnitude of the weight also increases as the investor becomes more confident about the view (He & Litterman, 2002). Asset allocation with this model most likely could give better performance than MVO asset allocation.

Research that evaluates portfolio proves that the Black-Litterman model generates portfolios with lower risk, less extreme asset allocations, and higher diversification across asset classes. Sensitivity analyses indicate that these advantages are due to more stable mixed return estimates that incorporate the reliability of return predictions, smaller estimation errors, and lower turnover (Bessler et al., 2017).

Another research shows that the portfolio that constructed with limited number securities generates returns higher with lower risk using the allocation that construct with Black-Litterman model (Stoilov et al., 2021). Their research uses shares of four industrial companies in Bulgarian Stock Exchange and construct an active portfolio management which means the views of the investor is the short-term outlook.

Meanwhile in Indonesia, the research conducted by Subekti et al. (2022) also used Black-Litterman model to compare two portfolio that built from two perspective: reverse optimization and the CAPM formula. Both model

are applied in the Indonesian stock market and the result shows that both approaches can build a portfolio using Black-Litterman model with same weight allocation.

Chairunnisa (2016) also conduct research comparing both Markowitz and Black-Litterman model optimum allocation performance with one to twelve months period. The research shows that Black-Litterman model optimum allocation generates higher return and better portfolio performance than Markowitz portfolio.

### III. RESEARCH METHODOLOGY

This paper constructs optimum weight on asset allocation of the investment portfolio that owned by DAPENBI, using Markowitz model and also Black-Litterman Model as a comparison. After finding the optimum weight that used both Markowitz and Black-Litterman model, this research tried to compare the weight and tested it using historic return of all of the class assets and find the best model that can be provided to DAPENBI or any pension funds that has the same risk appetite.

This study will focus on investment portfolio that managed by DAPENBI as one of the largest pension funds in Indonesia who manages more than IDR 10 trillion. Their portfolio consists of five asset class that consider as the most liquid one which are cash/term deposit, government bonds, corporate bonds, stock and mutual fund.

#### 1. Markowitz Model

In the Mean Variance approach, Markowitz (1952), the investor optimizes a tradeoff between risk and return. We calculated the asset return with this formula:

$$R_{t+1} = \ln(P_{t+1}) - \ln(P_t) = \ln \frac{(P_{t+1})}{(P_t)} \quad (1)$$

where:  $R_{t+1}$  = log return for period t  
 $P_{t+1}$  = the price of a security at time t + 1  
 $P_t$  = the price of a security at time t

Then the investor needs to find the expected portfolio of risky assets which is is the weighted average of the expected return of each asset in the portfolio. The weight assigned to the expected return of each asset is the percentage of the market value of the asset to the total market value of the portfolio.

$$E(R_p) = w_1E(R_1) + w_2E(R_2) + \dots + w_GE(R_G); \quad (2)$$

Where:  $R_p$  = rate of return on the portfolio over the period  
 $R_g$  = rate of return on asset g over the period  
 $w_g$  = weight of asset g in the portfolio (i.e., market value of asset g as a proportion of the market value of the total portfolio) at the beginning of the period  
G = number of assets in the portfolio

To measure the risk this paper used variance and standard deviation. In the case of an asset's return, the variance is a measure of the dispersion of the possible rate of return outcomes around the expected return (Fabozzi et al., 2012). The equation for the variance of the expected return for asset  $i$ , denoted  $var(R_i)$  with this formula:

$$var(R_i) = \sum_{n=1}^N p_n [r_n - E(R_i)]^2 \quad (3)$$

Since the variance is squared units, as we know from earlier in this section, it is common to see the variance converted to the standard deviation by taking the positive square root  $SD(R_i) = \sqrt{var(R_i)}$  (4)

This equation gives us the variance an individual return.

The variance of the portfolio return is calculated with covariance. The covariance between any two assets  $i$  and  $j$  is computed using the following formula:

$$cov(R_i, R_j) = p_1[r_{i1} - E(R_i)][r_{j1} - E(R_j)] + p_2[r_{i2} - E(R_i)][r_{j2} - E(R_j)] + \dots + p_N[r_{iN} - E(R_i)][r_{jN} - E(R_j)], \quad (5)$$

where:

$r_{in}$  = the  $n$ th possible rate of return for asset  $i$   
 $r_{jn}$  = the  $n$ th possible rate of return for asset  $j$   
 $p_n$  = the probability of attaining the rate of return  $r_{in}$  and  $r_{jn}$  for assets  $i$  and  $j$   
 $N$  = the number of possible outcomes for the rate of return

In general, for a portfolio with G assets, the portfolio variance is given by:

$$var(R_p) = \sum_{g=1}^G w_g^2 var(R_g) + \sum_{g=1}^G \sum_{\substack{h=1 \\ h \neq g}}^G w_g w_h cov(R_g, R_h) \quad (6)$$

Last, the formulation of the mean-variance portfolio problem is given by:

$$\min_{w_t} w_t \sum_{r_{t|t-1}} w_t - \frac{1}{\delta} w_t' \mu_{r_{t|t-1}} \text{ subject to } w_t' = 1 \text{ and } w_t > 0 \quad (7)$$

## 2. Black-Litterman Model

One of the popular features in Black-Litterman model is the possibility of an investor input the prediction that he has as a view component that the Markowitz model did not recognize. The investor view that is used in this research provided by DAPENBI, the pension fund that managed the investment portfolio. DAPENBI shared the expected return on each class assets that owned by its investment portfolio after getting insight from other pension fund and/or investment management in Indonesia. The Black-Litterman model uses equilibrium returns as a neutral starting point. Then, it is blended with the equilibrium portfolio from CAPM. The combination of CAPM and views investors resulted in the new expected return.

The equilibrium returns are derived using a reverse optimization method in which the vector of implied excess equilibrium returns is extracted from known information using this formula:

$$\Pi = \lambda \sum w_{market} \quad (8)$$

where:

$\Pi$  = Implied Excess Equilibrium Return Vector;

$\lambda$  = risk aversion coefficient;

$\sum$  = the covariance matrix of excess returns ( $N \times N$  matrix); and

$w_{market}$  = the market capitalization weight ( $N \times 1$  column vector) of the assets.

Then the new Combined Return Vector (E[R]) is calculated with this formula:

$$E[R]_{BL} = [(\tau\Sigma)^{-1} + P'\Omega^{-1}P]^{-1}[(\tau\Sigma)^{-1}\Pi + P'\Omega^{-1}Q] \quad (9)$$

The combination on this formula can be seen in this illustration (Satchell & Scowcroft, 2007):

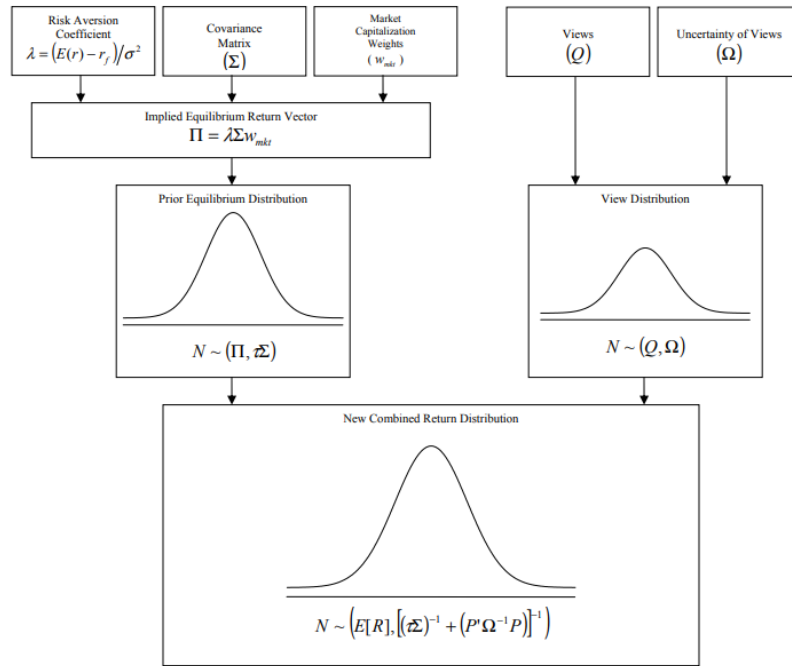

Fig. 1 Deriving the New Combined Return Vector (Source, Idzorek, 2007)

The variance posterior distribution above is calculated with

$$M_{BL} = [(\tau\Sigma)^{-1} + P'\Omega^{-1}P]^{-1} \tag{10}$$

where:

$E[R]_{BL}$  is the posterior return vector ( $N \times 1$  vector);

$\tau$  = uncertainty scalar of Implied Equilibrium Return;

$\Sigma$  = covariance matrix from historical return ( $N \times N$  matrix)

$P$  = link matrix ( $K \times N$  matrix)

$\Omega$  = uncertainty of the view ( $K \times K$  matrix)

$\Pi$  = implied equilibrium returns ( $N \times 1$  vector)

$Q$  = view vector from each asset ( $K \times 1$  vector)

This new expected return and variance as the risk approach then becomes the new input in the process of optimization. Using again the Markowitz model, the asset allocation of Black-Litterman can be expressed by this formula:

$$w_{BL} = (\lambda\Sigma_{BL})^{-1}\mu_{BL} \tag{11}$$

### 3. Compare The Optimum Weight

After having the optimum asset allocation using both Markowitz model and Black-Litterman model, this study will try to back testing those allocations. Both of the asset allocations will be compared with risk adjusted performance, which is Sharpe Index and also compare the annual return.

Sharpe ratio is calculated using this formula (Bodie et al., 2013):

$$\frac{(r_p - r_f)}{\sigma_p} \tag{12}$$

where:

$r_p$  = the average return on the portfolio

$r_f$  = average risk-free rate

$\sigma_p$  = standard deviation of portfolio return

#### IV. RESULT / FINDING

In this study, the portfolio is consisting of five liquid class assets in Indonesia which are cash that represented by Jakarta Interbank Offered Rate (JIBOR) 1-week, government bonds and corporate bonds using index published by Indonesian Bond Pricing Agency (IBPA), stocks represented by LQ45 index and mutual fund. The daily return was gathered from January 2015 to December 2021.

##### A. Markowitz Model

Table 1 shows the descriptive statistics for all class assets, including the average daily and annual return also the daily standard deviation that represent the risk of the asset. The average daily return will be used as the expected return in Markowitz model.

Table 11. Average Return and Risk Period 2015-2021

	Cash	Government Bonds	Corporate Bonds	Stocks	Mutual Fund
<b>Daily Return</b>	0.0213%	0.0390%	0.0427%	0.0024%	0.0012%
<b>Annual Return</b>	5.3350%	9.7501%	10.6838%	0.5955%	0.2877%
<b>StdDev (Daily)</b>	0.0033%	0.3301%	0.1499%	1.4031%	1.2918%

Source: (Processed by author, 2022)

Combining expected return that showed in Table 1 and the variance-covariance matrix in Table 2 below and also some constraint that DAPENBI defined, the optimum weight generated with Markowitz model can be seen in Table 3 while the expected return and sharpe ratio is provided in Table 4

Table 12. Variance-Covariance Matrix on Daily Return

	Cash	Government Bonds	Corporate Bonds	Stocks	Mutual Fund
Cash	0.000000	0.000055	0.000011	0.0000985	0.0000832
Government Bonds	0.000055	0.000109	0.000066	0.0001039	0.0000887
Corporate Bonds	0.000011	0.000066	0.000022	0.0000996	0.0000843

#### 4. Black-Litterman Model

The information of a covariance matrix of five returns, the link matrix **P** associated with the views and the prediction **Q** are provided in Table 5. The information on market returns is also included. The absolute views of **Q** are provided by DAPENBI as the owner of portfolio that used in this study.

Table 15. The Information Related to Parameter Black-Litterman

Parameter	Estimated Value
$\tau = \text{tau}$	0.05
$\lambda = \text{scalar}$	3.02948693
Link/Pick matrix	$P = \begin{bmatrix} 1 & 0 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 & 0 \\ 0 & 0 & 1 & 0 & 0 \\ 0 & 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 0 & 1 \end{bmatrix}$
Predictive return Q	$Q = \begin{bmatrix} q_{\text{cash}} \\ q_{\text{SBN}} \\ q_{\text{Obtigas}} \\ q_{\text{saham}} \\ q_{\text{reksadana}} \end{bmatrix} = \begin{bmatrix} 0.040\% \\ 0.030\% \\ 0.028\% \\ 0.058\% \\ 0.046\% \end{bmatrix}$
Combined Return Vector	$E_{rBL} = \begin{bmatrix} 0.040\% \\ 0.039\% \\ 0.038\% \\ 0.068\% \\ 0.062\% \end{bmatrix}$
Matrix Varian-Covarian B-L	$\sigma_{B-L} = \begin{bmatrix} 0.0000000011 & 0.0000056845 & 0.0000011838 & 0.0001025763 & 0.0000866567 \\ 0.0000056845 & 0.0000113476 & 0.0000068475 & 0.0001082770 & 0.0000923586 \\ 0.0000011838 & 0.0000068475 & 0.0000023419 & 0.0001037801 & 0.0000878619 \\ 0.0001025763 & 0.0001082770 & 0.0001037801 & 0.0002050620 & 0.0001892118 \\ 0.0000866567 & 0.0000923586 & 0.0000878619 & 0.0001892118 & 0.0001732312 \end{bmatrix}$

Table 17. Expected Return &amp; Sharpe Ratio

Portfolio Expected Return (Daily)	0.039%
Portfolio Expected Return (Annual)	<b>9.866%</b>
Portfolio SD	0.473%
Expected Sharpe Ratio	<b>3.633%</b>

Source: (Processed by author, 2022)

#### 5. Back Testing Result

In order to have another comparison between the optimum weight using Markowitz model with Black-Litterman model, this study also did back testing using the return in 2020 to show the impact on market uncertainty due to Covid-19 to the portfolio.

Table 18. Comparison Weight

Asset Class	DAPENBI	Markowitz	Black-Litterman
Cash	9.51%	4.00%	10.00%
Government Bonds	46.62%	30.00%	55.00%
Corporate Bonds	22.74%	58.00%	27.00%
Stocks	3.54%	4.00%	5.00%
Mutual Fund	10.23%	4.00%	3.00%

Table 19. Back Testing Result

	Annual Return 2020	Std Deviation (Annualized) 2020	Sharpe Ratio
DAPENBI	9.02%	8.08%	0.43
MVO	10.10%	6.00%	0.75
B-L	10.52%	6.57%	0.75

Source: (Processed by author, 2022)

## V. DISCUSSION

At a glance we can see from Table 1 that bond gives the highest annual return during period 2015 to 2021, both government and corporate bonds. In other hand, during the same period it is obvious that cash generates the lowest standard deviation meaning the lowest risk compare to other assets. If we put more details on the bond asset classes, the corporate bond generates higher return and surprisingly lower risk compare to government bond. The lower standard deviation most likely influenced by corporate bond's investor prefer to hold the bond into maturity since it is not actively traded in secondary market.

If we compare Table 4 and Table 7, it shows that optimum weight using Black-Litterman model generating both higher expected return and sharpe ratio. These results support the research conducted by Chairunnisa (2016) which the Black-Litterman allocation construct better portfolio performances. Additionally, the portfolio that generated with Black-Litterman model indicates more intuitive since this model include the investor's subjective view. This model is not just considering the historical data but also including the expected return ahead. We can see that Black-Litterman model gives higher composition in cash and also government bonds.

Table 8 showing the comparison between portfolio that generated by both of the model and the existing DAPENBI's portfolio. It presents that the portfolio constructed with Black-Litterman model seems close to the pattern of the DAPENBI's portfolio. Therefore, it is more visible for DAPENBI mimicking the asset allocation generated by Black-Litterman model. Furthermore, if we compare the back-testing result, even though both model shows similar Sharpe Ratio but the portfolio constructed by Black-Litterman model generates higher annual return.

## VI. CONCLUSION AND RECOMMENDATION

The mean-variance optimization is an essential tool for portfolio managers. However, it does have some weaknesses. The model's sensitivity to small changes in initial values, the estimation errors and the use of historical data are three elements that lead to a concentrated distribution of assets. The Black-Litterman model integrates the market equilibrium hypothesis according to the CAPM into the investors' views and creating a new return vector.

This study applied both Markowitz and Black-Litterman model to construct optimum weight for asset allocation managed by DAPENBI. The asset classes that used in this study are same asset classes with DAPENBI's existing portfolio. The result shows that the asset allocation constructed by Black-Litterman model pledges better both expected annual return and sharpe ratio. The back-testing result more or less shows the same thing, the Black-Litterman model generates higher return but at the same time generates higher standard deviation so that provides same sharpe ratio.

Both of DAPENBI and Black-Litterman model has higher allocation on government bonds than the corporate bonds. Markowitz model suggests higher allocation on corporate bonds because the historical return is also higher

but in contrast the market capitalization of this assets is not high so that it is harder for DAPENBI to implement. Considering the existing DAPENBI's portfolio asset allocation and also the risk adjustment performance as well as back testing result, this study recommends DAPENBI to implement the optimum asset allocation generated by Black-Litterman model.

#### ACKNOWLEDGEMENT

The first author would like to thank DAPENBI for accepting the request to be the subject on this case study, and also Bank Indonesia for the master scholarship.

### **Abstract**

*This research is entitled "Analysis of the Effect of Education, Women's Health, and Labor Force Participation Rate on Poverty in Metropolitan Semarang in 2017-2021". The purpose of the study was to analyze the effect of independent variables which include women's life expectancy, average years of schooling, and labor force participation rates on poverty in Metropolitan Semarang. The analytical method used is panel data regression with a cross section covering 6 regencies/cities in the Semarang Metropolitan area, including Semarang City, Kendal Regency, Demak Regency, Salatiga City, Grobogan Regency, Semarang Regency. While the time series data starts from 2017 to 2021. The results showed that the life expectancy of women and the average length of schooling for women had an effect on poverty in the Semarang Metropolitan area.*

*Keywords— Poverty, Women's Life Expectancy, Average Length of Schooling, Labor Force Participation Rate, Panel Data Regression.*

### **I. INTRODUCTION**

One of the problems in Indonesia is poverty. Even every developing country has the same problem. Economic development has a goal to improve the welfare of the people who have a close relationship with poverty. One way to increase the level of human welfare is to invest in human capital in education and health. Human capital investment has the aim of increasing productivity and creating community welfare.

Therefore, the problem of poverty has always been a development priority of a third world country. Changes in the condition of society and the existence of poverty which are in real terms are dynamic which always changes both in intensity or in size. Continuing a careful assessment so that the handling of this problem is always in accordance with the context of poverty itself. In Indonesia, with a large number of poor people, making the problem of poverty one of the development priorities (Hofmarcher, 2021).

The development of education and health are the two pillars to form human capital in economic development which is nothing but a long-term investment of a country. The achievement of development goals in the fields of education and health, in turn, can improve the quality and productivity of the population, where population productivity growth is the driving force for economic growth and the welfare of the population itself. Through investment in education, it will be able to improve the quality of human resources as shown by increased knowledge and skills that will encourage an increase in one's work productivity, and in the end someone who has high productivity will obtain better welfare and avoid poverty (Widyasworo, 2014).

The number of poor people in Semarang City in 2021 will reach 84.45 thousand people (4.56 percent), an increase of 4.87 thousand people compared to 2020 which amounted to 79.58 thousand people (4.34 percent). The poverty line of Semarang City also increased from Rp. 522,691, - in 2020 to Rp. 543,929,- in 2021. Despite the increase, Semarang City still has the lowest percentage of poor people in Central Java. Meanwhile, in general, in Central Java, the level of education completed by the poor is elementary/junior high school/high school graduation. However, the percentage of not completing elementary school is also high. The 12-year Compulsory Education Program still needs to be promoted to support compulsory basic education for the poor. And for Semarang, based on information obtained from poverty data and information in 2019, the majority of the poor graduated from SD/SLTP/SLTA.

Like education, welfare is basically a human resource speculation to create a prosperous society. The level of general welfare will greatly influence the level of local government assistance and has the power to closely relate to needs. Meanwhile, the level of need will be associated with the level of prosperity. Since welfare is the main character's effort to continue public government assistance, welfare has always been the main concern of public authorities as public specialist cooperatives. Public authorities must have options to ensure the right individuals to be solid by providing welfare administration in a fair, equitable, adequate, reasonable and quality manner.

Not only that, health problems are also another priority. A number of health problems that occur in the community are a priority for handling the Central Java Provincial Health Office together with related parties. With adequate health facilities and easily accessible to the public, health problems can be overcome little by little (Wijaya et al., 2020).

Assuming it's back to the state's goal, which is to help their relatives with a good salary, the issue of work is also one of the public's points of view that must be considered. In addition, the high population growth will affect the development of the young workforce. Apart from a rapidly growing workforce, the main problem of employment in Indonesia is how to increase efficiency. One of the advances in the field of business that requires extraordinary consideration in the implementation of its progress is that it is undeniable that the task of the female workforce is huge.

If we compare the lives of people in the poorest communities across developing countries, we can find that in fact - everywhere - it is women and children who are most deprived. To improve the living conditions of the poorest people, women must be involved in the mainstream of the economy. This includes increasing the level of women's participation in education and training programmes, expanding formal sector employment and expanding agriculture. In addition, it is very important to strive for guarantees for women to obtain equal access to various empowerment opportunities through education programs, services, and job opportunities. Legalizing employment in the informal sector where the majority of workers are women can also improve women's economic status (Dwi & Amory, 2018).

According to previous research by (Widyasworo, 2014) with the results showing that the three independent variables affect the level of poverty. The level of education and participation of women's workforce has a significant effect either partially or simultaneously, while the level of health has an effect but is not significant. The relationship that exists between the independent variable and the dependent variable is in the opposite direction. When one or all of the independent variables increase, the poverty rate will decrease. And the variable of women's labor force participation has the greatest influence on the poverty level because the reason women go to work is more dominant due to the economic demands of the family.

According to research from (Mulasari, F Dyah, 2015) the role of women seen from the life expectancy of women has a better value than men, the average length of schooling for women is still below the average length of school for men, the participation rate of the female workforce is still below the level of participation of the male workforce. man. Suggestions in this study are improvements in women's education, women's education and health are two interrelated things. If women have good education, the next generation will have good quality as well. In employment, it is necessary to review policies that make women marginalized in the world of work.

According to research from (Faridi, 2016) labor force participation reduces poverty. The coefficient of labor force participation is negative and very significant. The findings show that an increase of one unit of labor force participation reduces poverty by about 1.35 units. The reason may be that when job opportunities increase, people's incomes also increase, thereby reducing poverty. Health is another important factor reducing poverty. The results of this study are theoretically reasonable but not statistically significant. Although health spending reduces poverty, it has minimal impact. The literacy rate coefficient is negative and highly statistically significant. The findings show that with an increase of one literacy unit (LITR), poverty is reduced by around 1.13 units.

According to research from (Jacobus et al., 2022) the results of the study show that education, unemployment and gender inequality have an effect on poverty. This shows that the variables of education and gender inequality have a significant and negative effect on poverty, while the unemployment variable has a significant and positive effect on poverty in the Regency of Siau Islands, Tagulandang Biaro.

According to research from (Mulugeta, 2021) with the result that women's participation reduces household poverty. Therefore, this study recommends that households use family planning, promote women to attend higher education, be exposed to mass media, create public or private child care centers and access credit for women. At this time both the household and the government should have a joint effort and responsibility to find a possible panacea.

Based on the above, this research seeks to identify the variables, namely the level of education, women's health and the level of labor force participation, which are instruments that can help overcome the problem of poverty and seek appropriate solutions to help overcome the problem of poverty effectively according to its objectives.

## II. LITERATURE REVIEW

Poverty Poverty is one of the problems that humans always face. The problem of poverty is as old as humanity itself and the implications of the problem can involve all aspects of human life, although it is often not realized that its presence is a problem for the people concerned. For those who are classified as poor, poverty is something that is real in their daily lives, because they feel and live for themselves how they live in poverty (Mowafi & Khawaja, 2005).

Education (Nurkholis, 2013) a tool for economic development and also to advance the world of technology. In the practice of modern education management, one of the five functions of education is a technical-technological function both at the individual level to the global level. The technical-technological function refers to the contribution of education to technological developments, for example, education can help students to gain knowledge and skills necessary to live and compete in a competitive economy.

Many poor people experience ignorance or experience stupidity even systematically. Therefore, it becomes important for us to understand that poverty can lead to stupidity, and stupidity is clearly synonymous with poverty. To break the chain of cause and effect above, there is one key element, namely education. Because education is a means of eradicating ignorance as well as poverty.

(Tubaka, Saddam, 2019) stated that one of the basic capitals in the implementation of economic development is a good public health condition. In economic development, the implementation of health development must also be considered. (Nurkholis Afid, 2016) revealed that human capital can be measured through health, because awareness of health has a relationship with a person's productivity in carrying out their activities. Measurement of human capital in health can use the Life Expectancy Rate (AHH), where the higher a person's life expectancy, the higher the quality of his health indicators, and vice versa.

The analysis used to estimate the factors that influence poverty in Metropolitan Semarang. In this study, a regression model is used which must use three independent variables with a panel data regression analysis equation model with the selected model Fixed Effect Model. Regression analysis with econometric model as follows:

$$PVRT_{it} = \beta_0 + \beta_1 AHH_{it} + \beta_2 RLS_{it} + \beta_3 TPAK_{it} + e_{it}$$

Inwhere:

<i>Poverty</i>	: Poverty
<i>AHH</i>	: Life expectancy
<i>RLS</i>	: Average Length of School
<i>TPAK</i>	: Labor Force Participation Rate
$\varepsilon$	: Error Term (Error Factor)
$\beta_0$	: Constant
$\beta_1 \dots \beta_4$	: Independent Variable Regression Coefficient
<i>it</i>	: Year

## III. RESEARCH METHODOLOGY

The analysis used to estimate the factors that influence poverty in Metropolitan Semarang. In this study, a regression model is used which must use three independent variables with a panel data regression analysis equation model with the selected model Fixed Effect Model. Regression analysis with econometric model as follows:

$$PVRT_{it} = \beta_0 + \beta_1 AHH_{it} + \beta_2 RLS_{it} + \beta_3 TPAK_{it} + e_{it}$$

Inwhere:

<i>Poverty</i>	: Poverty
<i>AHH</i>	: Life expectancy
<i>RLS</i>	: Average Length of School

$TPAK$	: Labor Force Participation Rate
$\varepsilon$	: Error Term (Error Factor)
$\beta_0$	: Constant
$\beta_1 \dots \beta_4$	: Independent Variable Regression Coefficient
$it$	: Year

#### IV. RESULT / FINDING

This data analysis uses an error correction model, namely the Fixed Effect Model. The estimation steps include the Chow test, the goodness of the model test and the effect validity test in order to test the validity of the model and the Chow Test steps (Common Effect Model test, Fixed Effect Model test, test Hausman Test, Random Effect Model test). Test the goodness of the model and test the validity of the effect.

##### A. Chow test

The Chow test is a test used to determine whether the use of general fixed effects or effects is the most appropriate when estimating panel data (Widarjono, 2009).

The hypotheses of the chow test are:

$H_0$  : Common Effect Model / CEM selected model

$H_a$  : Fixed Effect Method / FEM selected model

##### B. Hausman Test (Hausman Test)

Hausman test is a test that compares the fixed effect model with random effects to determine the best model. Hausman's test is in accordance with the idea that Least Square Dummy Variables (LSDV) in the fixed effects model (FEM) and Generalized Least Square (GLS) in the random effects model are efficient, while ordinary least squares (OLS) in the general effects model (CEM) is not. efficient(Munandar, 2017). Hausman test hypothesis as follows:

$H_0$  : selected model Random Effect Model / REM

$H_a$  : Fixed Effect Model / FEM selected model

##### C. Lagrange Multiplier Test

The Lagrange Multiplier (LM) test is a test used to see whether the random effect model is better than the common effect model(Nandita et al., 2019). The hypotheses used are:

$H_0$  : selected model Random Effect Model / REM

$H_a$  : the selected model Common Effect Model / CEM

##### D. Parameter significance test

##### E. Simultaneous Significance Test (F-Test)

The F-test is used to understand whether all the independent variables (independent) have an effect on the dependent variable(Syukri & Hinaya, 2019). The F statistic test is a one-way significance test. The hypothesis of the F test is:

$H_0: \beta_{p,q} = 0$ (the independent variable regression parameter p on the dependent variable q has no significant effect)

$H_0: \beta_{p,q} \neq 0$ (the independent variable regression parameter p on the dependent variable q has a significant effect)

Based on the results of panel data regression calculations using the Fixed Effect Method model, the variables of Education, women's health, and labor force participation rates on poverty in the Semarang metropolitan in 2017-2021 were chosen with the following equation:

$$PVRT_{it} = -128.2078 + 1.9000291AHH_{it} - 1.888113RLS_{it} + 0.075370TPAK_{it} + e_{it}$$

Panel data estimation results with the selected model FEM:

Table 1. FEM . test

Variable	Coefficient	Std. Error	t-Statistics	Prob.
C	-128.2078	78.45312	-1.634196	0.1171
AHH	1.900291	1.082594	1.755313	0.0938
RLS	-1.888113	0.911205	-2.072106	0.0508
landfill	0.075370	0.052279	1.441683	0.1641
R-squared	0.988358			
F-statistics	222.8438			
Prob(F-statistic)	0.000000			

Source: Output Eviews 10

The result of the coefficient of determination (R<sup>2</sup>) which is 0.988358 or 98.83% shows that all independent or dependent variables consisting of education variables, women's health, labor force participation rate explain the changes contained in the dependent variable, namely poverty by 98.83% while the remaining 1.17% is explained by the variable others not included in this study. So you can conclude that the conclusion is that poverty in the Semarang metropolitan area is very much dominated by the independent variables in this study.

F-Statistic value of 222.8438 has a probability of 0.00 at a significance level of 5%, meaning that all independent variables significantly affect Semarang metropolitan poverty.

#### t test

The results of the t-test for all independent variables are in table 2.

Table 2. t test

Variable	t-Statistics	Prob.	Alpha	Conclusion
AHH	1.755313	0.0000	0.10	Significant (< $\alpha$ )
RLS	-2.072106	0.0000	0.10	Significant (< $\alpha$ )
landfill	1.441683	0.0000	0.10	Not Significant (< $\alpha$ )

Source: Output Eviews 10

## V. DISCUSSION

Based on the results of the study, it shows that health has an effect on poverty with a coefficient value of 1.900291, education has a negative effect on poverty with a coefficient value of -1.888113 and the level of labor force participation has an effect on poverty with a coefficient value of 0.075370.

This research is in line with (Widyasworo, 2014), which the results of this study indicate that the three independent variables have an effect on the level of poverty. The level of education and participation of women's workforce has a significant effect either partially or simultaneously, while the level of health has an effect but is not significant. The relationship that exists between the independent variable and the dependent variable is in the opposite direction. When one or all of the independent variables increase, the poverty rate will decrease. And the variable of women's labor force participation has the greatest influence on the poverty level because the reason women go to work is more dominant due to the economic demands of the family.

## VI. CONCLUSION AND RECOMMENDATION

Results The analytical method used is panel data regression with a cross section covering 6 regencies/cities in the Semarang Metropolitan area, including Semarang City, Kendal Regency, Demak Regency, Salatiga City, Grobogan Regency, Semarang Regency. The results showed that the life expectancy of women and the average length of schooling for women had an effect on poverty in the Semarang metropolitan area. While the level of labor force participation has no effect on poverty in Semarang.

## Operational Performance Efficiency and Financial Performance Efficiency of Aviation Companies in The Asia-Pacific Region During Covid-19 Pandemic

Febry Dhiya Ulhaq Fauzi<sup>1</sup>, Viverita Viverita<sup>2</sup>

<sup>1,2</sup> Faculty of Economic and Business: dept. of Management, University of Indonesia, Depok, Indonesia

### Abstract

*This study aims to evaluate the factors that affect the resilience of Asia Pacific airlines during the Covid-19 pandemic through operational efficiency and the financial performance's efficiency. The pressure due to the Covid-19 pandemic due to the lack of occupancy can disrupt the aviation industry's operational performance and financial performance. However, there are still few research examining the impact of the Covid-19 pandemic on the efficiency of airlines' operational and financial performance in the Asia Pacific region. By evaluating eight airlines located in the Asia Pacific region through two-stage data envelopment analysis.: For FSC companies, only Eva Air and China Airlines were able to increase the company's efficiency to achieve efficient conditions both operationally and financially during the Covid-19 pandemic (in 2020), and Air Asia as an LCC company was able to maintain good efficient conditions in 2019 and 2020 operationally and financially. Employees are the most important factor in influencing the efficiency of an airline. Thus, to be efficient and durable it is necessary to reduce the number of employees by 43%. the company's management can digitize to make it easier and provide a sense of security to customers, rearrange the strategy for selecting the fleet structure and focusing on domestic flights or short-haul flights before long-haul routes between continents.*

**Keywords—** Aviation Industry; Covid-19; Financial Performance Efficiency; Internal Two-Stage DEA; Operational Efficiency.

### I. INTRODUCTION

Covid-19 pandemic has been going on for 2 years and has caused a disruption on human life. This calamity resulted in an economic crisis that greatly affected the business world, including the aviation industry. The travel and tourism sectors are amongst the most affected sectors because they are vulnerable to the spread of the virus. The aviation industry, which is included in this sector experienced a decline in demand (Shao & Sun, 2016).

Conforming to International Civil Aviation Organization (ICAO) in 2021, the aviation industry had suffered a loss of \$371 billion. From 6 regions (Africa, Asia-Pacific, Europe, Latin America, Middle East, and North America), on average, airlines are experiencing a 2,695,480,497 decrease in occupancy in 2020 or 45.48% lower than the previous year (ICAO, 2021).

Fig. 10. Airline's Occupancy By Region (Source: ICAO, 2021)

Asia-Pacific had the highest occupancy in 2019, which means most flights happened in the Asia-Pacific region. As reported by the survey agency Skytrax, for the top 50 airlines company in 2019, 24 of them are from Asia-Pacific region, 14 are based in Europe, 4 in Middle East and North America, and 2 from Latin America and Africa region (Skytrax, 2020).

According to the International Air Transport Association (IATA), in 2020 airline's passengers as measured by revenue passenger kilometer (RPK), decreased by 90% YoY in April 2020. The collapse of economic activity and trade also affected the rate of shipments of goods at almost 30% lower YoY. Based on the International Civil Aviation Organization (ICAO), the total flights (passenger and cargo, domestic and international) had reached the lowest point in April 2020 where there were only 1,134,269 flights or 69.43% lower than April in 2019 (IATA, 2021).

Fig. 11. Flights and Airline's Available Seats in 2019-2020 (Source: ICAO, 2021)

The airline's available seats also experienced a drastic decline after the spread of the Covid-19 virus. In May 2020, there were only 100,978,462 seats available or 79.84% lower compared to the same month of the previous year. Decreasing number of flights and available seats, as shown in **Figure 2** simulates how a decrease in revenue will affect the performance or efficiency of the airlines companies because the aircrafts had been grounded and sent back to lease's company as indicated by RPK and available seats kilometer (ASK). The financial performance was also affected by this turmoil because it prevented companies from making investment due to lack of cash (Abdullah et al., 2020). Poor company performance can also increase the financial distress of the company which can lead to bankruptcy. A decrease in the amount of revenue can affect the company's cash flow which will affect the management of company assets. Companies will experience difficulties in regulating, managing or investing in working capital because they are constrained in cash. To operate or perform in daily services, company issued a number of funds and expect their returns in short period from sales or services that have been conducted. If the sales are higher, the operation cost will be lower and the profitability of the company will increase (Li & Cui, 2017, 2018; Mallikarjun, 2015).

Several studies had been conducted to analyze the impact of Covid-19 pandemic on airline companies (Abdullah et al., 2020; Pereira & Soares de Mello, 2021; Zheng, 2021). Some studies on airlines or aviation companies used the internal two-stage DEA model to measure the efficiency of the companies (Lin & Hong, 2020; Michali et al., 2021; Shao & Sun, 2016). These studies show that the scope on measuring the efficiency of the company's operations is limited with operational data only. According to these research that had been conducted, mostly only relied on operational data from the airlines. There are also limitations to the research conducted by Lin & Hong (2020) namely on the number of aircraft companies included, which was only the four best aircraft companies in China and they suggested that further research should increase the number of airlines and use more complex input and output variables.

There are several studies on airlines or aviation companies that use the internal two-stage DEA model (Lin & Hong, 2020; Michali et al., 2021; Shao & Sun, 2016). From these studies, the scope or limitations of the research only mostly measure efficiency from the operational side of the company, and according to research conducted by the type of data used only operational data from airlines, and there are limitations to the research conducted by Lin & Hong (2020), namely the limited number of aircraft companies that are used only to the 4 best aircraft companies in China and suggest that further research can be done by increasing the number of airlines and using more complex input and output variables (Lin & Hong, 2020). Therefore, by looking at the limitations of these studies and the opportunities that can be used for further research, this research could contribute by including financial aspects to measure the efficiency of financial performance and widen the studies coverage to Asia-Pacific region. This is because the Asia-Pacific region have the highest number of companies compared to other regions according to a survey by Skytrax in 2020. This research will also be conducted during the time period when conditions were 1 year before pandemic and the first year of the Covid-19 pandemic to see

the natural response or direct effect given by this pandemic to aircraft companies. Hence, this research is focusing on how Covid-19 pandemic affects the operational efficiency and the financial performance of aviation industry by using internal two-stage data envelopment analysis or also called network data envelopment analysis (NDEA) approach for airlines company in Asia-Pacific.

## II. LITERATURE REVIEW

### A. Data Envelopment Analysis

Data Envelopment Analysis (DEA) is a famous method on analyzing the efficiency of a company ([Wu et al., 2006](#)). This method can also be applied to measure airline company efficiencies ([Emrouznejad et al., 2008](#); [Emrouznejad & Yang, 2018](#); [Ghorbani et al., 2010](#); [Liu et al., 2013](#); [Mardani et al., 2017](#); [Odeck & Bråthen, 2012](#); [Sueyoshi et al., 2017](#); [Xiong et al., 2020](#)). In the previous studies mentioned before, they used traditional DEA types which were often criticized because in they appear to only change or transform input variables into output variables without explicitly explaining how this transformation process occurs ([Färe & Grosskopf, 2000](#)). To improve the use of the DEA method, the two-stage DEA model is more appropriate to use. There are two models of two-stage DEA, namely internal two-stage DEA and external two-stage DEA ([Emrouznejad & Yang, 2018](#)). Internal two-stage DEA is a type of DEA which uses an intermediate variable in its operation. This variable is indicated by the existence of an output variable from the stage 1 process and acts as an input variable at stage 2. This internal two-stage DEA is often also called network DEA (NDEA). Meanwhile, external two-stage DEA is a type of DEA that uses other methods or analytical techniques at the second stage after carrying out DEA operations (stage 1). The methods in stage 2 that are commonly used are regression techniques such as ordinary least squares (OLS) or bootstrapping, analytical hierarchy process (AHP), etc. ([Henriques et al., 2020](#)). Answering the main problem of the traditional DEA method, the two-stage internal model is the right model because this method explains how the process of transforming input variables into output variables with the help of the intermediate variables ([Henriques et al., 2020](#); [Kao & Hwang, 2008](#)).

### B. Efficiency of Airlines Company

First, research that was conducted by [Lin & Hong \(2020\)](#) regarding to the evaluation of cost efficiency, cost effectiveness and services effectiveness of 8 airline companies in China using the internal two-stage DEA method or network DEA (NDEA). The input variables consist of operating expenses, and the number of employees. Variables that act as intermediate variables (output stage 1 becomes input stage 2) are available seat kilometer (ASK) and available tonne kilometer (ATK). Meanwhile, the main outputs (stage 2's output) are revenue passenger kilometer (RPK), and revenue tonne kilometer (RTK). The results show that the service effectiveness of the aircraft company is better than its cost efficiency.

According to [Tavassoli \(2014\)](#) on his research in measuring the operational performance of airlines for passenger and cargo transportation. This study uses a novel-slacks-based method in measuring network data envelopment analysis (SBM-NDEA) to measure the technical efficiency and service effectiveness of the aircraft company. The results showed that the average technical efficiency and service effectiveness of the 11 aircraft companies were 0,7599 and 0,4515. The input variables are number of passenger planes, number of employees, and number of cargo planes. The intermediate variables are passenger plane kilometers and cargo plane kilometers. The output variables are passenger kilometers and tonne kilometers. The findings of this study are the average efficiency score at stage 2 is better than stage 1, and the efficiency value of aircraft companies is very low.

Then, the measurement of the company's operational efficiency (allocation, passenger transport, and freight transport) from 477 flight routes by [Shao & Sun \(2016\)](#) using the internal two-stage DEA (NDEA) method. This research has an input flight related cost variable. The intermediate variables are available tonnage (AT) and available seats (AS). The output variables are passenger throughput (PT) and freight throughput (FT). They revealed the differences in the constraints when measuring intermediate on NDEA significantly affect the value of flight route efficiency. Most flight routes have high allocation efficiency and passenger transport efficiency, while having low efficiency values in freight transport.

Next, as [Ling et al., \(2018\)](#) research on regarding to the productivity and efficiency of ASEAN aircraft companies using an external two-stage DEA method, namely DEA-Malmquist Total Factor Productivity (TFP) which has input variables in the form of operating cost, ASK, and output. In the form of RPK, passenger revenue. He agrees that RPK and passenger revenue have a positive significant effect on efficiency, ASK has a negative significance on efficiency, and operating cost does not have a significant impact on efficiency.

Furthermore, another external two-stage of DEA on measuring the efficiency of ASEAN aircraft using DEA and bootstrapping conducted by Hu & Tung (2017) shows that the efficiency of ASEAN aircraft companies from 2010 - 2014 has a declining trend. This study uses input variables in the form of aircraft number, operating cost, ASK, and output in the form of RPK and total revenue. The research focuses on measures and benchmarks the comparative operating efficiencies of ASEAN's major airlines and presents a new interpretation along with managerial implication and he argues that the disaggregate input efficiency of ASEAN airlines shows that aircraft efficiency is the lowest, operating cost efficiency is better, and available seat efficiency is the best.

Finally, study that was conducted by Barbot et al., (2008) regarding to the aircraft performance using the external two-stage DEA method consisting of DEA and total factor productivity. This research has inputs in the form of labor, fleet (number of operated aircraft) and fuel (in gallons consumed), as well as outputs such as ASK, RPK, and RTK. He claims a low-cost carriers (LCC) aircraft are more efficient than full-service carriers (FSC), then only labor has an effect on productivity.

Based on those evidence, for this research, The relationship between variables for the financial and operational performance of aircraft companies with the Covid-19 pandemic in this study is as follows

Fig. 12. Research Framework (Source: Author, 2022)

Based on Fig.3, it shows the relationship between the phenomenon or crisis of the Covid-19 pandemic on operational efficiency and the efficiency of the financial performance of aircraft companies. Operational performance can be seen from company resources such as capacity, number of airlines, and number of employees in carrying out company operations so as to obtain revenue which can be an efficiency component or variable of the company's financial performance (Cui et al., 2020; Cui & Li, 2017; Li & Cui, 2018; Mallikarjun, 2015; Tavassoli et al., 2014).

### III. RESEARCH METHODOLOGY

#### A. Data

The data in this research is airline companies that are registered or listed on the local stock market, and has complete data such as financial reports and their operational reports. Data is retrieved from S&P Capital IQ and Thomson Reuters on annual basis starting from pre-Covid-19 pandemic (January 2019) until the first year of the Covid-19 pandemic crisis (December 2020). This is because in figure 2, in January 2020, the number of flights and the available seats has decreased. For the number of flights, the large decrease in January 2020 against December 2019 was 16.067 flights, and for the large decrease in the number of occupied seats between January 2020 and December 2019 which was 6.891.182 seats. So, it can be said that in January 2020, the aviation industry was already feeling the effects of the Covid-19 pandemic. Another reason for choosing this period is to see the changes of companies performance conditions naturally without any bias from previous years.

Table 20. Airlines Company in Asia-Pacific

No	Airline's company (FSC)	IATA Code	Country
1	Singapore Airlines	SQ	Singapore
2	ANA Airlines	NH	Japan
3	Cathay Pacific	CX	Hong Kong
4	Eva Air	BR	Taiwan
5	Japan Airlines	JL	Japan
6	China Southern Airlines	CZ	China
7	China Airlines	CI	China

No	Airline's company (FSC)	IATA Code	Country
	Airline's company (LCC)	IATA Code	Country
1	Air Asia	AK	Malaysia

Source: Skytrax (2020)

Asia-Pacific had the highest occupancy in 2019, which means most flights happened in the Asia-Pacific region (Skytrax, 2020). In the 50 best airlines companies based on Skytrax 2019, 24 of them or 48% are from the Asia Pacific region. Of the 24 data, 17 of them are listed on stock exchanges in each country. In 17 listed Asia Pacific airlines, 8 of them have complete data where seven of them are *full service carrier* (FSC) and one *low-cost carrier* (LCC).

### B. Two-Stage Data Envelopment Analysis

In general, DEA is used in two formulation orientations, named input minimization (input oriented) and output maximization (output oriented). Input minimization is carried out to obtain the optimal number of inputs which will later be used for a predetermined amount of output. On the other hand, output maximization is used to obtain the optimal amount of output from a predetermined number of inputs. A DMU is said to be efficient if the efficiency score is 1 and inefficient if the efficiency score is below 1. In the two-stage DEA model, the orientation used in stage 1 is input oriented and output oriented at stage 2 (Chen & Zhu, 2018; Kao & Hwang, 2008, 2011). If the efficiency value generated by DEA is 1, this indicates that 100% of the inputs used are allocated or transformed into outputs. If the efficiency value is less than 1, the DMU or unit is not efficient and there are parts of the input that are not used or are not maximized by the existing inputs (Suzuki et al., 2011).

Fig. 13. Two-Stage DEA Process (Source: Emrouznejad, Dehnokhalajj & Clegg, 2021)

In this research, phase 1 is measuring operational efficiency and phase 2 is measuring the efficiency of financial performance. The network structure in the internal two-stage DEA of this study includes human resources which are described by the number of employees of the aircraft company. The number of employees is the input in the company's operations because it represents an investment in human resources. In achieving the level of operational efficiency, it is necessary to have a number of employees so that they can work more effectively and efficiently (Cui & Jin, 2020; Cui & Li, 2017; Li & Cui, 2017, 2018). Based on research conducted by Mallikarjun (2015); Tavassoli et al., (2014), seat miles (ASM or ASK) represent service capacity (supply), and passenger miles (RPM or RPK) represent service requests (service). It is not appropriate to increase supply and demand at the same time. RPK and ASK are 2 important indicators in measuring the operations of an aircraft company. ASK is used to produce RPK because this RPK is defined as the sum of ASK products between 2 places (destinations) and the amount of income (income passengers) served on the trip. Fleet size is the number of aircraft fleets available for maximum service. Companies that have large fleets tend to be able to change the number of ASK to a larger number of RPKs compared to companies that have a small fleet (low fleet size). Therefore, in this study, in phase 1, it will be used to measure the operational efficiency of airlines that have ASK and fleet size as input variables, and RPK as intermediate variables. The RPK which acts as the output of stage 1 will also act as input in stage 2. In this financial performance it can be seen from the service in selling its services as much as possible to generate income as well as the amount of costs incurred during operations, where this can be seen from the operating income and the cost of sales of the companies. Therefore, operating income can be used as an output variable from stage 2 and cost of sales as an input in stage 2 (Cui, 2019; Cui et al., 2020; Cui & Li, 2017; Li & Cui, 2017, 2018; Mallikarjun, 2015; Tavassoli et al., 2014). So, this research will use employee, fleet size and ASK as input (stage 1 input), RPK as an intermediate variable, and operating revenue as output variable (stage 2 output).

Measurement of operational efficiency and financial performance efficiency of this company will use R software in its processing and search for the weighted value ( $\lambda$ ) for each company's DMU and the target value of each input, intermediate, and output variable so that the company becomes efficient. Based on previous research, input variable, intermediate variable, and output variable can be seen below.

Table 21. Two-Stage Data Envelopment Analysis Variables

Input Variable (Stage 1)	Intermediate Variable	Output Variable
Employees (Cui & Jin, 2020; Cui & Li, 2017; Li & Cui, 2017, 2018)	RPK (Cui, 2019; Cui et al., 2020; Cui & Li, 2017; Li & Cui, 2017, 2018; Mallikarjun, 2015)	Operating revenue (Cui, 2019; Cui et al., 2020; Cui & Li, 2017; Li & Cui, 2017, 2018; Mallikarjun, 2015)
Fleet size (Cui, 2019; Cui et al., 2020; Cui & Li, 2017; Li & Cui, 2017, 2018; Mallikarjun, 2015)		
ASK (Cui, 2019; Cui et al., 2020; Cui & Li, 2017; Li & Cui, 2017, 2018; Mallikarjun, 2015)		
Input Variable (Stage 2)		
Cost Sales (Cui, 2019; Cui et al., 2020; Cui & Li, 2017; Li & Cui, 2017, 2018; Mallikarjun, 2015)		

Source: Author (2022)

#### IV. RESULT / FINDING

##### A. Efficiency Analysis

By conducting an internal two-stage of DEA, the results show that for full service carrier (FSC) airlines, Singapore Airlines in 2019, China Southern Airlines in 2019, Eva Air 2020 and China Airlines in 2020 which are efficient airlines (indicated by Overall Efficiency of 1). Cathay Pacific in 2019 has an efficiency value that is close to efficient with a value of 0.99. A company that has an efficiency of 1, means that this company is able to utilize company resources (shown by fleet, employees, ASK, and cost sales) to a minimum in creating or producing company revenue (indicated by operating revenue) efficiently. As for the low-cost carrier (LCC) company, Air Asia, it has an efficient level both before the Covid-19 pandemic (2019) or during the Covid-19 pandemic (2020). If you look at the average, FSC type companies are lower than LCC for the range of years from 2019 to 2020 which overall, the efficiency value for FSC is 0.91 while for LCC it is 1.00. When viewed based on the stage of the airline company's efficiency analysis process, at the operational efficiency stage, FSC, Singapore Airlines, Cathay Pacific, and China Southern Airlines were unable to maintain the company's operational efficiency, which was initially efficient (in 2019) to become inefficient during the Covid-19 pandemic. 19 takes place (in 2020). This is different from Eva Air and China Airlines, where during the Covid-19 pandemic the company's operations were still able to run efficiently. For LCC companies (Air Asia), the company can still run efficiently (efficiency = 1). Then, on the stage of financial performance efficiency, for FSC companies, Singapore Airlines companies (in 2019 and 2020), ANA Airlines (in 2019 and 2020), Eva Air 2020, Japan Airlines in 2019, China Southern Airlines in 2019 and China Airlines in 2020 has an efficient efficiency in its financial management. ANA Airlines was able to maintain the efficiency of its company's financial performance during the Covid-19 (2020) pandemic, and Eva Air and China Airlines succeeded in increasing the efficiency of the company's efficiency during the Covid-19 pandemic. In the Covid-19 pandemic (in 2020), with the decrease in the number of passengers and the drastic decline in the number of flights that can be seen from passenger revenue for each flight route (RPK), the majority of airlines in Asia Pacific have inefficient values. As for LCC companies, Air Asia was able to maintain its efficiency at an efficient level (efficiency = 1) before and during the pandemic.

Table 22. Airline Efficiency in 2019 and 2020

No	Type	Company	Efficiency

		(DMU)	Operational	Financial Performance	Overall	Direction
1	FSC	SQ 2020	0,83705	1	0,92	decrease
2		SQ 2019	1	1	1	
3		NH 2020	0,50716	1	0,75	decrease
4		NH 2019	0,83993	1	0,92	
5		CX 2020	0,77924	0,99917	0,89	decrease
6		CX 2019	1	0,99254	0,99	
7		BR 2020	1	1	1,00	increase
8		BR 2019	1	0,90494	0,95	
9		JL2020	0,57333	0,85559	0,71	decrease
10		JL 2019	0,88311	1	0,94

IATA code: SQ = Singapore Airlines; NH = ANA Airlines; CX = Cathay Pacific; BR = Eva Air; JL = Japan Airlines; CZ = China Southern Airlines; AK = Air Asia; CI = China Airlines  
Source: Author (2022)

In the airline industry, although they have the same line of business, the scale of operation, type of technology and focus of the airline business are different for each company. For example, the scale of this operation can be seen from the small or large number of airlines that are used for short-haul or long-haul flights. For long-distance flights, the company will prefer to use large-sized aircraft (wide body) because it requires a larger capacity and is able to cover longer distances in one flight compared to short-haul flights which only use small-sized aircraft (narrow body) (Khan & Pai, 2020).

The next step is to measure the target value of the input and output variables so that the DMU of the Asia Pacific airlines can be efficient (efficiency = 1) during Covid-19 pandemic (2020). The target value can be seen in **Appendix B**. Company that has achieved the efficient state (efficiency = 1), the change in the input and output value between the actual and the target is 0, where actual is the real data of companies input and output data in 2020. This is because the input or output value in the company is already optimal. Thus, reducing the number of inputs is no longer needed. For the operational stage, using a two-stage DEA analysis with oriented input consisting of employee, fleet, and ASK inputs, FSC companies such as Singapore Airlines, Eva Air, and China Airlines already have efficient efficiency values. Meanwhile, ANA Airlines, Cathay Pacific, Japan Airlines, Cathay Southern Airlines require substantial input reduction in order to achieve efficient conditions for their operations. In LCC companies such as Air Asia, during the Covid-19 pandemic, companies can achieve efficient conditions for their operations. This is in accordance with research conducted by Gillen & Gados, (2008); Sakthidharan & Sivaraman, (2018) which LCC companies are more suitable or suitable for high employee productivity due to various factors such as the type of fleet used tends to be the same (single type), service flight onboard such as less food or catering which leads to shorter turnaround times and less amount of cargo compared to preparation done by FSC companies. Therefore, at the stage of financial performance, LCC companies are able to have higher efficiency than FSC companies because they have a lower cost structure than FSC. This is in

accordance with research conducted by Jain & Natarajan (2015) and Lee & Worthington (2010). In addition, for the financial performance stage using a two-stage DEA analysis with output oriented, with the value of RPK and cost sales obtained by each company, the company should be expected to be able to achieve or obtain the revenue contained in the target operating revenue section.

## V. DISCUSSION

For FSC companies located in China, China Airlines is more efficient than China Southern Airlines, both operationally and financially, even though both companies are located in the same country. This is because if you look at Appendix A, the number of employees, fleet, and ASK has a much different number between the two companies. China Airlines has significantly fewer numbers than China Southern Airlines. The large number of Chinese Southern Airlines company resources that are not utilized optimally due to the Covid-19 pandemic makes the company have to reduce the number of company resources or inputs in order to achieve efficient conditions. This can be one of the factors why the China Southern Airlines company is not efficient, because during the Covid-19 pandemic, many resources were not used optimally.

From Table 5 and Appendix D, Singapore Airlines and ANA Airlines are not operationally efficient but financially efficient. The company's operational inefficiency can be seen in the large difference between the number of companies input utilities that are not used optimally while the resulting operational output is much lower, so companies need to reduce company inputs in terms of the number of employees (employees), the number of airlines (fleet), and available seat kilometer (ASK) in order to obtain efficient results. Meanwhile, the efficiency of the financial performance of the two companies can be due to the company's management being able to take full advantage of the financial conditions affected by the Covid-19 pandemic or have other strategies to get revenue when the company's operations are difficult. This is demonstrated by Singapore Airlines issuing mandatory convertible bonds to increase gross yields by approximately \$6.2 billion. The issuance of these bonds allows Singapore Airlines to maintain its equity base and provides additional options for increasing debt financing (Singapore Airlines, 2021). Unlike the case with ANA Airlines, to improve the efficiency of the company's financial performance, ANA Airlines is building a new business platform that utilizes customer data assets to create new revenue opportunities (ANA Airlines, 2021). This is useful for increasing the company's digitalization by combining existing business platforms such as the ANA Mileage Club app, Transportation Business, Travel Services, and ANA Credit Card business for customer convenience, such as ticket purchases and service sales operations. Then, on the company's cost management, in responding to Covid-19, ANA Airlines evaluated and drastically reduced the company's variable costs by adjusting capacity to suit passenger demand. For fixed costs, the company evaluates employee salaries and bonuses (employees). There are initiatives taken by the company to improve the efficiency of the company's financial performance such as reducing officer remuneration and employee salaries, reducing bonuses related to employee performance, conducting temporary leave programs, using digital technology for labor savings and automation, and using external resources (ANA Airlines, 2021).

From the results of calculating the efficiency target value for airlines, from the types of company input variables, it is found that the employee variable (employee) which has the biggest influence that causes airlines to become inefficient, which for inefficient companies in Asia Pacific, needs to do the reduction in the number of inputs by 43%, followed by the number of airlines (fleet) by 38%, and the number of available seats kilometer (ASK) by 28%. By reducing a very large number of employees, it is also expected to be able to reduce or minimize the company's fixed costs such as salaries and employee bonuses. Instead, this can be achieved through digitalization to provide convenience and a sense of security to customers because during the Covid-19 pandemic, it is necessary to reduce contact between people. Apart from the employee, in terms of the fleet, and available seat kilometer (ASK), the company's management can rearrange the strategy for selecting the fleet structure or combination of fleet types used by the company, such as focusing on maximizing the use of small fleets (narrow body) and retiring the widebody aircraft fleet, which is also a concern for companies that provide aircraft rental services (lessors) regarding the efficiency of this airline because the charter company is unable to pay its obligations or meet the requirements, the aircraft used will be returned to the airline. lessor companies and need to pay attention to the revenue structure of airlines (airline revenue strategy) which can be seen from revenue per available seat kilometer (ASK), revenue passenger kilometers (RPK), and company financing structures such as employee salaries, fleet maintenance costs (Guzhva et al., 2019). This is also a concern for the government because companies such as Singapore Airlines, Chinas Airlines, China, and Southern Airlines are state-owned enterprises. This is because the state becomes an investor or lender who can provide liquidity to support corporate airlines so that companies can survive during the Covid-19 pandemic (Albers & Rundshagen, 2020). In operational recovery, it can be done by focusing on domestic flights or short-haul flights before long-haul intercontinental routes. This

is in accordance with research conducted by Maung et al. (2022). Domestic and regional markets are the core business for low-cost airlines (LCC), but also a significant proportion of the total ASK generated by full service airlines (FSC). The combination of cessation of aircraft operations, as well as rebalancing of flight route networks that are rebalanced and focusing on shorter flight networks will have an impact on the pattern of growth rates and profitability (Maung et al., 2022).

Stage 1 is about measuring the company's operational efficiency during Covid-19 pandemic. Then, stage 2 is used to measure how efficiently the company creates revenue from the company's operational services. Since the research focuses on the international aviation industry, the results can be compared with similar research in the aviation field. Using internal two-stage DEA, airline company efficiencies from 2019 through 2020, operational efficiency is higher than the financial efficiency, and thus supporting the conclusion drawn by Lin & Hong (2020). Although the value of the company's operational efficiency is high, this has not determined whether the value of the company's financial performance efficiency is also high. This is conclusion supporting the conclusions drawn by Gramani (2012). This can be due to other factors that influence the formation of company revenue as well as cost components such as fuel costs and others (ben Lahouel et al., 2022; Cui & Li, 2017; Li & Cui, 2017, 2018). The high and low efficiency of the financial performance stage indicates how much RPK is being formed or converted into revenue. However, there is an advantage by separating the two stages, which can make it easier for managers to provide an overview of each company's performance. If these stages are not separated, it will be difficult to see which variables have the greatest influence on other variables, both at the operational stage and in financial performance. Since the research focuses on the international aviation industry, the results can be compared with similar research in the aviation field.

## VI. CONCLUSION AND RECOMMENDATION

The research was conducted on 8 airlines in Asia-Pacific consisting of 7 full service carriers (FSC) and 1 low-cost carrier (LCC) from 2019 to the first year of the Covid-19 pandemic (in 2020). aims to evaluate the factors that affect the resilience of Asia-Pacific airlines during the Covid-19 pandemic through operational efficiency and the efficiency of the company's financial performance. By using the internal two-stage DEA method, the results showed that from the component input variables used, it was found that the number of employees was the biggest factor affecting the resilience of aviation companies during the Covid-19 pandemic, so it was necessary to reduce the number of company inputs. in terms of employees so that the company is able to survive during the Covid-19 pandemic, followed by a reduction in the number of fleets as well as the number of available seat kilometer (ASK). In increasing the company's resilience, the company's management can digitize to make it easier and provide a sense of security to customers. Then, the company can rearrange the strategy for selecting the fleet structure or combination of fleet types used by the company, such as focusing on maximizing the use of the narrow body fleet and retiring the wide body fleet. In operational recovery, it can be done by focusing on domestic flights or short-haul flights before long-haul routes between continents. In this way, the combination of cessation of aircraft operations, as well as rearrangement of flight route networks and a focus on shorter flight networks will have an impact on the pattern of growth rates and profitability.

This research was conducted on 8 airlines in Asia-Pacific consisting of 7 full service carriers (FSC) and 1 low-cost carrier (LCC) from 2019 to the first year of the Covid-19 pandemic (2020) to analyze the operational efficiency and financial performance efficiency of the company. By using the internal two-stage DEA method, it found that the operational efficiency of the airline company is higher than its financial efficiency. This supports the conclusion drawn by Lin & Hong (2020). Overall efficiency, for full service carrier (FSC) airlines, five (Singapore Airlines, ANA Airlines, Cathay Pacific, Japan Airlines, and China Southern) of the seven companies experienced a drastic decrease in efficiency between 2019 and 2020 due to the Covid-19 pandemic in 2020. Then, two of them (Eva Air and China Airlines) experienced an increase in efficiency but only China Airlines reached the point of efficiency (efficiency = 1) both operationally and financially. Meanwhile, LCC-type airlines such as Air Asia, experienced an increase in efficiency during the Covid-19 pandemic but had not yet reached an efficient condition (efficiency = 1).

This research also suffers from some limitations. First, the availability of data or samples is one of the limitations. It was hard to find the complete data for each airline company such as airlines for low-cost carrier. Based on Skytrax, only Air Asia (AK) that a low-cost carrier that listed in their own stock market. So, it is quite difficult to compare between the full-service carrier and low-cost carrier. The differences number of airlines between full service carrier and low-cost carrier might impacts on the result. Second, the impacts of some external

factors on airline efficiency. Some existing papers applied some external factor by using regression to analyze the impacts of external factors, such as economic level, price level, etc (Li & Cui, 2018; Merkert & Pearson, 2015). Corresponding to these limitations, the suggestions or recommendation for the future research are consider the number of airline companies and in order to increase the efficiency accuracy, it is necessary to add other factors or variables into the study. It can be achieved by combine the internal two-stage DEA with external two-stage DEA, so method such regression can be applied to determine the external factor and it is possible to add some stages to the measurement of airline efficiency so that the process of transforming inputs into outputs becomes wider.

#### ACKNOWLEDGEMENT

The authors would like to thank the anonymous reviewers and the editor for their constructive comments and suggestions that improve this paper significantly.

## **Analysis of Factors Affecting the Indonesian Sharia Stock Index on the Indonesia Stock Exchange (IDX) for the period of February 2014 – January 2022**

Supriyanto<sup>1</sup>, Daryono Soebagyo<sup>2</sup>

<sup>1,2</sup>University of Muhammadiyah Surakarta: faculty of Economics and Business, Economic Development, Surakarta, Indonesia

### **Abstract**

*The Indonesian Syariah Stock Index is one of the stock indexes which of all shares have been listed on the Indonesia Stock Exchange. The Indonesian Syariah Stock Index was established on May 12, 2011 and in the year of its establishment it was listed on the Indonesia Stock Exchange with a total of 214 shares. The price of crude oil had a positive impact on the price of gold, the price of gold would always follow a rise in the price of crude oil. This proves that the price of gold does not function as a safeguard against the price of crude oil (Reboredo, 2013). (Gangopadhyay, Subhashis & Sen, 2016) find the price of crude oil negative on the price of gold. Gold can be a hedge when oil prices rise, investors choose to invest in gold. There has been a controversy between these studies about how crude oil prices affect the price of gold. The analytical method used in this study is descriptive analysis and data regression analysis Error Correction Model. (ECM) using eviews 10 software with secondary data obtained from the Central Statistics Agency (BPS), BI, and IDX. This study aims to determine the effect of Inflation, Exchange Rate, BI Rate, World Crude Oil Prices, and World Gold Prices on the Indonesian Sharia Stock Index in 2014 – 2022. The results showed that the five variables tested in this study, used the ECM method, using the ISSU, INF, KURS, BIR, HMD, and HED variables. In the period period 2014-2022. The results of the ECM regression, the variables that have an effect are EXCHANGE, INF(-1), EXCHANGE (-1), BIR (-1), HMD (-1) and HED (-1). So in the F test it looks like 0.0000 and R-square is 0.470686.*

*Keywords— Inflation, Exchange Rate; BI Rate; World Crude Oil Prices; and World Gold Prices.*

---

### **I. INTRODUCTION**

The stock price is an indicator of the success of the company's management. The better the company's performance will increase the share price of the company concerned. The increase in the share price will also reflect an increase in the wealth of shareholders as investors. Investors in investing their capital expect to make a profit, so before investing their capital, investors first need to recognize the factors that affect stock prices. Recognizing these factors is necessary so that investors can predict future stock prices and so that investors can prevent losses in their investments, because every investment must contain risks.

Investment is one of the activities to invest a capital that has been owned for a relatively long time with the aim of getting a profit in the future in the next few years. The era has progressed, all civilizations have had many renewals, of course, people also have many choices in investing their assets in addition to using banks, namely by investing their assets in the capital market. (Pardiansyah, 2020).

This is where market participants, namely individuals or business entities that have excess funds, invest in securities offered by companies that sell shares in the capital market (issuers). The capital market that is experiencing an increase (Bullish) or experiencing a decline (Bearish) can be seen from the rise and fall of recorded stock prices and is reflected through an index movement or better known as the Stock Price Index. (Dewi, Vina Sintya, 2016). The desire of potential investors to invest in listed companies is one of the factors that can affect stock prices. The factors that affect the capital market index are the exchange rate, inflation, BI Rate, world oil prices, world gold prices. The inflation rate in Indonesia, which often fluctuates, always experiences fluctuations in the graph of the inflation rate being not fixed every month, of course this will affect investment in capital, especially investment in this case the Stock Index. If the exchange rate experiences a decline, investors who will invest their shares will also experience a decline and this makes the capital market difficult to develop if the exchange rate is experiencing a decline.

The BI Rate is the interest rate, one of the policies that the government has implemented in regulating the amount of money circulating in the community when the BI Rate changes it will affect the interest rates for loans

or deposits. World crude oil has a significant influence on stock indices, meaning that when world oil prices increase in price, it will be a positive response to stock indexes, especially in the mining sector.

According to previous research conducted by (Martien, Rahmawati, 2015) macroeconomic factors that can affect stock price movements in Indonesia Sharia Stock Index on the Indonesia Stock Exchange as a factor of inflation, SBI interest rates and exchange rates. The results show that inflation is partially insignificant and has a negative relationship to ISSI stock prices, SBI interest rates are not significant and have a positive relationship to ISSI stock prices, the exchange rate has a significant effect on stock prices in Indonesia Syariah Stock Index (ISSI) and has a positive effect on stock prices. negative.

According to (Utari Purwo Astuti, 2021) that in the long run the exchange rate, gold price, DJIM have a significant positive effect and inflation has a significant negative effect on ISSI. In the short term, the inflation variable has a significant negative effect, while the exchange rate, gold price, and DJIM have no significant effect on ISSI.

Research from (Robiyanto, R, 2018) discusses The Effect of Gold Price Changes, USD/IDR Exchange Rate Changes and Bank Indonesia (BI) Rate On Jakarta Composite Index (JCI)'S Return and Jakarta Islamic Index (JII)'S Return, while the results of this study are the USD exchange rate /IDR has a significant negative effect on JCI. Meanwhile, the USD/IDR Exchange Rate and BI Rate had a significant negative effect on JII, while gold prices had a positive effect on JII.

Research from (Oktavia & Handayani, 2018) discusses the Effect of Rupiah Exchange Rate, GDP Growth, and Dow Jones Index on Composite Stock Price Index In Indonesia Stock Exchange with research results showing that the rupiah exchange rate has no effect on the JCI. Meanwhile, GDP growth and the Dow Jones average index (DJIA) have an influence on the JCI.

Research from (Umam, Khaerul Angga, 2019) discusses The Efficiency Of Macroeconomic Variables In Predicting Indonesian Sharia Stock Index with the results of the study showing that there is a short-term and long-term effect between the variables of exchange rates, interest rates, industrial production index, SBIS, and inflation on ISSI.

Research from (Halim, S, 2020) discusses the Analysis Of The Effect On Inflation, Interest Rate, Dow Jones Islamic Malaysia Index and Profitability On Stock Prices As Selected As Indonesia Sharia Stock Index while the results are Inflation, Interest Rates, Dow Jones Sharia, Profitability has an influence on the Indonesian Sharia Stock Index.

According to (Nature, Azhar, 2020) with the discussion of The Influence of Determining Factors on Islamic Stock Index in Indonesia, research shows that the Indonesian Sharia Stock Index (ISSI) is significantly and negatively affected by central bank interest rates in a long-term analysis. Similarly, in the short-term analysis, the central bank's interest rate has a significant and negative effect on ISSI and currency exchange rates. On the other hand, the SBIS rate of return and inflation are indicated to have an insignificant negative effect on ISSI. This study suggests that ISSI investors consider Central Bank interest rates, inflation, rupiah exchange rates, and SBIS returns to predict stock prices so that investors can make the right decisions in their investment policies.

Starting from this phenomenon, it is necessary to study more deeply about the factors that affect the stock price index on the IDX in the title Analysis of Factors Affecting the Indonesian Stock Index on the Indonesia Stock Exchange (IDX) for the period February 2014-January 2022. 2014 " The researcher hopes to find conclusions that are different from previous research and can look for more accurate subject matter for further research.

## II. LITERATURE REVIEW

The Indonesian Sharia Stock Index (ISSI) is an indicator that investors can use to determine stock market movements. By looking at the index numbers, it can be seen whether the current market movement is increasing or decreasing from before. The index serves as an indicator of market trends, meaning that the movement of the index describes market conditions at a certain time (Hasibuan, SA, Arwansyah, 2020). According to (Widodo, W, 2018) The Stock Price Index is an indicator or reflection of stock price movements. The index is one of the guidelines for investors to invest in the capital market, especially stocks. In investment activities, of course, investors as capital owners must be willing to take risks (risk takers). At the same time, the expected future return is one of the motivations for investors. The risk in investment is the possible difference between the actual return received and the expected return.

The capital market / stock market is a securities mechanism that is organized through the main exchange and parallel exchange. Included in the securities traded are common stock, preferred stock, convertible bonds, options, share rights, and share purchase rights certification (Shivakumar, H, 2007). The main instruments that can be used as an alternative investment for investors are stocks and bonds. One of the media that can be used as an alternative source of funding is the capital market by going public (Fudji Sri M, nd).

In investment, high inflation causes investors to be more careful in choosing and conducting transactions, so investors tend to wait to invest until the economic conditions are conducive to avoid the risks that may be caused by high inflation. (Goddess, VS, 2016). An increase in the price of just one or two goods cannot be called inflation, unless the increase extends to (or results in an increase in) most of the prices of other goods. (Salim, 2021). Currency rates show the price of a currency when it is exchanged for another currency. Determination of the exchange rate of a country's currency with the currency of another country is determined as well as goods, namely by the demand and supply of the currency concerned (Purwaningsih & Sulistiyani, 2020).

The interest rate can be used to show how much must be paid for a loan or other investment, all of which are contained in the agreement for repayment which is expressed as a percentage in an year. Interest rates can also affect company profits. The interest rate affects stock prices, the higher the interest rate, the lower the profit earned by the company and causes more investors to withdraw their funds by selling their stock and switching to the bond market. The increase in the BI rate has resulted in tighter liquidity in the banking sector which has resulted in difficulties in obtaining funds from third parties, namely: demand deposits, savings, deposits in addition to causing the cost of funds of banks to increase. (Rachmawati & Marwansyah, 2019). In general, the interest rate used in banks is determined and regulated by the government and its function is as a means of controlling the economy of a country (Halim, S, 2020).

World crude oil has a significant influence on stock indices, meaning that when world oil prices increase in price, it will be a positive response to stock indexes, especially in the mining sector. The world oil price that is often used as a reference in oil trading is West Texas Intermediate (WTI). WTI oil price is the highest oil price between Brent Blend and OPEC. This is because WTI is the highest quality oil because it has a low sulfur content so it is very good for use as gasoline (Gumilang & Hidayat, 2014).

Gold is a type of investment that investors are interested in because it has a relatively low level of risk, functions as a protector of wealth and is not affected by inflation (zero inflation). The increase in world gold prices will make investors more interested in investing in gold than stocks. This situation will make the JCI go down because investors will flock to sell their shares to switch to gold. The World Gold Price is the spot price in the London Gold Market which is formed from the accumulation of supply and demand. The World Oil Price is the spot price using the West Texas Intermediate standard which is formed from the accumulation of demand and supply of Light Sweet crude oil from market participants in Oklahoma, Texas (Handiani, S, 2014).

This research is a replica of the research conducted by (Hidayah, Anissa Nur, 2022) The World Gold Price has no significant effect in the short term but in the long term the World Gold Price has a significant effect on the Indonesian Sharia Stock Index (ISSI). What distinguishes this research from previous research is the time period taken in the study.

The econometric models for estimating the factors that influence the Stock Price Index are as follows:

$$\Delta \ln(\text{ISSI}_t) = \gamma_0 + \gamma_1 \Delta(\text{INF}_t) + \gamma_2 \Delta \ln(\text{KURS}_t) + \gamma_3 \Delta(\text{BIR}_t) + \gamma_4 \Delta \ln(\text{HMD}_t) + \gamma_5 \Delta \ln(\text{HED}_t) + \gamma_6 (\text{INF}_{t-1}) + \gamma_7 \ln(\text{KURS}_{t-1}) + \gamma_8 (\text{BIR}_{t-1}) + \gamma_9 \ln(\text{HMD}_{t-1}) + \gamma_{10} \ln \text{HED}_{t-1} + \gamma_{11} \text{ECT} + \varepsilon_{it}$$

where :

ISSI	: Indonesian Sharia Stock Index (Point)
INF	: Inflation (%)
EXCHANGE RATE	: Exchange Rate (Rupiah)
BEER	: BI Rate (%)
HMD	: World Crude Oil Price (US\$ per Barrel)
HED	: World Gold Price (US\$ per Ounce)
ECT	: Error Correction Term
$\gamma_0$	: $\lambda \beta_0$

$\gamma_1, \gamma_2, \gamma_3, \gamma_4, \gamma_5$	: short-term regression coefficients INF, EXCHANGE, BIR, HMD and HED
$\gamma_6$	: $-\lambda(1 - \beta_1)$
$\gamma_7$	: $-\lambda(1 - \beta_2)$
$\gamma_8$	: $-\lambda(1 - \beta_3)$
$\gamma_9$	: $-\lambda(1 - \beta_4)$
$\gamma_{10}$	: $-\lambda(1 - \beta_5)$
$\lambda$	: adjustment coefficient
$\varepsilon$	: element of error (error term)
t	: year

### III. RESEARCH METHODOLOGY

The analysis used to estimate the factors that influence the Indonesian stock index in this study used a regression model where we had to use two independent variables with multiple regression analysis equation model. The data that will be used in this study is secondary data in the form of time series data, obtained from February 2014-January 2022. The data collection in this study was done by opening literature studies and documents from previous research results and statistical data related to agriculture. In this study, using 5 variables consisting of the dependent variable including Inflation, Exchange, BI Rate, World Oil Jarga, World Gold Price.

The econometric model is as follows:

$$\Delta \ln(ISSI_t) = \gamma_0 + \gamma_1 \Delta(INF_t) + \gamma_2 \Delta \ln(KURS_t) + \gamma_3 \Delta(BIR_t) + \gamma_4 \Delta \ln(HMD_t) + \gamma_5 \Delta \ln(HED_t) + \gamma_6 (INF_{t-1}) + \gamma_7 \ln(KURS_{t-1}) + \gamma_8 (BIR_{t-1}) + \gamma_9 \ln(HMD_{t-1}) + \gamma_{10} \ln HED_{t-1} + \gamma_{11} ECT + \varepsilon_{it}$$

where :

ISSI	: Indonesian Sharia Stock Index (Point)
INF	: Inflation (%)
EXCHANGE RATE	: Exchange Rate (Rupiah)
BEER	: BI Rate (%)
HMD	: World Crude Oil Price (US\$ per Barrel)
HED	: World Gold Price (US\$ per Ounce)
ECT	: Error Correction Term
$\gamma_0$	: $\lambda\beta_0$
$\gamma_1, \gamma_2, \gamma_3, \gamma_4, \gamma_5$	: short-term regression coefficients INF, EXCHANGE, BIR, HMD and HED
$\gamma_6$	: $-\lambda(1 - \beta_1)$
$\gamma_7$	: $-\lambda(1 - \beta_2)$
$\gamma_8$	: $-\lambda(1 - \beta_3)$
$\gamma_9$	: $-\lambda(1 - \beta_4)$
$\gamma_{10}$	: $-\lambda(1 - \beta_5)$
$\lambda$	: adjustment coefficient
$\varepsilon$	: element of error (error term)
t	: year

### IV. RESULT / FINDING

Estimation results from the ECM . regression model

$$\Delta \ln(ISSI_t) = 2.34 - 0.007INF_t - 0.867 KURS_t - 0.0223 BIR_t + 0.0285HMD_t + 0.77HED_t - 0.137 INF_{t-1} - 0.269 KURS_{t-1} - 0.134(BIR_{t-1}) - 0.107HMD_{t-1} - 0.181HED_{t-1} + 0.130 ECT + \varepsilon_{it}$$

Table 1. VIF Multi Multiolearity Test

Variable	VIF	Criteria	Information
INF	1.230383	<10	There is no multicollinearity problem
EXCHANGE RATE	1.401488	<10	There is no multicollinearity problem
BEER	1.492080	<10	There is no multicollinearity problem
HMD	1.524455	<10	There is no multicollinearity problem
HED	1.128675	<10	There is no multicollinearity problem

Source: Eviews 10 data processing results

From the table it can be seen that the VIF value is not more than 10, so it can be concluded that in the regression model there is no multicollinearity and the regression model is feasible to use..

Table 2. Heteroscedasticity Test

White White Test

F-statistics	3.137661 Prob. F(72,22)	0.0019
Obs*R-squared	86.56958 Prob. Chi-Square(72)	0.1160
Scaled explained SS	84.23371 Prob. Chi-Square(72)	0.1535

Source: Eviews 10 data processing results

The output results show the value of Obs\*R-squared (Chi-Square) is 86.56958 while the probability value on the Chi-Square is 0.1160 > 0.05, it can be concluded that there is no heteroscedasticity problem.

Table 3. Linearity Test-Ramsey Reset

	Value	df	Pro
F-statistics	2.006715	(1, 82)	0.1604
Likelihood Ratio	2.296861	1	0.1296

Source: Eviews 10 data processing results

Linearity test used in this research is the Ramsey-Reset test with hypothesis formulation; : linear model (correct model specification) and : non-linear model (wrong model specification). The significance level ( ) used is 0.05 with the test criteria; accepted if F count or F statistic 0.05 and rejected if F count or F statistic > 0.05. The probability value of the test results is 0.1604 > 0.05 then it is accepted. It can be concluded that the model used is linear

Tables. 4 The Results of The Estimation of the Error Correction Model (ECM) Short-Term

Source: Eviews 10 data processing results

The results of the ECM estimation above show that long-term changes in inflation, currency exchange rates, BI Rate, World Oil Prices and World Gold Prices have an effect on the Indonesian Sharia Stock Index.

## V. DISCUSSION

Based on the results of the study, it shows that changes in the inflation rate in the short term (less than 1 year) have no effect on changes in the Indonesian Sharia Stock Index (ISSI) on the IDX with a coefficient of -0.00649. While in the long term (more than 5 years) changes in the government's inflation rate in the long term have a negative effect on changes in the Indonesian Sharia Stock Index (ISSI) on the IDX with a coefficient of -0.047100.

Based on the results of the study, it shows that changes in the exchange rate (exchange rate) in the short term (less than 1 year) have a negative effect on changes in the Indonesian Islamic stock index (ISSI) on the IDX with a coefficient of -0.868651. Whereas in the long term (more than 5 years) changes in exchange rates (exchange rates) to long-term changes potential negative effect on the Indonesian Sharia Stock Index (ISSI) on the IDX with a coefficient of as big as -0.052696

Based on the results of the study, it shows that the BI Rate in the short term (less than 1 year) has no effect on the Islamic stock price index (ISSI) on the IDX with a coefficient of -0.022745. While in the long term (more than 5 years) the BI Rate has a negative effect on changes in the Indonesian Sharia Stock Index (ISSI) on the IDX with a coefficient of -0.043862.

Based on the results of the study, it shows that the world oil price in the short term (less than 1 year) has no effect on the Islamic stock price index (ISSI) on the IDX with a coefficient of 0.028585. While in the long term (more than 5 years) World Oil Prices have a negative effect on changes in the Indonesian Sharia Stock Index (ISSI) on the IDX with a coefficient of -0.048588.

Based on the results of the study, the World Gold Price in the short term (less than 1 year) has no effect on the Islamic stock price index (ISSI) on the IDX with a coefficient of 0.078564. While in the long term (more than 5 years) the World Gold Price has a negative effect on changes in the Indonesian Sharia Stock Index (ISSI) on the IDX with a coefficient of -0.058915.

## VI. CONCLUSION AND RECOMMENDATION

In the short term, only the exchange rate variable has an influence on the movement of the Indonesian Sharia Stock Index, while in the long term (more than 5 years) all variables affect the movement of the Indonesian Sharia Stock Index which includes Inflation, Exchange Rate, BI Rate, World Oil Prices, and World Gold Prices

## 9. ACKNOWLEDGMENT

The author would like to say thank you to the supervisors and all parties who have helped in this research so that this research can be completed properly. support in participating in this manuscript/research.

## **Analysis Of The Impact Index Of Human Development In The Province Of Bali And Factors Influencing It**

Elisa Romadhona Devitasari<sup>1</sup>, Ir. Maulidyah Indira Hasmarini,MP<sup>2</sup>

<sup>1,2</sup>Muhammadiyah Surakarta University, Economic Development, Faculty of Economics and Business Muhammadiyah Surakarta, Sukoharjo, Central Java, Indonesia.

### **Abstract**

*The Human Development Index (HDI) is one of the most important indicators to measure success in efforts to build the quality of human life. HDI also plays an important role in the development of the modern economy because good human development can make production factors able to be maximized. A good quality population will be able to innovate to develop the existing production factors. In addition, high human development also results in an increase in the population so that it will increase consumption levels and will make it easier to increase economic growth. Badung Regency is a Regency in Bali Province that has been included in the high HDI category since 2017 with a value of 81.83. Meanwhile, districts with a medium HDI category are Bangli and Karangasem districts. Nevertheless, HDI achievements in all regencies/cities in the province of Bali have always increased in the last five years. This increase shows that the quality of human resources (HR) in Bali Province continues to increase. The improvement in the quality of human resources if used properly will certainly have a positive impact on the economy of the Province of Bali. This study focuses on 2017 to 2020 by observing several influencing variables, namely the district minimum wage, poverty, and education level. This study aims to analyze the magnitude of the influence of several variables in the model on the human development index in Bali in 2017-2020. And it can be concluded that the variables of Minimum Wage, Poverty, Education together affect the HDI in Bali Province, and the variables in the model affect the HDI by 99.86% and the remaining 0.14 is influenced by variables outside the model. The method that will be used in this research is quantitative method with panel data regression model. This research is expected to be a reference or information related to the Bali Province human development index that is used by related agencies or the community.*

*Keywords—Human Development Index; District Minimum Wage; Poverty; Education Level.*

---

### L. INTRODUCTION

Economic development in a region is the increase in people's income that occurs in the region, namely the increase in all added value that occurs in the region. The increase in income is measured in real value, meaning that it is measured in constant prices. It also describes the remuneration for production factors operating in the area. One of the factors that influence the economic development of a region is the human development index (HDI). HDI is an indicator of how to measure important aspects of the quality of human development and explains how people can access development outcomes in terms of income, health, education, and so on.

Badung Regency is a Regency in Bali Province that has been included in the high HDI category since 2017 with a value of 81.83. Meanwhile, regencies with moderate HDI category are Bali and Karangasem regencies. Nevertheless, HDI achievements in all regencies/cities in the province of Bali have always increased in the last five years. This increase shows that the quality of human resources (HR) in Bali Province continues to increase, so in this study we want to prove whether HDI is very influential on the development of the province of Bali.

The human development index (HDI) is one indicator to measure the level of physical and non-physical development of the physical quality of the population (andaiyani, 2012). The human construction index is a composite index that includes three alleged fields of human development from a physical and non-physical perspective of population quality. Differences in people's welfare levels can cause inequality between regions, so there must be a benchmark to analyze how much the Regency/City minimum wage (UMK) is influenced by the Human Development Index (IPM) in the province of Bali 2017-2020. The table is related to the HDI of the Province of Bali in 2017-2020.

Table 1. Bali Province Human Development Index 2017-2020

Tahun	IPM
2017	74,30
2018	74,77
2019	75,38
2020	75,50

## II. LITERATURE REVIEW

### A. Human Development Index (HDI)

The Human Development Index (HDI) is a compositional index based on three indicators: health, education and standard of living (Arsyad, 2010). The Human Development Index (IPM) is an aggregate measure of the basic dimensions of human development by looking at its development. The calculation of HDI as an indicator of human development has important objectives, including:

- a. Establish indicators that measure the basic dimensions of human development and the expansion of freedom of choice.
- b. Utilize a number of indicators to keep the measure simple.
- c. Form a single composite index instead of using a number of base indices.
- d. Create a measure that includes social and economic aspects. The index is a basic index that
- e. composed of the following dimensions:
- f. Long life and healthy life, with life expectancy indicators;
- g. Knowledge, as measured by literacy rates and a combination of school enrollment rates for
- h. elementary, middle and high levels; and
- i. A decent standard of living, with an indicator of GRDP per capita in the form of Purchasing Power Parity (PPP).

The concept of Human Development developed by the United Nations (UN), assigns a ranking of human development performance on a scale of 0.0 – 100.0 with the following categories:

High: HDI more than 80.0

Upper Middle: HDI between 66.0 – 79.9

Lower middle: HDI between 50.0 – 65.9

Low : HDI less than 50.0.

### B. District Minimum Wage (UMK)

UMK stands for City/Regency Minimum Wage. UMK is the lowest monthly wage consisting of basic wages and fixed allowances. Wages are money and so on which are paid as payers or as payers who have been assigned to do something, wages, rewards, rewards (actions), risks (Indonesian dictionary, 2002:1250).

Wage is the right of the worker/labourer that is received and expressed in money as payment from the employer or employer to the worker/laborer who is already established and paid in accordance with the work agreement, agreement, or statutory regulations, including allowances for the worker/labourer and his/her family for a job and/or service that has been or will be performed (Article 1 number 30 of manpower number 13 of 2003 concerning manpower).

### C. Poverty (KEM)

The definition of poverty in a broad sense is the limitations carried by a person, a family, a community, or even an area that causes discomfort in life. The poverty rate according to the Central Statistics Agency (BPS) is the percentage of the population below the poverty line in each district/city in Central Java. The poverty line which is the basis for calculating the number of poor people is determined by two criteria, namely consumption expenditure per capita per month which is equivalent to 2100 calories per capita per day and the minimum value for non-food commodities.

Robert Chamber (2010) said that poverty is an integrated concept that has five dimensions, while the five dimensions form a deprivation trap, namely:

- a. poverty itself,
- b. powerlessness (powerless),
- c. vulnerability to emergency situations (state of emergency),
- d. dependency, and
- e. isolation, both geographically and sociologically.

Poverty is one of the diseases in the economy of a region. Poverty is complex, meaning that poverty does not appear suddenly, but has a fairly long and complex background so that it is very difficult to find out the root of the problem of poverty itself, while poverty is multidimensional, meaning that it is seen from the many diverse human needs, so poverty also has various aspects. primary in the form of poverty of assets, socio-political organization, knowledge, and skills, and secondary assets in the form of poverty of social networks, financial resources, and information. As a result of the nature of poverty, it is illustrated in the form of malnutrition, inadequate water and housing, poor health services, and low levels of education. The pattern of poverty according to SumitroDjojohadikusumo (1995) is divided into four parts, namely:

- a. -Persistent poverty, namely poverty that has been chronic or hereditary
- b. -Cyclical poverty, namely poverty that follows the pattern of the overall economic cycle
- c. -Seasonal poverty, namely seasonal poverty as found in the case of fishermen and food crop farmers
- d. -Accidental poverty, namely poverty due to natural disasters or the impact of a certain policy that
- e. causes a decrease in the level of welfare of the population.

Meanwhile, according to Ragnar Nurkse (1953) and MudrajatKuncoro (1997) they divide poverty simply and generally into several measures:

- a. Absolute Poverty Individuals or groups, which are included in the absolute poverty measure if their
- b. income is below the poverty line and is not sufficient to meet their basic needs. This measure is
- c. used to determine the minimum level of income that is sufficient to meet basic needs, such as food,
- d. clothing, and shelter to survive.
- e. Relative Poverty Individuals or groups, which are included in the relative poverty measure if their
- f. basic needs have been met, but are still much lower than the situation
- g. surrounding community. Based on this measure, the poverty line will change if the level of people's
- h. lives changes, so that the measurement of poverty is relatively dynamic or will always exist.
- i. Individual or group cultural poverty, which is included in the measure of cultural poverty if the
- j. individual or group does not want to try to improve their level of life even though there are efforts
- k. from other parties or there are opportunities, in other words the individual or group is poor because
- l. of their own attitude, namely lazy and not there is an effort to improve his life to a better condition

#### *D. Level of education*

The level of education according to Lestari in Wirawan (2016) is an activity of a person in developing his abilities, attitudes and forms of behavior, both for future life where through certain organizations or not organized. Education is a conscious and planned effort to create a learning atmosphere and learning process so that students actively develop their potential to have religious spiritual strength, self-control, personality, intelligence, noble character, and skills needed by themselves, society, nation and state (Republic of Indonesia). Indonesia. 2003. Law No. 20 of 2003 concerning Education. No. 1.)

Feni in Kosilah&Septian (2020, 1139) Education is guidance or assistance given by adults to the development of children to reach maturity with the aim that children are capable enough to carry out their own life tasks, not with the help of others, "continued Hariandja in Nuruni (2014). :14) added that the education level of an employee can increase the company's competitiveness and improve company performance, his potential to have religious spiritual strength, self-control, personality, intelligence, noble character, and skills needed by himself, society, nation and state. Education is a process that aims to increase skills, knowledge and increase independence and the formation of one's personality (Arfida, 2003). It can be concluded from the above understanding that education is a process or effort for individuals to add higher knowledge and understanding that is needed by themselves, society, nation and state.

*E. Past Research:*

Research conducted by Pradnyadewi, D., & Purbadharmaja, I. B. (2017) entitled The influence of HDI, infrastructure costs, investment and economic growth on income distribution inequality in the province of Bali. In this study it was found that the HDI directly and significantly affect economic growth. Infrastructure costs and economic growth have a direct and significant impact on the inequality of income distribution. While HDI and investment have no significant effect on income distribution inequality. Economic growth is a variable that intervenes in the indirect effect of HDI and infrastructure costs on the unequal distribution of income.

Research conducted by Alhudhori, M. (2017). The title is The Effect of HDI, GRDP and the number of unemployed on the poor in Jambi Province. Economical. Based on multiple linear regression analysis, HDI has a positive relationship to the poor, where if the HDI increases by 1 percent, the number of poor people will increase by 0.358.

Research conducted by Susanto, A. B. (2013), entitled The Effect of Human Development Index (HDI) and Inflation on Economic Growth in Lamongan Regency. The econometric model hypothesis is used with the OLS (Ordinary Least Square) method. From the results of the analysis it can be concluded that the HDI and inflation variables based on the results of simultaneous testing, all variables simultaneously have a significant effect on economic growth in Lamongan Regency.

Research conducted by Saputra, W. A., & Mudakir, Y. B. (2011) with the title Analysis of the influence of population, GDP, HDI, unemployment on poverty levels in districts/cities of Central Java. The regression model used is Ordinary Least Square Regression using panel data using a fixed effect approach. This study uses a dummy year as one of the variables. From the research, it can be concluded that the Human Development Index has a negative and significant effect on the poverty rate in Central Java and unemployment negatively and significantly affects the poverty rate in Central Java.

## III. RESEARCH METHODOLOGY

The data collection method in this study used secondary data obtained from the Central Statistics Agency in 2017 to 2020 using the Quantitative panel data regression method with the following equation following :

$$IPM_{it} = \beta_0 + \beta_1UMK_{it} + \beta_2KEM_{it} + \beta_3TP_{it} + \varepsilon_{it}$$

Where :

HDI	= Human Development Index
UMK	= District Minimum Wage (Rupiah)
KEM	= Poverty (Rupiah)
TP	= Education Level (%)
$\beta_0$	= Constant
$\beta_1 \cdot \beta_3$	= Regression coefficient of independent variable
i	= District/City to i
t	= Year t
$\varepsilon$	= Error term (error factor)

The estimation stages of the econometric model above will include: estimation of model parameters using the Pooled Least Square (PLS) or Common Effect Mode (CEM) approach, Fixed Effect Model (FEM), and Random Effect Model (REM); selection of the best estimated model using the Chow test and Hausman test; test the goodness of the model on the selected model ; and test the validity of the effect of the independent variable on the selected model.

*A. Common Effect Model (CEM)*

The Common Effect Model or Pooled Least Square is the simplest panel data model approach, by combining time series data and cross section data. This model does not pay attention to the dimensions of time or individuals, so it can be assumed that the behavior of the data between individuals is the same in various time periods (Basuki, 2014). This method can use the Ordinary Least Square (OLS) approach. According to Gujarat (2012) OLS is a regression method that minimizes the number of squared errors.

#### *B. Fixed Effect Model (FEM)*

Fixed Effect Model (FEM) is a model with a different intercept for each subject (cross section), but the slope of each subject does not change over time (Gujarati, 2012). This model assumes that the intercept is different in each subject, while the slope remains the same between subjects. In differentiating one subject from another, a dummy variable is used (Kuncoro, 2011). This estimation model is also known as the least Square Dummy Variable (LSDV) model.

#### *C. Random Effect Model (REM)*

REM is a method that can be interpreted as individual effects that are assumed to be random. REM is more accurately estimated using the generalized least square (GLS) method because of the potential correlation between the disturbance variables in the equation. In the random effect model, the intercept value is assumed to be random from a large population value by taking into account errors from the cross section and time series. There are weaknesses in the fixed effect model resulting in reduced efficiency of 40 parameters, which can be overcome by random effects using the Generalized Least Square (GLS) model (Gujarati and Porter, 2012).

#### *D. Selection of Panel Data Regression Estimation Test*

##### *Chow test*

Chow test is a test to determine the best model between Common Effect Model (CEM) and Fixed Effect Model (FEM). If the result states that the null hypothesis is accepted, then the best model is CEM. But if the results reject the null hypothesis, then the best to use is FEM.

##### *Hausman test*

Hausman test aims to determine the Random Effect Model (REM) or Fixed Effect Model (FEM) to be used

##### *Lagrange Multiplier (LM) Test*

The Lagrange Multiplier (LM) test aims to compare and choose which model is the best between the Common Effect Model (CEM) and the Random Effect Model (REM).

#### *E. Hypothesis testing*

##### *Simultaneous Significance Test (F Test)*

The F test was conducted to see how much influence the independent variable had on the dependent variable as a whole. The hypothesis to test this is as follows:

- a. If the calculated F probability value  $< 0.05$  then  $H_0$  is rejected, meaning that overall there is an
- b. influence of the independent variable on the dependent variable.
- c. If the calculated F probability value  $> 0.05$  then  $H_0$  is accepted, so that together or as a whole there is no effect of the independent variable on the dependent variable.

##### *Partial Significance Test (t Test)*

The test used to see how far the influence of one variable individually in the related variables is described. The characteristics of the test used at the level = 5% are as follows:

- a. If the probability value  $< 0.05$  then  $H_0$  is rejected, so the independent variable has a significant effect on the related variable.

- b. If the probability value  $> 0.05$  then  $H_0$  is accepted, so that the independent variable has no significant effect on the specified variable.

#### Regression Coefficient (Adjusted $R^2$ )

Adjusted  $R^2$  is used to measure how large the independent variable is able to explain the related variable. Adjusted  $R^2$  is used because the value obtained is the corrected  $R^2$  value so that the results are not biased.

## V. DISCUSSION

On the results of the Chow test, which shows that the probability value of the resulting Chi square cross section is 0.0000. These results indicate that the probability value is less than 5% (0.05), so it can be concluded that the Fixed Effect Model is the chosen model. Hausman test results show that the probability value of a random cross section is 0.0000. These results indicate that the probability value is less than 5% (0.05), so it can be concluded that the Fixed Effect model was selected in the Hausman test.

While the regression results show that the district minimum wage has a significant effect of 0.0000 ( $<0.01$ ) which shows a positive influence on the human development index in Bali Province with a coefficient of 3.28E-06. The results conclude that when the minimum wage increases by 1 rupiah, income inequality will increase by 3.28E-06%. The regression results show that poverty has a significant effect of 0.0275 ( $<0.05$ ) which shows a negative influence on the human development index in Bali Province with a coefficient of -1.08E-05. The results conclude that when poverty increases by 1 rupiah, income inequality will decrease by 1.08E-05%.

The regression results show that education has a significant effect of 0.7763 ( $>0.10$ ) which shows a positive influence on the human development index in Bali Province with a coefficient of 0.012599. The results conclude that when education increases by 1 percent, income inequality will increase by 0.012599%.

## VI. CONCLUSION

This study uses panel data regression method so that the significant variables are the district minimum wage of 0.0000 ( $<0.01$ ), poverty of 0.0275 ( $<0.05$ ), education of 0.7763 ( $>0.10$ ). The F test in this study is 0.0000 so it can be interpreted that all variables together have an effect on HDI. R-Square is 0.9986 so that in this study the variables in the model have an effect of 99.86%.

The variables of Minimum Wage, Poverty, Education together have an effect on HDI. And the variables in the model affect HDI by 99.86% and the remaining 0.14 is influenced by variables outside the model. and in this study the best method chosen is the Fixed Effect Model (FEM). so that the human development index (HDI) is very influential on the province of Bali because by increasing the development index (IPM) it can increase the development of the province of Bali.

## Pharmaceutical Firm Profitability : A Descriptive Analysis During The Covid-19 Pandemic in Indonesia

Septiany Trisnaningtyas<sup>1</sup> and Rofikoh Rokhim<sup>2</sup>

<sup>1,3</sup>Department of Management, Faculty of Economics and Business, Universitas Indonesia, Jakarta, Indonesia

### Abstract

*This study aims to analyze pharmaceutical firm profitability during Covid-19 pandemic in Indonesia. During the Covid-19 period, the pharmaceutical industry was facing the demand for pharmaceutical products related to the treatment of Covid-19 experienced a significant increase, but on the other hand, the demand for products that were indirectly related to Covid-19 did not experience growth or even decreased. This study improves the existing literature on profitability in which includes factors effecting it (firm growth, market power, liquidity, firm size) based on quarterly financial statements. The studies used this industry and this scope of factors remains limited. The study period is January 2018 – December 2019 as period before Covid-19 and January 2020 – December 2021 as period during Covid-19. The data used is secondary data from the quarterly financial statements of selected nine pharmaceutical firms listed on the Indonesia Stock Exchange. Firm profitability is measured by ROA and ROE. Firm growth, market power, liquidity, firm size used in various researches as factors affecting profitability are also being analyzed in this study. A descriptive statistic is used to analyze the data. The results show that during pandemic firms continue to grow positively and increase the size even though the growth rate is lower. Firms tends to be less liquid and becomes more competitive facing fierce condition. Pharmaceutical companies in Indonesia can maintain profitability during pandemic but it is important to have a diversified portfolio which can fulfill the market demand.*

*Keywords— Profitability; Indonesia; Pharmaceutical; Covid-19*

---

### I. INTRODUCTION

The Covid-19 pandemic in Indonesia has caused more than 1.3 million people starting from the first case published in March 2020. The pandemic has an impact on various sectors, one of which is the pharmaceutical sector. Most of the national pharmaceutical raw materials depend on imports. The lockdown in raw material supplying countries has hampered the supply of national pharmaceutical raw materials. This condition certainly disrupts the business processes of pharmaceutical companies. During the Covid-19 period, the pharmaceutical industry was facing the demand for pharmaceutical products related to the treatment of Covid-19, such as prescribed medicine and supplement, experienced a significant increase, but on the other hand, the demand for pharmaceutical products that were indirectly related to Covid-19 did not experience growth or even decreased.

The industrial sector still provides the largest contribution to the structure of the national gross domestic product (GDP). Even though in the midst of a contraction in the national economy, the manufacturing industry sector still recorded positive performance, including the chemical, pharmaceutical and traditional medicine industries. The pharmaceutical industry is on the top five largest contributors from non-oil and gas manufacturing industry to the Indonesian economy. The value and GDP growth of the chemical, pharmaceutical and traditional medicine industries still grow during the pandemic.

According to data from the Ministry of Health, until 2021 there are 241 pharmaceutical manufacturing industries, 17 pharmaceutical raw material industries, 132 traditional medicine industries, and 18 natural product extraction industries. The pharmaceutical manufacturing industry consists of four state-owned companies, namely PT Bio Farma Tbk (as holding), PT Kimia Farma Tbk, PT Indofarma Tbk, and PT. Phapros Tbk and there are at least 195 national private industries, as well as 24 multinational companies (MNCs). Picture 1.1 shows the top 10 pharmaceutical companies in Indonesia based on sales value.

Fig 1. Top 10 Pharmaceutical Companies in Indonesia (Source : IMS Q4 2021)

One of the important goals of company management is to maximize financial and operational performance, because this will affect the company's stock price, company market value, owner's wealth and number of investors (Lessambo, 2018). The main objectives of the company in general is to maximize company profits. Without profit, it will be difficult for the company to achieve company targets. If the company performance increases, this can be seen from the incessant company's activities to produce profit (Kaylsi & Khoiruddin, 2021). The Covid-19 crisis brought enormous changes in financial position and business performance. For the pharmaceutical companies effects in 2020 are twofold. Their operations stayed stable, but average profitability decreased (Tusek, 2021). Therefore, it is important to understand the profitability of pharmaceutical firms and factors affecting it so firms can still manage to maximize their profit and performance during crisis.

## II. LITERATURE REVIEW

### A. Fundamental Theories

Sustainable financial performance is a key success factor for any organization (Liu, 2020). It is important to measure the company's performance continuously, and try to improve it by updating plans, improving operating techniques, measuring output, identifying the impact of resource use on financial performance, minimizing company risk, and being prepared to face conditions of uncertainty. Firm performance is used as the dependent variable in many studies. The company's performance represents the company's ability, effectiveness and efficiency when using its resources to produce output. Company performance is a set of partial organizational effectiveness, which includes the financial and operational output of the company (Lessambo, 2018).

The income statement provides very useful information about the profitability of a company's business enterprise and how it relates to the value of the company's stock. Profitability ratios show a company's operating or net income as a share of sales, and they are an indication of the company's efficiency and pricing strategy (Berk, DeMarzo, & Harford, 2012). ROA measures the profit derived from the value of its assets, which can be calculated from net income divided by total assets. ROE measures how the fate of shareholders during the year, which can be calculated from net income divided by total equity (Ross, Westerfield, & Jordan, 2016).

### B. Previous empirical studies

There have been several previous studies conducted regarding factors related to firms profitability from various industrial sectors as well as research related to the implications of Covid-19 on business and the economy. Lim and Rokhim (2020) found that liquidity, firm size, market power has significant relationship to profitability measured by ROA and ROE of pharmaceutical companies in Indonesia after the implementation of universal health coverage from the Indonesian government. Alarussi and Alhaderi (2018) also found firm size (total sales) has strong relationship to profitability in Malaysia. Jreisat & Bawazir (2021) conclude that there is a significant positive relationship between bank size and profitability (ROE).

As long as the business is operating, companies tend to grow and enlarge in size which gives them perfect control over the business environment. Growth (size) is highly desirable for corporate firms to stay in business or else the dynamic competitive forces of the market will reduce them to non-entities (Yadav et al., 2020). A study on banking profitability by examining the impact of competition found that lower level of competition in the market leads to increased profitability of Chinese commercial banks (Tan, 2017). Eladly (2021) in his

research found that there was a significant positive linear relationship between the standard deviation of equity returns on liquidity. Liquidity is valuable. The more liquid a business is, the less likely it is to experience financial distress (Ross, Westerfield, & Jordan, 2016).

### III. RESEARCH METHODOLOGY

A descriptive research design is applied in this research to describe the profitability of pharmaceutical firms in Indonesia. The sampling technique in this study is purposive sampling on the consideration of certain characteristics. This study selects nine listed pharmaceutical firms in Indonesia within the years 2018 until 2020 as the sample. These companies are listed in Indonesia Stock Exchange ([www.idx.co.id](http://www.idx.co.id)) based on the health sector in accordance with the JASICA (Jakarta Stock Exchange Industrial Classification) classification which was then selected only for those engaged in the pharmaceutical sector and registered for an IPO before 2020. Quarterly financial statement is taken from Thomson Reuters Datastream as well as obtained directly from the firm. Further, it's categorized into two periods which are 2018-2019 as the period before the Covid-19 pandemic and 2020-2021 as the period during the Covid-19 pandemic.

Table 1. Selected Nine Pharmaceutical Companies Listed in Indonesia Stock Exchange

No	Firm Code	Firm Name	Listing Date
1	DVLA	Darya-Varia Laboratoria Tbk.	11 Nov 1994
2	INAF	Indofarma Tbk.	17 Apr 2001
3	KAEF	Kimia Farma Tbk.	04 Jul 2001
4	KLBF	Kalbe Farma Tbk.	30 Jul 1991
5	MERK	Merck Tbk.	23 Jul 1981
6	PEHA	Pharos Tbk.	26 Des 2018
7	PYFA	Pyridam Farma Tbk.	16 Okt 2001
8	SIDO	Industri Jamu dan Farmasi Sido	18 Des 2013
9	TSPC	Tempo Scan Pacific Tbk.	17 Jun 1994

Source : Indonesia Stock Exchange (2021)

The variables and proxy measurements used in this study are ROA, ROE, firm growth (sales growth), market power (lerner index), liquidity (current ratio), firm size (total sales). The following formula used to calculate each variable.

$$\text{Return on assets} = \frac{\text{Net income}}{\text{Total assets}} \times 100\% \quad (1)$$

$$\text{Return on equity} = \frac{\text{Net income}}{\text{Total equity}} \times 100\% \quad (2)$$

$$\text{Current ratio} = \text{Log} \frac{\text{Current asset}}{\text{Current liabilities}} \quad (3)$$

$$\text{Sales Growth} = \text{Log} \frac{(\text{revenue of current year} - \text{revenue of previous year})}{\text{revenue of previous year}} \quad (4)$$

$$\text{Lerner Index} = \frac{(\text{revenue} - \text{cost of goods sold})}{\text{revenue}} \quad (5)$$

## IV. RESULT / FINDING

Table 2 shows the research on 70 observations. The average ROA of pharmaceutical companies in Indonesia before the Covid-19 pandemic showed a value of 2.1772 with a maximum value of 6.7907 and a standard deviation of 1.9605. ROE has an average of 3.1761 with a maximum value of 10.3009 and a standard deviation of 2.9513. Growth has a mean of 0.1010 with a maximum value of 2.6122 and a standard deviation of 0.5224. Lerner index has a mean of 0.4569 with a maximum value of 0.6160 and a standard deviation of 0.1191. Current ratio has a mean of 2.3715 with a maximum value of 2.9021 and a standard deviation of 0.2450. Size has a mean of 8.7860 with a maximum value of 9.7644 and a standard deviation of 0.6076.

Table 2. Descriptive Statistical Analysis (2018-2019)

Parameter	ROA	ROE	Growth	Lerner	Current Ratio	Size
Mean	2.1772	3.1761	0.1010	0.4569	2.3715	8.7860
Median	2.0125	3.5139	0.0299	0.4731	2.4280	8.6905
Maximum	6.7907	10.3009	2.6122	0.6160	2.9021	9.7644
Minimum	-2.3202	-7.1946	-1.4470	0.0954	1.9811	7.7600
Std. Dev.	1.9605	2.9513	0.5224	0.1191	0.2450	0.6076

Table 3 shows the research on 71 observations. The average ROA of pharmaceutical companies in Indonesia during the Covid-19 pandemic showed a value of 2.1974 with a maximum value of 9.9565 and a standard deviation of 2.5442. Meanwhile, ROE showed a decrease with an average of 2.9922 with a maximum value of 11.8650 and a standard deviation of 2.5442. Profitability in the period before the Covid-19 pandemic varied between the two proxies. ROA is higher during the Covid-19 period and the distance between maximum and minimum is also longer. In contrast to ROA, ROE in the period before the Covid-19 pandemic was higher with the distance between the maximum and minimum also relatively longer. Growth shows a decrease in sales growth compared to before the Covid-19 pandemic with an average of 0.0950 with a maximum value of 2.2002 and a standard deviation of 0.4173. Lerner index has decreased during the Covid-19 pandemic by an average of 0.4332 with a maximum value of 0.6547 and a standard deviation of 0.1192. This shows that there is higher competition during the Covid-19 pandemic. Current ratio has a mean of 2.3618 with a maximum value of 2.7724 and a standard deviation of 0.2540. The firm was listed as more liquid in the period before the Covid-19 pandemic. Size has an average of 8.8439 with a maximum value of 9.8600 with a standard deviation of 0.5868 which indicates that the market size is getting bigger than before the Covid-19 pandemic.

Table 3. Descriptive Statistical Analysis (2020-2021)

Parameter	ROA	ROE	Growth	Lerner	Current Ratio	Size
Mean	2.1974	2.9922	0.0950	0.4332	2.3618	8.8439
Median	1.5066	3.3780	0.0511	0.4470	2.4455	8.7398
Maximum	9.9565	11.8650	2.2002	0.6547	2.7724	9.8600
Minimum	-2.0100	-7.9500	-0.9000	-0.0300	1.9489	7.6287
Std. Dev.	2.5442	3.6452	0.4173	0.1192	0.2540	0.5868

Table 4 shows a comparison of the minimum and maximum data by firm between before and during the Covid-19 pandemic period. From a profitability perspective, Indofarma Tbk, a state-owned firm, had the lowest performance compared to other pharmaceutical companies in Indonesia both in the period before and during the Covid-19 pandemic. Meanwhile, Merck Tbk had the best performance in the period before the Covid-19 pandemic and was replaced by the Sido Herbal and Pharmaceutical Industry as the firm with the best performance during the Covid-19 pandemic period.

In terms of firm growth, Indofarma Tbk had the best performance in the period before and during the Covid-19 pandemic, while Merck Tbk had the lowest performance in the period before the Covid-19 pandemic and Tempo Scan Pacific Tbk in the period during the Covid-19 pandemic. Indofarma Tbk consistently has the lowest market power as indicated by the lowest lerner index both in the period before and during the Covid-19

pandemic, while Phapros Tbk. had the best market power in the period before the Covid-19 pandemic and was replaced by Pyridam Farma Tbk in the period during the Covid-19 pandemic. In terms of liquidity, it is shown that the data is quite varied with Phapros Tbk and Kimia Farma Tbk, both of which are also state-owned companies, being the companies with the lowest liquidity in the period before the Covid-19 pandemic. Meanwhile, Sido's Herbal and Pharmaceutical Industry was the most liquid firm in the period before the Covid-19 pandemic and was replaced by Pyridam Farma Tbk in the period during the Covid-19 pandemic. Pyridam Farma Tbk is consistent as the smallest firm in terms of firm size, while Kalbe Farma Tbk. consistently as the largest firm both in the period before and during the Covid-19 pandemic.

Table 4. Comparison of Minimum and Maximum Data by Firm

Variable	Minimum				Maksimum			
	2018-2019		2020-2021		2018-2019		2020-2021	
	Firm	Month-Year	Firm	Month-Year	Firm	Month-Year	Firm	Month-Year
ROA	Indofarma Tbk.	Sep-2018	Indofarma Tbk.	Dec-2021	Merck Tbk.	Dec-2019	Industri Jamu dan Farmasi Sido	Sep-2021
ROE	Indofarma Tbk.	Sep-2018	Indofarma Tbk.	Dec-2021	Merck Tbk.	Dec-2019	Industri Jamu dan Farmasi Sido	Sep-2021
Growth	Merck Tbk.	Mar-2018	Tempo Scan Pacific Tbk.	Dec-2021	Indofarma Tbk.	Dec-2019	Indofarma Tbk.	Dec-2020
Lerner	Indofarma Tbk.	Sep-2018	Indofarma Tbk.	Dec-2021	Phapros Tbk.	Sep-2018	Pyridam Farma Tbk.	Jun-20
Current Ratio	Phapros Tbk.	Mar-2019	Kimia Farma Tbk.	Sep-2020	Industri Jamu dan Farmasi Sido	Mar-2018	Pyridam Farma Tbk.	Mar-2021
Size	Pyridam Farma Tbk.	Jun-2019	Pyridam Farma Tbk.	Jun-2020	Kalbe Farma Tbk.	Jun-2019	Kalbe Farma Tbk.	Dec-2021

## V. DISCUSSION

The study results indicate that pharmaceutical firms still manage to maintain profitability in the midst of pandemic Covid-19. Compare to before pandemic, it is found that the average of ROA is slightly increased. The increase of ROA means increase of return rate and it indicates better performance. On the other hand, ROE found to be decreased. It suggests the firms are becoming less efficient at creating profits and increasing shareholder value. For better firm performance of pharmaceutical sector particularly in Indonesia, the implementations of innovative capabilities are very important (Andjarwati, 2020). The pharmaceutical industry is required to have a diversified product portfolio since the Covid-19 pandemic has change consumer behavior and the demand (Erlangga et al., 2020; Ayati et al., 2020). Pharmaceutical firms should gain momentum to create breakthrough products which also fulfill the need for Covid-19 related drugs.

Firms continue to grow positively even though the growth rate is lower during the pandemic. The slowdown in growth can be more due to the entry of newer medications since the priorities of pharmaceutical firms change in their portfolio to meet the market demand. Supply shortage of both active pharmaceutical ingredients (APIs) and finished products may have contributed slow-down in production thus price increase in essential prescription medicines, including antibiotics (Ayati et al., 2020). The market power tend to be more competitive during the pandemic as indicated by the lower Lerner index. The current global crisis due to Covid-19 has made product market competition fiercer, which ultimately affects the firm's performance (Liu et al, 2022). Firms become less liquid during pandemic. The emergence of the Covid-19 pandemic further worsened liquidity where the cash ratio and current ratio decreased (Karim et al., 2021). In terms of size, it is showed that firms becoming much

larger despite the pandemic situation. According to sales record in 2021 from IMS, despite slowdown in prescription drugs, supplement, herbal and over the counter products show a significant growth during pandemic. Thus, it is obvious that Industri Jamu and Farmasi Sido which its main products are supplement, herbal and over the counter be the most profitable firms during pandemic.

## VI. CONCLUSION AND RECOMMENDATION

The objective of this study was to analyze pharmaceutical firm profitability during Covid-19 pandemic in Indonesia. Profitability, measured by ROA and ROE, and its factors (firm growth, market power, liquidity, firm size) are included in the analysis. The data was collected from the quarterly annual statement of selected nine pharmaceutical firms in Indonesia listed in Indonesia Stock Exchange. A descriptive research design is applied in this research. The findings indicated that pharmaceutical firms still manage to maintain profitability in the midst of pandemic Covid-19. Firms continue to grow positively and increase the size even though the growth rate is lower. Firms are becoming more competitive facing fierce situations due to pandemic. Liquidity should be a concern since firms tend to be less liquid during pandemic. It is important to put attention on the factors affecting profitability especially competitiveness and liquidity. With regards to competitiveness, based on previous research, the implementations of innovative capabilities are very important. The pharmaceutical industry is required to have a diversified product portfolio since the Covid-19 pandemic has change consumer behavior and the demand. Pharmaceutical firms should gain momentum to create breakthrough products which also fulfill the need for Covid-19 related drugs. As for liquidity, the cash conversion cycle is also important because it will impact to cash received by the firm. This study is expected to provide fresh insight related to profitability and its factors of pharmaceutical firms especially during crisis.

## ACKNOWLEDGEMENT

We acknowledge the support of pharmaceutical firm that has been willing to share their quarterly financial report that has not been published yet at the time of the study.

## Regulation Analysis of Implementation Mobile Virtual Network Operator Business Model in Indonesia

A.Dr. Helni Mutiarsih Jumahur, S.H., M.H<sup>1</sup>, B.Rizkia Feriska, S.T<sup>2</sup>

<sup>1,2</sup>School of Electrical Engineering, Telkom University, Bandung, Indonesia

### Abstract

*Mobile Virtual Network Operator (MVNO) is an operator that does not have a frequency spectrum license, so MVNO must lease a frequency band to the Mobile Network Operator (MNO). The MVNO has three business models: Full MVNO, Light MVNO, and Brand Reseller. The difference between the three business models is in the ownership of the infrastructure of each business model. The MVNO has a positive impact, including increasing the market share of MNO, increasing connectivity, and being a choice for the customer. Many countries have successfully implemented MVNO, including Malaysia and Singapore. In Indonesia, MVNO cannot be implemented because of the regulations. However, the existence of Undang-Undang No. 11 Tahun 2020 tentang Cipta Kerja can support the implementation of MVNO in Indonesia through several amendments in the previous regulation. Therefore, in this study, we will discuss the analysis of the regulation of MVNO implementation in Indonesia using literature study method in terms on telecommunication operations. Based upon the result, The Full MVNO, Light MVNO, and Brand Reseller business models have different licenses due to different ownership of infrastructure. A business model with an active infrastructure is classified as a telecommunications network operator, and a business model without active infrastructure is classified as a telecommunications service provider.*

*Keywords—Telecommunication Operators; MVNO; Telecommunication Regulation*

---

### I. INTRODUCTION

Currently, cellular technology has entered the 5G generation. This 5G technology can provide data speeds up to 100 times compared to the previous generation. In addition, 5G technology can also use three different frequency spectrum bands, namely low band, mid-band, and high band, with a bandwidth around 80 MHz to 100 MHz. With this performance, the 5G network can support various new services such as autonomous cars, virtual reality, augmented reality, industry 4.0, the Internet of Things, and many more (GSMA, 2016). In this case, MVNOs can help MNOs develop 5G services (Mobilise, 2019). In addition, MVNO also has various other advantages, such as being able to help accelerate the improvement of broadband networks, increasing domestic innovation products, providing a variety of choices to the community, and many more (Munawaroh, 2016), (Rasmussen, 2021), (Williams, 2019).

The MVNO has been implemented in other countries, but the existing regulations in Indonesia, MVNO, cannot be implemented. In Peraturan Pemerintah No. 52 Tahun 2000 tentang Penyelenggaraan Telekomunikasi it was stated that the frequency spectrum could not be traded or transferred (Kementerian Komunikasi dan Informatika, 2000). Meanwhile, MVNO must lease the frequency spectrum from MNO in its implementation because MVNO does not have a frequency spectrum license, so MVNO must lease the frequency spectrum to MNO.

Previously research has been conducted on the study of the regulation of MVNO implementation in Indonesia and analysis of strategies using SWOT in Indonesia. The study results show that MVNO can be a profitable business for both the MVNO itself, MNO, and the community, so regulators must immediately develop regulations related to MVNO (Arif, 2010). Furthermore, research has been carried out on the Analysis of the Implementation of the Mobile Virtual Network Operator (MVNO) Business Model that is Appropriate to be Implemented in Indonesia as a Recommendation for the Ministry of Telecommunications and Information Technology. This study explains that MVNOs can provide differentiation for the community and provide a new positive impact for business competitors in the telecommunications industry by adjusting existing telecommunications regulations in Indonesia without forgetting aspects related to consumer protection (Munawaroh, 2016). Third references are about Governing MVNO in Development Countries by Pham Hai Son. This journal explains about developing regulatory framework for MVNO in development countries. The result from this research is offers several recommendations based on observations related to the structure, operation, and government of MVNO. Then, this recommendation can be considered as a reference and guidance for

implementation MVNO based on industry environment and social environment in a country (Son et al, 2019). Based on this, this study will discuss the analysis of the regulation of MVNO implementation in Indonesia.

II. LITERATURE REVIEW

A. Mobile Virtual Network Operators

MVNO is a service provider that does not have a frequency spectrum license, so MVNO must lease a frequency spectrum to MNO to operate. MVNO's cooperation with MNO will certainly provide mutual benefits. As a new operator, MVNO will increase the public's brand awareness of itself. As an existing, well-established operator, MNO can explore new markets that may have been previously unreachable (Camarán and Miguel, 2008), (Wahyudin, Amalia, and Lindra, 2017).

Based on the business model, MVNO has three business models, namely Full MVNO, Light MVNO, and Brand Reseller. The difference between the three business models lies in the ownership of the infrastructure. In the full MVNO business model, MNO only provides an access network, but for infrastructure starting from the core network, the services delivered into the sales distribution will be managed by MVNO. In the light MVNO business model, MVNO does not have any network infrastructure, so in its implementation, MVNO only focuses on business management and can create services specifically for its customers. A light MVNO business model will be leased to MNO for infrastructure technology. The reseller brand business model is different from the lightweight MVNO business model. MVNO in the reseller brand business model acts as an extension of MNO so that MVNO only resells services owned by MNO and cannot create its services. The difference between the three business models can be seen in Figure 1 (Nereo Consulting, 2014).

From an economic perspective, these differences will impact the revenue earned by each of these business models. These differences can affect the CAPEX and OPEX issued by the MVNO. From the Average Revenue Per User (ARPU) side, the full MVNO business model can determine the selling price or the ARPU itself. In contrast, the light MVNO business model and the ARPU reseller brand obtained are not as large as the ARPU in the full MVNO model (Nereo Consulting, 2014), (Cartesian, 2017). Previously, research has been carried out on the analysis of techno-economic calculations for the implementation of MVNO in Bandung City with the title "Cost-Benefit Analysis of MVNO Business Model for LTE 4G Services in Bandung City". This study indicates that MVNO is feasible to be implemented in Indonesia because it can create an ideal telecommunications industry. This study explained that the most feasible business model to be implemented in Bandung with the condition of the existing population was the Brand Reseller business model (Wahyudin, Amalia, and Lindra, 2017).

Fig. 1. The differences between MVNO Business Model (Nereo Consulting 2014)

### B. Benefit of Implementation MVNO in Indonesia

The implementation of the MVNO will undoubtedly impact Indonesia, especially for the MNO, the community, or the government. The following is the impact of MVNO implementation.

Table 1. Benefit of Implementation MVNO in Indonesia.

The Parties	Benefit
Mobile Network Operators	<ul style="list-style-type: none"> <li>• Increase MNO's market share</li> <li>• MNO can get new revenue streams</li> <li>• Reduce MNO's Subscriber Acquisition Cost (SAC) costs</li> <li>• Increase MNO EBITDA</li> </ul>
The Government	<ul style="list-style-type: none"> <li>• Increasing the acceleration of broadband network deployment in Indonesia</li> <li>• Improve connectivity and utility</li> </ul>
The Customers	<ul style="list-style-type: none"> <li>• Providing new service innovations</li> <li>• Increasing the variety of operator choices for Indonesian citizens</li> <li>• There is more competitive tariff flexibility.</li> <li>• Provide new content with more exclusive content and services</li> </ul>

Source: (Camarán and Miguel, 2008), (Rasmussen, 2021), (Williams, 2019)

### C. Benchmark of Implementation MVNO in Other Countries

Several countries in the world have successfully implemented MVNO. The following explains the MVNO that has been successfully implemented in several countries.

#### 1. Malaysia

Malaysia is the countries with a very competitive telecommunications industry. There are four MVNO business models in Malaysia: Full MVNO, Enhanced Service Provider, Enhanced Reseller, and Reseller. The Malaysian Communications and Multimedia Commission (MCMC) has determined that every MVNO must have a license originating from the MCMC. There are three categories of licenses in Malaysia, namely:

- a. Network Facilities Provider (NFP) is a license for ownership of infrastructures such as towers, satellites, optical cables, and other devices.
- b. Network Service Provider (NSP) is a license that can support connectivity.
- c. Application Service Provider (ASP) is a license related to services that require internet (Malaysian Communication and Multimedia Commission, 2021).

MVNO implementation in Malaysia must have a license according to their respective business models.

Table 2. Benefit of Implementation MVNO in Indonesia.

Business Model	NFP	NSP	ASP
Full MVNO	✓	✓	✓
Enhanced Service Provider		✓	✓
Enhanced Resellers		✓	✓

Source: (Malaysian Communication and Multimedia Commission, 2021)

#### 2. Singapore

There are two licenses in Singapore, namely Facilities-Based Operator (FBO) and Service-Based Operator (SBO). FBO is a license used to build a private customer network through international transfers. Meanwhile, SBO is a license used for telecommunications operations, including voice and data services. To be able to operate, the MVNO must have an FBO license. The MVNO must pay the FBO to use the network or other segments associated with the network (IMDA, 2019).

#### 3. India

MVNO was introduced in 2008 by Telecom Regulatory Authority of India (TRAI). India is the second largest mobile telephony market after China, and it attracted the interest of foreign players to enter the Indian mobile market. Operators such Vodafone, Maxis, Etisalat, and Telenor have already acquired stakes in existing players.

Based on this condition, TRAI allowing MVNO to operate in the market. TRAI has proposed a regulatory framework and their recommendation are expected to result in the issue of MVNO license. Table 3 shows the summary of recommendations by Indian Regulator on MVNO (Capgemini, 2009).

Table 3. Recommendation Indian Regulator for MVNO (Capgemini, 2009).

Regulatory Parameters	Current Regulations	Implication for MVNO
License	MVNO own individual license with service area same as parent MNO No rollout obligations	MVNO free to selective rollout within licensed circle of MNO
Business Model	Flexibility to choose business model Scope of service same as MNO while licensing and entry fee are lower requirement	Reduced rollout cost for MVNO
Service Obligations & Tariffs	MNO has no influence on prices MVNO is responsible for customer services, QoS, etc There is no limit to the amount of cooperation between MVNO and MNO	MVNO are free to set their prices and MVNO need to push for comprehensive SLA with MNO
MNO – MVNO Relationship	MVNO and MNO only attached in the same area MVNO license depend on relationship with MNO 6 months' notice to give to MNO, customers, DoT, and TRAI	MNO have higher bargaining power to MVNO
Exit Clause	MVNO will be disqualified from obtaining a new license in the same service area PBG will be forfeited and returned after the dues are paid	MVNO will need to be selective about regions of service rollout

#### 4. Pakistan

Pakistan was the first who introduced MVNO in South Asia. Basic regulation of MVNO in Pakistan is Clause 9.11.1 of Telecommunications Policy 2015. Tabel 4 shows the flow for MVNO License in Pakistan (SATRC , 2018).

Table 4. MVNO regulatory framework in Pakistan (SATRC, 2018).

Regulatory Parameters	Description
License Issuance and Commercial Agreements	MVNO allowed to operate a commercial agreement with more than one MNO The scope of MVNO and MNO cooperation define in the agreement between MVNO and MNO The commercial agreement shall submit to Pakistan Telecommunication (PTA) for approval After approval, the company should apply MVNO license to PTA
Number Allocation	MVNO are not allowed to instaal their own network element. MVNO should ensure that their users receive a goog quality services MVNO shall look into individual responsibilities aspect regarding clearly be pronounced in the document.
Customer Care and Services Provosioning	MVNO is responsible for the national security issues MVNO should not suspend services to MNO without approval PTA MVNO responsible for facilitating and billing customer MVNO shall submit the Code of Commercial Practice and Standard Contract of Service to PTA
Fee	MVNO should pay the regulatory fees
Roaming Agreement	MVNO should not enter into roaming agreements with other operatos

#### 5. Bhutan

MVNO will be licensed in ICT service and not permitted to develop its own core network due to the small market. For licensed frequency, MVNO in Bhutan eligible to apply spectrum similar t oo their parents MNO. In Bhutan, allocation of spectrum frequency based on the requirement of individual operators. The cooperation between MVNO and MNO in Bhutan expected to signing agreement before submitting license application.

Bhutan’s regulators believe that the introduction of MVNO might make mandatory obligation for MNO to entertain the request for MVNO. Otherwise, with the small market on Bhutan it might be difficult to introduce MVNO (SATRC, 2018).

*D. Telecommunication Operations*

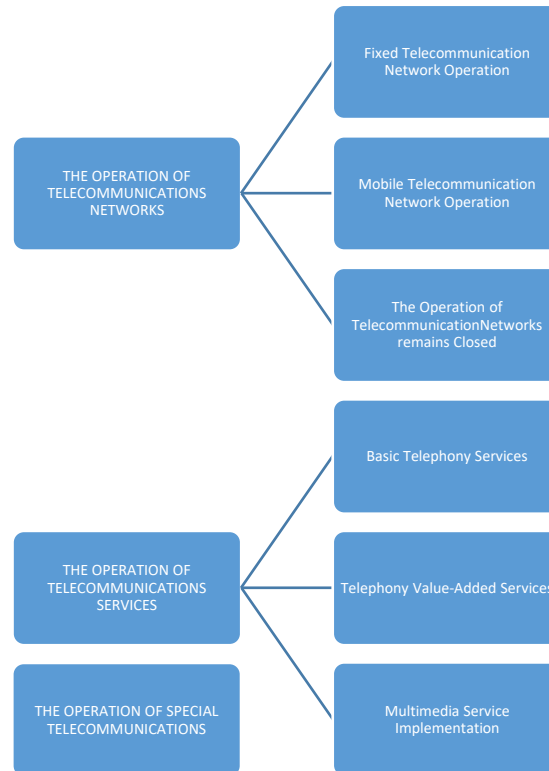

Fig. 2. Telecommunication Operations in Indonesia (Kementerian Komunikasi dan Informatika 2000).

Based on Undang-Undang No. 36 Tahun 1999 tentang Telekomunikasi, it is stated that the operation of telecommunications is the activity of providing and providing telecommunications services that enable the operation of telecommunications (Pemerintah Republik Indonesia, 1999). The operation of telecommunications is divided into three operations: the operation of telecommunications services, telecommunications networks, and special telecommunications.

An explanation of the categories of telecommunications operations can be seen in the following points.

*1. Telecommunication Service Operation*

The operation of telecommunications services is the activity of providing or providing telecommunications services that enable the implementation of telecommunications. The operation of telecommunications services is further divided into three parts: Basic Telephony Services, Telephony Value-Added Services, and Multimedia Service Implementation. The Regulation of the Minister of Communication and Information Number 5 of 2021 concerning Telecommunications Operations (Kementerian Komunikasi dan Informatika, 2020).

*2. Telecommunication Network Operation*

The definition of telecommunications network operation is providing and serving telecommunications networks that enable the implementation of telecommunications (Kementerian Komunikasi dan Informatika, 2020). The operation of the Telecommunication Network is divided into three categories: Fixed Telecommunication Network Operation, Mobile Telecommunication Network Operation, and The Operation of Telecommunication Networks remains Closed. Specific regulations that discuss the operation of

telecommunications networks in Indonesia can be seen in the Peraturan Menteri Komunikasi dan Informatika No. 7 Tahun 2015 (Kementerian Komunikasi dan Informatika, 2015).

### 3. *Special Telecommunications Operations*

The operation of special telecommunications is the operation of telecommunications with exceptional nature, designation, and operation. Regulations regarding the operation of special telecommunications are contained in the Peraturan Menteri Komunikasi dan Informatika No. 12 Tahun 2018 tentang Penyelenggaraan Telekomunikasi Khusus untuk Keperluan Instansi Pemerintah atau Badan Hukum.

#### E. *Regulation of Telecommunication Operations in Indonesia*

. Regulations related to the operation of Telecommunications in Indonesia are regulated in:

- a. Undang-Undang No. 36 Tahun 1999 tentang Telekomunikasi
- b. Undang-Undang No. 11 Tahun 2021 tentang Cipta Kerja
- c. Peraturan Pemerintah No. 52 Tahun 2000 tentang Penyelenggaraan Telekomunikasi
- d. Peraturan Pemerintah No. 46 Tahun 2021 tentang Pos, Telekomunikasi, dan Penyiaran
- e. Peraturan Menteri Kominfo No. 5 Tahun 2020 tentang Penyelenggaraan Telekomunikasi
- f. Peraturan Menteri Kominfo No. 13 Tahun 2019 tentang Penyelenggaraan Jasa Telekomunikasi.

### III. RESEARCH METHODOLOGY

The method used in this research is a literature study. A literature study is a research conducted based on theoretical descriptions, findings, and other research materials, which will be used to develop a framework for solving research problems (Kementerian Komunikasi dan Informatika, 2021). In this study, the data used as literature study material are MVNO definitions, MVNO business processes, benchmarks from other countries that have implemented MVNO, and existing regulations related to telecommunications operations in Indonesia. Then the data will be analyzed to produce an insight or recommendation regarding the regulation of MVNO implementation in Indonesia.

### IV. RESULT / FINDING

#### A. *Definition of MVNO Based on Existing Regulation*

Judging from the definition, MVNO is a service provider that does not have a frequency spectrum license, so if a definition approach is taken with existing regulations, MVNO can be categorized as a Telecommunication Operator. Telecommunications operations are divided into three categories: the operation of telecommunications networks, the provision of telecommunications services, and the operation of special telecommunications. The MVNO categories can be distinguished based on the ownership of the infrastructure by the MVNO. In the full MVNO business model, the infrastructure that MVNO must own is a core network, while in the light MVNO business model and brand resellers do not need to provide or have any infrastructure. Based on Peraturan Pemerintah No. 46 Tahun 2021 tentang Pos, Telekomunikasi dan Penyiaran, it is stated in the Pasal 26 clause (1) and (2) that:

- a. Business Actors who have an active infrastructure in the Telecommunications and/or Broadcasting sector may open access to the utilization of the said infrastructure to Telecommunication providers based on an agreement through the cooperation of the parties considering fair business competition by the provisions of laws and regulations.
- b. Business Actors who have the active infrastructure, as referred to in paragraph (1) for the Telecommunications sector, are Telecommunication Network operators (Kementerian Komunikasi dan Informatika, 2021).

From the regulations contained in the Government Regulation, it can be concluded that the MVNO with the Full MVNO business model is included in the Telecommunication Network Operation because the core network owned by this business model is included in active telecommunications equipment. In addition, MVNO can also have and provide its SIM card with a separate numbering system from MNO in this business model. The numbering system is also regulated in Peraturan Pemerintah No. 46 Tahun 2021 tentang Pos, Telekomunikasi, dan Penyiaran, as stated in Pasals 17 and 18 (Kementerian Komunikasi dan Informatika, 2021).

In the light of MVNO and Brand Reseller business models, MVNO does not have any telecommunication infrastructure, either active or passive, so these two business models can be categorized as Telecommunication

Service Providers. In the operation of telecommunications services, a license for the operation of telecommunications services will be granted by the Minister to telecommunications service providers to provide commercial telecommunications services (Kementerian Komunikasi dan Informatika, 2019). The implementation of telecommunications services is regulated in Peraturan Pemerintah No. 46 Tahun 2021 tentang Pos, Telekomunikasi, dan Penyiaran in Pasal 43 clause (1), (2), and (3) as follows.

- a. Telecommunication Network Operators may lease their Telecommunication Networks to other Telecommunication providers and non-telecommunication providers.
- b. As referred to in paragraph (1), the telecommunications network rental is carried out based on a fair, fair, and non-discriminatory agreement.
- c. In addition, the rental, as referred to in paragraph (1), the Telecommunication Network may be used by the Telecommunication service provider.

Regulations concerning the leasing of telecommunications networks are detailed in the Peraturan Menteri Komunikasi dan Informatika No. 5 tahun 2021 tentang Penyelenggaraan Telekomunikasi (Kementerian Komunikasi dan Informatika, 2020).

#### B. Adjustment with Undang-Undang No. 11 Tahun 2021 tentang Cipta Kerja

Telecommunication regulation in Undang-Undang No. 11 Tahun 2011 tentang Cipta Kerja regulated in Paragraph 15 concerning Post, Telecommunications and Broadcasting starts from Pasal 69 to Pasal 72. Telecommunications law is regulated in Pasal 71, which changes, deletes, or adds from Undang-Undang No. 36 Tahun 1999 tentang Telekomunikasi. Several Pasals of from Undang-Undang No. 36 Tahun 1999 tentang Telekomunikasi as amended in the Undang-Undang No. 11 Tahun 2011 tentang Cipta Kerja in Pasal 71 consisting of Pasal 11, Pasal 28, Pasal 30, Pasal 32, Pasal 33, Pasal 34, Pasal 45, Pasal 46, Pasal 47, and Pasal 48 (Pemerintah Republik Indonesia 2020b). This amendment can be seen in Table 3.

Table 3. Amandement in Undang-Undang No. 11 Tahun 2022 tentang Cipta Kerja.

Amendment	Undang-Undang No. 36 Tahun 1999 tentang Telekomunikasi	Undang-Undang No. 11 Tahun 2021 tentang Cipta Kerja
Pasal 11	The operation of telecommunications as referred to in Pasal 7 can be carried out after obtaining a permit from the Minister of Finance. The permit as referred to in paragraph (1) is granted with due observance of: simple procedure a transparent, fair and non-discriminatory process; as well as solution in a short time. Provisions regarding the licensing of telecommunications operations as referred to in paragraph (1) and paragraph (2) shall be regulated by a Government Regulation.	The telecommunications operation as referred to in Pasal 7 paragraph (1) can be carried out after fulfilling the Business Licensing from the Central Government. Further provisions regarding Business Licensing as referred to in paragraph (1) shall be regulated in a Government Regulation.
Pasal 28	The tariff for the operation of telecommunications networks and or telecommunications services is determined by the operator of telecommunications networks and or telecommunications services based on a formula determined by the Government.	The tariff for the operation of telecommunications networks and/or telecommunications services is determined by the operator of telecommunications networks and/or telecommunications services based on a formula determined by the Central Government. The Central Government may determine the upper limit tariff and/or lower limit tariff for telecommunications operations by taking into account the interests of the public and fair business competition.
Pasal 30	If the telecommunications network operator and/or telecommunications service provider has not been able to provide access in certain areas, the special telecommunications operator as referred to in Pasal 9 paragraph (3) letter a may operate the telecommunications network and or telecommunications services and or telecommunications services as referred to in Pasal 7 paragraph (1) letter a and letter b after obtaining permission from the Minister. If the telecommunications network operator and/or telecommunications service provider has been able to provide access in the area as referred to in paragraph (1),	In the event that the telecommunications network operator and/or telecommunications service provider has not been able to provide access in certain areas, the special telecommunications operator as referred to in Pasal 9 paragraph (3) letter a may operate the telecommunications network and/or telecommunications services as referred to in Pasal 7 paragraph (1 ) letter a and letter b after fulfilling the Business Licensing from the Central Government. In the event that the telecommunications network operator and/or telecommunications service provider has been able to provide access in the area as referred to in paragraph (1), the special telecommunications operator may continue to

	<p>the said special telecommunications operator may continue to operate telecommunications networks and or telecommunications services.</p>	<p>operate telecommunications networks and/or telecommunications services.</p>
<p>Pasal 32</p>	<p>The requirements for obtaining a permit as referred to in paragraph (1) shall be regulated by a Government Regulation.</p>	<p>Further provisions regarding Business Licensing as referred to in paragraph (1) shall be regulated in a Government Regulation.</p>
	<p>Telecommunication equipment which is traded, manufactured, assembled, imported and/or used in the territory of the Republic of Indonesia must comply with technical requirements and be based on permits in accordance with the prevailing laws and regulations. Provisions regarding the technical requirements of telecommunications equipment as referred to in paragraph (1) shall be regulated by a Government Regulation.</p>	<p>Every telecommunication tool and/or equipment manufactured, assembled, and imported for trading and/or use in the territory of the Republic of Indonesia must meet technical standards. Further provisions regarding technical standards of telecommunication tools and/or equipment as referred to in paragraph (1) shall be regulated in a Government Regulation.</p>
<p>Pasal 33</p>	<p>The use of a radio frequency spectrum and satellite orbit must obtain a government permit. The use of the radio frequency spectrum and satellite orbit must be in accordance with their designation and not interfere with each other. The government supervises and controls the use of the radio frequency spectrum and satellite orbit. Provisions on the use of the radio frequency spectrum and satellite orbit used in the operation of telecommunications are regulated by a Government Regulation.</p>	<p>The use of radio frequency spectrum and satellite orbit by Business Actor is required to fulfill Business Licensing from the Central Government. Use of radio frequency spectrum and satellite orbit by other than Business Actors must obtain approval from the Central Government. The use of the radio frequency spectrum and satellite orbit as referred to in paragraphs (1) and (2) must be carried out according to the designation and not cause harmful interference. In the event that the use of a radio frequency spectrum is not optimal and/or there is a greater public interest, the Central Government may revoke the Business License or approval for the use of a radio frequency spectrum. The Central Government may determine the joint use of the radio frequency spectrum. The holder of a Business License related to the use of the radio frequency spectrum as referred to in paragraph (1) for the operation of telecommunications may perform:</p> <ul style="list-style-type: none"> <li>a. cooperation in the use of radio frequency spectrum for the application of new technology; and/or</li> <li>b. transfer of use of radio frequency spectrum with other telecommunications operators.</li> </ul> <p>The cooperation on the use and/or transfer of the use of the radio frequency spectrum as referred to in paragraph (6) must first obtain approval from the Central Government. The guidance, supervision, and control of the use of the radio frequency spectrum and satellite orbit as referred to in paragraphs (1) and (2) shall be carried out by the Central Government. Further provisions regarding Business Licensing related to the use of a radio frequency spectrum and satellite orbit as referred to in paragraph (1), approval for the use of a radio frequency spectrum and satellite orbit as referred to in paragraph (2), joint use of a radio frequency spectrum, cooperation in the use of a radio frequency spectrum, and the transfer of the use of the radio frequency spectrum as referred to in paragraph (5) and paragraph (6) shall be regulated in a Government Regulation.</p>
<p>Pasal 34</p>	<p>Users of a radio frequency spectrum are required to pay a usage fee, the amount of which is based on the type and width of the frequency band used. The use of satellite orbits is required to pay a fee for the right to use the satellite orbits. Provisions regarding fees as referred to in paragraph (1) and paragraph (2) shall be regulated by a Government Regulation.</p>	<p>The holder of a Business License and approval for the use of a radio frequency spectrum as referred to in Pasal 33 paragraph (1) and paragraph (2) must pay a fee for the right to use a radio frequency spectrum, the amount of which is based on the use of the type and width of the radio frequency band. Further provisions regarding the fee for the right to use a radio frequency spectrum as referred to in paragraph (1) shall be regulated in a Government Regulation.</p> <p><b>PASAL 34A</b></p> <p>The Central Government and Regional Governments provide facilitation and/or convenience to telecommunications operators to develop telecommunications infrastructure in a transparent, accountable, and efficient manner.</p>

		<p>In the operation of telecommunications, the Central Government and Regional Governments may participate in providing shared facilities for passive telecommunications infrastructure for joint use by telecommunications operators at affordable costs.</p> <p>Further provisions regarding the role of the Central Government and Regional Government as referred to in paragraph (1) and paragraph (2) shall be regulated in a Government Regulation.</p> <p>PASAL 34B</p> <p>Business Actors possessing passive infrastructure that can be used for telecommunications purposes are obligated to open access to the said passive infrastructure utilization to telecommunications operators.</p> <p>Business actors who have infrastructure other than those referred to in paragraph (1) in the telecommunications and/or broadcasting sector may open access to the utilization of the said infrastructure to telecommunications operators and/or broadcasting operators.</p> <p>The use of passive infrastructure as referred to in paragraph (1) is carried out based on the cooperation of the parties in a fair, reasonable, and non-discriminatory manner</p> <p>Utilization of infrastructure as referred to in paragraph (2) is carried out based on the cooperation of the parties.</p> <p>Further provisions regarding the utilization of infrastructure as referred to in paragraph (1), paragraph (2), paragraph (3), and paragraph (4) shall be regulated in a Government Regulation.</p>
Pasal 45	<p>Whoever violates the provisions of Pasal 16 paragraph (1), Pasal 18 paragraph (2), Pasal 19, Pasal 21, Pasal 25 paragraph (2), Pasal 26 paragraph (1), Pasal 29 paragraph (1), Pasal 29 paragraph (2), Pasal 33 paragraph (1), Pasal 33 paragraph (2), Pasal 34 paragraph (1), or Pasal 34 paragraph (2) is subject to administrative sanctions.</p>	<p>Violation of the provisions of Pasal 16 paragraph (1), Pasal 18 paragraph (2), Pasal 19, Pasal 20, Pasal 21, Pasal 25 paragraph (2), Pasal 26 paragraph (1), Pasal 29 paragraph (1), Pasal 29 paragraph (2), Pasal 32 paragraph (1), Pasal 33 paragraph (1), Pasal 33 paragraph (2), Pasal 33 paragraph (3), Pasal 33 paragraph (7), or Pasal 34 paragraph (1) shall be subject to administrative sanctions.</p> <p>The administrative sanctions as referred to in paragraph (1) can be in the form of:</p> <p>written warning.</p> <p>temporary suspension of activities.</p> <p>administrative fines; and/or</p> <p>revocation of Business License.</p> <p>Further provisions regarding the criteria, types, amount of fines, and procedures for imposing administrative sanctions as referred to in paragraphs (1) and (2) shall be regulated in a Government Regulation..</p>
Pasal 46	<p>The administrative sanction as referred to in Pasal 45 is in the form of license revocation.</p> <p>The revocation of the permit as referred to in paragraph (1) shall be carried out after being given a written warning.</p>	<p>Pasal 46 deleted</p>
Pasal 47	<p>Whoever violates the provisions as referred to in Pasal 11 paragraph (1), shall be sentenced to a maximum imprisonment of 6 (six) years or a maximum fine of Rp. 600,000,000.00 (six hundred million rupiah).</p>	<p>Whoever violates the provisions as referred to in Pasal 11 paragraph (1) shall be sentenced to a maximum imprisonment of 10 (ten) years and/or a maximum fine of Rp. 1,500,000,000.00 (one billion five hundred million rupiah).</p>
Pasal 48	<p>Telecommunications network operators violating the provisions as referred to in Pasal 19 shall be subject to a maximum imprisonment of 1 (one) year and or a maximum fine of Rp. 100,000,000.00 (one hundred million rupiah).</p>	<p>Pasal 48 deleted</p>

Source: (Pemerintah Republik Indonesia, 2020)

From several amendments to these pasals, pasals relating to the implementation of MVNO in Indonesia are in pasal 11, pasal 28, pasal 32, pasal 34, and pasal 34B. Based on pasal 11, licensing for telecommunications operations in Indonesia must initially obtain a permit from the Minister. With this Undang-Undang Cipta Kerja, telecommunications operations in Indonesia must meet business permits from the central government. So that in its implementation, MVNO must first have a business permit from the central government. In addition, in pasal 28 of Undang-Undang Cipta Kerja No. 11 Tahun 2021, it is stated that the central government can

determine the upper and lower limits of the operation of telecommunications networks or services. So that MVNO as a network operator and a service in selling its services, must follow these regulations. The use of devices by MVNO, especially the Full MVNO business model, which provides active devices, must meet the technical standards applicable in Indonesia by pasal 32 of Undang-Undang Cipta Kerja No. 11 Tahun 2021. The technical standards cover aspects of electricity, electronics, safety, and health. The equipment tested to meet technical standards will have a certificate and a label related to the identity of the business actor, certificate number, and a warning sign that prohibits making changes so that the equipment does not meet the technical standards that have been set.

MVNO as an operator that does not have a frequency spectrum license must lease a frequency spectrum to MNO. It is one of the obstacles to implementing MVNO in Indonesia because it is not allowed. However, with Undang-Undang Cipta Kerja No. 11 Tahun 2021 Pasal 33, it is possible to implement it because it is explained that the radio frequency spectrum can be used simultaneously. Based on Peraturan Pemerintah No. 46 of 2021 tentang Pos, Telekomunikasi, dan Penyiaran pasal 50 paragraph (4), the purpose of using a shared frequency spectrum is to optimize the use of a radio frequency spectrum, cost efficiency of developing telecommunications infrastructure using a frequency spectrum, expanding regional coverage, increasing service quality, presenting new telecommunication services, making telecommunication service prices more affordable, and fulfilling national interests.

Pasal 34 of Undang-Undang Cipta Kerja No. 11 Tahun 2021 explains that passive infrastructure can be used jointly, both among network operators and telecommunications service providers. The addition of this pasal can support the implementation of MVNO in Indonesia because based on the MVNO topology, the business model with telecommunications infrastructure is only the Full MVNO business model. Therefore, MVNO must cooperate with MNO to provide a telecommunications network. Cooperation between MNOs and MVNOs enables sharing of infrastructure.

### *C. Cooperation between MVNO and MNO*

Cooperation in the telecommunications sector has been regulated in Undang-Undang No. 36 Tahun 1999 tentang Telekomunikasi. Pasal 2 states that cooperation must be carried out on the principles of benefit, fairness, equity, legal certainty, security, partnership, ethics, and self-confidence. Pasal 10 regulates the prohibition of monopolistic practices. So the telecommunications operators are prohibited from carrying out activities that result in monopolistic practices and unfair business competition. Based on this pasal, the cooperation between MVNO and MNO must comply with applicable regulations. Between MVNO and MNO must provide mutual benefits to each other be fair and non-discriminatory. Peraturan Pemerintah No. 46 tahun 2021 Pasal 23 paragraphs (1), (2), and (3) also states that the condition for service providers to be able to lease telecommunications networks to telecommunications network operators is that by leasing the network, it must be based on a fair, and non-discriminatory agreement. The pasals in the regulation can be used as a primary reference for cooperation between MVNO and MNO.

## V. CONCLUSION AND RECOMMEDATION

Conclusions that can be drawn from the analysis that has been carried out include:

- a. The license granted to the MVNO will depend on each business model.
- b. The Full MVNO, Light MVNO, and Brand Reseller business models have different licenses due to different ownership of infrastructure.
- c. Full MVNO's business model can be categorized as a telecommunication network operator.
- d. The Light MVNO and Brand Reseller business models can be categorized as providing telecommunications services.
- e. The changes to the telecommunications law in law number 11 of 2021 regarding job creation further support the implementation of MVNO in Indonesia.
- f. Cooperation between MVNO and MNO must be carried out following applicable regulations.

Suggestions that can be made for further research are:

There is an additional study regarding the more profound division related to the MVNO category in the operation of telecommunication networks. After the amendment, there is a additional study regarding the final derivative regulations

## Public Consumption Analysis Of Special Region of Yogyakarta With Panel Data 2015-2019

Erlin Anggraini<sup>1</sup>, Eni Setyowati<sup>2</sup>

<sup>1,2</sup>Economic Development, Economics and Business, Muhammadiyah Surakarta University, Sukoharjo, Indonesia

### Abstract

*Household consumption is a major component of gross regional domestic product. The higher the income of a household, the higher the level of consumption. And if the level of consumption is getting lower then it is caused by lower household income as well. This study aims to determine the effect of the variable total population, minimum wage, education, and gross regional domestic product. The analytical method used is the panel data regression analysis method. The sample of this research was conducted in Bantul, Gunung Kidul, Kulon Progo, Sleman and Yogyakarta city. This study uses quantitative research using secondary data obtained from the Central Statistics Agency (BPS) of the Special Region of Yogyakarta and Bappeda of the Special Region of Yogyakarta. The results of this study showed that total population variable partially had no significant effect on the consumption variable, while the minimum wage, education, and gross regional domestic product partially had significant positive effect on the consumption variable. The variables of total population, minimum wage, education, and gross regional domestic product simultaneously have an effect on the consumption variable.*

*Keywords—Public Consumption; Total Population; Minimum Wage; Education; Gross Regional Domestic Product*

---

## I. INTRODUCTION

Consumption is household spending on goods and services with the aim of meeting their needs. The goods referred to are durable goods, such as cars and household appliances, while non-durable goods, such as food and clothing, with the exception of the purchase of a new house. While services include intangible goods, such as haircuts/barbers, health services, and education (Mankiw, 2012).

Household consumption is the main component of gross regional domestic product (GRDP). The relationship between consumption and income is called consumption desire or Propensity to Consume, while all expenditures made by households to buy all needs in the form of durable goods and services are called consumption expenditures. The higher the income of a household, the higher the level of consumption and vice versa. Household consumption in the expenditure of gross regional domestic product (GRDP) is about 60% of the total consumption each year. This is because household consumption is greater than the consumption of other needs, so that household consumption becomes interesting to study (Sayuti, 1989).

Likewise for the special province of Yogyakarta (DIY). Based on statistical data in DIY in 2015-2019, it was explained that household consumption expenditure from 2015 to 2019 continued to experience a significant increase, and caused the growth of gross regional domestic product (GRDP) to experience a significant increase. Based on various publications, consumption expenditure is quite large, which is more than half of the total GRDP. Consumption expenditure is more than other expenditures. This is understandable considering that consumption is the main thing that is non-negotiable because in general consumption is the need to meet the needs of daily life, especially basic needs, namely food, clothing, housing, education and health needs.

## II. LITERATURE REVIEW

### A. Consumption

Consumption can be defined as the share of household income used to finance the purchase of various services and other needs. In fact, the amount of consumption varies according to the rise and fall of family income. Thus it can be said that consumption is always related to the level of income, if the level of income increases then consumption will increase, on the contrary if income decreases then consumption will decrease (Partadireja, 1995).

### *B. Function of Consumption*

The consumption function is a curve that describes the nature of the relationship between the level of household consumption in the economy and the national income (disposable income) of the economy (Dumairy, 1996).

The consumption function is:

$$C = a + bY$$

Information :

C = Consumption rate

a = Household consumption when national income is 0

Y = National income level

The consumption tendency can be divided into two, namely the marginal tendency to consume and the average consumption tendency (Mankiw, 2003).

### *C. Consumption Hypothesis*

There are several hypotheses regarding consumption, including the following (Suparmoko, 1991):

- A. Absolute Income Hypothesis. This hypothesis determines consumption with absolute income level, so that the relationship between income and consumption is a function of short-term consumption. Therefore the curve always intersects the vertical axis.
- B. Relative Income Hypothesis. If the individual's income level increases, consumption will increase in proportion to the increase in income. Meanwhile, if the income level falls, consumption will not decrease proportionally
- C. Permanent Income Hypothesis. The permanent income hypothesis states that current consumption depends on current income and income that can be predicted in the future.
- D. Life Cycle Hypothesis. Someone tends to receive low income at a young age, high at middle age, and low again at old age, so the savings ratio will fluctuate in line with their age development, i.e. young people will have negative savings, middle-aged people save and repay loans. in their youth, and old people take the savings they made in middle age.

### *D. Factors Influencing Consumption*

#### *a. Total population*

According to Badan Pusat Statistik (BPS) what is meant by population is all people who live in the geographical area of the Republic of Indonesia for 6 months or more and or those who live for less than 6 months but aim to settle down.

#### *b. Minimum wage*

According to Law no. 13 of 2003 Minimum Wage is a minimum standard used by entrepreneurs or industry players to provide wages to workers in their business or work environment.

#### *c. Education*

Law No. 20 of 2003 explains that education is a conscious and planned effort to create a learning atmosphere and learning process so that students actively develop their potential to have religious spiritual strength, self-control, personality, intelligence, noble character and skills needed by themselves, society and the state.

#### *d. Gross Regional Domestic Product (GRDP)*

Gross Regional Domestic Product (GRDP) is the total value added of goods and services produced from all economic activities in an area. GRDP calculation uses two kinds of prices, namely current prices and constant prices.

### *E. Previous Research*

Ismail, (2018) in a study entitled "The Influence of Population on Rice Consumption in Asparaga District, Gorontalo Regency". The analytical method used is simple regression to see the effect of population on rice

consumption. The results showed that the population in Asparaga District, Gorontalo Regency each year has a very positive effect on the amount of rice consumption.

Yanti and Murtala, (2019) in a study entitled "The Effect of Income, Number of Family Members and Education Level on Household Consumption in Muara Dua District, Lhokseumawe City". The analytical tool used in this study uses multiple linear regression. The results showed that the education level variable had a positive effect on the amount of household consumption.

Humaedi, (2020) in his research entitled "The Influence of Wages on Employee Consumption (study at PT. Dino Custom Mixing District of Tangerang - Banten). This study uses a quantitative method, namely the method with numbers. The quantitative method used for this research is a questionnaire filled out by respondents using a Likert Scale measurement. Based on the test results indicate that wages affect the consumption of employees at PT. Dino Custom Mixing.

Nurbayan and Juliansyah, (2018) entitled "The Influence of Per capita Income, GDP, and Total Population on the Consumption Level of the Aceh Tamiang Regency in 2003-2016". This research uses multiple log-linear regression analysis method. Based on the results of the research, the GRDP variable affects the level of consumption

Rohman and Effendi, (2019) entitled "The Influence of Population, Inflation and Economic Growth on Public Consumption in Magelang City". The analytical method used in this study is multiple linear regression analysis with the Ordinary Least Square (OLS) approach. The results show that the population does not have a significant effect on people's consumption.

Jung, McFarlane and Das (2021) in their research entitled "The effect of minimum wages on consumption in Canada". The analytical method used in this research is the auto regressive distributed lag (ADRL) approach. The results of this study indicate that the minimum wage has a positive effect on consumption in Canada.

Inglesi-Lotz and Morales (2017) in their research entitled "The effect of education on a country's energy consumption: Evidence from developed and developing countries". The analytical method used in this research is panel data. The results of the study show that education has a positive effect on energy consumption in various developed and developing countries.

Su (2011) in his research entitled "The Effect Of Population Density, Road Network Density, And Congestion On Household Gasoline Consumption In US Urban Areas". The analytical method used in this study uses parametric statistical tests. The results of this study suggest that the population variable has a negative effect on gasoline consumption in urban areas of the United States.

Alonso (2020) in his research entitled "The Impact of the Minimum Wage on Nondurable Consumption". The analytical method used is panel data regression analysis. The results of this study suggest that the minimum wage has a positive effect on long-term consumption.

Barnidge et al (2015) in their research entitled "The Effect Of Education Plus Access On Perceived Fruit And Vegetable Consumption In A Rural African American Community Intervention". The analytical method used in this study uses a participatory action research (PAR) approach. The results showed that the education variable had an effect on the consumption of vegetables and fruit in the African-American rural community intervention.

### III. RESEARCH METHODOLOGY

#### A. Research Method

This study uses panel data regression analysis. Analyzing panel data using the Eviews 9 program. This study uses quantitative research using secondary data. The data used is a combination of time series and cross section. In other words, panel data is data obtained from cross-sectional data which is observed repeatedly on the same individual unit (object) at different times (Juanda, 2021). The panel data estimation equations used in general are:

$$CM_{it} = \beta_0 + \beta_1 PQ_{it} + \beta_2 TPEN_{it} + \beta_3 UMP_{it} + \beta_4 PDRB_{it} + \varepsilon \quad (1)$$

Description:

CM	= Public Consumption Rate (Million)
PQ	= Total Population (Soul)
UMP	= Minimum Wage (Million)
TPEN	= Education Level
PDRB	= PDRB (billion rupiah)
$\beta_0$	= Constant
$\beta_1, \beta_2, \beta_3, \beta_4$	= Regression coefficient of independent variables
e	= Error term
i	= County or city
t	= Year

The calculation of the regression model has 3 approaches to analyze panel data, including:

#### B. Common-Constant Method

The Common-Constant method or can be called Pooled Least Square (PLS) is a model obtained by combining or collecting all cross section data and time series data. This data model is then estimated using ordinary least squares (OLS) (Pangestika, 2015). According to Gujarati et al., (2012) the big problem with this PLS model is that it does not differentiate between various airlines or the response of the explanatory variable to the total cost is the same for each airline at all times. The panel data regression model can be formulated as follows:

$$CM_{it} = \beta_0 + \beta_1 PQ_{1it} + \beta_2 UMP_{2it} + \beta_3 TPEN_{3it} + \beta_4 PDRB_{4it} + \varepsilon_{it} \quad (2)$$

Description:

CM	= Public Consumption Rate (Million)
PQ	= Total Population (Soul)
UMP	= Minimum Wage (Million)
TPEN	= Education Level
PDRB	= PDRB (billion rupiah)
$\beta_0$	= Constant
$\beta_1, \beta_2, \beta_3, \beta_4$	= Regression coefficient of independent variables
e	= Error term
i	= County or city
t	= Year

#### C. Fixed Effect Method

The Fixed Effect Model method, according to Juanda, (2021), is a method that intercepts regression between individuals because each individual is considered to have its own characteristics. The FEM method explains that an object has a constant that remains in magnitude for various periods of time. To distinguish one object from another, a dummy variable is used. Therefore, this model is often referred to as Least Squares Dummy Variables (LSDV). The LSDV model equation is as follows:

$$CM_{it} = \alpha_1 + \alpha_2 D_{2i} + \alpha_3 D_{3i} + \alpha_4 D_{4i} + \alpha_5 D_{5i} + \alpha_6 D_{6i} + \alpha_7 D_{7i} + \beta_1 PQ_{it} + \beta_2 UMP_{2it} + \beta_3 TPEN_{3it} + \beta_4 PDRB_{4it} \quad (3)$$

Description:

- CM = Public Consumption Rate (Million)  
 PQ = Total Population (Soul)  
 UMP = Minimum Wage (Million)  
 TPEN = Education Level  
 PDRB = PDRB (billion rupiah)  
 $\beta_0$  = Constant  
 D = Pseudo variable  
 i = Shows City/District  
 t = Shows the time series 2011-2015  
 $\alpha_{1,2,\dots}$  = Intercept  
 $\beta_{1,2,\dots}$  = Indicates the direction and influence of each (Slope)  
 $\mu$  = Disturbance factor or not observable

#### D. Random Effect Method

According to Astuti, (2010) stated that the REM method is used to overcome the weakness of the fixed effect method which uses dummy variables, so that the model experiences uncertainty. Without using quasi-variables, the random effects method uses residuals that are thought to have a relationship between time and between objects. The REM model equation is as follows:

$$CM_{it} = \beta_1 PQ_{1it} + \beta_2 UMP_{2it} + \beta_3 TPEN_{3it} + \beta_4 PDRB_{4it} \quad (4)$$

Description:

- CM = Public Consumption Rate (Million)  
 PQ = Total Population (Soul)  
 UMP = Minimum Wage (Million)  
 TPEN = Education Level  
 PDRB = PDRB (billion rupiah)  
 i = Shows City/District.  
 t = Shows the time series 2011-2015  
 $\beta_{0i}$  = Intercept coefficient or random constant  
 $\beta$  = Indicates the direction and influence of each one  
 $\mu$  = Disturbance factor or can not be observed

To determine the most appropriate model for estimating the panel data regression parameters, there are three tests that can be carried out, namely:

#### E. Chow Test (Likelihood Test Ratio)

The Chow test is a test used to find out whether the FEM model is better than the PLS model by looking at the significance of the FEM model which can be done with the F statistical test. For the formulation of the hypothesis,  $H_0$ , the model chosen is Polled Least Square (PLS), and  $H_A$ , the model that is used. Selected Fixed Effect Model (FEM). The test criteria are  $H_0$  accepted if p-value  $>$  and  $H_0$  is rejected if p-value  $<$ . In conclusion,

if the  $p$ -value  $> 0.05$ , then  $H_0$  is accepted so that the selected model is pooled least square. While the  $p$ -value  $0.05$ , then  $H_0$  is rejected so that the model chosen is Fixed Effect Model.

#### *F. Hausman Test*

To find out whether the fixed effect model is better than the random effect model, the Hausman test is used. The Hausman test statistic follows a chi-square statistical distribution with as many degrees of freedom as the number of independent variables ( $p$ ). Formulation of the hypothesis,  $H_0$  then the model selected Random Effect Model (REM), and  $H_A$  then the model selected Fixed Effect Model (FEM). The test criteria are  $H_0$  accepted if  $p$ -value  $>$  and  $H_0$  is rejected if  $p$ -value  $\leq$ . In conclusion, if the  $p$ -value  $> 0.05$ , then  $H_0$  is accepted so that the model chosen is the Random Effect Model. While the  $p$ -value  $0.05$ , then  $H_0$  is rejected so that the model chosen is Fixed Effect Model.

To see an accurate value estimate in the panel data regression function, it is necessary to carry out a goodness of fit test including the F statistic test, R2 determinant test, and t test.

#### *G. F Statistic Test*

According to Kuncoro, (2013) the F statistical test basically shows whether all the independent variables included in the model have a joint effect on the dependent variable. F test is used to test the existence of a model. The formulation of the hypothesis,  $H_0 : \beta_1 = \beta_2 = \beta_3 = \beta_4 = 0$ ; the model does not exist and  $H_A : 0$ ; existing models. The test criteria  $H_0$  is rejected if the statistical significance is  $F$  and  $H_0$  is accepted if the statistical significance is  $F >$ . In conclusion, if the significance of  $F 0.05$  then  $H_0$  is rejected which means the model does not exist, and  $H_0$  is accepted if the significance of  $F > 0.05$  then  $H_0$  is accepted which means the model exists.

#### *H. Determination of Adjusted R-Square (R<sup>2</sup>)*

According to Kuncoro, (2013) the coefficient of determination ( $R^2$ ) is to measure how far the model's ability to explain variations in the dependent variable is. In general, the coefficient of determination for cross-site data is relatively low because of the large variation between each observation, while for time series data it usually has a high coefficient of determination. The coefficient of determination test aims to see the percentage of variation (diversity) of the dependent variable that can be explained by the variation of the independent variables in the model. The value of the coefficient of determination is used to measure the contribution or contribution of the independent variables to the dependent variable. The value of the coefficient of determination ranges from zero to one. The closer to one the model is said to be better because it shows the more precise or suitable a regression line and the greater the variation of the independent variable can explain the variation of the dependent variable.

#### *I. T Test*

Test the validity of the effect of the selected model using the t test. The partial regression coefficient test (t test) was conducted to determine whether or not the influence of the independent variables in the model was significant or not. The formulation of the hypothesis,  $H_0 : \beta_1 = \beta_2 = \beta_3 = \beta_4 = 0$ , the  $i$ -th independent variable has no significant effect and  $H_A : \beta_2 \neq \beta_4 0$ , the  $i$ -th independent variable has a significant effect. The test criteria  $H_0$  is rejected if the statistical significance of  $t_i$  and  $H_0$  is accepted if the statistical significance of  $t_i >$ . In conclusion, if the statistical significance of  $t_i 0.10$  then  $H_0$  is rejected, which means the  $i$ -th independent variable has a significant effect. And  $H_0$  is accepted if the statistical significance  $t_i > 0.10$  then  $H_0$  is accepted, which means the  $i$ -th independent variable has no significant effect.

#### *J. Operational Definitions Of Research Variables*

Consumption is expenditure activities carried out by consumers to fulfill their needs of goods and services in order to fulfill the needs or satisfaction of consumers themselves. The unit of the Consumption Level variable is in rupiah.

According to the Central Statistics Agency (BPS) population is all people who live in the geographical area of the Special Region of Yogyakarta for 6 months or more and or those who live less than 6 months but aim to settle down. The data used is the population in 2015 – 2019 (in soul units).

Education is a form of investment in human resources in the life of the nation and state in order to create quality human resources. Education must be prioritized in balance with physical capital investment because education is the basic capital to create quality children of the nation so that education is categorized as a long-term investment. The data used in this study is the average length of school for 2015 – 2019 (in years).

According to the Central Statistics Agency (BPS) Wage/salary is a reward in the form of money received from employers to workers for work that has been or will be carried out and determined according to an agreement, or legislation. Compensation will be paid on the basis of an employment agreement between the employer and the worker, including allowances for both the worker himself and his family. While the minimum wage is the lowest wage (excluding overtime pay) paid to employees by type of work or position. The data used in this study is the minimum wage for the Special Region of Yogyakarta in 2015-2019 (in rupiah).

Gross Regional Domestic Product (GRDP) is a process of activity that develops in the economy which results in an increase in goods and services produced for the prosperity of society (Todaro, 2011). The data used in this study is the Gross Regional Domestic Product (GRDP) at the current prices of the Special Region of Yogyakarta in 2015-2019 (in million rupiah).

#### IV. RESULT / FINDING

Based on the results of the Chow test and Hausman test, the estimated accuracy of the model can be seen in the following table:

Table 1. Chow Test Results And Hausman Test

Model Testing	Prob.	P-value (5%)	Selected Model
Chow Test	0,000000	0,05	FEM
Hausman Test	0,000000	0,05	FEM

Source: Data processed by the author with Eviews, 2022

Based on the results of the Chow test from table 1 that the probability value is  $0.000000 < 0.05$ , then  $H_0$  is rejected and  $H_1$  is accepted so that the model chosen is Fixed Effect Model. Furthermore, according to the results of the Hausman test from table 1, it shows that the probability value is  $0.000000 < 0.05$ , so  $H_0$  is rejected so that the model chosen is the Fixed Effect Model.

Hypothesis testing can be seen based on the results of the t test, F test, and  $R^2$  test, the results of the test can be seen in the following tables:

Table 2. tTest Results

Variable	Prob.	P-value (Significance 10%)	Description
PQ	0,1545	$P > 0,10$	Not Significant
UMP	0,0613	$P < 0,10$	Significant
TPEN	0,0015	$P < 0,10$	Significant
PDRB	0,0858	$P < 0,10$	Significant

Source: Data processed by the author with Eviews, 2022

Based on the results of the t-test from table 2, it shows that if the statistical significance is 0.10 then  $H_0$  is rejected, which means the to-i independent variable has a significant effect. And  $H_0$  is accepted if the statistical significance of  $t_i > 0.10$  which means the to-i independent variable has no significant effect. From the table it can be seen that the population variable has no significant effect, while the minimum wage, education, and GRDP variables have a significant effect.

Table 3. F Test Results

Variable	Prob (F-Statistic)	Criteria	Conclusion
PQ, UMP, TPEN, PDRB	0,000000	$P < 0,10$	Take effect

Source: Data processed by the author with Eviews, 2022

Based on the results of the F test from table 3, it shows that the probability value (F-Statistic) is  $0.000000 < 0.10$ , it means that all variables such as population, minimum wage, education, and GRDP together have an effect on public consumption level.

Table 4. Coefficient of Determination Test Results (R2)

R-square	Adjusted R-square	S.E. of Regression
0,991463	0,987194	43973,13

Source: Data processed by the author with Eviews, 2022

Based on the results of the coefficient of determination test (R2), it shows that the variables of population, minimum wage, education, and GRDP affect the level of consumption by 99.14%, while the remaining 0.86% is influenced by variables outside the model.

## V. DISCUSSION

The estimated Public Consumption Rate can be influenced by total population, minimum wage, education level, and PDRB. Based on the results of panel data regression analysis assisted by the Eviews version 9 analysis tool, hypothesis testing has been carried out. The following are the results of the research with the proposed hypothesis:

### B. *The Effect of total population to public consumption*

Based on the results of research on the total population variable in testing, the value of Prob is obtained. of 0,1545 more than 0,10 ( $P > 0,10$ ). This shows that  $H_1$  is rejected, where the total population variable has no significant effect on public consumption. The high value of the total population variable is not a measure of the size of public consumption rate. In other words, the increase in population is not only a factor causing the increase in the level of public consumption but is also found in other variables.

### C. *The Effect of minimum wage to public consumption*

Based on the results of research on the minimum wage variable in testing, the value of Prob is obtained. of 0,0613 less than 0,10 ( $P < 0,10$ ). This shows that  $H_2$  is accepted, where the minimum wage variable has a significant effect on public consumption. Therefore, minimum wage can affect the value of the public consumption. This means that the greater the value of the minimum wage, the greater the influence on the public consumption.

### D. *The Effect of education level to public consumption*

Based on the results of research on the education level variable in testing, the value of Prob is obtained. of 0,0015 less than 0,10 ( $P < 0,10$ ). This shows that  $H_3$  is accepted, where the education level variable has a significant effect on public consumption. Therefore, education level can affect the value of the public consumption. This means that the greater the value of the education level, the greater the influence on the public consumption.

### E. *The Effect of PDRB to public consumption*

Based on the results of research on the PDRB variable in testing, the value of Prob is obtained. of 0,0858 less than 0,10 ( $P < 0,10$ ). This shows that  $H_4$  is accepted, where the PDRB variable has a significant effect on public consumption. Therefore, PDRB can affect the value of the public consumption. This means that the greater the value of the PDRB, the greater the influence on the public consumption.

## VI. CONCLUSION AND RECOMMENDATION

Based on this research, it shows that the population variable has no effect on the level of public consumption. While the variables of minimum wage, education and GRDP have a significant positive effect on the level of public consumption. variables of population, minimum wage, education and PDRB together or simultaneously affect the level of public consumption.

ACKNOWLEDGMENT

We would like to thank Sustainable Collaboration in Business of Telkom University in Indonesia, who give me the opportunity to attend this international conference.

## **The Influence Analysis of Economic Growth towards Zakat, Poverty level and Unemployment in Indonesia for the period 2018-2020**

A. Nuzila Kholidah Alfath<sup>1</sup>, B.Dr. Didit Purnomo, S.E., M.Si<sup>2</sup>, C. Fauzul Hanif Noor Athief, L.c., M.Sc<sup>3</sup>

<sup>1,2,3</sup>Muhammadiyah Surakarta University: Economic Development, Faculty of Economic and Business, Muhammadiyah Surakarta, Sukoharjo, Central Java, Indonesia.

### **Abstract**

*Economic growth is seen as the most important part of economic policy as it is an indicator of improving people's welfare. Thus, this study aims to analyze the effect of economic growth on zakat, poverty rate, and unemployment in Indonesia for the period 2018-2020. Indonesia is a developing country that makes absolute poverty and a number of other economic problems still occur. the rate of economic growth will increase when unemployment and poverty are no longer complex and multidimensional problems. and issues that cause high curiosity to the income gap factor distribution of zakat funds in Indonesia. using quantitative approach with linear regression model using secondary data obtained from BPS, BAZNAS and scientific literature. zakat funds have a negative and significant effect on economic growth, poverty has a significant negative effect on economic growth, unemployment has a positive but not significant effect. simultaneously, the variables zakat (X1), unemployment (X2), and poverty (X3) have a significant effect of 86.28% on economic growth (Y). The remaining 13.72% is influenced by variables or other factors that are not included in the model.*

*Keywords— Economic growth; Zakat; Poverty; Unemployment*

---

### **I. INTRODUCTION**

Indonesia is one of the developing countries that compete internationally and want to become a developed country. In realizing this desire, the Indonesian government must carry out development in all aspects such as economic aspects and non-economic aspects. In the implementation of development there will be a relationship between the government and the community directly which will result in a reciprocal relationship between the government and all levels of society. Economic growth is one of the indicators used to assess the success rate of development carried out by a region, especially in the economic field, this growth is a summary of the growth rate of various economic sectors that describes the level of economic change that occurred during the 2018-2020 period. Economic growth shows the extent to which economic activity can generate additional income or welfare in a given period. Economic growth in an area that continues to show improvement illustrates that the region's economy is developing well (Purnama, 2014).

Zakat in language means blessing, growing, Holy, good san clean something. While the understanding of zakat in syara ' is a certain count of property and the like which obliges his people to issue it to the poor and others with special conditions (Alifia, 2020). Zakat is one of the instruments in Islam in the field of property distribution. So that the treasure will always rotate and circulate. Therefore, one of the goals of zakat is to prevent the accumulation of property. Zakat has many benefits for the economy both from macro and micro aspects, such as encouraging inclusive economic growth. Zakat will increase the consumption of basic goods and services and will change the use of luxury goods and services to the staple ones. The distribution of zakat to the poor and the needy leads to the increase of their income due to the low level of their wealth and income. The income and share of the zakat may be used for the consumption of essential goods. On the other hand, zakat will reduce the wealth and income of the rich. The loss of the rich's wealth and income may reduce the consumption of luxury goods and services (Suprayitno, 2020). Zakat payment will foster an inclusive economic growth which does not only cause the economy to grow but also reduce the unemployment, poverty, gap and does not harm the environment. (Khasandy et al., 2019).

Poverty is not only related to income level but also from social aspect, environment and even empowerment and participation level. (Arif Novriansyah, 2018) stated that "poverty should not be considered only as low income, but should be considered as capability handicap". According to the theory, if people work and then get income that is used to meet their basic needs, it can be said that there are no poor people. Thus, if the unemployment rate decreases, it will cause the poverty rate to decrease (Widiastuti & Kosasih, 2021). Poverty is not just a global problem. Indonesia as a developing country has also experienced this problem since its independence until today.(Saleh, 2002).

According to (Purnama, 2014) unemployed or unemployed people are those who do not have a job and are actively looking for work. A region is often faced with a large number of unemployed and labor force growth is not comparable to the relatively small number of jobs. This, making the problem of poverty more serious. Unemployed or unemployed people are those who do not have a job and are actively looking for work. Unemployment by the definition of BPS is (1) those who do not work and are looking for work; (2) those who do not work and prepare for business; (3) those who do not work and do not seek work because they feel it is impossible to get a job; and (4) those who do not work and do not seek work because they have been accepted to work, but have not started working. (Ridho & Indah, 2020).

Based on the description above, there is a formulation of the problem, namely how the mechanism of economic growth affects zakat management funds, poverty levels, and unemployment rate in Indonesia so as to determine the direction of government policy.

## II. LITERATURE REVIEW

### A. *Economic Growth*

Economic growth is an increase in gross national product in a country (Ridho & Indah, 2020). According to the growth theory proposed by Robert Solow and Trevor Swan, better known as the Solow - Swan growth theory, economic growth is determined by the availability of production factors and the level of technological progress. The factors of production according to Solow-Swan consist of population, labor, and capital accumulation (Kuncoro et al., 2022). According (Syofya, 2018) explained that in macroeconomic analysis, economic growth has two different terms of understanding. On the one hand, economic growth is used to describe an economy that has experienced economic development and reached a higher level of prosperity. On the other hand, economic growth aims to describe the economic problems faced by a country or a region in the long term.

### B. *Factors That Determine Economic Growth*

According to (Purnama, 2010) the main factor in the economic growth of every nation. That is :

- a. Capital accumulation, including all new forms or types of investment invested in land, physical equipment, and capital or human resources
- b. Population growth
- c. Technological advances

And there are four factors that determine economic growth :

- a. Land and other natural wealth
- b. Number and quality of population and labor
- c. Capital goods and technological level
- d. Social systems and attitudes of society

### C. *The Relationship Between Economic Growth And The Distribution Of Zakat Funds*

The relationship of zakat in economic growth is generally that zakat funds received by mustahik will increase its purchasing power. This increase will encourage increased production of goods and services, and encourage increased production capacity which will ultimately aggregatally promote national economic growth. According to (Anik & Prastiwi, 2019) zakat in the perspective of Islamic economics as a property that has been determined by the government or authorized officials to the general public or individuals who are binding, final, without receiving certain rewards carried out by the government in accordance with the ability of the owner of the property. As it is known that the potential of zakat in Indonesia is very large. In 2015, based on research conducted by the National Amil Zakat Agency (BAZNAS), the potential of zakat in Indonesia reached Rp 286 trillion (BAZNAS, 2018: 3). Because by giving the poor and other rights contained in our property, there will be a circulation of money that results in the development of the function of money in economic life in society.

### D. *The Relationship Between Economic Growth And Poverty*

According (Purnama, 2014) states that economic growth without the addition of employment opportunities will lead to inequality in the distribution of the addition of income (*ceteris paribus*), which will further create a condition of economic growth with an increase in poverty. The relationship between economic growth and poverty is a complex and controversial relationship. In general, economic growth is a precondition for poverty reduction. (Jayadi & Brata, 2016) By increasing economic growth and income equity, the poor have decreased.

### E. *The Relationship Of Economic Growth With Unemployment*

Economic growth and unemployment have a close relationship because the working population contributes to the production of goods and services, while unemployment does not contribute. Quality economic growth is expected to solve the problems of unemployment and poverty. (Purnama, 2014). According to the theory, if people work and then earn income that is used to meet their basic needs, then it can be said that there are no poor people. Thus, if the unemployment rate decreases, it will lead to a decrease in the poverty rate (Widiastuti & Kosasih, 2021).

#### F. Recent Research

Research on Zakat in creating an increase in national income has been carried out by Anik and Prastiwi (2019) with the title "Zakat action in increasing economic growth through equity distribution. The results showed that zakat tools are very important in the effort to provide economic potential of the people. Alternative solutions and strategies offered by Islam are none other than the system of management (distribution and utilization) of zakat productive and creative. With the management as intended, it is expected to empower the poor to become Aghniya (the rich) and make mustahiq into muzakki. Even the habit of donating in Indonesia has undergone a fundamental change (Athoillah, 2018)

Research Novriansyah (2018) entitled The effect of unemployment and poverty on economic growth in Gorontalo province states that unemployment and poverty affect economic growth in Gorontalo province. The results showed that the level of poverty in the province of South Sumatra is quite fluctuating, but in general it is seen that the poverty rate in the province of South Sumatra is much higher than the national poverty rate.

Research on the effect of economic growth on poverty has previously been conducted by Romi and Umiyati (2018), entitled "The effect of economic growth and Minimum wage on poverty in Jambi city". By using multiple linear regression analysis tools in the form of semilog. The results showed that partially economic growth has no significant effect on poverty.

### III. RESEARCH METHODOLOGY

The type of research carried out related to the preparation of this research is quantitative, whose research procedures produce data and numbers that will be presented in the form of a percentage of the results of the analysis, data on the analysis of the effect of economic growth on Zakat funds, poverty levels, and unemployment. Type of data in this study is the type of secondary data, according to (Permatasari, 2020) secondary data is data owned by sources that are ready to be used and can provide information in determining decisions even though it must be processed first. The data used are taken from the publication of the Central Statistics Agency, among others, data on economic growth, poverty rate, and the level of indemnity as well as for zakat distribution data obtained from the financial statements published by Baznas Indonesia, the data analysis techniques used are time series data using IBM SPSS 22 tools or applications. In the GDP data obtained quarterly secondary data on GDP above the base price so that it must be interpolated using the Quadratic Match Sum method in Eviews 10 to obtain monthly GDP data. Linear regression Model used in this study as follows

:

$$Y_t = \beta_0 + \beta_1 X_{1t} + \beta_2 X_{2t} + \beta_3 X_{3t} + \epsilon_t$$

di mana:

$Y$  = Economic Growth

$\beta_0$  = Constanta

$\beta_1 \beta_2 \beta_3$  = Coefficient regress

$X_1$  = Zakat

$X_2$  = Unemployment

$X_3$  = Poverty

$E$  = error

$t$  = time series data

A. *Economic Growth (Y)*

According to (Maryanti, 2009) economic growth is the development of activities in the economy that cause the goods and services produced in the community to increase and the prosperity of the community to increase. In the analysis of a country's economic growth is calculated from the rate of Gross Domestic Product (GDP) as the total production (outout) produced by a country in a period that can be obtained from quarterly data so that it must be interpolated by quadratic method

B. *Zakat (X1)*

Wealth that has reached nisab and haul that must be issued by Muslims as a purifier of property and soul. The zakat in this study is recorded in BAZNAS

C. *Unemployment (X2)*

Unemployment is the labor force but has not worked or has not found a permanent job. Unemployment is usually caused because there are still few job vacancies Provided that are not comparable to the number of the labor force. The Central Statistics Agency (BPS), states that the unemployment is a labor force that has not worked and is looking for pekerjaan or is preparing a business or residents who already have a job but have not started ([www.bps.go.id](http://www.bps.go.id)).

D. *Poverty (X3)*

Poverty is the inability to meet the minimum standards of food and non-food needs. This study used time series, poverty line data from 2018-2020 in Indonesia

#### IV. RESULT / FINDING

A. *Multiple Linear Regression Analysis*

Table 1. Multiple linear regression analysis

Model	Unstandardized		Standardized Coefficients
	B	Std. Error	
Constant	86.282	37.449	
Zakat X1	-.341	.638	-.089
Unemployment X2	83.836	2.624	1.339
Poverty X3	-.822	.998	-.857

Source : Data Processed from SPSS V.22

Can be applied in obtaining the equation of this research :

$$Y = 86.282 - 0.341 X_1 + 83.836 X_2 - 0.822 X_3 + \varepsilon$$

Description:

- The value of the constant obtained is equal to 86,282. It shows that the variables of zakat, unemployment and poverty if the situation is fixed or constant, the value of the economic growth variable is 86,282%.
- The coefficient of zakat variable is -0.341. This proves that in every increase of 1 unit of zakat variable means that it shows an increase in economic growth worth -0.341 %. If there is a decrease of 1 unit in the sharia stock variable, it shows a decrease in economic growth of -0.341 %.
- Coefficient of unemployment variable is worth 83,836. It shows that in every increase of 1 unit of variable unemployment it shows an increase in economic growth of 83,836%. If there is a decrease of 1 unit in the sukuk variable, it shows a decrease in economic growth of 83,836%.

- d. Coefficient of poverty variable is 0.822. This shows that in every increase of 1 unit of poverty variable means that it shows an increase in economic growth worth -0.822 %. If there is a decrease of 1 unit in the sharia stock variable, it shows a decrease in economic growth of -0.822 %.

*B. Classical Assumption Test*  
*Normality test*

Table 2. Normality test One-Sample Kolmogorov-Smirnov Test

		Unstandardized Residual
N		36
Normal	Mean	-.0001899
Parameters <sup>a,b</sup>	Std. Deviation	38474033187.63829000
Most Extreme	Absolute	.133
Differences	Positive	.122
	Negative	-.133
Test Statistic		.133
Asymn. Sig. (2-tailed)		.105 <sup>c</sup>

Source : Data Processed from SPSS V.22

- a. Test distribution is Normal.
- b. Calculated from data.
- c. Lilliefors Significance Correction.

Table (4.2) shows that Sig data is 0.105 which is  $0.105 > 0.05$  until the data does a normal distribution. The results of this test through the use of Kolmogorov-Smirnov stated if the results obtained by the variable zakat, unemployment and poverty berate residual normal distribution

*Multicollinearity test*

The use of multicollinearity test in this study is VIF test, where if the value of VIF in a variable more than 10 means there is a problem or problem of multicollinearity in the variable

Table 3. Multicollinearity test

Variable	VIF	Criteria	Conclusion
X1	1.226	< 10.00	Does not cause multicollinearity
X2	6.891	< 10.00	Does not cause multicollinearity
X3	7.798	< 10.00	Does not cause multicollinearity

Source : Data Processed from SPSS V.22

*Heteroskedasticity test*

Heteroskedasticity test is a data test to find whether in a regression analysis model experiencing multi-variant of the data used. Heteroscedasticity occurs when the residual type shown varies from several observations, not occurring heteroscedasticity is a condition of a viable regression model. The hetetoskedasticity test can be known from the significance value or from the scatterplott graph.

Figure 1. shows that the pattern of dots is seen not clearly in the scatterplot image and the dots are distributed above or below the number 0 with random and spread. The conclusion is that the regression model does not experience heteroskedasticity

Fig 1. Heteroskedasticity test

Source: data processed from SPSS V.22

C. Hypothesis Test

T test

Is one of the validity tests used to determine the magnitude of the effect of independent variables independently.

Tabel 4. Hypothesis Test (t test)

Variable	sig. T	Criteria	Conclusion
X1	0.534	$\leq 0,01$	X1 significant effect on $\alpha = 0,01$
X2	1.339	$\leq 0,01$	X2 significant effect
X3	-0.857	$\leq 0,01$	X3 significant effect

Source : Data Processed from SPSS V.22

F test

Test F is a hypothesis test used in order to test the influence of variables together. The Model can be said to exist if all independent variables simultaneously have an influence on the dependent variable. In this study, the formulation of the hypothesis model existence test is

H0:  $\beta_1 = \beta_2 = \beta_3 = 0$ , the regression coefficient is simultaneously zero or the model does not exist;  
 HA:  $\beta_1 \neq 0 \vee \beta_2 \neq 0 \vee \beta_3 \neq 0$ , regression coefficients are not simultaneously zero- valued or models exist. H0 will be accepted if prob value. or sig. empirical statistics  $F \geq \alpha$ .; H0 will be rejected if prob value. or sig. empirical statistics  $F \leq \alpha$ . From the regression model known value prob. or sig. the

statistical empirical F in the model estimate has a value of  $0.0000 < 0.01$ , so  $H_0$  is rejected. In conclusion the model used in research exist

*Coefficient of determination test*

Coefficient of determination ( $R^2$ ) shows the predictive power of the estimated model. From the results of regression estimation obtained value  $R^2$  equal to 0.874, meaning 87.4% variation of economic growth variable (Y) can be explained by zakat variable(X1), unemployment(X2), and poverty(X3). The remaining 12.6% is influenced by variables or other factors that are not included in the model.

V. DISCUSSION

A. *The Effect Of Zakat On Economic Growth*

In this study Zakat has a significant negative effect on economic growth. Conceptually, the development of the zakat system can be considered as a complement to government programs in poverty alleviation. A certain degree of synchronization with government programs is expected. However, the current regulatory framework for the zakat sector must be improved so that the operation of the zakat system can be carried out more effectively. The results of this study are not in line with Widya Permatasari's research (2020) which states that Zakat has a positive and significant effect on economic growth, then Rachma sari Anggraini's research (2016) which shows that the variable zakat, infak, and alms (ZIS) has a positive and significant effect on economic growth in indonesia, then research by Purwanti Dewi (2020) explains that zakat, infak, alms has a positive effect on economic growth. The absence of results due to differences in the period of data collection.

B. *The Effect Of Poverty On Economic Growth*

In this study, poverty has a significant negative effect on economic growth. Poverty is caused by a person's inadequacy in carrying out his daily life to a better level. Poverty is an emergency problem if it is not solved quickly, as more and more people are poor, then the pace of the economy can decrease or slow down. This is also evidenced by research conducted by Achmad (2018) on Poverty Analysis of Indonesia's economic growth. shows the results that poverty has a significant negative effect on economic growth, then research Nadia Ika Purnama (2010) states that economic growth has a negative and significant influence on the level of poverty in North Sumatra province, then research Zurlinda, Purwaka Hari Prihanto, Jaya Kusuma Edy (2020) economic growth has a negative influence on the number of poor people in Tebo regency

C. *The Effect Of Unemployment On Economic Growth*

Unemployment can make economic growth decline as people's purchasing power falls, resulting in a lethargy for entrepreneurs to invest (Utami, 2020). In this study, unemployment has a significant positive effect on economic growth. This study is not in line with the research Of Nadia Ika Purnama (2015) that economic growth has a positive but insignificant influence on the unemployment rate in Medan. then the research conducted by Rovia (2006) which discusses the effect of unemployment and inflation on economic growth in Trenggalek Regency the results showed that unemployment has a significant effect on the rate of economic growth in Trenggalek Regency. The existence of non-conformance results due to different regions

VI. CONCLUSION AND RECOMMENDATION

- a. Simultaneously, the variables zakat (X1), unemployment (X2), and poverty (X3) significant effect of 86.28% on economic growth (Y). The remaining amount of 13.72% influenced by variables or other factors that are not included in the model
- b. some zakat has been shown to have a negative and significant effect on economic growth in 2018- 2020.
- c. partial unemployment proved to have a positive and significant effect on economic growth in 2018-2020. Then the variable penggangur significant effect on economic growth.
- d. partial poverty has been shown to have a negative and significant influence on economic growth in 2018-2020

- e. Further research is expected to be able to add variables or periods of research data to specify the scope that will be used as better research material.
- f. Governments should design policies to strengthen collection mechanisms and develop transparent and easy-to-use Zakat distribution methods to benefit people in need
- g. The government prepares the management of zakat nationally accompanied by regulations that overshadow the management of zakat. In addition, there are institutions that are needed to support the zakat management system, including the Directorate of zakat with better performance, audit institutions, and social entrepreneurship institutions.
- h. The government needs to provide a budget for training programs to workers in order to have good skills or soft-skills so that they can work with good incomes so that poverty rates can decrease.
- i. It is hoped that local governments can prioritize job creation in labor-intensive sectors of the economy so that unemployment decreases and the number of poor people will decrease.

<sup>1,2</sup> Faculty of Economic and Business, Universitas Indonesia, Depok, Indonesia

### Abstract

*This study investigates factors affecting individual's information privacy disclosure in the context of mobile wallet applications in Indonesia by adopting privacy calculus theory number of mobile wallet applications users are increasing and to use advanced features of these applications, providing personal information is inevitable regardless the phenomenon of information leakage occurred these past few years. There are limited studies on the actual behavior of consumer in disclosing their information. To supplement the literature, this study will adopt privacy calculus in the context of mobile wallet...: The proposed model is using self-administered survey distributed online with instrument based on previous privacy calculus literature. Data collected from 294 individuals who use mobile wallet application is processed using PLS-SEM.: The result indicates that people still disclose their personal information to obtain benefit even though there are perceived risks occurs. Immediate gratification shows the biggest influence in customers' personal information disclosure. The findings provide insight to the mobile wallet application companies to better understand the behavior of their users in disclosing personal information. Given the importance of customer data, these finding may help these actors to tailor their offers and minimize privacy risk to customers*

*Keywords— Mobile wallet; Privacy Calculus Theory; Perceived Benefits; Perceived Privacy Risks*

### I. INTRODUCTION

Internet users in Indonesia continue to increase from year to year and based on (Bayu, 2020) reaching 196.7 million in 2020, or 73.7% of the total population and 4.3% when compared to the total internet users worldwide ( Kemp, 2020). The internet is used for various purposes such as accessing social media, conversation applications, banking, entertainment, and online shopping (Nirmala, 2020). One of the impacts of this high number of internet users is that digital financial services are growing positively. The total number of mobile wallet users in Indonesia in 2020 was recorded at 63.6 million (Inc., 2021). Based on a survey titled Boku: 2021 Mobile Wallets Report, Ovo, ShopeePay, LinkAja, Gopay and Dana are the five mobile wallets in Indonesia with the highest transaction growth in 2020. Bank Indonesia does not specifically define a mobile wallet, only several providers such as PT Visionet Internasional. (OVO) and PT Dompot Anak Bangsa (Gopay) are registered in the payment system of Bank Indonesia. (Bank Indonesia, 2020).

To get access to this mobile wallet, consumers are required to provide personal information such as name and e-mail address even to upload an image of identification such as an identity card if they want to access certain features. The collection of consumer personal information will assist companies in providing goods or services to increase consumer satisfaction (Aguirre et al., 2015; Thomas et al. 2020 in Aiello et al., 2020). Today, companies collect more information from consumers than ever to understand and serve consumers better (Seiders et al., 2005; Simonson 2005 in Mothersbaugh et al., 2012). Providing consumer identities into online lending and borrowing electronic agreements is regulated in Law no. 77/POJK.01/2016 concerning information technology-based lending and borrowing services article 20. In this law, it is stated that companies are required to ensure that the authentication, verification, and validation processes are carried out properly. Although this law regulates lending and borrowing funds electronically, this article is apparently adopted by fintech companies, including mobile wallet providers, so that the phenomenon of uploading ID cards to applications is becoming common in the community as a way of user authentication. In other words, information uploaded by consumers will ease the business to verify the authenticity of internet-based application users. However, this causes the consumer's personal information to be in the hands of the service provider company and creates the risk of information breaches (Kim et al., 2019).

One of the biggest risks arising from the large amount of personal data uploaded online is a privacy violation. There are at least three reports regarding privacy violations in Indonesia. In 2020, news circulated that 91 million user data of an e-commerce spread in May and July (APJJI, 2021). In May 2021, another news circulated that

data on 279 million Indonesians was leaked and sold (Association of Indonesian Internet Service Providers, 2021). The Ministry of Home Affairs stated that ID card data itself was not confidential data but certain parties were not allowed to collect and sell data on ID cards (Ariyanti, 2018). However, currently data on ID cards can be used by irresponsible parties to apply for online loans from illegal companies (Ariyanti, 2018). Indonesian people's concerns regarding this phenomenon can be seen in June 2021 which echoed in one of the social media which revealed how easy it is for someone to use another person's identity to apply for an online loan (Astutik, 2021). This phenomenon obstructs the business from collecting their consumers' information. Given the importance of consumers' data disclosure for companies, we argue that analysis of factors influencing consumers in disclosing their personal data becomes important.

There are several theories used by researchers to study online privacy behavior, however, privacy calculus theory is a general approach to study the combined effect of opposing forces on the perception and behavior of privacy (Li, 2012), this theory explains the trade-off between perceived privacy risk and perceived benefit of person in the disclosure of his personal information (Kim et al., 2019). From the perspective of this theory, economic benefits, personalization or convenience and social benefits tend to negate the disadvantages of perceived risk (Wilson & Valacich, 2012 in Barth & de Jong, 2017). Privacy calculus theory has been used by previous research to study the reasons consumers disclose personal information to hotel mobile applications and internet of things services (Kim et al., 2019). Another study conducted by Cheng et al. (2021) regarding the disclosure of personal information shows that immediate gratification has a positive effect on the perceived benefits of being willing to disclose personal information of online-based ride-sharing consumers. Privacy calculus is the most useful theoretical framework in discussing contemporary issues in privacy (Culnan & Bies, 2003 in Moroson & DeFranco, 2015). In addition, extensive empirical validation (Smith, et al, 2011 in Moroson & DeFranco, 2015) makes this theory is used as the main framework in this study.

Perceived benefits have a positive influence on the willingness to disclose personal data, inversely proportional to perceived privacy risk, which shows a negative effect (Kim et al., 2019). The benefits referred to in this context are the personalization of products or services that can be felt by consumers if they disclose the information needed by the company. Research conducted by Barth & de Jong (2017), explains that in conditions faced with choices, individuals usually choose small benefits in the short term rather than larger benefits in the long term, this benefit is called immediate gratification. In Indonesia, several mobile wallet applications require consumers to upload selfies with their ID cards as a verification requirement to access advanced features of the application, such as the pay later feature and transfer funds to other users in the same application.

In view of the above, this study was conducted to analyze the disclosure of personal data to the mobile wallet application from the perspective of privacy calculus theory.

## II. LITERATURE REVIEW

### A. *Antecedents Of Perceived Privacy Risks*

According to Dinev et al. (2006) and Malhotra, Kim and Agarwal (2004) on privacy calculus theory, perceived privacy risk is the extent to which people believe in the potential loss associated with disclosing personal data. Furthermore, in the study of Gutierrez et al. (2019) perceived privacy risks are defined as the uncertainty, discomfort and/or concern that users feel when they cannot anticipate the consequences of disclosing personal information. Dinev and Hart (2006) and Xu et al. (2011) define privacy risk as the likelihood and severity of losing one's personal information because of the party's opportunistic behavior (Jozani et al., 2020). Research by Glover and Benbasat (2010), explains the risk of misuse of information identified as one of the concerns of consumers in connection with e-commerce transactions (Bugshan & Attar, 2020).

An important aspect of personal information is the level of sensitivity of it (Mothersbaugh et al., 2012). Information sensitivity is defined as information from a person's profile that has the potential to undermine privacy if disclosed to untrustworthy parties or hostile individuals (McKnight et al., 2011). Based on the typology of information sensitivity conducted by Milne et al. (2017), perceived risk related to financial data is categorized into monetary risk where examples of risks that arise from misuse of this information are credit card fraud, theft of account information to sales and sharing of personal information to third parties. Some examples of potential harm caused by disclosing personal information include psychological (e.g. loss of self-concept due to shame), physical (eg loss of life or health), or material (e.g. financial or assets loss) (Mothersbaugh et al., 2012). Information sensitivity has an important role in determining attitudes towards the disclosure of personal information and consumers are more worried about sharing this information on websites because information

leakage can cause financial losses (Kim et al., 2019). B In the context of this study, personal information stated in ID card is sensitive data because if it falls into the hands of an irresponsible party, it will have the potential to cause material and immaterial losses, therefore, the first hypothesis proposed in this study is:

**H1** : Information sensitivity has positive effect to perceived privacy risk

Privacy awareness, defined as the extent to which a person is aware of a company's privacy practices, is an important factor of perceived privacy risk (Cheng et al., 2021). This factor allows a person to make decisions in disclosing personal information. Therefore, it can be assumed that someone with a high awareness of privacy can protect his personal data and space (Pötzsch, 2009). These people will feel higher privacy risks compared to people who have lower privacy awareness (Cheng et al., 2021). By increasing users' awareness of the personal data that companies hold, they can become more aware of the potential threats to their data (Parker & Flowerday, 2021). This explanation forms the basis of the second hypothesis therefore, we argue that:

**H2** : Privacy awareness has positive effect to perceived privacy risk

The next construct is previous online privacy invasion which is someone's negative experience from disclosing personal data online. Consumers who have experienced invasion of privacy information have higher concerns about perceived privacy risk compared to people who have not experienced it (Cheng et al., 2021). These experiences range from spam emails to identity theft and consumers who have experienced them do not feel like disclosing their personal data online (Awad & Krishnan, 2006). With the leaking of data for 279 million Indonesians and being traded in 2021 (Kontan.id, 2021), the Indonesian people have experienced an invasion of their personal data. Thus, the proposed hypothesis is:

**H3** : Previous online privacy invasion has positive effect to perceived privacy risk

Mobile payment security refers to the security that individuals feel when using a mobile terminal for payments (Cheng et al., 2021). The volume of mobile payment transactions in Indonesia was USD 16.4 billion in 2019 (www.marketingcarf.getcraft.com,2020) and to USD 28 billion in 2020 (databoks.com, 2021). Compared to cash transactions, mobile payments are more secure and convenient and this payment method guarantees information privacy such as protection of payment information so that a higher mobile payment security indicates a lower risk of disclosing personal information (Cheng, et al, 2021). Thus, the proposed hypothesis is as follows

**H4** : Mobile payment security has a negative effect on perceived privacy risk

Previous studies have emphasized the importance of information disclosure requirements for organizations and it has become common for users to provide information (for example, location and payment account details) on internet platforms to access services (Cheng, et al, 2021). In the mobile wallet application, at least an email address and name are needed to be able to access the service. As previously explained, to access some advanced features, this application even asks consumers to upload selfies with their ID cards. The more information a mobile wallet application requests, the more concerned consumers will be about the potential for information leakage (Cheng, et al, 2021). Thus, the proposed hypothesis is as follows:

**H5** : Personal information disclosure requirements have a positive effect on perceived privacy risk

Another factor mentioned in Cheng et al.(2021) is the negative media coverage where the exposure indicates the reputation of the company, which affects people's assessment of an entity, and can influence individual risk perceptions. Repeated media exposure can affect familiarity with an object, and the amount of information available can reduce the perception of risk. In Indonesia, news about the misuse of personal data related to online loans has been widely covered by the media and has caused consumer concerns about their personal information (Kompas.com). Thus, the we argue that this factor is relevant to be raised in research in Indonesia with the hypothesis proposed as follows:

**H6** : Negative media coverage has positive effect to perceived privacy risk

Trust was used as an antecedent of perceived privacy risks in previous studies (Malhotra et al., 2004; McKnight et al., 2011; Kim et al., 2019). Trust reflects a willingness to be in vulnerability based on positive things (Zhou, 2013). Yu et al. (2016) define trust in the context of online payments as a user's willingness to make payments over a mobile network and expect the payment platform to fulfill its obligations, regardless of the user's ability to monitor the actions of the service provider. If a person believes a website is reliable, functional and useful, he will be more likely to disclose information on that site (McKnight et al., 2011). Trust

is negatively associated with perceived privacy risk (Kim et al., 2019). Based on previous research, this research will propose the following hypothesis:

**H7** : Trust has positive effect to perceived privacy risk

*B. Antecedents Of Perceived Benefit*

Smith et al. (2011) explain perceived benefits as related to financial rewards, personalization, and social adjustment benefits (Kim et al., 2019). The results of research by Keith et al., (2013) show that perceived benefits increase a person's intention to disclose personal information. Network externalities are perceived benefit factors used in Kim et al's research (2019) and are defined as the value or effect that users obtain from a product or service will bring about more value to consumers with the increase of users, complementary products, or service (Katz & Saphiro, 1985 in Hsu & Lin, 2016). Hsu and Lin (2016) divide network externalities into two, namely direct and indirect network externalities.

Direct network externalities emphasize the benefits obtained by adding new users (Zhang et al., 2017) which in the research of Kim et al. (2019) is divided into two, namely the number of IoT services, namely the number of points of internet-based application services and perceived critical mass defined as the large number of application users. The use of social networking sites is an example presented in this study, where the addition of new users provides existing users with greater opportunities to communicate and share, thereby increasing the utility of existing users. Similar to previous research, mobile wallets will also provide greater benefits if they have a number of users, both from the seller's and buyer's side, so that the two factors, perceived critical mass and number of IoT services, are adapted as antecedents and modified to suit the purpose of this research into numbers of application services with the following hypothesis:

**H8** : Number of application services has positive effect to perceived benefit

**H9** : Perceived critical mass has positive effect to perceived benefit

Indirect networks benefits are obtained by network users but are not directly generated from other users of this network (Lin et al., 2011). The study conducted by Kim et al. (2019) examines two factors from indirect network externalities, namely perceived compatibility and perceived complementary where the results of this study indicate that perceived compatibility affects perceived benefits significantly. Compatibility is defined as the extent to which a particular technology is perceived as consistent with the values, needs and experiences of the people who adopt that technology (Lin et al., 2011). The results of the study by Oliveira et al (2016) in Othman et al. (2020) explained that people believe that making virtual payments will bring them benefits. On the other hand, if people refuse to use a mobile wallet, they will not use it (Othman et al., 2020). Based on the findings of previous studies, the hypotheses proposed in this study are:

**H10** : Perceived compatibility has positive effect to perceived benefit

Interestingly, the results of a study conducted by Kim et al. (2019) shows that perceived complementary does not significantly affect perceived benefit, which means that additional attributes of the service do not increase the utility of consumers. This finding is different from previous research conducted by Hsu & Lin (2016) where an increase in perceived complementary makes IoT services more useful. Perceived complimentary imply that when a product or service complimented to the main offered in greater supply or at a lower price, the value and demand for the main product will increase. In this study, complementary products or services from the mobile wallet application are used as an antecedent of perceived benefit because there are complementary services from the applications, such as GoTagihan from GoJek which allows users to pay household bills such as electricity cashless using GoPay. Thus, we argue that:

**H11** : Perceived complimentary has positive effect to perceived benefit

Self-control problems cause individuals to tend to make decisions based on small and immediate benefits (Cheng et al., 2021). This factor is called immediate gratification in previous research, with a discount as one of the examples presented. It is elaborated that immediate gratification will stimulate people (Barth & de Jong, 2017). Based on our knowledge, this factor has only been used in the research of Cheng et al. (2021) where the research results show a positive influence on perceived benefits. Based on a survey conducted by Databoks in 2021, 69% of respondents who use mobile wallets adopt this technology due to discounts. vice). The perceptions of immediate benefits are directly associated with the perceptions of benefits (Cheng et al., 2021). Based on previous research and survey results in Indonesia, the authors propose the following hypotheses:

**H12** : Immediate gratification has positive effect to perceived benefit

### C. Privacy Calculus Theory

Houston and Gassenheimer (1987) in Moroson and DeFranco (2015) stated privacy calculus is based on exchange theory where this theoretical framework is the most adopted approach to study the combined effect of opposing forces on privacy perceptions and behavior. This theory states that a person's intention to disclose personal information is based on a calculus of behavior in which potentially conflicting factors are weighed in order to obtain a result, consumers carry out a risk-benefit analysis and decide whether to provide personal information based on the final results of the analysis. Lee, 2012). Research by Culnan and Armstrong (1999) and Laufer and Wolfe (1977) in Jozani et al. (2020) describes privacy calculus theory as a theory that examines the trade-off between costs and benefits that arise from disclosing information.

Privacy calculus serves as the summation of personal beliefs about the positive and negative outcomes expected from disclosure of information (Li, 2012). Furthermore, Wottrich et al. (2018) stated that people base their intention to disclose personal information on privacy calculus, where they consider potentially competitive factors, such as the costs and benefits of trading, taking into account the likely outcomes, trying to maximize positive outcomes and minimize negative outcomes. Angst and Agarwal, 2009; Li et al., 2011; Min and Kim, 2014 in Najjar et al., 2020) describe privacy calculus as a cognitive process in which some level of privacy can be sacrificed if the future benefits of an option outweigh the potential costs. This model considers two opposing components, namely risk and benefit (Dinev and Hart, 2006 in Moroson and DeFranco, 2015). The risks of disclosing personal information stem from consumer privacy concerns (Xu et al, 2008) but consumers also consider the benefits of disclosing personal data such as better service quality and service personalization (Culan and Bies, 2003). When making judgments, consumers do not perceive privacy as an absolute social value, but rather as a commodity characterized by economic value (Bennet, 1995 in Moroson and & DeFranco, 2015).

The results of previous studies show consistent results, where perceived privacy risk will reduce consumer intentions in disclosing personal data and is inversely perceived benefits would have a positive effect both in the context of IoT services and IT-enabled ride sharing (Cheng et al., 2021). Based on previous research, the hypothesis proposed in this study is

**H13** : Perceived privacy risk has negative effect to intention to disclose personal information

**H14** : Perceived benefit has positive effect to intention to disclose personal information

There are inconsistencies in the results of research on consumer intentions and behavior towards the disclosure of personal data (Cheng et al., 2021). However, the research conducted by Cheng (2021) is in line with the research conducted by Keith et al. (2013) where the results of both empirical studies show that people who have the intention to disclose personal data will have a positive effect on their behavior in disclosing personal data. Based on the two results of this study, the final hypothesis proposed is:

**H15** : Intention to disclose information has positive effect to disclosure of personal information

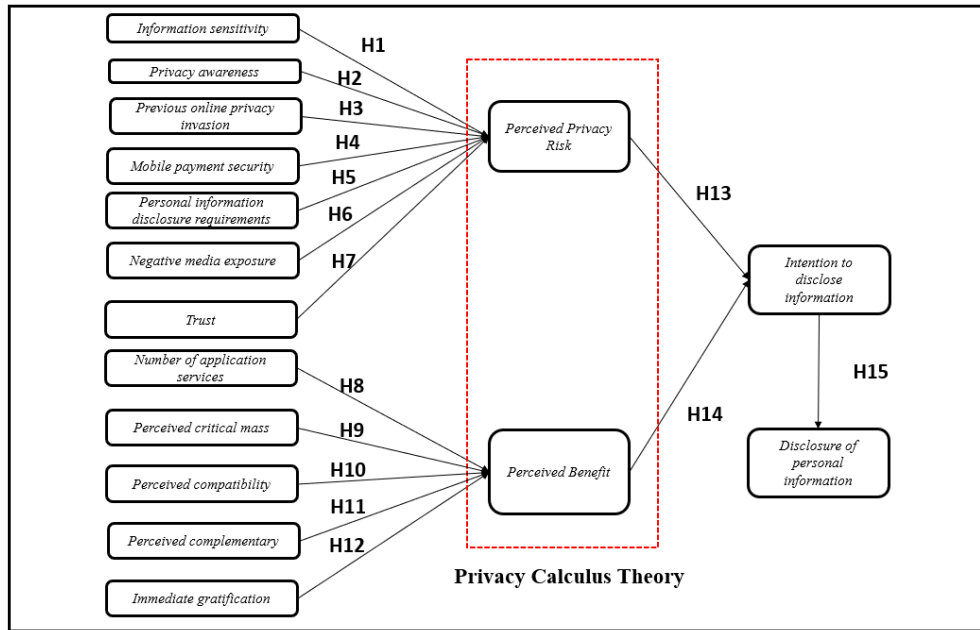

Fig. 1. Conceptual Model

III. RESEARCH METHODOLOGY

To test the hypothesis, the measuring instrument used is a questionnaire adapted and modified from previous studies. This study will use a Likert scale from 1 to 6, where 1 indicates the respondent "strongly disagrees" and 6 "strongly agrees" with the statement given. There are sixteen constructs that will be studied to measure the factors that influence the disclosure of personal information to the mobile wallet application.

Table 1. Definition of constructs

Constructs	Definition
Information sensitivity	Belief that certain information is possible result in loss of privacy if disclosed to others (McKnight, Lankton & Tripp, 2011 in Kim et al., 2019)
Privacy awareness	The extent to which one has knowledge of the organization's privacy practices (Cheng, et al., 2021)
Previous online privacy invasion	Negative experiences of online disclosure of information (Cheng, et al., 2021)
Mobile Payment Security	The security that individuals feel when using a mobile terminal for payments
Personal information disclosure requirements	Information that users must provide to use the mobile wallet application
Negative media coverage	Negative news about the application
Trust	Willingness to take risks (Meyer et al, 1995 in Ozdemir et al, 2017)
Number of application services	Individual beliefs about the number of application services (Hsu & Lin, 2016)
Perceived critical mass	User expectations of how much other people will use a technology (Kim, et al, 2019)
Perceived Compatibility	How far is the application considered consistent with the existing values, needs and past experiences of the adopters of the application (Hsu & Lin, 2016)

Perceived Complementary	Accessibility of products with characteristics that complement individual products (Lin et al., 2011)
Immediate gratification	Small and immediate benefits that directly affect decision making (Cheng, et al., 2021)
Perceived Privacy Risk	The extent to which people believe there are potential harms associated with disclosing personal information (Kim et al., 2019)
Perceived benefit	Financial rewards, personalization, and social adjustment benefits in exchange for personal information (Kim et al., 2019)
Intention to disclose information	Intention in disclosing personal data to mobile wallet application
Disclosure of personal information	Disclosure of personal data to the mobile wallet application

A quantitative approach is adopted by means of self-administered questionnaires. The data is analyzed using Partial Least Square Structural Equation Modelling (PLS-SEM). The unit of analysis of this study is a mobile wallet application user with criteria that must be met by the respondent, namely 17 years old and have used a mobile wallet application.

Partial least squares structural equation model (PLS-SEM) method. This method was used because PLS-SEM can explain the variance in the dependent variable when examining the model (Hair Jr et al., 2016). Researchers can use PLS-SEM when the analysis is concerned with testing the theoretical framework from a predictive perspective and when the structural model is complex and includes many constructs, indicators and/or relationships of the research model (Hair et al., 2016), the first step in evaluating the results of PLS-SEM. SEM involves measurement models. If the measurement model meets all the necessary criteria, the researcher then needs to evaluate the structural model.

The first evaluation of the measurement model is to test the loading indicator, where the recommended loading value is above 0.7. The next step is to assess the reliability of internal consistency (internal consistency reliability) using Cronbach's alpha and composite reliability (CR) with a recommended value greater than 0.7. Another evaluation on the measurement model is the average variant extracted (AVE) to analyze convergent validity, this value is at least 0.5. Fornell-Larcker criterion and cross-loading values were used to measure discriminant analysis.

After the measurement model assessment shows satisfactory results, the next step is to test the structural model. The first step is conducting collinearity test by measuring the value of the inner VIF, with the recommended value between 0.2 and 5. Testing the significance and relevance of the structural model relationship that represents the hypothetical relationship between constructs. The values used in this test are t-values and p-values with a significance level of 5% which are commonly used in marketing research. Thus, the relationship between constructs can be said to be significant if the p-values in the bootstrap are < 0.05. This study uses one-tailed tests because the hypothesis already has a certain direction, so that the reference value of t-values is > 1.65. Next is to see determinant coefficient ( $R^2$  value) to see the predictive power of a research model with a value of 0.75, 0.5, or 0.25 defined as strong, moderate, or weak.

#### IV. RESULT / FINDING

Table 2 elaborates the characteristics of 294 respondents in this research.

Table 2. Respondents characteristic

Respondents characteristic (n = 294)	Frequency	Percentage
<b>Gender</b>		
Male	117	39,8%
Female	177	60,2%
<b>Age</b>		
17 - 20 year old	24	8,2%

21 - 25 year old	62	21,1%
26 - 30 year old	129	43,9%
31 - 40 year old	70	23,8%
> 40 year old	9	3,1%
<b>Education</b>		
High School	85	28,9%
Diploma	21	7,1%
Bachelor Degree	138	46,9%
Master Degree	49	16,7%
Doctoral Degree	1	0,3%
<b>Frequency in using mobile wallet application</b>		
Less than 4 times a month	29	9,9%
4 - 8 times a month	105	35,7%
9 - 15 times a month	95	32,3%
> 15 times a month	65	22,1%
<b>Domicile</b>		
Jabodetabek	177	60,2%
Outside Jabodetabek	117	39,8%
<b>Mobile wallet application that is frequently used</b>		
Shopeepay	185	19,1%
LinkAja	234	24,2%
Gopay	90	9,3%
Dana	216	22,3%
Ovo	237	24,5%
Others	5	0,5%

Hypothesis testing was carried out using the Structural Equation Model (SEM) method. The initial step in this analysis is to evaluate the measurements model to evaluate the validity and reliability of the measured construct (Hair Jr et al., 2016). The results of the validity and reliability tests on the main data can be seen in the following table.

Table 3. Validity and reliability tests

In reliability testing using Cronbach's alpha and composite reliability (CR), there are several constructs where Cronbach's alpha value is below the threshold (0.7), namely privacy awareness (0.668), trust (0.659), and perceived complementary (0.686). When viewed from the value of composite reliability (CR) with recommended value is greater than 0.7, only trust has a value below the threshold, 0.521. When analyzing and assessing reliability, the true value of reliability is usually between Cronbach's alpha and composite reliability (Hair Jr et al., 2016). Thus, a construct with Cronbach's alpha value below 0.7 but has a CR value higher than the threshold can be said to be reliable.

There are several indicators that have outer loadings values below 0.7. In general, indicators with an outer loading value between 0.4 and 0.7 can be considered for deletion if the removal of these indicators increases the composite reliability value above the threshold but indicators with a value below 0.4 should always be removed from the construct (Hair Jr et al., 2016). Therefore, the TR1 indicator will be removed from the construct, while the indicator with a value between 0.4 and 0.7 will be maintained considering that the composite reliability value is above the recommended value. This removal of indicator causes the increment of Cronbach's alpha to 0.689, CR to 0.796, and AVE to 0,674.

To test discriminant validity, the approach used in this study is the cross-loadings approach and the Fornell-Larcker criterion where this approach is still a standard tool for testing discriminant validity (Hair Jr et al., 2016). The Fornell-Larcker criterion compares the square root of the AVE value with the correlation of the latent variable where specifically the square root of each AVE construct is greater than the highest correlation with other constructs, these two approaches are the most frequently used in testing discriminant validity (Hair Jr. et al., 2016). A model has a good discriminant validity value if the correlation between constructs and their indicators is higher than the correlation with indicators from other block constructs. In this study, the discriminant validity requirements using the Fornell-Larcker criterion and cross-loadings have been met.

Table 4. Validity and reliability tests with Fornell-Larcker criterion

In evaluating structural model, the value of the variance inflation factor (VIF) is below 5, indicating there is no collinearity problem in this research model. The value of R<sup>2</sup> depends on the complexity of the model and the research discipline. In marketing research, the R<sup>2</sup> value of 0.75 is described as strong, 0.50 moderate and 0.25 weak. (Hair Jr et al., 2016).

Construct	R2	p-Value
DPI	0,669	0,000
ID	0,181	0,002
PB	0,348	0,000
PPR	0,346	0,000

Information sensitivity ( $\beta = 0.330$ ;  $t$ -value = 5.124;  $p$ -value = 0,000), privacy awareness ( $\beta = 0.134$ ;  $t$ -value = 3.013;  $p$ -value = 0,001), previous online privacy invasion ( $\beta = 0.097$ ;  $t$ -value = 1.908;  $p$ -value = 0.028), mobile payment security ( $\beta = -0.124$ ;  $t$ -value = 2.024;  $p$ -value = 0,022), and negative media coverage ( $\beta = 0.231$ ;  $t$ -value = 3.908;  $p$ -value = 0,000) have influences to perceived privacy risk. Hence H1, H2, H3, H4 and H6 are supported. However, H5 and H7 are not supported in this study. Personal information disclosure requirements ( $\beta = 0.047$ ;  $t$ -value = 0.838;  $p$ -value = 0.201) and trust ( $\beta = 0.005$ ;  $t$ -value = 0.073;  $p$ -value = 0.471) do not show effect to perceived privacy risk.

Furthermore, perceived compatibility ( $\beta = 0.144$ ;  $t$ -value = 2.052;  $p$ -value = 0,020) and immediate gratification ( $\beta = 0.336$ ;  $t$ -value = 4.872;  $p$ -value = 0,000) show positive influence to perceived benefit. Therefore, H10 and H12 are supported. Different to prediction, number of application services ( $\beta = 0.114$ ;  $t$ -value = 1.351;  $p$ -value = 0.088), perceived critical mass ( $\beta = 0.074$ ;  $t$ -value = 0.898;  $p$ -value = 0.185), and perceived complementary ( $\beta = 0.053$ ;  $t$ -value = 0.624;  $p$ -value = 0.266) show no effect to perceived benefit. Hence, H8, H9, and H11 are not supported.

Statistic results of perceived privacy risk ( $\beta = -0.123$ ;  $t$ -value = 1.740;  $p$ -value = 0.041) shows negative effect to intention to disclose information. Same as perceived benefit ( $\beta = 0.427$ ;  $t$ -value = 29.017;  $p$ -value = 0.000) that shows positive effect to this construct. The same relationship occurs from intention to disclose information ( $\beta = 0.818$ ;  $t$ -value = 5.973;  $p$ -value = 0.000) to disclosure of information. Therefore, H13, H14 and H15 are supported.

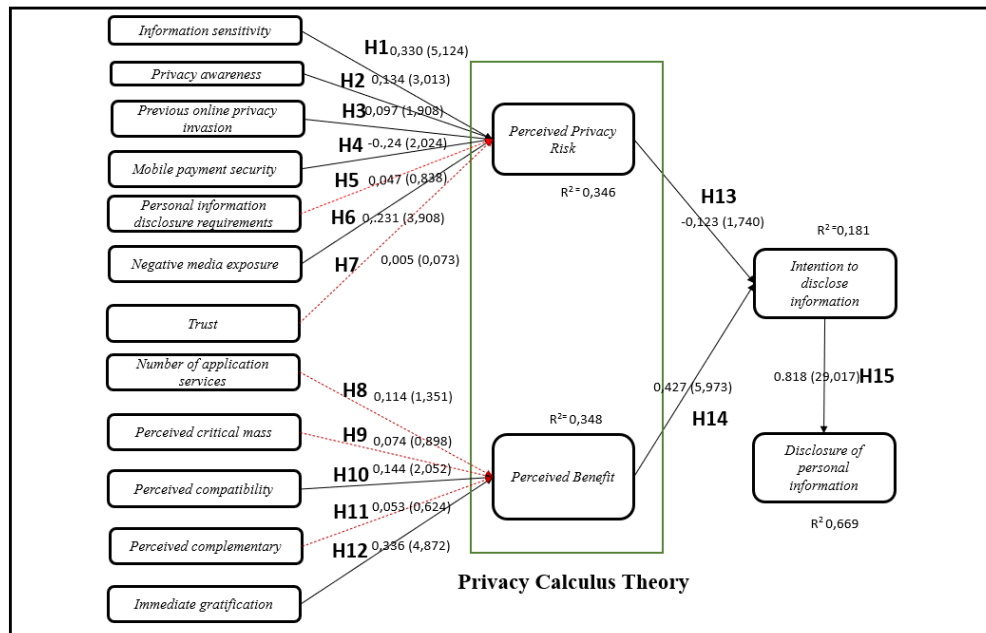

Fig. 2. Results for the proposed hypothesis

## V. DISCUSSION

Firstly, the analysis shows that some antecedents of perceived privacy risk have effect on intention to disclose information. Information sensitivity shows positive effect on intention to disclose information. This shows that the more sensitive the information that consumers must provide to the mobile wallet application, the higher the perceived privacy risk. Customers are reluctant to provide sensitive personal information such as financial information that can be used to personalize the services offered (Kim et al., 2019). It is also revealed in this study that privacy awareness, previous online privacy invasion, and negative media exposure show positive effects to intention to disclose information, while mobile payment security has negative effect. On the other hand, the insignificant result of personal information disclosure requirements might be caused that it has become common among smartphone users' mobile applications to disclose their information and there are disadvantages for consumers if they do not provide it (Cheng et al., 2021). Furthermore, trust does not show effect to intention to disclose information. This finding differs from the results of previous studies, where the results show that trust in empirical studies in e-commerce (Malhotra et al., 2004), online contexts (Zimmer et al., 2010) and internet of things (IoT) (Kim et al. 2019) has a negative effect on perceived privacy risk. One of the reasons that might explain the difference in these findings is that respondents in this study felt that the existence of a mobile wallet application was very helpful for digital transactions, especially the applications mentioned in this research instrument were the mobile wallet application with the most users in Indonesia based on the Boku 2021 survey, so that the effect of trust does not affect perceived risk. Another thing that might explain this finding is based on the associationist view, trust and perceived risk are independent variables of attitude. It means, both can be represented independently rather than inferring perceived risk from trust (or vice versa) (Richard Eiser et al., 2002).

Secondly, perceived compatibility shows positive influence on intention to disclose information. This finding implies that users who feel that using a mobile wallet service is in accordance with their values and beliefs, are more prone to adopting the service (Hsu & Lin, 2016). In addition to that, this empirical study finds that immediate gratification will stimulate people and when faced with a choice, people usually prefer small benefits in a short period of time compared to larger benefits in the future (Barth & de Jong, 2017). Unexpectedly, number of application services, perceived critical mass, and perceived complementary do not affect the perceived benefit. This implies that the value of the services offered has not increased with the increase in the number of users. The possible reason behind this finding is the high use of cash payments. Although Hsu & Lin (2016) explained that popular and inexpensive complementary applications increase the value of a product or service, this empirical research proves that this is not found in the context of mobile wallets. An explanation that might support this result is that there are many other payment methods that have been adopted by users of the mobile

wallet application, so that complementary services such as paying electricity bills, taxes, and topping up pulses do not affect consumers' perceptions of the benefits of mobile wallets.

Finally, the privacy calculus theory predicts negative relationship which are supported in overall samples. This finding implies that the higher the perceived risk, the lower the consumer's intention to disclose personal information (Cheng et al., 2021). Furthermore, there is a potential benefit, people are willing to provide their personal information despite the higher privacy risks and perceived benefits also implying a stronger desire to disclose personal data (Kim et al., 2019). The relationship between information disclosure intention and disclosure behavior is inconsistent in the literature (Cheng et al., 2021). However, this study shows that there is positive relationship between intention and actual behavior on disclosing personal information (Cheng et al., 2021).

## VI. CONCLUSION AND RECOMMENDATION

The results of this study indicate that there is a positive effect of perceived benefit and a negative influence of perceived privacy risk on the intention to disclose personal information. This empirical research also proves that there is a positive effect of intention to disclose on the disclosure of personal information. This find supplements the literature on the privacy calculus theory framework by applying to the context of mobile wallets in Indonesia with twelve factors which are divided into seven factors of perceived privacy risk and five factors of perceived benefit. The results of this study support the basic theory of privacy calculus which states that a person's intention in disclosing personal data is a privacy calculus in which potentially opposing factors are weighed in order to obtain a result, consumers conduct a risk-benefit analysis and decide whether to provide personal information based on the final results. analysis (Li, 2012). In addition, some researchers argue that there is a paradox between the actual intention and behavior in disclosing personal data (Cheng et al., 2021). In this empirical study, the results of the analysis indicate that there is a positive relationship between intentions and actual behavior in disclosing personal data.

This research also has implications for managerial and corporate policy makers. Given that companies need data from consumers to provide personalized services, it is important to look at what factors influence the disclosure of consumer personal data to a platform, in the context of this study, a mobile wallet application. Companies that are aware that information sensitivity, privacy awareness, and previous online privacy invasion are correlated with perceived privacy risk can make clear regulations on consumer privacy protection in mobile wallet applications. To overcome negative media exposure, companies are expected to have crisis planning and emergency communication. Furthermore, based on empirical results, mobile payment security is negatively associated with perceived privacy risk, so companies must ensure that every transaction on a mobile wallet application is guaranteed safe.

The factor that has the greatest influence on the perceived benefit is instant gratification. This finding can be taken into consideration by the company to be able to increase the instant benefits that can be felt by its users. Examples of benefits that can be considered are providing additional discounts to consumers who have a certain level of application usage frequency or discounts from repeat purchases at one of the consumer's favorite merchants. The results of this empirical study, as a whole, prove that perceived benefit is a factor that influences the disclosure of one's personal data to the mobile wallet application. Thus, companies can consider increasing the benefits that consumers feel from using this application.

This research is inseparable from the limitations that can be used as improvements for further research. This research was only conducted in the context of mobile wallet application users so the results might be different if used in other contexts such as e-commerce. More than sixty per cents respondents in this study are domiciled in Greater Jakarta, so that further research can expand the reach of research respondents to other areas, especially outside Java. Thus, it can be seen whether there is a cultural influence in the disclosure of personal data.

**Analysis of Factors Affecting Non-Oil Gas Exports in Indonesia 2017-2021**

Arsyi Asriawati<sup>1</sup>, Dr. Daryono Soebagyo, M.Ec<sup>2</sup>

<sup>1,2</sup>Muhammadiyah Surakarta University: Economic Development, Faculty of Economics and Business Muhammadiyah Surakarta University, Sukoharjo, Indonesia.

**Abstract**

*A country's exports have an important role in increasing economic growth. Exports encourage the development of the domestic product market through the production process. Each country has the potential of natural resources that can be exported to expand the international trade market so as to attract investors to invest in the leading sector. Indonesia has 34 provinces with various sector in each region, especially in the non-oil and gas sector such as agriculture, mining and industry. Non-oil and gas exports in Indonesia from 2017-2021 continue to fluctuate where this is influenced by various factors. Therefore, this study aims to determine the factors that influence non-oil and gas exports in Indonesia and to analyze which provinces have a dominant influence on non-oil and gas exports. The research used a panel data regression analysis tools consisting of time series data for 4 years and cross section data 34 provinces. Based the results of research, it is known that inflation has a significant effect on non-oil and gas exports. While foreign investment and Gross Regional Domestic product (GRDP) simultaneously have no significant effect on non-oil and gas exports in Indonesia. It can be concluded that partially inflation, foreign investment and GRDP have a significant effect on non-oil and gas exports.*

*Keywords— non-oil and gas exports; inflation; foreign investment; GRDP*

**I. INTRODUCTION**

A country's exports have an important role in increasing economic growth. Exports can supply the country's budget through revenues and foreign currency that can be used to improve infrastructure and create an attractive investment climate (Mohsen, 2015). In addition, exports also have an important role in developing the domestic product market. The role is related to the efforts made by the government to encourage an increase in the amount of output and the use of more modern technologies in the production process.

Indonesia is an archipelagic country with 34 provinces that have abundant natural resources. DG of plantitaion dalam (Aisyah & Renggani, 2021) states that the oil and gas reserves are considerable as well as agricultural and plantation products. In an effort to diversify exports to commodities other than oil and gas, the Indonesian government focuses more on exporting agricultural products such as cocoa, coffee, palm oil, natural rubber and white pepper. The non-oil and gas sector which is the leading sector is in the agricultural, mining and industrial sectors. The use of technology that has not been maximized has an effect on the products produced so that they are not able to compete with the products of other countries. In export activities, there are several things that affect the value of exports. In the chart below, the development of the value of non-oil and gas exports and the factors that affect them will be attached.

Fig 1. Non-Oil and Gas Exports in Indonesia in 2017 – 2021

Source : Indonesian Ministry of Trade

Table 1. Realization of Indonesian Foreign Direct Investment in 2017 - 2021

No	Year	Realization of FDI (Million US\$)
1	2017	32.239,00
2	2018	29.307,00
3	2019	28.208,90
4	2020	28.666,30
5	2021	31.093,10

Source: Indonesian Central Statistics Agency

In chart 1.2 it can be seen that the realization of foreign investment during the period 2017 to 2019 continues to decline. The realization rate of FDI in 2019 has the lowest value of 28.208,90 million US\$. Then starting in 2020, it has begun to increase again until in 2021 there was a very significant increase of 31.093,10 million US\$.

Gross Domestic Product (GDP) is one of the indicators used to look at economic growth. GDP is the output of goods and services produced by units of production within the territorial boundaries of a country for a year. Meanwhile, to find out the income of a region can be seen through the GRDP (Gross Regional Domestic Product). One of the components that contribute to GDP is total exports. In macroeconomic theory, the relationship between exports and national income is an identity equation because exports are part of the national income level (Hutagulung, 2020). The following will be attached a graph of Gross Domestic Product (GDP) in Indonesia.

Table 2. Gross Domestic Product (GDP) in Indonesia 2017 - 2021

No	Year	GDP ( Billion Rupiah)
1	2017	9.912.928,10
2	2018	10.425.851,90
3	2019	10.949.155,40
4	2020	10.723.054,80
5	2021	11.118.868,50

## II. LITERATURE REVIEW

### A. Export

Export is the activity of selling goods/services from the customs area in accordance with applicable laws and regulations. The customs area is the entire national territory of a country, where import duties and exit duties are levied on all goods that cross the boundaries of that territory, except for certain parts of the territory that are expressly (by law) declared as territories outside the customs territory. The export of a country usually consists of goods and services produced within its own country . however, it does not rule out the possibility of exporting goods that are imported or some goods in imports and some goods in re-export (Purnamawati & Fatmawati, 2013)

In export trade transactions, an exporter has a lot to do with various agencies / institutions that support the implementation of these export transactions. In general, the grouping of export goods is as follows (Purnamawati & Fatmawati, 2013):

- a. Goods regulated by the export trade system, is a grouping of goods whose export can only be carried out by a company that has obtained recognition as a registered exporter from the minister of industry and trade. A registered exporter is a corporate or individual entity that has received recognition from the Minister of Industry and Trade to export certain goods according to applicable decisions. Items that are regulated by the commercial system include coffee, text and plywood.

- b. Goods supervised by export, are goods whose export can only be carried out by a company that obtains approval from the Minister of Trade or an appointed official taking into account the proposal of a technical supervisory agency. Goods that are supervised by exports include: fertilizers, oil and gas, palm kernel, milkfish fry and so on.
- c. Goods that are prohibited from export, are goods that must not be exported as stipulated by the Minister of Trade in accordance with the needs and development of the national economy and interests in general. The types of goods that are prohibited for export include: fishery products in a living state, wild animals and natural plants that are protected and ancient goods of cultural value.
- d. Goods that are free of export, are goods that do not belong to the regulated, supervised and prohibited group of goods for their export. Thus its export can be carried out by any company or individual that already has predetermined requirements.

The general provisions of exports in Indonesia have been stated in the decree of the Minister of Industry and Trade No.558/MPP/Kep/12/1998. The annex to this decision has been amended several times. Last time with the decree of the Minister of Industry and Trade No. 118/MPP/Kep/2003.

### *B. Inflation*

*Inflation* is an economic symptom that indicates a sustained rise in the general price level. The condition of inflation is that there is a general and continuous increase in prices (Hasyim, 2017). Inflation can have an effect on a country's exports can increase because capital from debt or loans to produce goods and services increases. This is in accordance with the opinion (Ball, 2005), i.e. when the inflation rate is high, it will encourage loans and loans will be repaid at a smaller value for money. Judging from the source of the cause, inflation can be classified into three, namely:

- a. Demand inflation, this group of inflation is called demand pull inflation. This inflation arises when there is an increase in prices in overall demand. In other words, inflation occurs in a state of rapidly developing economies. High job opportunities generate high incomes, thus encouraging expenditures that exceed the economic ability to produce goods and services. This overspending gives rise to inflation (Hasyim, 2017).
- b. Supply inflation, another term for this inflation is cost pull inflation. This inflation is due to an increase in production costs. Prices and wages rise before the full level of resource use is reached. Labor insists on demanding wage increases even though there are still many workers who are not working. A highly skilled workforce will offer its workforce at a high price. High wages and production costs will encourage producers to sell their produce at high prices which in turn urges other prices to also rise (Hartono, 2006).
- c. Mixed inflation, is inflation caused by the mixture and the pull of demand and the impulse of costs. The result of mixed inflation itself is the increase in unemployment due to pressure on labor offers urging to increase wages or monopolistic / oligopoly actions within companies in the economy so that there is an income gap or what is known as a deflationary gap.

### *C. Foreign Investment*

Investment or investment is an investment given by individuals or companies or organizations both domestically and abroad. In accordance with Law No.25 of 2007 concerning Investment is Foreign Investment and Domestic Investment. Based on economic law decisions or business law, investment technology is divided into foreign direct investment by local investors and foreign investors and investment made indirectly by foreign indirect investment carried out in the capital market (Untung, 2010). Direct investment is a form of direct investment where the investor is directly involved actively in business processing activities and is directly responsible in the event of a loss. Foreign investment in the form of direct investment, especially regarding the establishment / formation of a new company, is somewhat different because the project in question must not only meet formal requirements but also material requirements. On condition that the formil is intended in the sisi that it must be fulfilled the provisions of the regulations of the State concerned, while the material condition is in the sense that the project will be able to meet the economic usefulness of the state (Sunny, 1976).

Indirect investment is a short-term investment that includes transaction activities in the capital market and in the money market. This investment is called short-term investment because in general, buying and selling shares

and or currencies in a relatively large period of time depends on fluctuations in the value of shares and or currencies to be traded (Suprancana, 2006). Law No.1 of 1967 states that the definition of foreign investment in this Law only includes direct foreign investment carried out according to or based on the provisions of this Law and which is used to run a company in Indonesia, in the sense that the owner of the capital directly bears the risk in the investment.

#### D. Gross Regional Domestic Product (GRDP)

Gross Regional Domestic Product (GRDP) is the amount of gross added value arising from all sectors of the region's economy. The purpose of calculating this GRDP is to provide information that can describe regional economic performance, assist in regional policymaking or planning, and evaluate development results (DJPB, 2020). According to the Central Statistics Agency, Gross Regional Domestic Product (GRDP) is one of the important indicators to find out the economic condition in a region in a certain period, both on the basis of prevailing prices and on the basis of constant prices.

GRDP on the basis of prevailing prices describes the added value of goods and services calculated using the price in the current year. GRDP according to the prevailing price is used to determine the ability of economic resources, shifts, and the economic structure of a region. GRDP on the basis of constant prices indicates the added value of such goods and services which is calculated using the price in force in one year as the base year. Constant price GRDP is used to determine the real economic growth from year to year or economic growth that is not influenced by price factors. According to the Central Statistics Agency, the calculation of GRDP conceptually uses three kinds of approaches.

- a. Production Approach, Gross Regional Domestic Product is the amount of added value to goods and services produced by various units of production on the territory of a region over a certain period of time (usually one year). The production units in this presentation are grouped into 17 business fields (sectors), namely: agriculture; forestry and fisheries; mining and quarrying; processing industry; procurement of electricity and gas; water procurement, waste management, waste and recycling; construction; large and retail trade, repair of cars and motorcycles; transportation and warehousing; accommodation preparation and drinking; information and communication; financial services and insurance; real estate; corporate services; administration of government, defense and compulsory social security; educational services; health services and social activities; other services.
- b. Spending Approach, Gross Regional Domestic Product is the amount of value of goods and services (Output) products produced within an area to be used as final consumption by households, Non-profit Institutions serving Households, and the government coupled with investment (gross fixed capital formation and inventory changes), as well as net exports (representing exports minus imports).
- c. Revenue Approach, Gross Regional Domestic Product is the amount of recompense received by production factors that participate in the process of prosukdi in an area within a certain period of time (usually one year). The repayment in question is wages and salaries, land rent, interest on capital and profits, all of which have not been deducted from income tax and other direct taxes. In this definition, GRDP includes also depreciation and net indirect taxes (indirect taxes minus subsidies).

### III. RESEARCH METHODOLOGY

To determine the effect of inflation, foreign direct investment (FDI), and gross regional domestic product on non-oil and gas exports in Indonesia, this study uses panel data. This study used panel data regression analysis which consisted of time series data for five years and cross section data for 34 provinces in Indonesia which resulted in 170 observations. So that the econometric model of this study is:

$$\text{LogEXP}_{it} = \beta_0 + \beta_1 \text{Inf}_{it} + \beta_2 \text{LogFDI}_{it} + \beta_3 \text{LogGRDP}_{it} + \varepsilon_{it}$$

EXP is total Indonesian Non-oil Exports in million dollars, Inf is Inflation in percentage, GRDP is Gross Regional Domestic Product in million dollars, FDI is Foreign Direct Investment in million dollars, log is logarithm based operator  $\varepsilon$ ,  $\beta_0$  is the intercept,  $\beta_1 \dots \beta_3$  are the slope coefficient of the model,  $i$  is cross section and  $t$  represent the time series.

## IV. RESULT / FINDING

This study analyzes the factors affecting non-oil and gas exports in Indonesia. The independent variables used are three variables, namely inflation, foreign investment and gross regional domestic product. This study used a panel data regression analysis tool with model estimation through three approaches, namely Common Effect Model (CEM), Fixed Effect Model (FEM) and Random Effect Model (REM). The following will be presented the results of the panel data regression estimates in Table 4-1.

Variable	CEM		FEM		REM	
	Coefficient	Prob.	Coefficient	Prob.	Coefficient	Prob.
C	-5,4656	0,0000	-26,953	0,0727	-6,2701	0,0018
INF	9,0547	0,0330	2,3374	0,4317	3,2472	0,2673
LOG(FDI)	0,3301	0,0003	0,0953	0,4511	0,1902	0,0624
LOG(GRDP)	0,8832	0,0000	2,8102	0,0255	1,0322	0,0000
R-Squared	0,53729		0,84618		0,27508	
F-Statistic	64,2524		20,3243		20,9978	
Prob(F-statistic)	0,00000		0,00000		0,00000	
DW-Stat	0,81885		2,22842		1,72045	
Model Selection Test						
(1) Chow Test Cross Section F(33,133) = 8,093734; Prob.F(33,133) = 0,0000						
(2) Hausman Test Cross section random $\chi^2(3) = 11,372652$ ; Prob. $\chi^2(3) = 0,0099$						

Source: Processed E-Views

Based on the model above, it is necessary to do some testing to determine the best estimation model. Here are the results of the model tests that have been carried out. In the chow test, the hipotesis ( $H_0$ ) states that the selected model is the Common Effect Model while the alternative hypothesis ( $H_A$ ) states that the selected model is the Fixed Effect Model. In table 4-1 it can be seen that the value of Prob.F (0,0000)  $< \alpha$  (0,05) then  $H_0$  is rejected so that the selected model is FEM (Fixed Effect Model).

In the chow test the selected model is FEM then the next test is the hausman test. Hipotesis ( $H_0$ ) the hausman test states that the selected model is the Random Effect Model while the alternative hypothesis ( $H_A$ ) states that the selected model is the Fixed Effect Model. In table 4-3 it can be seen that the value of Prob.F (0,0285)  $< \alpha$  (0,05) then  $H_0$  is rejected so that the selected model is FEM (Fixed Effect Model). Based on the chow test and hausman test, the selected model is FEM (Fixed Effect Model).

There are three tests carried out in this study, namely the Simultaneous Significance Test (Statistical F Test), Partial Significance Test (Statistical Test t), and Coefficient of Determination ( $R^2$ ). Based on table 4.1, it can be seen that the Value of Prob (F-statistic) in the Fixed Effect Model estimate with Prob (0,0111)  $< \alpha$  (0,05) which means  $H_0$  is rejected. So it can be concluded that together the variables of Foreign Investment, Domestic Investment, and Employment have a significant influence on the dependent variable.

The test criteria for the statistical test t is that if the prob  $> \alpha$  then  $H_0$  is accepted, but if the prob  $\leq \alpha$  then  $H_0$  is rejected. The results of the statistical test t for all independent variables in the Fixed Effect Model (FEM) can be seen in table 4.2.

Variable	Prob	Criteria	Conclusion
	t-statistic		

INFLATION	0,4317	> 0,10	No significant effect
LOG(FDI)	0,4511	> 0,10	No significant effect
LOG(GRDP)	0,0255	< 0,05	Significant at $\alpha = 5\%$

Source: Processed E-Views

The coefficient of determination is used to find out how much the variance of the dependent variable can be explained by the independent variable. Table 4.1 shows the regression results of fixed effect models, obtained values R-Squared ( $R^2$ ) of 0,84618 which means that 84,62% of the variation in the non-oil and gas export variable can be explained by the variables of inflation, foreign investment and gross domestic product. The remainin 15,38% is influenced by variables or other factors that are not included in the model.

## V. DISCUSSION

Based on the chow test and hausman test, the selected model is FEM (Fixed Effect Model). Here are the complete results of the Fixed Effect Model estimation model in table 4.3.

Table 5. Fixed Effect Model Estimation Model			
$\text{LogEXP}_{it} = -26,953 + 2,3374\text{LogINF}_{it} + 0,0953\text{LogFDI}_{it} + 2,8102\text{LogGRDP}_{it} + \varepsilon_{it}$			
	(0,4317)	(0,4511)	(0,0255)***
$R^2 = 0,84618$ ; F-Stat = 20,3242; Prob(F-statistic) = 0,0000			

Source: Processed E-Views

Description: \* = significant at  $\alpha (0,01)$ ; \*\* = significant at  $\alpha (0,05)$ ; \*\*\* = significant at  $\alpha (0,10)$ . The number in parentheses is a t-statistical probability.

In table 5.1, it can be seen that the independent variable in the FEM model that has a significant influence on non-oil and gas exports is GRDP. Meanwhile, what does not have a significant influence on non-oil and gas exports is inflation and foreign investment.

The GRDP variable has a regression coefficient of 2,8102 with a probability value of 0,0255 where the value is smaller than  $\alpha (0,05)$ , so it can be concluded that the GRDP has a positive and significant effect on non-oil and gas exports, which means that if the GRDP increases by 1%, non-oil and gas exports increase by 2,8102%. According to (Sukirno, 2004) states that the determinants of exports is the country's ability to produce goods that can later compete in foreign markets. With the increase in GRDP in each region, it will also increase the amount of production of goods produced so that the export of these products will also increase, and vice versa. The results of this study are in accordance with research conducted by Aisyah (2021) which states that GDP has a positive and significant effect on exports. There are other studies that support this research, namely the research conducted by (Ashari, Sudarusman, & Presetyo, 2020) that GRDP has a positive and significant effect on non-oil and gas exports.

The inflation variable has a regression coefficient of 2,3374 with a probability value of 0,4317 where the value is greater than the  $\alpha (0,10)$ , so it can be concluded that inflation has no significant effect on non-oil and gas exports. The findings of this study are consistent with the results of the research conducted (Ashari et al., 2020). The foreign investment variable has a regression coefficient of 0,0953 with a probability value 0,4511 where the value is greater than the  $\alpha (0,1)$ , so it can be concluded that foreign investment has no significant effect on non-oil and gas exports. The results of this study are supported by research (Editiawarman & Idris, 2020) which states that foreign direct investment has no significant and positive effect on Indonesia's non-oil and gas exports to the United States.

For the constant value of the 34 provinces in Indonesia, the highest is North Maluku Province. This can be seen from the value of non oil and gas exports in North Maluku Province which continues to increase significantly from 2017-2021. In contrast to other provinces, the development of export value is not too high and even tends to fluctuate. From the demand side, economic growth stems from the high acceleration in the

component of foreign exports. The increase in inventory also affects the economic growth of the North Maluku because it is supported by the activities of the mining sector and the manufacturing industry. (BI, 2021).

## VI. CONCLUSION AND RECOMMENDATION

Based on the results of research and testing that has been described regarding the analysis of the effect of inflation, foreign investment and GRDP on non-oil and gas exports in Indonesia in 2017-2021, several conclusions can be drawn as follows:

- a. Based on the results of data processing, the Fixed Effect Model (FEM) was selected as the best estimator model.
- b. The coefficient of determination ( $R^2$ ) of the Fixed Effect Model (FEM) of 84,62% variation in non-oil and gas export variables can be explained by the variables of inflation, foreign investment and GRDP. The remaining 15,38% is influenced by variables or other factors that are not included in the model.
- c. Through test F Statistics proves that simultaneously the variables of inflation, foreign investment and GRDP have an influence on non-oil and gas exports in Indonesia.
- d. Through the Statistical Test, it can be seen that partially the GRDP variable has a significant effect on non-oil and gas exports in Indonesia with a coefficient of 2,8102. Meanwhile, inflation and foreign investment have no significant effect.

Muhammadiyah Surakarta, Sukoharjo, Central Java, Indonesia.

### Abstract

*In Indonesia, rice has become a primary food especially in Central Kalimantan Regency/City. Food needs such as rice are the essential basic needs for the community and need to be fulfilled before other needs. The reduction in harvested area and rice production cause shortages in food availability especially rice. This study examines the effect of harvested area, agricultural sector labor, regional minimum wages, and education on district/city rice production in Central Kalimantan Province from 2018 to 2021. This study employed panel data regression to estimate secondary data from 14 districts/cities of Central Kalimantan Province for a 4-year research period from 2018 to 2021. The results showed that only harvested areas negatively affected rice production, while agricultural sector labor, regional minimum wages, and education did not affect rice production in Central Kalimantan districts/cities from 2018 to 2021.*

*Keywords: labor, harvested area, education, rice production, regional minimum wage.*

### I. INTRODUCTION

The agricultural sector is vital to Indonesia's development and the national economy. Most of Indonesia's population makes a living as farmers. The agricultural sector is vital to provide food, industrial raw materials, business opportunities, and farmer's income source. One of the agricultural commodities that are needed by the community is rice. It is because rice is needed by the community as their primary food. There are several reasons for the importance of sustainable rice production: rice is a primary food for the Indonesian and is an important commodity to maintain food security in rice farming, which has become a part of the lives of Indonesian farmers. Thus, creating significant employment opportunities and the contribution of business but rice to household income are quite large (Hamdan, 2013).

Central Kalimantan is an area for the development of various food crops. One of the crops is rice commodity which mainly cultivated by farmers in Central Kalimantan. According to Purwaningsih (2017), labor is one of the main inputs in farming. Agricultural labor is classified into human, livestock, and mechanical or machine labor. Labor can be obtained within the family or from outside the family. The workforce is further divided into male, female, and child workers. Labor restrictions on children are under aged 14 years old.

Based on BPS data for the last four years (2018-2021) the workforce in the agricultural sector in Kalimantan continues to tend to increase every year. In 2018 499.137 people were working in the agricultural sector. There is an increase by 504.701 people in 2019. However, in 2020 the workforce decreased by 1.791 people to 502.910 people. In 2021, the workforce will increase by 2730 people to 505640 people. The data can be seen in Table 1.1.

The rice production is expected to increase by the increase in labor. Thus, that the agricultural sector can become one of the leading sectors that able to fulfill the community's need for food which continues to increase. The data can be seen in Table 1.2 that rice production during the last four years has fluctuated but tends to increase.

Table 1. The Development of Workforce in Agricultural Sector in Central Kalimantan 2018-2021

Year	Rice Production (ton)
2018	499137
2019	504701
2020	502910
2021	505640

Source : Statistic of Central Kalimantan

Table 1. provide that in 2018 the rice harvested area in Central Kalimantan Province was 202.142 ha, with a total rice production of 223647.26 tons. Thus, the rice commodity is identified as the most significant food crop commodity in Indonesia. However, in 2021, rice production in Central Kalimantan experience a significant decline of 55507.96 tons from 455952,00 in 2020 to 400444.04 tons in 2021. This makes Central Kalimantan has the lowest rice production in Indonesia in 2021. The low rice production in Central Kalimantan is not affected by the agricultural sector workforce. It is because in 2020 the agricultural sector workforce was increase, while rice production was declined. Another factor is the problem of micro water management (irrigation) and the use of superior varieties, which are still few in Central Kalimantan.

Table 2. The Development of Rice Production in Central Kalimantan from 2018 to 2021

Year	Rice Production (ton)
2018	223647,26
2019	443561,33
2020	455952,00
2021	400444,04

Source: Beurau of Statistic of Central Kalimantan

Greling (2012) revealed that farmers and agricultural industry organizations often emphasize the importance of the agricultural sector in the South African economy. In reality, however, the agricultural sector has accounted for less than 3% of the economy since 2005. The results show that the agricultural sector has not been able to meet the demand for the leading food consumed domestically since 2000. However, this does not result in an expected rapid increase in foodstuffs and general inflation. Second, agricultural exports do not play a significant role in growth but balance economic development. Third, the sector has been releasing labor to the entire economy since 1962 that meets the economic development literature. Fourth, the agricultural sector has been making net capital transfers throughout the economy since the mid-2000s. Finally, the agricultural sector has the most substantial linkages representing about 7% of the economy in 2010.

Central Kalimantan Province has various potentials and problems related to food security, especially rice production, where the level of rice production fluctuates yearly. Meanwhile, the needs of food from year to year continue to increase. This affected by various factors, one of which is the workforce in the agricultural sector, which continues to increase and affects the rice production level in Central Kalimantan. The effect of inputs (harvested area, labor, wages, and education) can affect the level of rice production in Central Kalimantan. This study aimed to determine the effect of the harvested area, labor, wages, and education on rice production in the districts/cities of Central Kalimantan during the 2018-2020.

## II. LITERATURE REVIEW

### A. *Production Theory*

According to Sukirno (2011), there is a very close relationship between the production factors and the production result in the production process. Habib (2013) stated that the production theory describes the relationship between the production factors and the production level. The production theory can be expressed in terms of the production function and the production level. The factors of production are known as inputs, and the amount of production is called output.

According to Murdiantoro (Setyaningsih & Padang, 2018), in farming activities, production factors are needed, consisting of four components: capital, land, labor, and expertise. In some literature, some experts list only three factors of production: land, capital, and labor. Each factor has a different function and is interrelated with each other. If one of the factors is unavailable, then the production process or farming will not work, especially the three factors such as land, capital, and labor.

The production factor of land (land) consists of several other natural factors such as water, air, temperature, sunlight, and others. The existence of soil production factors is seen in its narrow area and other aspects such as

soil type, land use, topography, low height, and others. In addition to land production factors, agriculture is also affected by capital factors. The higher capital per business unit will boost capital-intensive or intensive business. Labor also has an important role in agricultural production in economics. Labor is a tool of human physical and brain power, which cannot be separated from humans and is aimed at production efforts. According to some agricultural economists, workers aged 15-64 years are potential residents who can work to produce goods or services (Setyaningsih & Padang, 2018).

#### *B. Rice Production*

Rice is the primary food source for the Indonesian population, most of which is cultivated as lowland rice. In general, lowland rice varieties in conditions of narrow spacing will experience a decrease in growth quality, such as fewer tillers, shorter panicle length, and of course, a reduced number of grains per panicle compared to wide spacing (Andrias et al., 2017).

Land area, seeds, fertilizers, and labor factors affect the production and production efficiency of rice farming. The level of rice production is strongly affected by various factors, such as technology, pre-harvest and post-harvest handling, human resources, land, fertilizers, and others (Puronomo & Utami, 2018).

#### *C. Harvested Area and Rice Production*

Agricultural land determines agricultural commodities. A large area of land will produce more products. Each region has its unit to determine the land area. The unit for calculating land area is divided into 4; internationally, it uses ha/hectare; nationally, it uses ha/m<sup>2</sup>. Provincially it is often used shoulder, tombak, or chain. As for local, goods such as handicrafts are usually used (Nurmala, 2012).

The harvested area in Indonesia continues to increase, although the area of rice fields in Indonesia tends to decrease. It happens because the harvested area is the result of multiplying the area of land with the intensity of the plant. Where the wider the paddy field, the more the harvest area increases, indicating that the intensity of the crop is more dominant in the development of the harvested area (Hasan, 2010).

Hartina et al. (2018), using multiple regression analysis OLS (Ordinary Least Square), found that land area has a significant influence on rice production in Sanggi-Sanggi Village, Palangga District, South Konawe Regency with a regression coefficient of 0.466 and empirical significance ( $\rho$ )  $t$  is 0.020 ( $< 0.10$ ). While the wages of labor and education have no effect on rice production with empirical significance ( $\rho$ )  $t$  of 0.565 ( $> 0.10$ ) and 0.682 ( $> 0.10$ ), respectively.

#### *D. The Effect of Education on Rice Production*

Education is one of the most important factors to improve the quality of human resources and is very decisive in processing their farming business because education will affect how farmers think (Onibala et al., 2017).

The level of education of farmers will affect how they think about managing their farming business. It affects their ability to manage a farm and accept innovations. Education also has a positive relationship with a person's aspirations which will ultimately determine a person's decision. Farmers with higher education are usually more dynamic, fast, and precise in making decisions from each alternative business than farmers with low education. This is because they have more experience in agriculture (Yusmel et al., 2019).

A study by Machmuddin et al. (2019) employed multiple regression analysis OLS (Ordinary Least Square) found that education and the land area had a positive and significant effect on organic rice production with regression coefficient values of 50,500 each and 9.796 and the empirical significance ( $r$ )  $t$  was 0.003 ( $< 0.10$ ) and 0.000 ( $< 0.10$ ), respectively in 2015 in Tasikmalaya regency. Meanwhile, the age and experience of the farmer's business do not affect organic rice production, with an empirical significance ( $\rho$ )  $t$  of 0.231 ( $> 0.10$ ) and 0.154 ( $> 0.10$ ), respectively.

#### *E. The Effect of Wage on Rice Production*

Wages are payments of money obtained as a form of services provided and provided by workers to entrepreneurs (Sukirno, 2011). According to the Manpower Law No. 13 of 2000, Chapter I, Article 1, Paragraph 30, wages are the rights of workers/laborers that are received and expressed in the form of money as a reward from the entrepreneur/employer to the worker/laborer which is determined and paid according to a work agreement, regulations and services that have been or will be performed.

The size of the wages given by the company to its workers will affect the production level. When a person feels satisfied with the wages received, his production at work will increase. Sufficient wages, in this case, are

wages that are enough to be used in everyday life. So that when the level of income is sufficient, it will lead to concentration, leading to increased production (Kurniawan, 2010).

A study by Hassan & Kornher, (2021) using the standard error correction model (VECM) found that wages had a significant and significant effect on rice production in Bangladesh during the period 1994-2014 with a regression coefficient value of 0.063, and an empirical significance value ( $\rho$ ) t of 0.011 ( $< 0.10$ ).

#### *F. The Effect of Labour on Rice Production*

According to BPS (2021), labor is a population aged 15 years and over who is working, who has a job but temporarily does not work, and someone who does not have a job and is looking for work is categorized as working. Self-employed, trying to be assisted by temporary workers/family, and casual workers.

According to Purwaningsih (2017), labor is one of the main inputs in farming. Agricultural labor is classified into human, livestock, and mechanical or machine labor. Labor can be obtained within the family or from outside the family. The workforce is further divided into male, female, and child workers. Labor restrictions on children are age under 14 years old.

Previous studies, including Tou (2017) using multiple regression analysis OLS (Ordinary Least Square), found that land area and labor significantly affected rice production in Angkaes, Weliman District, Malacca Regency November 2015 - May 2016 with the respective regression coefficient values. - 0.335 and 0.194 respectively. The empirical significance ( $\rho$ ) t is 0.046 ( $< 0.10$ ) and 0.007 ( $< 0.10$ ) respectively. While education has no effect on rice production with an empirical significance value ( $\rho$ ) t of 0.692 ( $> 0.10$ ).

#### *G. Previous Literature*

In Aceh Province during the period 2021-2025, Fitri et al. (2021), using OLS (Ordinary Least Square) multiple regression analysis, found that land area has a significant effect on rice production with a regression coefficient value of 0.335, as well as an empirical significance value ( $\rho$ ) t is 0.000 ( $< 0.10$ ).

A study by Syahril (2021) found that the harvested area significantly affected the increase in rice production in the city of Yogyakarta during the 1993-2015 by using Vector Autoregression (VAR) regression analysis. In contrast, at the first period it got 0% then in the second period it rose high to 12% and was stable at 5<sup>th</sup> period to 10<sup>th</sup> period ranged from 11% in the last targeted period.

Rosyadi & Purnomo (2012) in Sukoharjo Regency in 2008, using descriptive analysis, found that the performance of food production, especially grain of rice, has increased significantly from year to year. However, the increase in production has not been able to offset the growth in rice consumption which grew higher than rice production growth. This shows that from the aspect of food availability, food security in the research area is still very low because it cannot provide food for all people in the research area.

Hasmarini & Purnomo (2016) used survey research methods involving farmers (farmer groups) as members of the Village Community Food Barn (LPMD). The rapid rural appraisal technique was chosen in the form of quantitative and qualitative analysis. Preliminary survey is conducted in the Baturetono and Wonogiri areas during the 2010 period. The results show that the active role of stakeholders (A-B-G-C) is significant in supporting farmer institutions (granaries). Economic and social aspects are also proven to have an important role in increasing the empowerment of farming communities. This model is a social engine for rural communities and local institutions, especially to achieve regional food security.

Min et al. (2021), using multiple regression analysis OLS (Ordinary Least Square), found that land area, labor, and education had a significant effect on rice production in China from 2005 to 2020, with each regression coefficient of 0.646; 0.004 and -0.092, and the empirical significance value ( $\rho$ ) t is 0.035 ( $< 0.10$ ); 0.012 ( $< 0.10$ ) and 0.061 ( $< 0.10$ ) respectively.

A study by Guo et al. (2021) in China during from 2014 to 2018 by using logit regression analysis, found that wages had a negative and significant effect on rice production with a regression coefficient value of -0.1642 and an empirical significance value ( $\rho$ ) t of 0.0248 ( $< 0.10$ ). While education has no effect on rice production with an empirical significance value ( $\rho$ ) t of 0.1904 ( $> 0.10$ ). Meanwhile, a study by Rahaman et al. (2021) in Bangladesh in 2021 using Cobb-Douglas regression analysis found that education had no effect on rice production with a regression coefficient value of 0.342 and an empirical significance value ( $\rho$ ) t of 0.245 ( $> 0, 10$ ).

Yamane (2021) using descriptive analysis, found that in the small-scale Awach scheme, low yields and small cultivation area yielded a profit per household of only about half that of the large-scale Ahero scheme IN Kenya from 2017 to 2018. The high cost of wages in Awach puts pressure on rice farm management because, although family labor is used for rice cultivation, additional labor is required for transplanting and weeding, which incurs costs. Sales of rice cover this in the previous year or livestock sales. In both areas, most of the wage workers are people who live in the same area. In Ahero's case, the scheme's scale is large, and the hired workers are unknown. However, in Awach, there is a high level of neighbor recruitment; thus, labor wages can also be understood as a source of income for people in the area.

Abidin et al. (2022) by using the ADF test (Augmented Dicky-Fuller) found that labor had a positive and significant effect on rice production in Malaysia during the period 1991-to 2020 with a regression coefficient value of 0.341, and an empirical significance value ( $\rho$ )  $t$  is 0.000 ( $< 0.10$ ).

In Brazil and Cuba, Garcia et al. (2021), using the SENSU model, found that Brazil showed greater sustainability based on better availability of environmental resources for rice cultivation, relatively lower environmental burden, and a better economy. And productive performance, a worse job, wage policies, and higher satisfaction of social demand for rice. On the other hand, Cuba exhibits environmental resource deficits, higher relative environmental burdens, lower economic and productive performance, better labor and wage policies, and unmet social demand for rice.

Shaikh et al. (2016), using regression analysis of Ordinary Least Squares (OLS), found that capital and land area affected Rice Productivity in Jaffarabad District, Balochistan, during the period 2008-2012, with regression coefficients of 2.799 and 0.189, respectively, as well as significance empirical ( $\rho$ )  $t$  of 0.04 ( $< 0.05$ ) and 0.00 ( $< 0.01$ ). The relationship pattern used in these two variables with Rice Productivity is linear.

Izuchukwu (2011), using panel data regression analysis, found that labor affected Rice Productivity in Nigeria during the period 1986-2007, with a regression coefficient of 0.113 and an empirical significance ( $\rho$ )  $t$  of 0.00 ( $< 0.01$ ). The relationship pattern used on these variables with Rice Productivity is linear.

Hassan & Kornher (2021), using the standard error correction model (VECM), found that wages had a significant and significant effect on rice production in Bangladesh during the period 1994-to 2014 with a regression coefficient value of 0.063 and an empirical significance value ( $\rho$ )  $t$  of 0.011 ( $< 0.10$ ).

Previous studies, including Tou (2017) using multiple regression analysis OLS (Ordinary Least Square), found that land area and labor significantly affected rice production in Angkaes, Weliman District, Malacca Regency November 2015 - May 2016 with the respective regression coefficient values. - 0.335 and 0.194 respectively, and the empirical significance ( $\rho$ )  $t$  is 0.046 ( $< 0.10$ ) and 0.007 ( $< 0.10$ ), respectively. While education has no effect on rice production with an empirical significance value ( $\rho$ )  $t$  of 0.692 ( $> 0.10$ ).

During the 2015 period in Tasikmalaya Regency, Machmuddin et al. (2019), using multiple regression analysis OLS (Ordinary Least Square), found that education and the land area had a positive and significant effect on organic rice production with regression coefficient values of 50,500 each. and 9.796 and the empirical significance ( $r$ )  $t$  was 0.003 ( $< 0.10$ ) and 0.000 ( $< 0.10$ ), respectively. Meanwhile, the age and experience of the farmer's business do not affect organic rice production, with an empirical significance ( $\rho$ )  $t$  of 0.231 ( $> 0.10$ ) and 0.154 ( $> 0.10$ ), respectively.

### III. RESEARCH METHODOLOGY

This study utilize secondary data obtained indirectly, in this case, through library research. The data is sourced from the Central Statistics Agency (BPS). To complete the secondary data processing, related information was also collected through various literature, newspapers, and articles downloaded through the internet. This secondary data is in the form of time series and cross-section data. Time series data is collected periodically based on the sequence of time, such as in hours, days, weeks, months, quarters, and years. Time series data is taken from 2018-to 2021. Meanwhile, the cross-section data uses 14 districts/cities in Central Kalimantan.

This study uses panel data regression analysis during the period 2018-2021 in 14 districts/cities of Central Kalimantan, with the following econometric model:

$$PP_{it} = \beta_0 + \beta_1 LP_{it} + \beta_2 EDU_{it} + \beta_3 UPAH_{it} + \beta_4 TKP_{it} + \varepsilon_{it}$$

where :

$PP$	= Rice production (ton)
$LP$	= Harvested area (Ha)
$EDU$	= Education (year)
$UPAH$	= Wage (rupiah)
$TKP$	= Agricultural labor (jiwa)
$\beta_0$	= Constanta
$\beta_1 \dots \beta_4$	= Coefficient
$\varepsilon_t$	= Residual
$i$	= Regency/ city (i)
$t$	= year (t)

#### IV. DISCUSSION

Hypothesis testing is done in order to interpret the regression results correctly. The estimation results of Panel Data Regression using Pooled Ordinary Least Squares (PLS), Fixed Effect Model (FEM), and Random Effect Model (REM) approaches can be seen in Table 1.3.

##### A. Estimated Model Selection Test

The Chow test and Hausman test will be used to select the best-estimated model – Pooled Least Square (PLS), Fixed Effect Model (FEM), or Random Effect Model (REM). If it turns out that in the Chow test, Pooled Least Square (PLS) is chosen and the Hausman test is Random Effect Model (REM), then an additional test must be carried out, namely the Lagrange Multiplier (LM) test, to choose the best-estimated model between Pooled Least Square (PLS) and Random Effect Model (REM).

Table 3. Panel Regression Estimation Result- *Cross section*

Variable	Coefficient		
	PLS	FEM	REM

Source: Appendix.

##### B. Uji Chow

The Chow test is used to determine the estimated PLS or FEM model. The  $H_0$  of the Chow test: the estimated model is Pooled Least Squares (PLS), and the  $H_A$ : the estimated model is the Fixed Effect Model (FEM).  $H_0$  is accepted if the p-value (p-value), probability, or empirical statistical significance  $F >$ ;  $H_0$  is rejected if the p-value (p-value), probability, or empirical statistical significance  $F <$ . The results of the Chow test can be seen in Table 3.

From Table 1.3, it can be seen that the p-value (p-value), probability, or empirical significance of the F statistic is 0.0001 (<0.01), so H0 is rejected. In conclusion, the estimated model is FEM.

C. Hausman Test

Hausman test is employed to select the FEM or REM estimated model. H0 Hausman test: the estimated model is the Random Effect Model (REM), and the HA: the estimated model is the Fixed Effect Model (FEM). H0 is accepted if the p-value (p-value), probability or empirical statistical significance  $2 >$  ; and H0 is rejected if the p-value (p-value), probability or empirical statistical significance  $2 <$  . Hausman test results can be seen in Table 1.3.

From Table 1.3, it can be seen that the p-value (p-value), probability, or empirical statistical significance of 2 is 0.0000 (<0.01), so H0 is rejected. In conclusion, the estimated model is the Fixed Effect Model (FEM).

In advance, the Fixed Effect Model (FEM) was chosen as the best-estimated model from the Chow test and Hausman test. The complete estimation results of the FEM model are presented in Table 1.4.

Table 1.4 Model Estimasi Fixed Effect Model (FEM)

$\widehat{PP}_{it} = -857078,0 - 3,710140LP_{it} + 0,836704TKP_{it} + 0,007519 UMR_{it} + 69223,53HLS_{it}$
(0,0003)* (0,4843) (0,6818) (0,1602)
R2 = 0,845823; DW = 1,778835; F. = 12,26295 ; Prob. F = 0,000000

Source: Appendix 1. Explanation: \*Significant at  $\alpha = 0,01$ ; \*\* Significant at  $\alpha = 0,05$ ; \*\*\* Significant at  $\alpha = 0,10$ ; The number in brackets is the probability of the statistical value t.

D. Fixed-Effect Estimated Model Existence Test

The model exists when at least one independent variable affects the dependent variable (not all regression coefficients are zero). The existence of the model is the F test. Because the best-estimated model FEM (Fixed Effect Model), there are five independent variables, then the formulation of the hypothesis is  $H_0: \beta_1 = \beta_2 = \beta_3 = \beta_4 = \beta_5 = 0$  (regression coefficient of the four variables is zero, or the model does not exist);  $H_A: \beta_1 \neq 0 \vee \beta_2 \neq 0 \vee \beta_3 \neq 0 \vee \beta_4 \neq 0 \vee \beta_5 \neq 0$  (at least one regression coefficient is not equal to zero or the model exists). H0 will be accepted if the p-value (p-value), probability, or empirical statistical significance  $F >$ ; H0 will be rejected if the p-value (p-value), probability, or empirical statistical significance  $F <$ .

From Table 1.4, it can be seen that the probability value of p-value (p-value) or empirical significance of the F statistic is 0.0000 (< 0.01). Thus, H0 is rejected. In conclusion, the FEM model is preferred.

E. The Interpretation of Coefficient Determination (R2)

The coefficient of determination (R2) indicates the predictability of the estimated model. From Table 1.4, it can be seen that the R2 value in the Fixed Effect Model (FEM) is 0.845823. It means that 84.6% of the variation in rice production variables can be explained by the variables of harvested area, agricultural sector labor, regional minimum wages, and education. The remaining 15.4% is affected by other variables or factors that does not included in the model.

F. Validity Test of Effect of Independent Variables Estimated Model FEM

The effect validity test examines the significance of the effect of the independent variables individually or partially. Test the validity of the effect using the t-test. H0 t-test is  $\_i=0$ , the ith independent variable in the estimated model has no significant effect; The HA is  $\_I\neq 0$ : the ith independent variable in the estimated model has a significant effect. H0 will be accepted if the probability value of p-value (p-value) or empirical statistical significance  $t >$ ; H0 will be rejected if the probability value of p(value) or statistically significant empirical  $t <$ . The results of the effect validity test can be seen in Table 1.5.

Table 5. Result of Validity Test of Effect of Independent Variable

Variable	Sig.t	Criteria	Conclusion
LP	0,0003	< 0,01	Significant at $\alpha = 0,01$
TKP	0,4843	> 0,10	Not Significant
UMR	0,6818	> 0,10	Not Significant
HLS	0,1602	> 0,10	Significant

#### G. *The Effect of Harvest Area on Rice Production*

The results showed that the harvested area affect rice production negatively with a regression coefficient of -3.710140 and a practical significance ( $\rho$ ) t of 0.0003 ( $< 0.01$ ). It means that increasing the harvested area by 1 ha will reduce rice production by 3.710140 tons. The study results differ from the hypothesis, which states that the harvested area will increase rice production. The negative effect of harvested area on rice production is because the conversion of productive land functions to non-agricultural uses is increasing and threatening food security in Central Kalimantan Province. Land conversion is often felt with the dynamics of development characterized by the transformation of economic and demographic structures. Thus, the availability of productive land used for growing rice is decreasing daily. On the other hand, the land cultivated per farmer is getting smaller, and the land quality is also getting lower. Excessive land exploitation has an impact on the decline in rice production in Central Kalimantan. This study is in line with research conducted by Nizar & Ariyanto (2016), who found that harvested area had a negative effect on rice production in Riau Province from the period 2005- to 2013. A different study found by Fitri et al. (2021) found that harvested area increases rice production in Aceh Province from 2021- to 2025.

#### H. *The Effect of Agricultural Labour on Rice Production*

The results showed that farmer labor did not affect rice production with an empirical significance ( $\rho$ ) t of 0.4843 ( $> 0.10$ ). It means that the increase or the decrease of the workforce will not affect rice production. This is not in line with the hypothesis that labor is one of the main inputs in increasing production output in farming. The insignificant effect of agricultural labor on rice production is related to the decreasing area of rice field. Thus, when the workforce increases, this still does not affect rice production. The results are in line with research conducted by Heriyana et al. (2021). The study found that labor did not affect sticky rice production in Panyiaran Village, Cikong District, Tasikmalaya Regency in 2021. Onibala et al. (2017) found different things, the result explained that labor affected rice production in Koya Village, South Tondano District in 2017.

#### I. *The Effect of Regional Minimum Wage on Rice Production*

The results showed that the Regency Minimum Wage did not affect rice production with an empirical significance ( $\rho$ ) t of 0.6818 ( $> 0.10$ ). If the UMR goes up or down, it will not affect rice production. This is not in line with the initial hypothesis that when a worker is satisfied with the wages received, the production at work will increase. Wages do not affect rice production because wages only reach the minimum wage. Thus, they cannot meet other daily needs. Low wages cause workers to shift from the agricultural sector to the industrial sector, although this does not affect rice production because most workers come from farming families.

The results of this study in line with Ningsih & Indrajaya (2015) that wages did not affect the production of the silver handicraft industry in Sukawati District, Gianyar Regency in 2015.

#### J. *The Effect of Education on Rice Production*

The results showed that education did not affect rice production with an empirical significance ( $\rho$ ) t of 0.1602 ( $> 0.10$ ). This means that education will not affect rice production. A person's education, in general, will affect their thinking. With education, a person will have broader knowledge, quickly develop ideas and adopt technology and have a more dynamic attitude towards new things, especially in the face of more effective changes. However, the study results show that education does not affect rice production. This is because, in formal education, one only learns about general knowledge, not about agricultural information. Thus, the high level of formal education does not determine the level of rice production.

These results in line with research by Neonbota & Kune (2016), which found that education, did not affect rice production in Haekto Village, East Noemuti District in 2016. While Suharyanto (2015) found different results that education affected rice production in Bali Province during 2015.

## V. CONCLUSION

The estimation result from the Chow and Hausman test in this study revealed that the Fixed Effect Model is preferred. The F test shows that the model exists with an empirical statistical significance of F of 0.0000 ( $< 0.01$ ). The coefficient of determination ( $R^2$ ) is 0.845823. It means that 84.6% of the variation in rice production variables can be explained by harvested area, agricultural sector labor, regional minimum wages, and education.

The 15.4% is affected by other variables or factors that not included in the model. Based on the results of the effect validity test, only harvested area affects rice production. The rest variables such as agricultural labor, regional minimum wages, and education have no effect on district/city rice production in Central Kalimantan Province from 2018 to 2021. Nizar & Ariyanto (2016) suggest using agricultural production inputs in a balanced way to make the results be proportional to the level of production. For future research, it is hoped that other more complex and measurable variables can be used in explaining the factors of income inequality, considering that the independent variables used in this study are still not fully able to explain the factors of income inequality in a more wide area. In addition, further researchers are expected to be able to use complex and systematic analytical tools in explaining the factors of income in an area in the short and long term.

## **E-Wallet Adoption of Indonesians Millennial Generation: The Roles of Perceived Benefits as Mediating Variable**

Abi Yusuf Nur Asida<sup>1</sup> and Rini Kuswati<sup>2</sup>

<sup>1,2</sup>Management Department, Faculty Economy and Business, Universitas Muhammadiyah Surakarta, Surakarta, Indonesia.

### **Abstract**

*Technological progress is very fast and turbulent, especially for the millennial generation in Indonesia. This study generally aims to examine the behavioral model of e-wallet adoption. Specifically, this study aims to analyze the effect of ease of use and comfort of use on e-wallet adoption in the millennial generation in Indonesia. In addition, it aims to analyze the role of perceived benefits as a mediator of the effect of ease of use and convenience of use on e-wallet adoption. Respondents in this study were 215 students, through an online survey. The sampling technique used non-probability sampling with purposive sampling method. Test the validity and reliability using smart PLS analysis on the outer model. Hypothesis testing using the smartPLS inner model output. The results of data analysis indicate that this research instrument has good validity and reliability. Ease of use and convenience of use have a direct effect on the behavior of Indonesian millennial generation e-wallet adoption. The perception of benefits has been proven to be a partial mediator in the Indonesian millennial generation e-wallet adoption behavior model. This novelty study shows that the adoption behavior of Indonesian millennial youth in adopting e-wallet is not only paying attention to the benefits of e-wallet services, but e-wallet adoption behavior is seen as a necessity in this era of digital technology.*

*Keywords— Comfort of use; E-wallet Adoption; Ease of use; Indonesian Millennial Generation; Perceived Benefits*

---

### **I. INTRODUCTION**

In the era of the pandemic COVID-19, there have been many changes in the lifestyle of the Indonesian people. Among them are shopping habits that carry out transactions with the system directly to the source of the seller and usually payment is made in cash. However, with the COVID-19 pandemic, many companies are offering ways of paying for their products through electronic money applications (Boggie et al., 2021). In addition, the policies carried out by the Indonesian government during this pandemic include the existence of large-scale social restrictions (PSBB), this is an indicator that causes limited social movement from one area to another. So that sellers and buyers try as much as possible to make transactions, but do not meet face-to-face closely to reduce confirmation of the corona virus (Kuswati & Saleha, 2018). That way, there are several companies that have implemented health protocols. One of them is by implementing payments using electronic money applications (Tangke et al., 2016).

The Bank considers that the use of e-wallet is more efficient and practical so that the current type of e-wallet payment can encourage Bank Indonesia to cooperate between banks and institutions related to non-cash payments with the aim of reducing non-cash payment transactions to the public to reduce cash circulation in Indonesia. and create a less cash society (Kussudyarsana, 2016). The use of E-Wallet is in great demand among young people or millennials. According to research from Ipsos Indonesia's Director of Customer Experience, 68% of E-Wallet users are young people because their productivity level is much more active than other groups. This makes students begin to take advantage of technological developments, especially in Fintech (financial technology) in conducting shopping transactions. The promos offered are the main motivation for students to use e-wallet. The more they use the e-wallet application, the more ease of use and comfort of use they feel, so the decision to adoption e-wallet and loyalty to use it is not only because of attractive promo offers. (Nadhilah et al., 2021).

Research on e-wallet by Olivia & Marchyta, (2022), The study shows that perceived ease of use has a positive effect on continuance intentions, meaning that if perceived ease of use increases, it will lead to higher continuance intentions. E-wallet customers will be more interested in continuing to use e-wallet if they feel that e-wallet is easy to learn, easy to use to fulfill their desires, and easy to be proficient in using easy to use for

transaction purposes. But the perceived of benefits not have a significant effect on the intention to continue using e-wallet. While the second research on e-wallet by Afolo & Dewi, (2022) with the results of the study showing that the perceived benefits, the perception ease of use, and the perception of trust partially have a positive and significant effect on the interest of e-wallet users. From some of these descriptions, it is necessary to conduct research related to ease of use and comfort of use by adding a mediating variable of perceived benefits to the adoption of the use of e-wallet (Kuswati & Irmawati, 2018).

The purpose of this study is to analyze the effect of ease of use and comfort of use on the adoption of e-wallet usage in the millennial generation, to analyze the effect of ease of use and comfort of use on perceived benefits, to analyze and discuss the effect of perceived benefits on e-wallet adoption in the millennial generation, to analyze and discusses whether perceived benefits mediate ease of use towards e-wallet adoption decisions in the millennial generation, and whether to analyze and discuss perceived benefits mediating comfort of use towards e-wallet adoption in millennials.

## II. LITERATURE REVIEW

### A. TAM

In recent years, there have been extensive research studies on the factors influencing mobile payments or E-wallet usage in various countries including China, India, Japan, and Korea. Among them, the two most popularly used models are: (i) Technology Acceptance Model (TAM) and (ii) Unified Theory of Acceptance and Use of Technology (UTAUT). TAM is a concept to help researchers to better understand users' intentions in adopting new information systems in their daily lives. It is also a theoretical framework specifically designed to help analyze and predict the propensity of users to accept new information technologies. User perceived usefulness and perceived ease of use are two core constructs in TAM (Daştan & Gürler, 2016). However, it also suffers from limitations as it often neglects the social aspects involved in the adoption of new technologies such as social influence (Isrososiawan et al., 2019).

### B. UTAUT

Venkatesh dkk. (2003) fixed the TAM model and named the new model as UTAUT. UTAUT is a technology acceptance model developed by performing various stages to track individual experiences with new technologies. This enhanced model integrates important elements with respect to the acceptance of new information technologies. A total of Eight theories of technology adoption, reviewed and compared in detail. This new model acts as an important managerial tool for discovering and formulating plans for the introduction of new technologies. It has 70% accuracy in estimating the adoption of new information technology. Under UTAUT, generally use three dots and use the situation to determine and determine intentions for new information technologies. The three key constructs are: (i) expected performance, (ii) expected effort and (iii) social influence. Previous studies hypothesized that these three factors have a motivational effect on intention and use behavior in adopting technology. In addition, behavioral intention and usage behavior are moderated by various combinations of gender, age, and experience (Teng Tenk et al., 2020) .

### C. Adoption E-Wallet

The development of an increasingly sophisticated era makes people prefer to use e-wallet to make transactions rather than direct payments because e-wallet is more practical. The use decision based on the statement by Fandy Tjiptono (2014: 21) is a stage where the customer knows the problem, searches for information about certain goods or brands and evaluates how good there are several alternatives themselves to be able to provide solutions to the problem. , which is then focused on the purchase decision. Based on the theory by Kotler & Keller (2016: 235) "Usage decision making carried out by customers also has differences that are adjusted to the behavior of usage decisions on consumers" (Wiradimaja & Rikumahu, 2019).

Based on the explanation above, the researcher formulates a hypothesis:

H1 : Ease of use has a positive and significant impact on e-wallet adoption

H2 : Comfort of use has a positive and significant effect on e-wallet adoption

#### D. Ease Of Use

Perception ease of use is a level where the use of technology can be accepted by someone (Purba et al., 2020)). In using an e-wallet, the ease of use showing things that must be considered in a company, because it gives users interest in meeting their needs. Perceived of benefits is also important in consumers using e-wallet, because consumers feel the benefits of e-wallet applications so they will use them more often in transactions (Isa & Istikomah, 2020). Sun and Zhang (2015) in Abrilia & Sudarwanto, (2020) explained that from the dimensions of perception of ease, namely ease to learn (easy to learn), ease to use (easy to use), clear and understandable (clear and easy to understand), and become skillful (becoming skilled). Davis & Wang in Afolo & Dewi, (2022) defines perceived convenience as a measure of the extent to which future users perceive a system as barrier-free. Dirnaeni et al., (2021) Perception ease of use is a person's belief that using technology can be done easily without requiring excessive effort.

Based on the explanation above, the researcher formulates a hypothesis

H3 : Ease of use has a positive and significant effect on perceived benefits

#### E. Comfort Of Use

Comfort of use has been identified as an important determinant of why consumers decide to buy or use. RodriguezTorrico, San-Martin, & Jose-Cabezudo, (2019) defines comfort of use as a consumer's perception of the time and effort saved by using a service. Users can get unprecedented comfort and efficiency through mobile devices without traveling to financial institutions. The concept of convenience was first used by Copeland (1923) to show a measure of the time and effort that consumers spend in buying products (Kazemi et al., 2015). The concept of comfort of use is an important element in the field of marketing. Realizing the importance of service comfort of use, business people, in this case sellers/service providers, have begun to focus on providing services that can maximize the speed and ease of the consumer buying process. (Agnesya Aridinta & Widijoko, n.d.).

Based on the explanation above, the researcher formulates a hypothesis

H4 : Comfort of use has a positive and significant effect on perceived benefits

#### F. Perceived Benefits

According to Faradila & Soesanto, (2016) explained that perceived benefits is defined as how a new system can provide usefulness to its users. Perceived benefit is a measure of the extent to which the use of technology is believed to bring benefits to its users. The existence of a perception of benefits can affect someone's purchase or use interest. For example, when a consumer has tried to make a transaction via DANA, they will be able to feel the benefits of the DANA, and eventually consumers will tend to be interested in using it again.

Based on the explanation above, the researcher formulates a hypothesis

H5 : Perceived benefits partially has a positive effect on the effect ease of use and comfort on e-wallet adoption

Fig 1. Framework (Source: Modification of Olivia & Marchyta, (2022), Afolo & Dewi, (2022)

### III. RESEARCH METHODOLOGY

The type of research used in the study using quantitative methods. The population in this study were private and public students in Central Java. The sampling technique, non probability sampling and used purposive sampling. This research uses primary data using a closed questionnaire. The questionnaire was created using google form with a likert scale format. The data analysis technique in this study used partial least squares (PLS) with the SMARTPLS software. All variables have a positive and significant effect on e-wallet adoption and perceived benefits partially mediate the relationship between ease and convenience on e-wallet adoption.

The sampling technique used is purposive sampling where this technique is used to determine the research sample with certain considerations or criteria with the aim that the data obtained is representative data (Sugiyono, 2010). Not all samples have criteria that are in accordance with the authors specified, so the sample that is able to become respondents are private and public students in Central Java, aged 17-25 years, using e-wallet (OVO, Dana, Gopay and Shopeepay).

The samples size in this study were 215 respondents. This study uses primary data in its preparation. Data obtained through respondents' answers using a closed questionnaire. The data collection method used in this research is the distribution of questionnaires via google form. The questionnaire was made using a Likert scale format with a scale that is often used in the preparation of the questionnaire is the interval scale.

The PLS-SEM analysis is used as a tool to predict and explore complex models with less stringent data requirements (Sekaran & Bougie, 2017). The data analysis technique in this study uses Partial Least Square (PLS) with the help of SMARTPLS Software. The advantages of using partial least squares are that the number of samples required in the analysis is relatively small, the SMARTPLS approach is considered more powerful because it is not based on assumptions, SMARTPLS is able to test SEM models with various forms of scale such as ratios, Likert and others (Approach, 2016). PLS-SEM analysis consists of two, namely the Outer model and the Inner model (Ghozali dan Latan, 2014).

### IV. RESULT / FINDING

#### A. Description

This study aims to explain the effect of ease of use and comfort of use on the decision to use E-wallet with perceived benefits as a mediating variable for students in Central Java. To conduct this research, researchers took as many as 215 respondents. The analysis process is carried out using the Smart PLS 3.0 application. Based on the data obtained from the characteristics of respondents by age, it shows that the majority of respondents are aged 21-23 years with a percentage of 59.3%. Then the gender who filled out the most respondents was male as much as 55.1%, the type of e-wallet that was widely used was Shopeepay as much as 51.4%, and for filling out the most questionnaires, namely from the University of Muhammadiyah Surakarta as much as 51.1% with a total respondent 110.

Table 1 Description of Respondens

<b>AGE</b>		
Age	Frequency	Persentase
17-20	60	28,2 %
21-23	128	59,3 %
24-25	27	12,5 %
Total	215	100 %
<b>Gender</b>		
Male	118	55,1 %
Famele	97	44,9 %
Total	215	100 %
<b>The type of e-wallet used</b>		
Dana	54	25 %
Gopay	20	9,3 %
Shopeepay	111	51,4 %
Linkaja	7	3,2 %
OVO	15	7,4 %
Etc.	8	3,7 %
Total	215	100 %
<b>Origin of Institution/University</b>		
UMS	110	51,1%
UKSW	16	7,4%
IAIN Salatiga	14	6,5%

UNS	8	3,8%
STIE	8	3,8%
Etc.	59	27,4%
<b>Total</b>	<b>215</b>	<b>100 %</b>

## B. Data analyst

### Outer Model Analysis (Measurement Model Evaluation)

#### 1. Convergen Validity

Based on the results of data processing using Smart PLS, it is known that each indicator of the research variables has a value of outer loading  $> 0.7$ . However, according to (Chin, (1998), Kussudyarsana, Setyawan, Kuswati, (2019)) the measurement scale for the loading value of 0.5 to 0.6 is considered sufficient to meet the requirements of convergent validity. The data above shows that there is no indicator variable whose outer loading value is below 0.5, so all indicators are declared feasible or valid for research use and can be used for further analysis.

In addition to looking at the outer loading value, convergent validity can also be assessed by looking at the AVE (Average Variance Extracted) value  $> 0.5$  so that it can be said to be valid with convergent validity (Fornell and Larcker, 1981). The following is the AVE value of each of these research variables:

Table 2 Score Average Variance Extracted

Variable	AVE (Average Variance Extracted)	Description
Ease os use (X1)	0.571	Valid
Comfort of use (X2)	0.658	Valid
Perceived Benefits (Z)	0.700	Valid
E-wallet adoption (Y)	0.595	Valid

Source : Processed primary data, 2022

Based on the table above, each variable in this study shows an AVE (Average Variance Extrancted) value, which is  $> 0.5$ . Each variable in this study has a main value for ease of use of 0.571, comfort of use 0.658, perceived benefits of 0.700, and the decision to use E-wallet of 0.595. This shows that each variable in this study can be said to be valid with discriminant validity.

Table 3 Crossloading in Discriminant Validity

Indicator	Ease of use (X1)	Comfort of use (X2)	Perceived benefits (Z)	E-wallet adoption (Y)
X1.1	<b>0,775</b>	0,548	0,465	0,589
X1.2	<b>0,766</b>	0,563	0,438	0,495
X1.3	<b>0,773</b>	0,560	0,517	0,492
X1.4	<b>0,659</b>	0,437	0,427	0,479
X1.5	<b>0,796</b>	0,561	0,640	0,489
X2.1	0,562	<b>0,792</b>	0,524	0,544
X2.2	0,542	<b>0,795</b>	0,471	0,576
X2.3	0,526	<b>0,808</b>	0,543	0,570
X2.4	0,607	<b>0,828</b>	0,616	0,572
X2.5	0,627	<b>0,831</b>	0,662	0,604
Y1	0,488	0,529	<b>0,825</b>	0,500
Y2	0,556	0,580	<b>0,839</b>	0,521
Y3	0,542	0,609	<b>0,810</b>	0,590
Y4	0,626	0,615	<b>0,871</b>	0,574
Z1	0,560	0,545	0,488	<b>0,766</b>
Z2	0,541	0,584	0,509	<b>0,802</b>
Z3	0,509	0,476	0,451	<b>0,717</b>
Z4	0,530	0,605	0,602	<b>0,778</b>
Z5	0,449	0,499	0,455	<b>0,790</b>

Source :  
:

Processed primary data, 2022

Based on the data presented in the table above, it can be seen that each indicator in the research variables has the largest cross loading value on the variables it forms compared to the cross loading values on other

variables. Based on the results obtained, it can be stated that the indicators used in this study have good discriminant validity in compiling their respective variables.

## 2. Reliability Testing And Cronbach Alpha

Table 4. Composite Reliability and Cronbachs Alpha

Variabel	Composite Reliability	Cronbachs Alpha
Ease of use (X1)	0.869	0.811
Comfort of use (X2)	0.906	0.870
Perceived benefits (Z)	0.880	0.857
E-Wallet adoption (Y)	0.903	0.830

Source : Processed primary data, 2022

From the Table 4, it can be shown that the composite reliability value of all research variables is  $> 0.7$ . The ease of use value is 0.869, comfort of use is 0.906, perceived benefits is 0.880, and E-wallet adoption is 0.903. This shows that each variable has met composite reliability so it can be concluded that all variables have a high level of reliability.

Based on the table above, it shows that the cronbach alpha value of all variables in this study is above  $> 0.6$ , which means that the cronbach alpha value has met the requirements so that all constructs can be said to be reliable.

From the table above, the results of the Collinearity Statistics (VIF) to see the multicollinearity test with the results of the ease of use variable on perceived benefits are 2,279. Then the value of the comfort of use variable on perceived benefits is 2,492. And for the value of the perceived benefit variable on the E-wallet adoption is 2,007. Each variable has a cut off value  $> 0.1$  or equal to the VIF value  $< 5$  then it does not violate the multicollinearity test.

## B. Inner Model Analysis

### 1. Goodness of fit

Based on the table above, the R-Square is used to see the magnitude of the influence of the ease of use and comfort of use variables on the E-wallet adoption, with a value of 0.570 or 57%, it can be said that this relationship is a moderate or moderate relationship. Then the R-Square is also used to see the magnitude of the influence of the ease of use and comfort of use variables on the perception of benefits, namely with a value of 0.560 or 56%, it can be said that this relationship is a moderate or moderate relationship. The following is the result of calculating the Q-Square value:

$$\begin{aligned}
 Q\text{-Square} &= 1 - [(1 - R^2_1) \times (1 - R^2_2)] \\
 &= 1 - [(1 - 0,570) \times (1 - 0,560)] \\
 &= 1 - (0,43 \times 0,44) \\
 &= 1 - 0,1892 \\
 &= 0,8108
 \end{aligned}$$

Based on the results of the research above, the Q-Square value is 0.8108. This value explains the diversity of the research data can be explained by the research model of 81.08%, while the remaining 18.92% is explained by other factors that are outside the research model. have a good goodness of fit.

### 2. Hypothesis Testimg

Table 5. Path Coefisien (Direct and Indirect Effect)

	Hypothesis	Original Sample	t-Statistics	P Values	Description
<b>Direct Effect</b>					

Ease of use (X1) -> E-Wallet Adoption(Y)	H1	0,259	3,194	0,001	Positive Significant
Comfort of use (X2) -> E-wallet Adoption (Y)	H2	0,346	4,306	0,000	Positive Significant
Ease of use (X1) -> Perceived Benefits (Z)	H3	0,352	4,447	0,000	Positive Significant
Comfort of use (X2) -> Perceived Benefits (Z)	H4	0,462	5,627	0,000	Positive Significant
Perceived Benefits (Z) -> E-Wallet Adoption Y)	H5	0,232	2,487	0,013	Positive Significant
<b>Indirect Effect</b>					
Ease of use (X1) -> Perceived Benefits (Z) -> E-wallet Adoption (Y)		0,080	2,162	0,031	Positive Significant
Comfort of use (X2) -> Perceived Benefits (Z) -> E-Wallet Adoption (Y)		0,107	2,204	0,028	Positive Significant

Source : Processed primary data, 2022

The fifth hypothesis examines whether perceived benefits mediate partial the relationship between ease of use and comfort of use to the E-wallet adoption, the results of testing the hypothesis above use 2 tails. Based on the table above, it shows that the t-statistic value for ease of use is 2.162, which means  $> 1.96$  with a p value of 0.031, which means  $< 0.05$ . And the comfort of use variable has a t-statistic value of 2.204 which means  $> 1.96$  with a p value of 0.028 which means  $< 0.05$ . So it can be concluded that all relationships between ease of use and comfort of use variables on the E-wallet adoption can be mediated by perceived benefits.

## V. DISCUSSION

This study discusses the results of the analysis of the effect of ease of use and comfort of use on decisions to use E-wallet which is partial mediated by perceived benefits for millennial youth of Indonesian. The sample in this study amounted to 215 respondents who were students in Central Java, Indonesia. In this study, we tested the data with smartPLS 3.0 software. The results of the hypothesis test are as follows, Based on the above results, ease of use and comfort of use have a positive and significant effect on decisions to use E-wallet, so that the first hypothesis is supported. above, comfort of use has a positive and significant effect on perceived benefits, so the fourth hypothesis is supported. Perceptions of benefits partial mediate the relationship between ease of use and comfort of use on the decision to use E-wallet, all relationships between the variables of ease of use and comfort of use on the decision to use E-wallet can be partial mediated by perceived benefits.

## VI. CONCLUSION AND RECOMMENDATION

### A. Conclusion

This study aims to analyze the effect of ease of use, comfort of use on e-wallet adoption with perceived benefits as a mediating variable. This research uses TAM and UTAUT models. TAM is a concept to help researchers to better understand users' intentions in adopting new information systems in their daily lives. It is also a theoretical framework specifically designed to help analyze and predict the propensity of users to accept new information technologies. UTAUT is a technology acceptance model developed by performing various stages to track individual experiences with new technologies. This enhanced model integrates important elements with respect to the acceptance of new information technologies. A total of eight theories of technology adoption were evaluated, reviewed and compared in detail. This new model acts as an important managerial tool for evaluating and formulating plans for the introduction of new technologies. All variables have a positive and

significant effect on e-wallet adoption and perceived benefits partially mediate the relationship between ease of use and comfort of use on e-wallet adoption.

#### ACKNOWLEDGEMENT

I would like to thank the innovation research institute of the University of Muhammadiyah Surakarta and the management Department of the Faculty Economics and Business Universitas Muhammadiyah Surakarta for facilitating and providing support so that this research can be completed on time and hopefully this research can be useful for all of us.

## Analysis of the Effect of Infrastructure Development on Economic Growth in East Nusa Tenggara

Rini Yustika Sari<sup>1</sup> and Siti Aisyah<sup>2</sup>

<sup>1,2</sup>Faculty of Economics and Business, Universitas Muhammadiyah Surakarta, Surakarta, Indonesia

### Abstract

*Economic growth is one of the success factors of economic development, defined as an activity in the economy that makes the production of goods and services in society increase and will increase the prosperity of the community. The availability of infrastructure is one of the important supporting factors as the driving force behind economic growth. Investment in economic and social infrastructure is absolutely necessary in order to assist and integrate all economic activities to run smoothly and productively. The purpose of this study is to analyze the influence of infrastructure such as roads, transportation, electricity, education, health and communication on economic growth in East Nusa Tenggara. The research was conducted using secondary data from 2016 to 2020. The Model used was multiple linear regression using panel data with Fixed Effect Analysis. The results of this study indicate that the education and communication infrastructure has a positive and significant effect on economic growth. The implication is that in an effort to increase economic growth, the government must prioritize development of economic and social infrastructure that has a major contribution to growth of the economy.*

*Keywords— Infrastructure; Economic Growth; Panel Data; East Nusa Tenggara; Development*

### I. INTRODUCTION

Economic growth is one of the success factors of economic development. Economic growth is usually measured by the development and growth of the economy in a country from each period to the next. The higher the value of economic development the better the economic growth in the country. Economic notations that is used as an indicator to see its growth is Gross Regional Domestic Product (GRDP). Development is needed to increase economic growth and the realization of the welfare of a region. Welfare can be realized, one of which is by equitable distribution of infrastructure development. Adequate and equitable infrastructure in all regions of a country will make it easier for economic actors to access and carry out economic activities. The running of economic activities properly will create economic growth. Economic growth is one of the success factors of economic development. Economic growth is usually measured by the development and growth of the economy in a country from each period to the next. The higher the value of economic development, it can be seen that the better the economic growth in the country. Economic growth that is used as an indicator to see its growth is Gross Regional Domestic Product (GRDP) (Fang, 2013). Development is needed to increase economic growth and the realization of the welfare of a region. Welfare can be realized, one of which is by equitable distribution of infrastructure development. Adequate and equitable infrastructure in all regions of a country will make it easier for economic actors to access and carry out economic activities. The running of economic activities properly will create economic growth (Maqin, 2011).

Infrastructure is usually carried out by the government, which can cooperate with a business entity by the Presidential Regulation of the Republic of Indonesia Number 67 of 2005 concerning Government Cooperation with Business Entities in Infrastructure Provision. Infrastructure improvements are expected to bring prosperity and independence, and accelerate economic development to make economic activity more efficient. So, the government is obliged to complete economic support facilities and infrastructure. With more complete public facilities, the private sector will be more enthusiastic to invest in the area. Infrastructure development is a government asset to provide service to the public. The infrastructure includes roads, bridges, landscaping, offices buildings, hospitals, and so on (Weya et al., 2021).

Economic growth is a long-term problem, and economic growth is an important phenomenon experienced by the world in recent times. The process of economic growth is known as Modern Economic Growth. Basically, economic growth is defined as a process of long-term per capita output growth (Nazneen et al, 2021). This means that in the long term, an increase in welfare will result in an increase in per capita output, which also includes many alternatives in consuming goods and services, and is followed by an increase in people's purchasing power. The context of economic development, regional expansion is expected to encourage new development and

creativity in managing regional potential. This encouragement will increase opportunities to explore various new regional economic potentials that have not been paid attention to. In addition, the existence of new regions resulting from the expansion is expected to trigger the formation of new economic growth centers that will encourage the acceleration of regional economic development (Iskandar, 2011).

The economic progress of a region shows the success of a development although it is not the only indicator of the success of development. There are three kinds of measures to assess economic growth, namely output growth, output growth per worker, and output growth per capita. Output growth is used to assess the growth of production capacity which is influenced by the increase in labor and capital in the region (Yuniarti, 2020). Output growth per worker is often used as an indicator of changes in regional competitiveness (through productivity growth). Meanwhile, per capita output growth is used as an indicator of changes in economic welfare (Yuniarti, 2020). High economic growth does not guarantee the realization of community welfare. As various experts have pointed out, even though economic policies are designed to promote growth and proper modernization of the economy, it turns out that the big problems of poverty and underdevelopment cannot be solved by economic growth (Widada, 2019).

The development of an area aims to improve welfare and realize social justice for all levels of society. For this reason, development requires the right approach, so that it can produce growth accompanied by equity. Infrastructure plays an important role in increasing investment and expanding the reach of community participation, as well as equitable distribution of development outcomes (Bertoletti et Al, 2022). Infrastructure is a driving force for economic growth. From the allocation of public and private financing, infrastructure is seen as the locomotive of national and regional development. Infrastructure also plays an important role in improving the quality of life and human welfare, among others, in increasing the value of consumption, increasing labor productivity and access to job opportunities, as well as increasing real welfare. Infrastructure also has an important influence in increasing the value of consumption, increasing labor productivity and access to employment (Gouvea, 2022).

The role of infrastructure as a driver in the economic sector will be able to encourage the development of related sectors as a multiplier effect and in the end will create new business fields and provide production output as input for consumption. Therefore, the government needs to accelerate the program for equitable development in all regions. Thus, the development process that occurs is not only biased in areas that are already developed, but also in other areas that are considered to be lagging behind. Infrastructure is believed to be able to accelerate national economic development and increase the level of economic disparity between regions. In this context, infrastructure development can be a driver of economic growth (Khaled et al, 2022). However, there are many challenges in managing and developing infrastructure, such as the existing infrastructure gap between regions and a less than optimal infrastructure network to support sustainable economic development in the future.

The role of infrastructure is important to connect various centers of economic activity with their buffer areas. In remote areas that are difficult to reach, such as on the slopes of mountains or valleys, people usually live in poverty and are isolated from development progress even in the nearest growth centers. These obstacles prevent the poor from participating in the development process, both to get better jobs and to increase work productivity (Kirschner and Finaret, 2021).. Currently, infrastructure development can play a role in poverty alleviation, namely by increasing access for the poor and access to government intervention to be more effective in reducing poverty. Better access will reduce the cost of living, increase income, and open up opportunities for the poor to benefit from economic growth.

The poverty rate in NTT in 2005 tends to decrease but is above the national average. During the period 2010-2014 poverty in NTT decreased by 3.03 percent. The percentage of poor people in NTT is high, in 2014 the percentage of poor people nationally reached 10.96 percent, while in NTT it was 19.8 percent. Poverty is determined by productive attitudes and living habits, education level and health status, in addition to limited employment opportunities and limited institutional and economic system support (Bappenas, 2015). Distribution of districts and cities in NTT Province according to average economic growth and poverty reduction from 2008 to 2013, with the following explanation. The districts of Flores, Kupang, and Maumere are districts with average economic growth and poverty reduction above the provincial average. Economic growth that occurs in this quadrant can encourage faster poverty alleviation (pro-growth, pro-poor) (Yuniarti, 2020).

In a previous study conducted by Suswita (2020), on "The Effect of Infrastructure on Economic Growth in Simalungun Regency" discussed the importance of infrastructure development on economic growth. The absence of infrastructure in an area will cause obstacles to faster economic growth in a country. The variables

used in the study (Suswita, 2020), namely the length of the road, the amount of clean water, and the number of electricity customers, it is suspected that the relationship between all independent variables can affect economic growth. The results of the research process, namely economic growth can be explained by the variables of Road Length, Total Volume of Clean Water, and Number of Electric Customers, while the remaining 41.80% is influenced by other variables outside this regression equation or variables not examined. The results of the study have not described how to formulate an economic growth with the influence of road infrastructure development, transportation, electricity, health, and education. This research will provide a more detailed novelty aspect related to the variables of roads, transportation, electricity, health, and education which are thought to have significant and valid relationships in the process of economic growth in the province of East Nusa Tenggara.

## II. LITERATURE REVIEW

Economic growth is one indicator of measuring the success of economic development in a country. Economic development is a series of activity processes carried out by a country to develop economic activities or activities in order to increase the standard of living/prosperity (Income per capita) of the community by reducing income inequality, providing employment opportunities, better education, improving health and nutrition standards, improvement of environmental conditions, and equal opportunity, as well as refreshment of cultural life (Sukwika, 2018). Factors suspected as the most important economic growth is the availability of capital and labor factors. An increase in capital and labor will increase aggregate output in the economy. Capital includes public and private sector investments in the economy, for example, the private sector builds factories, purchases production machinery, etc. (N. Iskandar, 2019).

The characteristics of infrastructure are externalities, both positive and negative and the existence of a natural monopoly caused by high fixed costs and their level of importance in the economy. In addition, infrastructure is also non-exclusive (no one can be excluded), non-rivalry (consumption of one individual does not reduce the consumption of other individuals) and generally the marginal cost is zero. Infrastructure is also generally not traded (non-tradable) (Jiang, 2020). Infrastructure also plays an important role as one of the driving wheels of economic growth. The rate of economic growth and investment of a country or region cannot be separated from the availability of infrastructure such as transportation, telecommunications, sanitation, and energy (Atmaja, 2015). The increase in infrastructure and its improvement by the government is expected to spur economic growth

Highway infrastructure is a facility designed to facilitate transportation by land. Road infrastructure is a link between regional functions using various modes of transportation. Road infrastructure investment will affect the economic sector with the assumption that this increase will act as a stimulus for regional economic development or as a fulfillment of the level of demand (demand) of a region's economic growth (Haicheng, 2021). Transportation infrastructure is the main thing in supporting access to community mobility in carrying out daily activities and the process of delivering goods or services. The provision of transportation infrastructure has a reciprocal relationship with the economy of a region to support the development of urban and rural areas (Khan, 2018). The effect of the provision of transportation modes will have a positive impact on an area because transportation is closely related to accessibility, where accessibility is a factor that greatly determines the organization of space in urban areas (Marsu, 2018).

The influence of electricity and industrialization on economic growth in Indonesia is quite important because the aspect of the relationship between the use of electricity is getting higher and consequently will have an impact on the economic development of a country. The relationship between electricity consumption and economic growth is statistically significant and is shaped like an inverted U-curve. This means that the higher the economy of scale, the higher the electricity consumption (Buhaerah, 2016). However, the more advanced a country's economy is, the dominant industrial sector will shift from heavy industry to light manufacturing and service industries, which will result in a decrease in electricity consumption.

Health development is one of the national development efforts carried out in all areas of life. Health development aims to increase awareness, willingness and ability to live a healthy life for everyone in order to realize an optimal level of public health. Health is the main and absolute capital that must be owned. With good health will have a good influence on the environment, able to meet their needs, with health a child can attend school in the process study, and more importantly, with good health it is hoped that people will long-lived (Nurhayati and Suparman, 2014). Health infrastructure is one of the key factors in achieving health development in Indonesia. The World Health Organization (WHO) defines health as a state of complete physical, mental and social well-being and not merely the absence of disease and infirmity (Beach, 2021). In practice, the

measurement of the level of health used is life expectancy. This measure is one of three components in calculating the Human Development Index (HDI) (Mukmin P, 2015).

East Nusa Tenggara Province is one of the provinces in eastern Indonesia with a total of 22 regencies/cities consisting of 21 regencies and 1 city. Automatically there must be a number of private and public schools ranging from elementary schools, middle schools to universities. In this material, the author wants to discuss the development of the 21st century Modern Era which is often known as the Industrial Revolution Era 4.0 (four point zero) for all schools in NTT in preparing all the attributes and tools to live in the 21st century or the era of the Industrial Revolution 4.0 (Machida, 2014).

Telecommunications today is something that cannot be separated from everyday life, it has even become a necessity. The benefits of telecommunications services (Telecommunication Services) have been felt by many parties, starting from business people, housewives, and even children. Telecommunications has become an inseparable need for the activities of every individual's life, especially in the era of information and technology which is growing rapidly at this time (Paravee, 2020). This. The importance of telecommunications for a country, especially in the economy, has been conveyed by the ITU that every 1% growth in teledensity will increase 3% of a country's economic growth. The need for information is absolutely owned by a nation because it can increase economic growth, standard of living and quality of society, for that it is necessary to provide adequate information infrastructure such as access, capacity, quality and reach (Ngatono, 2016).

Table 1. GRDP Growth of East Nusa Tenggara

Years	GRDP Current Prices	Growth Rate
2016	83742,79	5,12
2017	90758,93	5,11
2018	98930,19	5,11
2019	106731,76	5,25
2020	106480,97	-0,84

Source: Central Statistics Agency, processed.

Economic growth is formed from the performance of regional/island economic growth where the contribution of each region is very diverse. One of the reasons for this diversity is the differences in the state of infrastructure between one region and another. Based on table 1 above, it can be seen that the highest economic growth rate of East Nusa Tenggara Province was in 2019 at 5.25%. Meanwhile, in 2020 the rate of economic growth in East Nusa Tenggara decreased by -0.84%. Every achievement of the level of economic growth in the province of East Nusa Tenggara certainly cannot be separated from the role of infrastructure as a supporter of economic activity. The availability of economic infrastructure such as road, electricity, and transportation infrastructure as well as social infrastructure such as educational facilities, health facilities, communication facilities, are important factors in influencing regional productivity which ultimately affects economic growth.

### III. RESEARCH METHODOLOGY

The type of data used in this research was secondary data, time serial data (periodic data) for the period of 2016 to 2020 obtained from the Central Statistics Agency of East Nusa Tenggara Province. The data needed in this study include: 1) Data on Economic Growth in the Province of East Nusa Tenggara, 2) Data on Infrastructure Development in the Province of East Nusa Tenggara. The data processing in this study uses fixed effect models (FEM). Fixed Effect Models are models with different intercepts for each subject (cross section), but the slope of each subject does not change over time.

The data analysis technique used was descriptive analysis and panel data regression analysis using the fixed effect model method, where the functions are as follows:

$$Y_{it} = \alpha + \beta_1 X_{1it} + \beta_2 X_{2it} + \beta_3 X_{3it} + \beta_4 X_{4it} + \beta_5 X_{5it} + \beta_6 X_{6it} + \varepsilon_{it} \quad (1)$$

In this study, we will find out the factors that will influence economic growth (Y) by involving road variables with units of kilometers ( $X_1$ ), transportation with units of..... ( $X_2$ ), electricity with units of kilowatts ( $X_3$ ), Health with number of person unit ( $x_4$ ), Education with a connotation unit ( $x_5$ ), and Communication with a percentage unit (%) with a connotation ( $x_6$ ) in West Nusa Tenggara Province

## IV. RESULT / FINDING

The results of panel data testing using the Fixed Effect Model, in the form of the influence of Road, Transportation, Electricity, Health, Education and Communication to GRDP. test results regression is as follows:

Table 2. Panel Data Estimation Results with Fixed Effect Model

Variable	Coefficient	t-Statistic	Prob.
Road	-0.440995	-0.300985	0.7642
Transportation	0.000830	0.956350	0.3417
Electricity	-0.001847	-1.200165	0.2335
Health	-33.65232	-0549120	0.5844
Education	5.208205	2.022835	0.0463
Communication	21.64482	5.416358	0.0000

Source: Data processing results, 2022

Based on Table 2, the t statistical test or partial test produces road variable obtained a t-stat value of -0.3009 with sig value. of 0.7642, which means that the road variable has a negative and not significant effect on the economic growth of East Nusa Tenggara Province. Transportation variable obtained a t-stat value of 0.9563 with sig value. of 0.3417, which means that the transportation variable has no significant effect on the economic growth of East Nusa Tenggara Province. Electricity variable obtained a t-stat value of -1.2001 with sig value. of 0.2335, which means that the electricity variable has a negative and not significant effect on the economic growth of East Nusa Tenggara Province. Health variable obtained a t-stat value of -0.5491 with sig value. of 0.5844, which means that the health variable has a negative and not significant effect on the economic growth of East Nusa Tenggara Province. Education variable obtained a t-stat value of 2.0228 with sig value. of 0.0463, which means that the education variable has a positive and significant effect on the economic growth of East Nusa Tenggara Province. Communication variable obtained a t-stat value of 5.4163 with sig value. of 0.0000, which means that the communication variable (X6) has a positive and significant effect on the economic growth of East Nusa Tenggara Province.

Table 3. Regression Coefficient Test Results

Estimation	Value
R-squared	0.994749
Adjusted R-squared	0.993020
S.E. of regression	247.3750
Sum squared resid	5017940.
Log likelihood	-746.1260
F-statistic	575.3285
Prob(F-statistic)	0.000000
Durbin-Watson	1.478490

Source: Data processing results, 2022

Based on the results of hypothesis testing conducted for this study, the following results were obtained: Based on F test's Table 3 above, it is known that the probability value of the F-Statistic is  $0.000 < (0.05)$  which means  $H_0$  is rejected. So it can be seen that road, transportation, electricity, health, education and communication altogether will affect GRDP.

The interpretation of the coefficient of determination ( $R^2$ ) shows how capable the variation of the independent variable is in explaining the variation of the independent variable. Based on Table 2, it can be seen that the coefficient of determination is 0.99 thus the variation in the variable Road, Transportation, Electricity,

Health, Education, and Communication explain 99% of the variation in East Nusa Tenggara's economic growth, 1% is explained by other variables outside the model.

## V. DISCUSSION

Length of road has no significant effect on GRDP. The length of the road is no longer the only main supporter of smoothness economy. This is because each County or City already has access roads that are enough so that it does not require additional road length. Road quality which plays an important role in the smooth flow of the economy between economic areas. If the length of the path with the condition Good roads will make the distribution of economic goods faster because the risk of traffic jams and the slow speed of vehicles due to damaged roads will be smaller. But if the road quality the more it is improved, the smooth running of economic goods and services will contribute in supporting higher economic growth. This is in line with the research conducted by Kaupa (2015) which discusses Effect of Infrastructure on Economic Growth in South Sumatera Province with the ordinary least squares method which indicates that Length of road has no effect on GRDP.

Transportation has no significant effect on GRDP. The East Nusa Tenggara Provincial Government has launched an acceleration transportation infrastructure development so that the GRDP growth rate increases. One of the steps taken is to involve the private sector to participate as well as in infrastructure development through investment (investment), good foreign and national parties. However, the field of businesses in the transportation infrastructure sector in domestically, especially in areas where there is no interest for the private sector. This is because, the level of Payback takes time long enough that the government becomes main or single role for development or maintenance of transport infrastructure (Palilu, 2018). This is in line with the research conducted by Chen et., al (2021) which discusses Does Transport Infrastructure Inequality Matter for Economic Growth? Evidence from China. *Land* with Theil index and Gini coefficient are the two most popular methods for quantifying inequality which indicates that transportation has no effect on GRDP.

Electricity has no significant effect on GRDP. The relationship between electricity consumption and economic growth significantly can be interpreted if the higher the economy of scale, the electricity consumption will also increase. However, the more advanced a country's economy is, the dominant industrial sector will shift from heavy industry to light manufacturing and service industries, which will result in a decrease in electricity consumption. Thus the availability of energy supply, especially adequate and affordable electricity, is crucial in the development of the industrial sector because one of the critical aspects in the business of the manufacturing sector is the guarantee of the availability of electrical energy (Bank Indonesia, 2015). This is in line with the research conducted by Hidayati & Permana (2022) which discusses The Development of Economic Infrastructure in Western and Eastern Indonesia to Support People's Welfare Improvement with the panel data method with fixed effect model which indicates that Electricity has no effect on GRDP.

Health has no significant effect on GRDP. The low level of health of human resources will further reduce productivity so that the output produced from an area/region both in quantity and quality will have an impact on economic growth. Efforts that can be made by the government to maintain the health of the population so that they are always physically and mentally healthy are to ensure the availability of adequate health facilities for the entire community. The availability of adequate health facilities can make it easier for the community to access good health services when needed and is expected to keep the community in prime condition so that it is good. This is in line with the research conducted by Munawaroh & Haryanto (2021) which discusses Development of Infrastructure and Economic Growth of Papua Province. With the panel data method with Random Effect Model which indicates that Health has a positive but not significant effect on GRDP.

Education has significant effect on GRDP. Good human resources are influenced by the level of education. As one of the important aspects in the process of developing a mindset constructive and creative human resources, education is absolute needed. The higher the human capital a person has, the ability to produce goods and services will also increase, thus affecting the level of income. By Therefore, the government needs to increase development in the field of education which is more adequate, namely in the form of school construction and repairs the curriculum. This is in line with the research conducted by Weya et., al (2021) which discusses The Influence of Infrastructure Development on Economic Growth in the Province of Papua Year 2006–2020 with the panel data method which indicates that education has a positive effect on GRDP.

Communication has significant effect on GRDP. The digital economy has become one of the important ways to promote high-quality economic development. technological advances affect economic growth. Therefore, it

is necessary to aggressively develop digital industry with the gradual development of the internet in order to become an advanced economic development, the development of digital infrastructure must be consolidated, deep integration of new infrastructure such as 5G, big data, internet. Must be developed and traditional enterprises must be supported to carry out the construction and transformation of sustainable digital infrastructure. Must be developed and traditional enterprises must be supported to carry out the construction and transformation of sustainable digital infrastructure. This is in line with the research conducted by Zhang et al., (2021) which discusses Study on The Effect of Digital Economy on High-Quality Economic Development in China with Feasible Generalized Least Squares (FGLS) method which indicates that communication has a positive effect on GRDP.

## VI. CONCLUSION AND RECOMMENDATION

Based on the results of the panel model regression analysis using the Fixed Effect Model and the discussion of the results of the study between the dependent variable and the independent variable as already described, it can be concluded that in the partial test health and communication variables have a positive and significant effect on GRDP and the variables road, transportation, electricity, and health have no effect on GRDP.

Infrastructure provision in Indonesia is slow due to constraints at various stages of the project, starting from preparation until implementation. In order to overcome these obstacles, there are some regulations or policies that can be carried out by the government including the following: Develop priority infrastructure, according to which infrastructure is most needed and most influential on the economy in East Nusa Tenggara. Overcoming infrastructure funding problems with the Cooperation scheme Government and Business Entities so that they are expected to increase financial feasibility of the project, including infrastructure and optimizing risk allocation between Government and Private in project provision infrastructure from preparation, pre-construction, construction to with operation and maintenance.

The development of infrastructure needs to always be considered, especially infrastructure that has an influence on economic growth, such as health and communication infrastructure. The government is expected to pay more attention to communication infrastructure. The development of communication infrastructure is very important because it can be used as another option if road access is not possible to be built and replaced with the internet and the use of other advanced technologies. Especially in East Nusa Tenggara Province, with the development of adequate communication infrastructure, it can reach areas or areas that have been difficult to reach so far. The direction of development is also starting to be directed towards digital and communication assets, especially for areas that are difficult to reach with transportation access because it can save time and costs.

In transportation infrastructure, to overcome congestion problems that have an impact on productivity, the government can implement several policies such as limiting vehicle age, limiting vehicle ownership, progressive parking rates, as well as increasing, and renewing public transportation. The Provincial Government of East Nusa Tenggara is expected to optimize the electricity infrastructure to strengthen the electricity system to be able to serve various electricity needs, in particular to encourage investment growth and increase the electrification ratio in East Nusa Tenggara Province. The availability of infrastructure is indeed not fully evenly distributed, so it is hoped that the community will use the available infrastructure facilities wisely.

The time period in this study only covers 5 years due to the limitations of the research data. This research is still possible to be developed further, therefore for future research it is hoped that further researchers will be able to add a longer research period to find out the pattern of infrastructure influence in a longer period of time and use the variables used in this study by adding some variables or even make changes to the variables that according to researchers most influence the impact of road infrastructure development in an effort to increase people's economic growth.

## Media Convergence And Covid-19 Pandemic: An Explorative Study Of The Perspective Of Media Workers At The Office Of PT. Media Televisi Indonesia

A. Gina Sara Melati<sup>1</sup> and B. Kanti Pertiwi<sup>2</sup>

<sup>1,2</sup>Faculty of Economic and Business, Universitas Indonesia, Depok, Indonesia

### Abstract

*The advancement in technology and digitalization has caused disruption in various industries, including the media industry. Media companies and channels continue to find ways to stay relevant and survive in gaining the audiences attention and preferences. Therefore, a strategy facing the challenge has been taken by many media companies my going through a convergence process. Where the media company which before only entertained a certain platform audience, namely television, printed or radio, now has to answer the needs of audiences on all platforms. A media company in Indonesia, Metro TV also has taken the step in going through a convergence process. This is done to widen its market potential and grab audiences on a larger level. The convergence began in early 2022, which was also the beginning of public restrictions due to the global COVID-19 pandemic. Companies, including Metro TV had to adjust accordingly to government relations. This impacted the way of work and the convergence process. This research explores the impact it has towards the media workers, specifically reporters at Metro TV and how the company addresses the needs of its workers.. The research uses a qualitative interpretivism approach, where in-depth interviews will be conducted with Metro TV's employees, including its reporters and those at the managerial level. The findings will become a reminder and suggestion on how the company establish relations with its workers and how to enhance their motivation through the needed support in times of change and crisis. PT. Media Televisi Indonesia performs three dimensions of convergence, namely structural convergence, news coverage convergence and presentation convergence from the five dimensions of convergence.*

*Keywords— Media Convergence; Pandemic; Explorative Study*

---

### I. INTRODUCTION

The presence of social media and various online news platforms, poses a challenge for conventional media to get an audience to stay afloat. Media convergence is one way that can be done for conventional medias to survive. Media convergence is carried out to produce the types of news that can be consumed by multi-platform audiences, whether television viewers, print media readers or radio listeners so that media convergence can be referred to as media integration through digitalization carried out by the media industry (Nugroho, 2020). The convergence process has caused a number of media entrepreneurs in Indonesia to combine all previously separate subsidiaries into one media (Sambo & Yusuf, 2017). One of them is PT. Media Televisi Indonesia, which combines its subsidiaries, namely Metro TV, Media Indonesia, Medcom.ID and MG Radio, to become Media Group News.

At the start of the convergence process of Metro TV and Media Group News media in 2020, the world was facing the challenges of the Covid-19 pandemic. The pandemic had an impact on a number of companies because companies had to change their operational activities by implementing the Work from Home system. Adjustments were also made by Media Group News. Therefore, the convergence process, namely training between news platforms, is also adjusted, which is done online.

The process of media convergence is inseparable from the development of HR skills, which initially only focused on one platform, but now one must be able to answer multiplatform needs. So a talent performance management process is needed. Talent performance management is a continuous process of identifying, measuring, and developing the performance of individuals and work groups and aligning them with the strategic goals of the organization (Aguinis, 2019).

The company's relationship with the company's talents must be increasingly considered and taken into account. Especially for journalists or reporters, who are constantly required to provide optimal performance and are at the forefront of gathering information, with various adjustments such as providing news material for multiplatform and using digital technology. Technological changes and expectations of these changes have the

potential to increase stress and impact on employee conditions (Baran, Correia, & Thompson, 2011). In addition, the conditions and uncertainty of the Covid-19 pandemic that continues to change and positions journalists and reporters as a group at risk of being exposed. So companies must be able to attend and read the conditions of employees, because news agencies that provide the support and assistance needed by employees are proven by research that can help journalists survive, adapt and have better performance (Beam & Spratt, 2009; Reinardy, 2011). In addition, it is also important to apply appropriate assessment and compensation for welfare and career development.

This research aims to see how the perspective of journalists when facing the COVID-19 pandemic and the adaptation to changes in media convergence in Media Group News.

## II. LITERATURE REVIEW

### A. *Impact of Media Convergence on the Work Experience of Media Workers*

The word convergence refers to two or more things/objects meeting and uniting at a point. The term convergence has been widely used since 1990. The word is commonly used in the development of digital technology, the integration of text, numbers, images, video and sounds (Briggs & Burke, 2000).

Media convergence on the work experience of media workers, taken from a research conducted by Smeeta Mishra in India in 2016, where in-depth interviews were conducted with 20 journalists, revealed that journalists there considered media convergence at that time was not an urgency and wasn't their main concern. The television and newspaper journalists in India from the research said that most Indian journalists did not take the convergence process seriously. In addition, a television journalist in the research said that the convergence training he received to produce news for multiplatform was not used in his daily work routine. However, the research also stated that this did not stop the media in India from carrying out various forms of convergence.

Convergence is carried out to be able to produce a variety of media content using technological tools and infrastructure for diverse audiences. The impact of the convergence process occurs on the content, audience, technology, and the media industry itself (Nugroho, 2020). The challenges of the Covid-19 pandemic that had hit the world coincided with other challenges by the media and journalism industry.

Pauline Gidget Resterio Estella in her research tries to see how a journalist maintain to work in a crisis situation of the Covid-19 pandemic, especially in carrying out the role as a trusted source of information in the midst of the rapid flow of communication through the internet. Estella chose Southeast Asia as the location and background of the research, as a region that has a diverse political, cultural, economic diversity, and has a high level of internet penetration. However, Estella also expressed the view that journalism in the Southeast Asian region is still in its early stages as a result of the lack of research and development infrastructure, as well as the lack of appreciation for journalistic research itself (Estella, 2020).

Meanwhile, research conducted by Hoak regarding the stress level of journalists and the organizational support while reporting a pandemic, discussed how organizational support can mitigate and overcome the uncertain conditions caused by the Covid-19 pandemic. Hoak mentioned that although the long duration of the pandemic can affect the way an organization or company perceived existing conditions, for the research it can be concluded that organizational support in newsrooms can be more important and crucial when there are events that disrupt the daily news gathering activities, such as a pandemic. Ensuring the support of superiors and colleagues can be as important as providing technological equipment and tools to gather news that journalists, especially reporters, need (Hoak, 2021).

Casero-Ripolles also revealed that the midst of the Covid-19 pandemic, news consumption has shown a significant increase, even capturing an audience that prior to the pandemic was less likely to be interested in the latest news. In addition the media, especially television, seems to have regained their journalistic authority, even though if you look at the data, television is now no longer the main reference to search for news or information. (Casero-Ripolles, 2020).

## III. RESEARCH METHODOLOGY

The research method used is qualitative research with a descriptive approach, qualitative research aims to understand what is experienced by the research subject as a whole and by way of description in the form of

words and language, in a special context by utilizing various scientific methods. A descriptive approach is used to solve problems and answer existing challenges based on the information and data collected.

This case study uses qualitative research methods with a descriptive approach and aims to describe the process of media convergence and talent management, specifically Metro TV reporters and how they answer the challenges of the media industry during the Covid-19 pandemic.

The time of research starts from January 2022 to April 2022, with the research location being conducted at Metro TV Jakarta. Data collection is done virtually via Zoom and Google Meet.

The population in this study are all Media Group News journalists with a sample of reporters and journalists as well as the leaders of the Metro TV convergence process. With a total of 18 respondents who were interviewed. The reporter criteria used as respondents are:

1. Active reporter at Metro TV
2. Have worked for at least 3 years
3. Have attended and participated in convergence training

Digging more in-depth information is done through interviews, with respondents selected who are competent and can answer questions related to this research. Namely representatives of the Metro TV editorial managerial division, who are responsible for leading the convergence process, including the Head of Convergence Metro TV, Metro TV newsroom manager, and Metro TV executive producer. Interviews were conducted in-depth and in a focused manner using open-ended questions.

The framework of questions that serve as a guide for interviews with directors of Metro TV are as follows:

Table 1.

Topic	Questions
Introduction	<ol style="list-style-type: none"> <li>1. What is your job description, sir/madam?</li> <li>2. What are your responsibilities like?</li> </ol>
Media Convergence Adaption and Transition	<ol style="list-style-type: none"> <li>1. How urgent is the convergence process?</li> <li>2. How to introduce convergence and change processes?</li> <li>3. What is the process of training and mentoring like?</li> <li>4. What is the prepared communication process like?</li> <li>5. Is there any resistance from employees and how to deal with it?</li> <li>6. How to adapt to the Covid-19 pandemic?</li> <li>7. How to see and measure the needs of employees, especially reporters in the convergence process in the midst of the Covid-19 pandemic?</li> <li>8. What are the goals and benchmarks for the success of media convergence?</li> </ol>

Question framework that serves as a guide in conducting interviews with Metro TV employees (reporters):

Table 2.

Topic	Questions
Introduction	<ol style="list-style-type: none"> <li>1. How long have you worked at Metro TV?</li> <li>2. What is your job description?</li> </ol>
Understanding the Concept of Media Convergence	<ol style="list-style-type: none"> <li>1. Do you know the media convergence process plan?</li> <li>2. What is understood about media convergence?</li> </ol>

	<p>3. What is the process of introducing and training media convergence like?</p> <p>4. How is the readiness of Metro TV reporters and other media under Media Group News to carry out the media convergence process?</p> <p>5. How has the Covid-19 pandemic affected the work process and media convergence training?</p>
Perspective Exploration	<p>1. How do you see the need for media convergence in the company?</p> <p>2. Has the training process and introduction to media convergence been effective?</p> <p>3. How does the Covid-19 pandemic affect your challenges at work?</p> <p>4. What is the impact of media convergence on your work?</p> <p>5. Did you get support and have your needs met during the media convergence process and during the Covid-19 pandemic?</p> <p>6. How important are the needs provided by the office for you?</p> <p>7. What kind of support or assistance do you expect?</p> <p>8. Do you have any suggestions regarding the implementation of media convergence in the company?</p>

Data analysis was carried out through thematic analysis. Thematic analysis is carried out to identify, analyze and report the pattern of themes from the collected data.

IV. RESULT / FINDING

Media convergence carried out by Media Group News are structural convergence, news coverage convergence and presentation convergence. The transformation implemented by the media group is that previously a journalist was limited to covering and creating news content for only one platform where he worked, but now a journalist (reporter) covers news to be given to various platforms (multiplatform). The same thing happened in newsrooms, where previously news was received by various editors on different platforms, but now the sending and receiving of news is centralized. The newsroom transformation process implemented by Metro TV and Media Group is shown in Figure 1.

Figure 1. Newsroom Flow

Figure 1 shows the transformation of newsrooms that has been carried out by Media Group News. Newsroom 3.0 is an integrated newsroom. In Newsroom 3.0 newsrooms provide content for multiple channels by integrating a complete news stream for print, broadcast and digital versions from planning to production. The responsibility for the channel is not assigned to one particular person, but the responsibility for news coverage belongs to the section head. The structure of the room also consists of a news-hub or news center, and there are branches connected to the center. In this integration there is a unification of workflows and also the use of shared news content. All the news, information and content that journalists collect is collected in a database known as a basket. The results of this coverage can then be used for processing depending on the needs of each media with

their respective characteristics. Interviews were conducted on 18 participants. Participants were divided into 2 (groups) based on the function of position in the Metro TV office and Media Group News, namely group 1 reporter and group 2 managerial.

The interview findings in this study are: convergence has an impact on working conditions during the covid-19 pandemic, lack of organizational support for employees in dealing with media convergence, implementation of convergence policies in the field is not effective, convergence causes workload to increase, office support for employee health when the pandemic is sufficient and the convergence policy needs to be accompanied by a policy of additional incentives and benefits.

## V. DISCUSSION

**Convergence Impacts Working Conditions During the Covid-19 Pandemic:** Adjustment of the workday schedule is done without losing the productivity of the office and the company. Metro TV journalists who originally got 2 (two) days off every week. Now they get 3 (three) days off, implementing a work from home or WFH system, because there are no demands to look for pictures and provide live reports or live reports on television, many sources of information either personal, companies, and ministries/agencies hold events and conferences online. Therefore, journalists are required to be able to adapt to using devices to attend and cover the information, and Reporters are still required to go directly to the field and cover the news. This is because television still requires presence and audio-visual material. So, reporters face the risk of contracting and spreading the virus.

Convergence is the fusion of several elements of the Media Group News platform to increase efficiency. One reporter can provide material or coverage to multiplatform. In the beginning, each platform sent its own reporter or journalist, now it can be reduced to become a joint reporter. With the modification of the work system, the impact is also seen on jobs that no longer require physical presence in the office. Especially in news coverage and processing. So that the pandemic has also transformed the work system in Metro TV and Media Group News.

**Lack of Organizational Support Towards Employees in Facing Media Convergence:** Media convergence is introduced and implemented in stages to employees and reporters of Metro TV and Media Group News since 2019. The introduction system is also carried out through an approach to superiors and outreach to other reporters. The socialization was carried out many times with various media, both in writing, face to face and virtual, Reporters understand the need for media convergence to be implemented. This was stated by a few participants, Reporters think that the system is very crucial because it directly affects their work in the field, Reporters feel that the training provided when they first became employees has become their main provision because they are required to take part in multi-platform training first. Now the training for their convergence feels the same as they got in the past, the training provided is also mixed skills, such as how to write in print aimed at online and TV journalists, as well as how to appear and give direct reports to print journalists. However, the training system provided by Metro TV reporters was said to be less effective. Because the material provided is not in accordance with what they do in the real field, and mentoring program is also provided for the convergence reporters. However, this program is admittedly not optimal. This is because the appointed mentors are said to have busy schedules, so they cannot continuously monitor the coverage and performance of their mentored children.

**Implementation of Convergence Policy in the Field Ineffective:** The implemented system is still ineffective and not good. The implementation that has not been maximized is also recognized by managers who are also participants. "Where he said that because of the new system, it was very understandable that there were shortcomings and needed time to adjust", Inconsistent communication of assignments so that it becomes difficult to carry out daily tasks, Forming converged journalists from 'finished' journalists from print, online and television media will be more difficult, when compared to forming or recruiting new journalists who are really focused on becoming convergence journalists, They feel the impact on their work in the field actually adds a heavier burden. Because they must provide more than 1 (one) news coverage material to the platform and seeing the readiness and preparedness of the reporters and the human resources of Media Group News, it was said that their reporters were 'Ready not ready, they must be ready'. So, they have no choice but to adapt and follow the policies of the office.

**Convergence Causes Workload to Increase:** Media convergence causes employees to feel objected and overwhelmed by increasing the platform for them to provide coverage. So that a few resistances emerged from the reporters to follow or carry out this media convergence process, The burden felt by TV reporters is also considered heavier than other platform reporters. Because they are still prioritized and relied on for coverage that requires live reports on television, The addition of a news platform, as well as a different type of script format requested by the office, the reporters who went into the field felt more Tired. Especially with the condition of the Covid-19 pandemic which also attacks them psychologically, and Lack of communication and understanding which leads to objections to carrying out convergence without clear directions.

Seeing the condition of the reporters in the field and the various attitudes related to media convergence, the managers are also aware of the resistance from the employees. But this resistance is seen as natural, mainly due to a lack of understanding and a reluctance to change. However, the resistance shown by employees, especially reporters, did not show a meaningful attitude or lead to an offensive attitude. The average only complains about working conditions behind with his fellow friends. So that resistance and objections are seen by managers as conditions that do not prevent them from continuing to carry out the existing media convergence.

The managerial team said that they continue to open lines of communication and carry out continuous dialogue to provide understanding and facilitate the implementation of media convergence. The socialization that continues to be carried out is in the form of understanding and changing the way of thinking of reporters who think they work for 3 platforms.

But reporters still feel a lack of communication exists to address this media convergence. Both from discussing the existing system and to conveying complaints about the difficulties they encountered in the field, which became the basis for them to be reluctant to undergo the media convergence process.

**Office Support for Employee Health During the Covid-19 Pandemic:** In dealing with the Covid-19 pandemic, all employees, including reporters, are faced with a few challenges, both psychologically and physically. They must be more secure because they go directly to the field with high mobility to get news. Seeing this condition, managers and superiors also see the need for health support that needs to be given to employees. Specially to increase and maintain the immunity of employees and reporters, Health needs such as vitamins and the necessity of testing for Covid-19 through tracing and tracking are the concerns of the office. Especially with a few employees who have tested positive for Covid-19. They continue to be given assistance and assistance to assist their recovery and recovery. This is reflected in how the office allocates additional budget for this, Support for medical equipment and health assistance during the Covid-19 pandemic was also welcomed by employees, including reporters. They feel the presence and good intentions of the office by continuously providing vitamins and Covid-19 test facilities regularly and free of charge, and Employees who have contracted Covid-19 also feel how they feel very helped by the assistance and facilities provided by the office. Whether it's from tests to help get isolation facilities at the athlete's house. This assistance and assistance are also considered very important by reporters. Especially considering their job, they inevitably must go directly to the field and still meet with many people. So, they are more susceptible to exposure to the virus and the risk of contracting the Covid-19 virus.

**Convergence Policy Needs to Be Accompanied with Additional Incentives and Benefit Policies:** Media convergence causes adaptation to change in the existing system, many of them also expect additional incentives in the form of money, there is no assistance in the form of credit allowances or quotas from the office even though reporters often must access events and make scripts from home, because it coincides with their WFH (work from home) schedule. This has an impact on the need for internet quota packages, However, this is inversely proportional to the statement given by the supervisor who was also an interview participant. Where the participant stated that the office continues to aid reporters to carry out independent reporting, including by providing credit allowances, Reporters also hope for additional incentives as a form of compensation for work they perceive as additional work compared to before. Managers also said that plans for remuneration systems and incentive benefits are also being designed and worked out for employees who are considered productive and good. However, it has not been implemented optimally due to the current conditions, and however, there are also managerial parties who consider this monetary incentive to be detrimental to professionalism and should be removed to avoid harm to both parties. Both the company and the employees.

Next, the motivation needed does not come from the company or the manager, but the motivation of employees and reporters is the spirit and passion from within the individual. However, the reporter considers the current working conditions with increasing needs during the Covid-19 pandemic. Almost all participants considered monetary benefits to be their main motivator to continue to work and survive at the Metro TV and

Media Group News offices. Moreover, they have communicated this to their superiors, and received an answer that the incentive system is being drafted.

Participant number 11 also revealed that the motivation given by the office is very important to help him increase work productivity. Looking at the current conditions, both internally in the office from the work he does and the external conditions of life's demands, he revealed that monetary benefits or money are the main motivators to increase motivation and productivity at work.

#### VI. CONCLUSION AND RECOMMENDATION

The perspectives of journalists or reporters when dealing with the covid-19 pandemic and adapting to changes in media convergence at Media Group News based on an exploratory study of media workers' perspectives, there are several important points, namely: convergence has an impact on working conditions during the covid-19 pandemic, lack of organizational support for employees in the face of media convergence, implementation of convergence policies in the field is not effective, convergence causes workload to increase, office support for employee health during the pandemic is sufficient and convergence policies need to be accompanied by policies of additional incentives and benefits.

PT. Media Televisi Indonesia performs three dimensions of convergence, namely structural convergence, news coverage convergence and presentation convergence from the five dimensions of convergence mentioned

## Text Mining Approach to Analyze User Response on Social Media Towards a Sales Promotion Program

Kana Nathania<sup>1</sup> and Arga Hananto<sup>2</sup>

<sup>1,2</sup>Faculty of Economics and Business, Universitas Indonesia, Jakarta, Indonesia

### Abstract

*The purpose of this research is to investigate how users responses to a technology company's sales promotion program in Indonesia through comments on social media by identifying influential keywords and themes. Tokopedia, an Indonesian technology company that specializes in E-Commerce, has seen significant growth. Tokopedia implements a marketing strategy, specifically a sales promotion, as part of their business strategy. Sales promotion might influence user's perspectives, thus it's critical for the firm to understand user's perspective. This study applied text mining to analyse user's perspective through user comment on social media to get a wider picture, trends, and user interests. Using the Twitter API, the authors gathered 13,921 Twitter comments between January 1, 2021, and December 1, 2021. These data were subjected to content analysis using word frequency, part of speech tagging, co-occurrence matrix, core-periphery analysis, and network analysis. Even though text mining has been used in marketing, to author best knowledge, this research is among the first to investigate sales promotions using network analysis. This research was effective in identifying influential keywords and themes distribution. The influential keywords are associated to Tokopedia monetary promotion benefits, which may be employed for marketing strategies and social media network activation. The author also identified community themes, which are (i) multi-product promotions, (ii) Gojek and Tokopedia sales promotion collaboration, (iii) Tokopedia monetary promotions, (iv) viral content, and (v) PLN promotion, which could provide valuable information for the company to improve their business performance. This research offers a novel approach of transforming social media content into meaningful insights about sales promotion.*

---

### I. INTRODUCTION

In recent years, Indonesia has seen growth in the development of technology-based companies. This was shown by Indonesia's ranking, which ranked fifth in the world with 2,193 start-ups in 2019, after the United States, India, the United Kingdom, and Canada. The growth of unicorn and decacorn start-ups demonstrates not only the quantity but also the quality of companies owned by Indonesia (Ministry of Communication and Informatics, 2020). One of the startup technology companies in Indonesia is Tokopedia, which ranks second in Indonesia in terms of unicorn valuation, with a US \$7 billion valuation (CBInsights, 2021). Tokopedia's status as a unicorn also has a significant economic impact, particularly during a pandemic, which is consistent with the company's objective.

In its business activities, Tokopedia conducted sales promotion as one of their marketing strategies to increase customer transactions. According to Shimp (2010), sales promotions may attract customers by offering a variety of benefits (Sinha & Verma, 2018a). Sales promotion could not only increase customer transactions, but also improve brand awareness and keep customers engaged with the brand because of the benefits provided (Sinha & Verma, 2018a). Sales promotions on consumer behavior have a positive correlation with short-term or behavioral effects in increasing sales volume and purchase intentions and long-term effects or perceptual behavior that show a positive and significant relationship between sales promotion techniques and brand loyalty (Santini, Vieira, Sampaio, & Perin, 2016). In this research, Tokopedia's sales promotion program is called Waktu Indonesia Belanja (WIB), which provides discounts of up to 90%, as well as cashback vouchers and free shipping fees. The program was held every 25th to the end of each month throughout 2021.

Even though sales promotion could generate a good impact on sales, it could also lead to a negative impact (Marshall & Johnston, 2018). Hanaysha (2018) and Eleboda (2017) found that sales promotions had a negative impact on purchase decisions. Hanaysha (2018) also proved that sales promotions may have a negative impact on customer perceptions of brand quality since lowering product costs tends to have low quality. Hence, it is critical for a company to understand user perspectives and responses during a sales promotion program to

provide feedback to the company. Companies could achieve this by listening to users through interviews, generating surveys or analyzing comments from social media that could provide useful information.

Tokopedia uses social media to distribute information regarding the sales promotion program. Because of the enormous number of active users, social media is widely used nowadays. According to the Indonesia Digital Report 2021 (Hootsuite & We are Social, 2021), Indonesia has 170 million active social media users. The high penetration of social media in the public community causes companies to use social media as a tool for marketing and brand building. User interaction on social media not only allows the company to exchange information but can also be used by users to share and exchange information (Tsimonis & Dimitriadis, 2014). The data received from social media could be used to measure user opinions on corporate services and establish user preferences. Therefore, companies could utilize user responses on social media to obtain a bigger picture of trends and interests.

Based on the previous arguments, this research method analyzed user responses during sales promotions that were gathered from social media. User comments on social media frequently concern specific companies, brands, services, and products. This research extracted data from the social media platform, Twitter, a microblogging platform. Several studies have shown that brand advocates who use social media may make a difference in service performance, allowing businesses to focus on their core competencies and to get insight from their customers via Twitter (Hewett, Rand, Rust, & Heerde, 2016; Liu, Burns, & Hou, 2017; Grover, Kar, Janssen, & Ilavarasan, 2019). This massive volume of user feedback on social media may be efficiently mined and used as a strong source of information for businesses, particularly for guiding marketing plans based on what people actually think about their products and services (Dwivedi et al., 2020). The massive volumes of social media data emphasize the need for a system that is capable of efficiently transforming textual large data into brand insights. Considering users' comments on social media are typically huge in quantity, this research used text mining methods to organize the data.

In this research, we used a text mining method, specifically network analysis. Text mining employs Natural Language Processing (NLP) methods to optimize the identification of hidden information from unstructured data, with the goal of identifying relationships between textual elements such as the occurrence and co-occurrence of specified terms (Kwartler, 2017). The network analysis approach is used to investigate relationships in social data and to analyze the co-occurrence of certain phrases. Network analysis not only analyzes each word as the smallest unit but also the source, flow, and semantic relationship between information from a group of words to achieve a more precise understanding. The semantic relationship between these words can create a network that can describe the associations of the words that appear and their characteristics (Hou, Cui, Meng, Lian, & Yu, 2019). Text mining itself has been commonly used in marketing, according to Halper, Kaufman, and Kirsh (2013), text analysis is used to analyze target markets, customer relationship marketing, social media, churn detection, and market analysis (Oh & Kim, 2020). Liu, Burns and Hou (2017) also investigated brand-related user-generated content on Twitter using Latent Dirichlet Allocation and sentiment analysis, as did Jia (2018), who used text mining to quantify ratings on restaurant reviews.

Even though active studies have identified marketing through text mining, to the author's best knowledge, there is no prior study that analyzed customer response towards sales promotion using network analysis. The large volume of textual data on Twitter that this research used could have a greater impact than traditional methods. Textual data can be used to get marketing insights (Berger, Humphreys, Ludwig, Moe, Netzer, & Schweidel, 2019). This study extends the literature by proposing an analytical framework based on machine learning techniques that have rarely been applied in the competitive environment of the service industry (Gur & Greckhamer, 2019). Thus, this research could enrich the literature on sales promotion as network analysis can identify relevant concepts and their interrelations that may provide marketing insights. By combining several disciplines, this research has the potential to gain relationships and approaches. This study used numerous text mining approaches, including word frequency, part of speech tagging, co-occurrence matrix, core-periphery analysis, and network analysis.

There are two main objectives of this research, first it identified influential words that appear in users' comments about a sales promotion program. Those influential keywords could be employed for company marketing strategies and social media network activation. Second, this research identified the several themes that appear on Twitter during sales promotion. Each theme has its own insight that could enhance a company's service performance. This research also offers several contributions by applying a novel approach to transforming social media content into meaningful insights about sales promotion. These findings also support

user responses evaluations and recommendations that may provide significant information to the company in order to improve their business performance.

## II. LITERATURE REVIEW

To provide context for the research and emphasize our contributions, the author mainly focuses on four research streams : (i) sales promotion (ii) social media (iii) text mining (iv) network analysis.

This research focus to analysed user response on sales promotion program from users perspective. To gathered users response, companies mostly used traditional method such as interview or survey. Through digitalization many company start to analyse users response through content in social media. This research chose new approach by utilizing social media to analysed user response on sales promotion. Considering users' comments on social media are typically huge in quantity, this research used text mining methods to organize the data. Furthermore, to answer those research objectives this research use network analysis which could identify influential keywords and themes by identifying flow, and semantic relationship between information from a group of words to achieve a more precise understanding and found out the themes that appeared. Thus, this research could enrich the literature on sales promotion as network analysis can identify relevant concepts and their interrelations that may provide marketing insights. This research also combining several text mining methods, including word frequency, part of speech tagging, co-occurrence matrix, core-periphery analysis, and network analysis. To the author's best knowledge, there is no prior study that analysed customer response towards sales promotion using network analysis. This research contributed to the existing of understanding by offering an analytical framework based on text mining techniques that have rarely been used in the competitive environment of the service sector.

### *A. Sales Promotion*

Sales promotion is one of the elements of the promotion mix, which aims to increase purchases of a product through consumers, salespersons, or those included in the channel (Marshall & Johnston, 2018). Promotion is a powerful marketing tactic that allows a company to engage customers more effectively with its brands (Kim & Kang, 2018). The advantages in sales promotion can be categorized into two types, namely utilitarian and hedonic (Sinha Verma, 2020). What is meant by utilitarianism are benefits related to meeting basic needs and rational aspects of purchasing, while hedonistic benefits are related to wants, feelings, and emotions. The two advantages are positively correlated in increasing product sales. In addition, through the benefits offered in sales promotion, it can have a great influence on brand equity (Sinha & Verma, 2018a).

According to Hanaysha (2018) and Eleboda (2017), sales promotion could also have a negative influence on purchase decisions. Hanaysha (2018) further reveals that sales promotions can be harmful to customer perceptions of a brand since a reduction in product pricing generates a perception of low quality. Other research also discovered that overuse of sales promotion is not a good promotional strategy and can lead to a general cheapening of brand image and distrust by customers (Marshall & Johnston, 2018). Therefore, it is important for a company to understand user response during a sales promotion program.

In this research, the author analyzes user response towards the Tokopedia price promotion program on social media using text mining. Although prior studies have investigated marketing issues with text mining, the authors are unaware of similar studies that have examined user response to sales promotion using the network analysis method. Previous research typically employed questionnaires or traditional approaches; for example, Sinha and Verma (2019) conducted a field survey to examine the association between sales promotion and user impressions.

### *B. Social Media*

In recent years, many researchers have argued that it is vital to investigate information on social media platforms (John, Kim, & Barasz, 2018; Drakett, Rickett, Day, & Milnes, 2018). Many users use social platforms to tell others about their daily activities and experiences as well as their opinions. The fact that users are organized into networks of individuals with similar opinions and ideas is a major advantage of social platforms (Palos-Sanchez, Saura, Reyes-Menendez, & Esquivel., 2018). Social media has a form of environment that can be accessible from anywhere on the globe, and most of it can stimulate interactions amongst users to share their thoughts (Grover, Kar, Janssen, & Ilavarasan, 2019). Therefore, it is crucial for businesses to analyze

user opinions on social media because it allows them to connect with consumers who may become potential clients.

Twitter, a social media platform that allows users to disseminate messages, was employed in this research. Twitter has a significant role in the world, as evidenced by the fact that it receives 1.6 billion unique visitors each month and has 330 million active users (Sashi, Brynildsen, & Bilgihan, 2019). According to the Hootsuite Digital Report 2021, there are 14.05 million Twitter users in Indonesia. Twitter is commonly used to spread repetitious material from the media in order to provoke responses (Ma, Tse, Sato, Zhang, & Lu, 2020). Therefore, Twitter questions could generate conversations amongst people and create traffic. Several studies have stated that there is a need for companies that utilize social media to contribute to service improvement so that they can engage and gain insight regarding their brand from customers on the Twitter microblogging platform. (Hewett, Rand, Rust, & Heerde, 2016; Liu, Burns, & Hou, 2017; Grover, Kar, Janssen, & Ilavarasan, 2019)

This research examines Twitter comments, often known as tweets, which are users' opinions. Tweets are limited to 280 characters and are used to produce useful thoughts. Twitter is another example of a social media platform with great information transmission capabilities (Kitano, Yamada, & Tan, 2021). One of the main benefits of platforms such as Twitter is that users are organized in networks, enabling users to explore groups of people, communities, and people related by common interests rather than individual profiles or personalities. (Hubert et al., 2017). Twitter data can also be easily extracted in this research by using the Twitter API. Furthermore, compared to other e-commerce companies, Tokopedia has the most Twitter followers (1 million). Those are the reasons for choosing Twitter in the research.

### *C. Text Mining*

This research used a text mining method in data collection. Text mining itself is a process of transforming text data in the form of unstructured text into usable information (Kwartler, 2017). Text mining is a part of data mining that is used to discover information from data in the form of text. The amount of data obtained from social media can be difficult to quantify because the data has qualitative properties of unstructured data and has a lot of noise. This challenge can be solved using text mining (Netzer, Feldman, Goldenberg, & Fresko, 2012). Text mining itself has been used in the marketing field. For example, in the research of Ghose, Ipeiroti, and Li (2012) using text mining and crowdsourcing to estimate demand from hotels, Liu, Burns, and Hou (2017) investigated brand-related user-generated content on Twitter using Latent Dirichlet Allocation and sentiment analysis, and Susan Jia (2018) used text mining to quantify ratings on restaurant reviews.

Textual data can be used to get marketing insights and be used for prediction and understanding tools (Berger, Humphreys, Ludwig, Moe, Netzer, & Schweidel, 2019). By combining several disciplines, text analysis has the potential to gain relationships and approaches. There are several steps in text analysis, namely, pre-processing data and analyzing text data. This step may change according to the research objectives. In this research, the authors used three main steps, which are: data collection, data pre-processing, and data analysis.

### *D. Network Analysis*

On social media, circulating information will spread faster than in offline media. The speed of information dissemination in online media forms an information flow that maps relationships with one another to form a network. The network is represented as a graph with a combination of several nodes (values, sentiments, attributes, locations, ideas) and the relationships between the nodes, namely edges (links, ties, associations, affiliations, interactions) (Zhao L & Min C, 2019). In social media, nodes can be referred to as topics, accounts, and hashtags, while edges are relationships, friendships, following, web links, and information flows (Zafarani, Abbasi, & Liu, 2014).

To find out the importance of nodes on a network, there are several types of centrality calculations in identifying the position of nodes in the network. The first is degree centrality, which measures the number of edges owned by one node (Golbeck, 2015). According to Henderson, Iacobucci and Calder (1998), degree centrality can identify how central or popular a particular node is in a network (Webster & Morisson, 2004). Another measurement to see the importance of a node is the Betweenness Centrality, which measures how important each node is related to other nodes (Zafarani, Abbasi, & Liu, 2014). It measures the centrality in the graph based on the shortest path. According to Freeman (1979), betweenness centrality can play a role in activating other words in the network (Holzmann and Wuhner, 2000). Therefore, nodes with high betweenness centrality can act as bridges or intermediaries in the network. Closeness Centrality describes the distance of nodes to one another. If a concept has a close distance to another concept, then the concept has a high closeness

centrality (Wasserman and Faust, 1994). According to Freeman (1979), closeness centrality can describe the independence of a node.

Network analysis can be useful for quantifying the relationships between words that can show the semantic structure of topics from certain domains, namely social media (Himmelboim, Smith, Rainie, Shneiderman, & Espina, 2017). Topics in the network can be identified by building a co-occurrence matrix based on the word frequency co-occurrence and then analyzing the community based on optimization of modularity (Blondel, Guillaume, Lambiotte, & Lefebvre, 2008). The first two types of matrices in network analysis are: the first two-mode network is a description of the article and keywords that appear in the article, while the one-mode network connects keywords based on their appearance in the document (Lee & Sang, 2018). This research used one type of network.

### III. RESEARCH METHODOLOGY

The text mining technique was employed in this study to examine user responses on Twitter during the sales promotion program by finding influential keywords and user topics. This research is divided into three primary stages: data collection, pre-processing, and data analysis (Fig. 1). In the first stage, data is acquired by searching for text-based comments on Twitter using the Twitter Application Program Interface (API). The data is then pre-processed using R software (R Core Team, 2021), with the following R packages: dplyr (Wickham, François, Henry, & Müller, 2021), stringr (Wickham, 2019), tm (Feinerer & Hornik, 2020), and stopwords (Benoit, Muhr, & Watanabe, 2021). This stage includes text normalization, slang terms, and stop words to clean up the text before going to the next stage. At the data analysis stage, the data was subjected to word frequency, POS Tagging, biterns co-occurrence matrix, and core-periphery analysis, using netUtils (Schoch, 2022) and udpipe (Wijffels, 2021) packages from R. The researchers were also able to discover the influential keywords and the theme for each community using Gephi. Finally, the results of those steps, influential keywords and themes, could give the company insightful information.

The author realizes the importance of validating the collected data because the data might contain spam or bot tweets. As a result, when collecting data, the author filters it twice using a total of seven unique keywords to ensure that the data acquired was relevant to the research objectives. Data is retrieved using Twitter's API for academic research with specific keywords to filter only tweets related to Tokopedia's sales promotion program. Furthermore, this research also conducted multiple phases in pre-processing steps to strengthen the validity of the data, such as detecting spam tweets, deleting duplicate tweets, tokenization, eliminating terms that do not have an important function on the network, and utilizing the part of speech tagging approach. Those methods are considered to reducing bias in tweets, which might interfere the analysis steps (Liu et al., 2019; Leem & Eum, 2021).

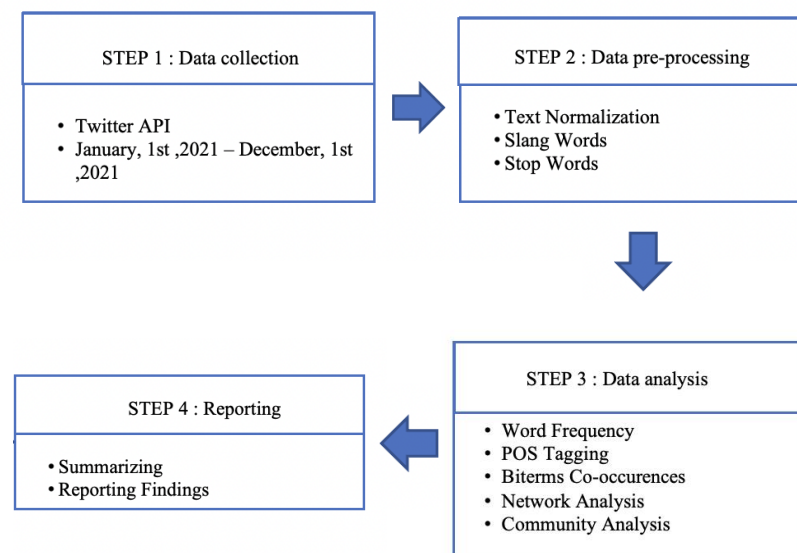

Fig. 1 Research Framework

### E. Data Collection Stage

This stage used R software to extract tweets and user comments from Twitter. Twitter Application Programming Interfaces (API) for Academic Research are utilized to get Twitter historical data. Twitter data is retrieved using keywords related to Tokopedia and sales promotion program, the keywords are 'Tokopedia,' 'Tokped'. Furthermore, to filter tweets that are related to sales promotion, the researcher added additional keywords which are, 'diskon' (discount), 'promo' (promotion), 'cashback,' 'ongkir' (shipments fee), and 'wib'. This research successfully gathered 13,921 Twitter comments between January 1, 2021, and December 1, 2021.

### F. Pre-Processing Stage

During this stage, the researchers divided it into two steps. The first step is called text normalized data. It removes text from unnecessary terms such as URLs or links, hashtags, emoji, numbers, and symbols, and it also removes any duplicate tweets. The second step was slang words and stop words. Slang words is a process to transform informal/daily words into standard words. This method was used because most of the tweets contain informal daily language. The next step is to stop words. It removes stop words such as conjunctions, prepositions, and other words that have no meaning as individual words.

### G. Data Analysis

The frequency of words is the first stage of analysis of data that has been processed in the pre-processing stage. The purpose of this step is to do statistical analysis on the frequency of word occurrences throughout the document. At this step, the researcher examines a collection of words that are processed by creating a corpus, which then generates information about the frequency of each word that appears.

Building Co-occurrence matrix with The Part of Speech (POS) Tagging technique. POS tagging optimizes word selection by classifying the types of words (nouns, adjectives, verbs). The researchers then selected the types of words to be processed further to obtain a more optimized analysis. During this step, the researcher used the R package called udpipe (Wijffels, 2021). After obtaining the POS Tagging output, the author chose "noun" as the type of word to be used as an input in creating a biterm co-occurrence matrix. A biterm co-occurrence is a pair of terms that frequently appear or occur sequentially in a phrase. This bigram co-occurrence list may examine semantic links or correlations between words in user comment data (Hou, Cui, Meng, Lian, & Yu, 2019).

Network Building and Analysis. After knowing the words that often appear, this study examines the relationships and associations of each word by using the Network Text Analysis method. This study uses a one-mode network which reconstructs from a two-mode network where the relationship between each document and the words that appear is converted into a relationship between keywords. In one mode network, there is no relationship between articles but focuses on the keyword relationship (Lee & Rha, 2018). The relationship between keywords analyzed by one-mode networks can describe the relationship between keywords. This relationship can be measured based on the degree of centrality, betweenness centrality, and closeness centrality.

Next is community analysis. The objective of this stage was to identify the themes of each community that have strong interaction (Blondel, Guillaume, Lambiotte, & Lefebvre, 2008). The Gephi software conducted modularity calculations with the Louvain method, which were then visualized to show the distribution. This is accomplished by examining the classification of nodes in the cluster based on the amount of interaction of keywords. The results of each cluster show that the words are closely connected to one another and that they have a strong relationship. Each community represents a unique theme that could generate user insights that are beneficial to the company.

## IV. RESULT/FINDING

### A. Words Frequency

Using pre-processed data, the researcher estimated the frequency of words from 13,921 Twitter comments. The data is supposed to be clean and clear of meaningless terms that might influence research analysis. The researchers obtained the following results:

Table 1. Words Frequency. (Author's Work)

No	Words	Frequency
1	Tokopedia	3866
2	<i>Promo</i> (promotion)	2013
3	<i>Diskon</i> (discount)	1465
4	Cashback	1180
5	<i>Membeli</i> (buy)	1162
6	<i>Ongkir</i> (shipping fee)	1054
7	<i>Gratis</i> (free)	1053
8	<i>Kupon</i> (coupon)	797
9	<i>Memakai</i> (use)	660
10	Shopee	536

Overall, the researchers obtained a total of 8,155 unique words that can be shown in Table 1. From the table we can see that 'tokopedia', 'promo'/promotion, 'diskon'/discount, 'ongkir'/shipping fee, and 'cashback' appear in the high frequency words that appear in Twitter comments. Despite this, the word 'wib' as the name of Tokopedia's sales promotion program is not shown in the list. This is because sentences containing the word 'wib' tend to be spam, which has the characteristic of high duplication of comments. The data was deleted at the pre-processing stage. Another word in Table 1 is 'Shopee', which is the name of a competitor of Tokopedia. The words 'cashback', 'free' and 'shipping costs' are classified as the benefits in the sales promotion program. Further analysis related to the relationship between words and their influence in the network can be seen in the network analysis method.

#### B. Centrality Measurement and Core-Periphery Analysis

Table 2 shows the results of centrality in the form of degree centrality, closeness centrality, and betweenness centrality. Each measurement has a different meaning according to its role in the network. The five words that have the highest degree are 'tokopedia', 'promo', 'cashback', 'ongkir', and 'coupon'. Based on the previous explanation, words with a high degree of centrality are words that have a big impact on the network. This word can be a stimulus for marketing activity (Seitz & Roosen, 2015).

Table 2. Centrality Measurement.

No	Words	Degree Centrality	Closeness Centrality	Betweenness Centrality
1	Tokopedia	41,000	0,707	1282,317
2	<i>Promo</i> (promotion)	20,000	0,552	388,317
3	Cashback	11,000	0,504	141,850
4	<i>Ongkir</i> (Shipping fee)	9,000	0,513	343,900
5	<i>Kupon</i> (coupon)	9,000	0,496	60,750
6	<i>Kode</i> (Code)	5,000	0,322	1,867
7	<i>Wanita</i> (women)	4,000	0,314	58,500
8	<i>Temam</i> (Friend)	3,000	0,352	55,000
9	<i>Keluarga</i> (Family)	3,000	0,265	57,000
10	Group	3,000	0,352	55,000

Furthermore, the closeness centrality indicates how closely one node relates to another node. Closeness centrality showed the 'independence' of the nodes, as this node could appear without other words that activate the word. Through these words, the company can use them as a communication strategy to activate a network. Based on Table 2, it is known that the words that appear are 'tokopedia', 'promo', 'ongkir', 'cashback', and 'coupon'. The last centrality measurement is betweenness centrality. This measurement describes the role of the node as a bridge or intermediary in the network. Those words are 'tokopedia', 'promo', 'ongkir', 'cashback' and 'tahta'/throne. These words can be used to create new networks so that information circulation can be expanded.

Researchers also analyzed the core-periphery to determine the structure of a network, using the method of Borgatti and Everett (2000). From the output from core-periphery analysis, it is shown that there are 6 nodes

#### D. Author's Work

The network distribution is shown in Figure 2. The size of the letters and circles represents the degree of centrality. The thickness of the connected red lines reflects the frequency of words, where the thicker the line, the higher the frequency. The different colors in the network represent each community. The strength of interaction between nodes influences the number of nodes in a community. A node appears in the same community if it has a strong association, such as a high relationship or occurrence. Table 3 shows that each community has a different proportion in the network. It also states the theme for each community. Five communities were identified. Those themes are: multi-product promotion, Tokopedia monetary promotion benefit, Gojek and Tokopedia sales promotion collaboration, viral content, and PLN promotion. This sequence also describes the proportion of communities in the network. The largest proportion is in multi-product promotion at 42.37%, and the smallest is in PLN promotion at 6.78%.

### V. DISCUSSION

#### A. Influential keywords

The results of the core-periphery analysis confirmed that words included as the core also have a high degree of centrality. Those words were classified to be the influential words in the network. Thus, it is important for Tokopedia to pay attention to those dominant words since they have a big impact on the network. Those influential words are 'tokopedia', 'promotion', 'cashback', 'ongkir', and 'coupon'. According to Seitz and Roosen (2015), influential words could be used as a reference to determine marketing communication strategies.

The word 'promo' plays an important role in the network, which ranked second after Tokopedia in terms of degree centrality, closeness centrality, and betweenness centrality. This indicates that the word 'promo' has a big influence, may occur without depending on other words, and can act as an intermediary word to expand the network. The words 'ongkir' and 'cashback' also appeared in the third and fourth positions as well. These two words are related to the benefits of the sales promotion program, which are free shipping and cashback vouchers. According to the comments, those words are used by two types of users: buyers and sellers. Sellers used the words promo, ongkir, and cashback to promote products on Twitter with the purpose of increasing awareness about a product/brand or generating sales, as seen by the large number of product links observed in user comments. Sales promotion benefits are frequently employed in promotion tweets to attract customers. Meanwhile, from the buyer's perspective, those words appear to convey both negative and positive comments about the benefits and promotions offered.

This research could gain insights from these influential keywords. First, according to the words that often appear in the network, many words in this program are also associated with utilitarian benefits, such as 'price,' 'ongkir,' free,' fast,' 'cashback,' 'cheap,' 'original,' and 'saving.' This is also consistent with the type of sales promotion employed, which is a type of monetary promotion that activates words with utilitarian benefits on the network. Second, these benefits, cashback and free shipping fees, have a significant impact on the *network*. Both free shipping and *cashback* could increase the total order volume (Vana, Lambrecht, & Bertini, 2018; Shehu, Papias, & Neslinal, 2020). Free shipping benefits could generate consumers' perception of compensating them for taking a risk to purchase risky products and could have positive effects (feeling component). However, in contrast, the increase in order volume from cashback is driven by a higher spend for both high and low risk products (Shehu, Papias, & Neslinal, 2020). Tokopedia may utilize these benefits to stimulate social media networks while still performing continuous evaluations regarding those benefits. Finally, Tokopedia's communication strategy should address information to both buyers and sellers. Tokopedia could use Twitter to increase engagement between Tokopedia and buyers and sellers. Engagement with sellers on social media might come in the form of likes, shares, or comments on the seller's post.

#### B. Community Identification

The first community (42.37 percent) is multi-product promotions. This community includes several words, which are 'tokopedia,' 'harga,' 'pulsa', 'shopee', 'buku', 'original', and 'Lazada.' In this community, two types of product promotions appeared: 'pulsa' and 'buku' and several competitor names, such as 'shopee' and 'lazada.' Aside from that, the words 'original' and 'price' are frequently used while promoting a product. In addition, the appearance of competitors' names in user comments related to product promotions on Twitter revealed that several products were also sold on other platforms such as Shopee and Lazada. According to Ye, Xia, Zhang, Zhan, and Li (2020), online comments on internet networks can be used to identify competitors. As a result,

Tokopedia may leverage user comments to actively perform competitor analysis from the user's perspective to discover more about competitors. This is highly beneficial because competitor data is relatively difficult to obtain. The user's opinion on competitors could help Tokopedia by giving insights to improve their service performance.

The word 'original' is frequently used to promote items, and there is a connection between Tokopedia-Shopee-Original. The word "original" is used in product promotion to increase the perceived value of the product to customers. Peng, Zhang, Wang, and Liang (2018) divide customer perceived value into four categories: pricing value, functional value, emotional value, and social value. Originality falls under the category of functional value, which is related to a product's quality and safety. This is also related to the word 'harga/price,' which is contained in the price value (Peng, Zhang, Wang, & Liang, 2018). According to Peng, Zhang, Wang, and Liang(2018), perceived value has a positive influence on purchase intention.

In the second community, users discussed the benefits provided by Tokopedia's sales promotion, namely free shipping fee, and cashback. These benefits mentioned are included in the category of monetary promotion. Some of the words that emerged were 'cashback', 'coupon', 'ongkir'(shipping fee), 'teman'(friends), 'keluarga'(family), and 'rekomendasi'(recommendations). Of the overall benefits offered, cashback and free shipping fees get high enthusiasm from users. Cashback and free shipping are used by users, especially sellers, to attract buyers, while buyers provide reviews regarding these benefits. In the network, the word 'ongkir' activates the words of recommendation, friends, family, and groups that describe the existence of e-WOM. The E-WOM appeared because of referral marketing from Tokopedia, which could provide benefits for users. According to Berman (2016), a recommendation from a friend or family member could be more highly valued and respected than a paid advertisement.

The third community theme is, Gojek and Tokopedia sales promotion collaboration called '*Waktu Indonesia Belanja Spesial Kolaborasi Anak Bangsa*'. Several words appear, including 'promo'(promotion), 'link', 'kode'(code), 'gojek,' and 'kolaborasi'(collaboration). Users are enthusiastic about the collaboration; this phenomenon is something that they have been waiting for because it is a merger between the two largest unicorn companies in Indonesia. This also shows that Tokopedia uses Twitter to distribute information, particularly about the ongoing promotional program. Comments including these words are not only related to information distribution, but also appear in buyers' reviews, both positive and negative. Tokopedia could take advantage of social media listening by utilizing text mining to provide customer feedback on social media regarding any issues that arise. Since negative e-WOM might impact purchase decisions (Haque, Kabir, Tarofder, Rahman, & Almalmi, 2020).

A content that is currently viral is also seen in the fourth community. The words that appeared were 'tahta'/throne, 'pria/man', 'wanita/woman', and 'harta/treasure'. The sort of material that might become viral is determined by how many people like, agree with, or prefer it, which could lead to more people sharing, commenting on, or liking the content. According to Erdoğan and Çiçek (2012), the type of content shared and preferred by social media users are music, funny, and extraordinary things online. This was related to how people think about social media, a platform where people want to entertain themselves, search for sincerity and fun, as well as share information and instructions. Those preferable content has a tendency to be viral and viral content has a positive relation on increasing brand loyalty of the customer (Erdoğan & Çiçek, 2012). Therefore, brand content should be entertaining and fun while also providing information about the brands (Erdoğan & Çiçek, 2012; Gamboa & Goncalves, 2014). Furthermore, according to Sinha and Verma (2018b), there is a gender effect on sales promotion benefits and customer perceptions; women tend to prefer hedonistic benefits and men are more interested in utilitarian benefits. Thus, Tokopedia could leverage content by using words that are related to hedonic benefit and conducting hedonic value promotion to attract certain targets, particularly women.

The theme for the fifth community is related to PLN Partnership Promotions. In this community, users were seen talking about promotions from PLN in collaboration with Tokopedia, Bukalapak, and Ace Hardware for selling electronic products. The collaboration between PLN and Tokopedia utilizes the target market of e-commerce, namely the younger generation, who are accustomed to using technology to participate in this program.

Researchers conducted further analysis related to the relationship between network analysis and centrality measures. Words that are in the viral content and referral marketing community have a high betweenness centrality value. Viral content and referral marketing in this *network* could distribute information and trigger the emergence of new communities. The company could employ viral content and referral marketing as a social

media communication strategy to improve user engagement and network activation. Furthermore, the researchers discovered that the words 'Shopee' and 'Bukalapak,' which act as competitors, had a high closeness centrality. This means that competitors might play an important role in the network since they are quick to activate other words in the network.

## VI. CONCLUSION AND RECOMMENDATION

This research objective is to analyze user response on social media towards a sales promotion program. Using the text mining approach, this research was effective in identifying influential keywords and community themes. The influential keywords are associated with Tokopedia monetary promotion benefits, which may be employed for marketing strategies and social media network activation. The findings of our research also identified five community themes, which are (i) multi-product promotions, (ii) Gojek and Tokopedia sales promotion collaboration, (iii) Tokopedia monetary promotions, (iv) viral content, and (v) PLN promotion.

Generally, massive content on social media has provided great opportunities and challenges for exploiting the large volumes of data to create insightful information for business. This research offers a novel approach to transforming social media content into meaningful insights about sales promotion. The method uncovers hidden patterns and helps to understand customer perspective during sales promotion programs. This research conducted between December 2021 until May 2022, through those months this research reveals Tokopedia marketing strategy on 2021 and the gap on 2022 in the following results and what need to be improve. The results of this study can provide inputs for the company related to the sales promotion program

First, Tokopedia should consider those influential words in the communication strategy, particularly on social media during the sales promotion program. The words 'promo' can be used to activate the network and promote content on social media. The terms 'cashback' and 'ongkir' refer to the advantages of sales promotions, which have a large impact on the network and are in high demand among users. These two words can be used to activate a network and distribute information. Tokopedia could use those words in every advertisement related to *Waktu Indonesia Belanja* sales promotion program. However, if the two promotional programs are carried out for a long time, it can affect the company's profits and revenue. Therefore, Tokopedia needs to conduct periodic evaluations regarding the free shipping and cashback programs while still prioritizing the company's profitability. It is expected that the benefits provided over time have been recognized by users, enabling Tokopedia to reduce the intensity of sales promotions concerning the financial performance. Tokopedia can categorize its customers into several tiers based on their recent behaviors in order to deliver offers and services based on their activities. Sales promotion strategies must be reviewed on a regular basis while checking up on the situation, particularly threats from other competitors, in order to minimize the possibility of churn. Based on researcher observation, Tokopedia has reduced the sales promotion benefit and only apply those benefits in the selected stores and based on specific term and conditions. In recent advertisements, Tokopedia focus on discount and free shipping benefits. Tokopedia WIB advertisement in 2022 less shown Cashback benefits compare to 2021 advertisement. On the other hand, based on this research result, Tokopedia might consider to improve cashback and free shipping as their main benefits.

Second, the use of social media Twitter serves as a social hub for sellers and buyers to exchange information. As a result, Tokopedia's communication strategy with Twitter users should include information about sellers as well as buyers. Tokopedia may leverage social media, specifically Twitter, to increase engagement between Tokopedia and its stakeholders, especially users and buyers. Engagement is important for companies because it can have a positive impact to the company (Kang, 2014; Men & Tsai, 2016). Tokopedia can implement engagement strategies on social media for sellers and buyers through two-way dialogue to create interaction and create WOM (Chen, 2017). To buyers, Tokopedia can handle customer complaints on social media in a responsive manner. Meanwhile, a two-way dialogue with the seller can be done by commenting and reacting by liking the seller's post on Twitter which will trigger the interaction. For example, when seller X post content related to products that sold on Tokopedia, Tokopedia can provide supportive comments to start a dialogue or react to a favourite button on Twitter that expresses Tokopedia's support for the seller to increase engagement. Based on researcher observations, those engagement partially has been done but Tokopedia need to improve engagement especially with seller.

Third, Tokopedia may utilize viral content as a social media communication approach to improve user engagement and information spread. Tokopedia could constantly monitor viral content on social media that could be used as a reference for Tokopedia content. Viral content could be obtained from trending topics that appeared. Nevertheless, Tokopedia should still determine the type of content, such as focusing on content that

has high emotional value, entertaining, and fun to create hedonic benefits and stimulate users' responses on social media for the network. Based on researcher observation, Tokopedia has improve their WIB short video to be funnier, add music and more interesting in 2022 compare to 2021. Tokopedia also used Korean Band as one of their actors in their short video to engage more users. Unfortunately, Tokopedia content still need improvement to be viral since the previous advertisement didn't leverage trending topics as their content.

Fourth, Considering a sales promotion approach with more hedonic benefits to sharpen marketing strategies for certain target markets in accordance with the viral content and utilitarian benefits that tend to be felt more dominant in the words that appear. The perception of utilitarian benefits (perception of price-quality) has a positive impact or relationship on consumer attitudes but not on behavioural intentions while the hedonic benefits perception has been shown to have a direct positive impact and relationship on consumer attitudes and behavioural intentions (Jee, 2021). Therefore, it is important for Tokopedia to increase hedonic benefits. Based on Bandyopadhyay et al. (2021) hedonic benefits relate to value shopping obtained through immediate monetary and non-monetary, and delayed non-monetary. Tokopedia can apply these types of promotions such as adding product quantity without increasing the price, giving complementary products for free, giving free gifts/products, making lucky draws or scratch cards online to get prizes after purchasing products, holding contests with prizes that use skills such as competitions and provide premium items after making a purchase. Tokopedia had conducted giveaway challenge on 2021 WIB. Tokopedia should conduct several non-monetary promotions benefits like, online lucky draw, giving premium items/complement items in 2022.

Finally, Tokopedia should constantly be engaged in performing competitor analysis. This is indicated by the appearance of competitors' names in tweets, community 1 (42.37%), and the high value of closeness centrality. Tokopedia should create exceptional deals that are appealing and different from those of its competitors, particularly for items that are in high demand among customers. As a result, Tokopedia may leverage user comments using text mining methods to actively perform competitor analyses from a user's perspective to discover more about competitors (Ye, Xia, Zhang, Zhan, & Li, 2020). This is highly beneficial because competitor data is relatively difficult to obtain. The user's opinion on competitors could help Tokopedia by giving insights to improve their service performance.

This research may be expanded in various ways. The first is to expand the social media coverage by including user comment from other social media platforms such as Instagram and Facebook. This is conducted to gather a wider range of user responses and to compare them across multiple social media platforms. By obtaining user responses from other social media, the data owned is not limited to users with Twitter accounts. The collected data is expected to improve data analysis outcomes by detecting developing themes and user characteristics on each platform. Companies may use this to develop more specific marketing communication plans with varied techniques based on the findings of each platform's analysis. Second, extending the data collection duration. This is done with the intention of utilizing network analysis based on time/dynamic changes. Researchers can detect patterns that arise throughout time and their differences over time. Researchers can examine the relationship between themes and the occurrence of time to acquire more information that can be utilized to develop better time-specific marketing strategies. Third, use sentiment analysis to complement existing methods. This is done to obtain more comprehensive results for negative or positive comments. The disadvantage of this research is that it can only map comments that appear without identifying negative and positive responses. It is hoped that using the results of the sentiment analysis method, companies would be able to identify aspects associated with negative or positive things in order to discover problems, solve them, and enhance services provided. Finally, assessing user input on other competitors' sales promotion programs. Tokopedia may leverage user comments on competitors to analyse and compare the company's strengths and weaknesses. This is critical in order for the firm to maintain their competitive advantage. As a result, user comments on rivals may be analyzed further, particularly on competitor names that appear on networks such as Shopee, Lazada, and Bukalapak.

## The Effect of Profitability on Firm Value in Manufacturing Companies Listed on The Indonesia Stock Exchange

Erik Kartiko<sup>1</sup>, Dida Farida Latipatul Hamdah<sup>2</sup>, Lina Nurlaela<sup>3</sup>, Milda Apriliya Royani<sup>4</sup>  
<sup>1,2,3,4</sup>Garut University, Garut, Indonesia

### **Abstract**

*The research topic discusses the effect of profitability on firm value. Fatima (2017) that the relationship between profitability and firm value can be said to be directly proportional or positively related, thereby showing the company's performance. According to Arizona (2020): "Companies that can generate high profits will tend to have a higher company value, because high company profits will increase the company's stock price, which means it will increase the value of the company in the eyes of investors". However, in reality, the return on equity (ROE) has increased but the price to book value (PBV) has actually decreased. The population and sample of this research are 26 companies listed in the food and beverage industry sub-sector manufacturing companies on the Indonesia Stock Exchange. The sampling technique is non-probability sampling with quantitative methods. Then data collection using library research, internet studies and documentation. SPSS Version 20.0 application is used for data processing. The results of the study explain that profitability has no significant effect on firm value. This is because investors pay more attention to prospects, risks and commodities. In addition, because profitability is not the only indicator that investors pay attention to in investing. The results of this study are in line with the results of research conducted by Lambu (2019) that: "Profitability partially has no significant effect on firm value". The results of this study provide a broad idea so that the company's value can be optimal in considering what factors are the company's weaknesses.*

*Keywords— Profitability; Firm Value.*

---

### I. INTRODUCTION

Companies are one of the drivers of the country's economy, including in Indonesia. In general, the main goal of each company is to maximize profits or profits for investor satisfaction. The existence of the company for the community has a positive impact, such as creating jobs, increasing income, contributing to regional and state revenues, and supporting economic improvement (Haholongan, 2016).

Firm value is a condition obtained by the company after undergoing activities for several years as an example of public trust in a company (Noerirawan and Muid, 2012). The rise and fall of the value of the company can be seen from its share price. Companies that have a level of corporate value certainly cannot be separated from various factors that influence it. According to Soekotjo (2019), the influencing factors are financial functions such as dividend policy, investment decisions, and added to the level of profit or often referred to as profitability obtained by the company.

According to Fatima (2017) the relationship between profitability and firm value can be said to be directly proportional or positively related, thereby showing the company's performance. With the increase in the company's performance, the stock price in the capital market increases and this has an impact on increasing stock returns. Profitability is considered as a benchmark on the company's performance in generating profits. According to Sudiarta (2016) if the company is able to increase profits, it indicates that the company is able to perform well so that it can create a positive view of investors and will also increase the share price of the company.

According to Fatima (2017) that: "The relationship between profitability and firm value can be said to be directly proportional or positively related". High profitability indicates a good company performance in generating profits so that it will increase the value of the company which means it will attract investors to invest. Then according to the opinion expressed by Arizona, et al (2020) that: "Companies that can generate high profits will tend to have higher company values, because high company profits will increase the company's share price, which means it will increase the value of the company in the eyes of investors". However, in reality, Return On Equity (ROE) increased but Price To Book Value (PBV) actually decreased. With the inconsistency of theory

and research results as well as existing phenomena, this research is intended to conduct further research on the problems above.

Based on the above background, the authors are interested in conducting a research entitled "The Effect of Profitability on Firm Value in Manufacturing Companies Listed on The Indonesia Stock Exchange." This study aims to determine the effect of profitability on firm value in manufacturing companies listed on the Indonesia Stock Exchange.

## II. LITERATURE REVIEW

### A. Profitability

Profitability ratio is a ratio to assess the company's ability to seek profit. This ratio also provides a measure of the level of management effectiveness of a company (Kasmir, 2014).

### B. Profitability Goals and Benefits

According to Kasmir (2014) the purpose of using profitability ratios for companies and for parties outside the company is as follows:

- a. To measure or calculate the profit earned by the company in a certain period.
- b. To assess the company's profit position in the previous year with the current year.
- c. To assess profit development over time.
- d. To assess the amount of net profit after tax with own capital.
- e. To measure the productivity of all company funds used both loan capital and own capital.
- f. To measure the productivity of all company funds that are used either by own capital.

Meanwhile, the benefits of profitability are as follows:

- a. Knowing the level of profit earned by the company in one period.
- b. Knowing the company's profit position in the previous year with the current year.
- c. Knowing the profit development from time to time
- d. Knowing the amount of net profit after tax with own capital.
- e. Knowing the productivity of all company funds used both loan capital and own capital.

### C. Types of Profitability Ratios

According to Kasmir (2014) the types of profitability ratios that can be used are as follows:

- a. Profit Margin on Sales
- b. Return on Investment (ROI)
- c. Return on Equity (ROE)
- d. Earnings per Share of Common Stock

The profitability ratio used in this study is Return on Equity (ROE) because this ratio is one of the most important variables that investors see before they invest. A stable level of profitability gives investors confidence that the company has a good performance in earning profits.

### D. Return On Equity (ROE)

Return On Equity (ROE) is a ratio used to measure net profit after tax with own capital. This ratio shows the efficiency of the use of own capital. The higher this ratio, the better. This means that the position of the owner of the company is getting stronger, and vice versa (Kasmir, 2015).

The formula for calculating ROE is as follows:

$$\text{Return On Equity (ROE)} = \frac{\text{Profit After Tax}}{\text{Owner's Equity}}$$

### E. The Value Of The Company

According to Harmono (2009) explains that: "Company value is the company's performance which is reflected by the stock price formed by the demand and supply of the capital market which reflects the public's

assessment of the company's performance".

*F. Firm Value Measurement Method*

Firm value can be measured by a ratio called the valuation ratio. According to Weston and Copeland in Wijaya (2017) firm value can be measured using several measurement methods, namely:

1. Price Earning Ratio (PER)
2. Tobin's Q
3. Price to Book Value (PBV)

In this study, the valuation ratio used is Price to Book Value (PBV) because this ratio is widely used in investment decision making. In addition, there are several advantages of Price to Book Value (PBV), namely book value is a stable and simple measure that can be compared with market prices.

*G. Price to Book Value (PBV)*

Harmono (2014) states that: "A high price book value reflects a high share price compared to the book value per share. The higher the share price, the more successful the company is in creating value for shareholders. The measurement of price to book value (PBV) can be calculated as follows:

$$Price\ to\ book\ value\ (PBV) = \frac{Price\ per\ Share}{Book\ Value\ of\ Share}$$

Price book value is widely used in making investment decisions. There are several advantages of price to book value, namely it is a stable and simple measure that can be compared with market prices and can be compared between similar companies to show a sign that a stock is expensive or cheap.

According to Kasmir (2014) explains that: "The profitability ratio is a ratio to assess the company's ability to seek profit. This ratio also provides a measure of the level of effectiveness of a company's management. The size of the company's profitability in this study uses Return On Equity (ROE). The reason is because Return On Equity (ROE) is a ratio to measure net income after tax with own capital, this ratio is considered the most appropriate among other profitability ratios in relation to stock returns because in the capital account section there is also a share capital account, which is the shareholder's capital. share.

High profitability will give a positive signal to investors that the company is in a favorable condition. This attracts investors to own company shares. High demand for shares will make investors appreciate the value of shares greater than the value recorded on the company's balance sheet, so that the company's PBV is high and the company's value is high. Thus, profitability has a positive influence on firm value.

Based on the description described above, the framework of thought in this research can be described in Figure 1. below:

Figure 1. Research Paradigm

Based on the literature review, previous research and the framework described above, the hypotheses that can be proposed in this study are as follows:

H: Profitability has an effect on firm value in manufacturing companies listed on the Indonesia Stock Exchange.

### III. RESEARCH METHODOLOGY

The research uses descriptive method with quantitative approach analysis, namely the results of the research conducted emphasizing the analysis of numerical data (numbers). According to Sugiyono (2015) states that: Quantitative research methods can be interpreted as research methods based on the philosophy of positivism, used to examine certain populations or samples, data collection using research instruments, data analysis is quantitative/statistical, with the aim of testing hypotheses. has been established.

The variables in this study are as follows:

#### 1. Independent Variable

According to Sugiyono (2015) that: "Independent (free) variables are variables that affect or are the cause of changes or the emergence of the dependent (bound) variable". The independent variable in this study is Profitability (X) as measured by Return On Equity (ROE).

#### 2. Dependent Variable

According to Sugiyono (2015) that: "The dependent variable (bound) is a variable that is influenced or is the result, because of the independent variable". The dependent variable in this study is firm value (Y) as measured by price to book value (PBV).

Based on the description above, the operationalization of the research variables in table 3.1 can be arranged as follows:

Table 1. Variable Operations

Variabel	Dimensions	Indicator	Scala
Profitability (X) Kasmir (2015:204)	<i>Return On Equity (ROE)</i>	<ul style="list-style-type: none"> <li>• Net Income</li> <li>• Total Equity</li> </ul>	Ratio
Firm Value (Y) Harmono (2014:114)	<i>Price to Book Value (PBV)</i>	<ul style="list-style-type: none"> <li>• Price per Share</li> <li>• Company Book Value</li> </ul>	Ratio

#### A. Population and Sample

##### Population

The population in this study is a manufacturing company in the food and beverage industry sub-sector which is listed on the Indonesia Stock Exchange with a total of 26 companies.

##### Sample

The sample is part of the number and characteristics possessed by the population. The sample is part of the number and characteristics possessed by the population. If the population is large, and it is not possible for the researcher to study everything in the population, for example due to limited funds and time, the researcher can use samples taken from that population (Sugiyono, 2015). In this study, the author uses a sampling technique, namely non-probability sampling with a purposive sampling approach. The reason this research uses purposive sampling technique is because not all samples meet the criteria according to the needs in this study. The criteria to be used in this study are as follows:

Table 2. Sampling Criteria

Sampling Criteria	Total
Manufacturing companies listed on the Indonesia Stock Exchange (IDX) in the food and beverage sub-sector during 2013 – 2020.	26
Manufacturing companies in the food and beverage sub-sector on the Indonesia Stock Exchange (IDX) that did not publish complete and consecutive annual reports during 2013 – 2020.	0

Food and beverage sub-sector manufacturing companies that did not distribute dividends during 2013-2020	(16)
Manufacturing companies in the food and beverage sub-sector on the Indonesia Stock Exchange (IDX) that do not have complete financial data to calculate the variables in the study during 2013 – 2020.	(8)
Total target population	2
Target Population sampled Total sample (2 companies x 8 years)	16

Of the 26 manufacturing companies in the food and beverage sub-sector listed on the Indonesia Stock Exchange, after purposive sampling, 2 companies that meet the criteria are as follows:

Table 3. The list of food and beverage sub-sector manufacturing companies listed on the Indonesia Stock Exchange used in this study.

No.	Code of Emiten	Name of Company
1	INDF	PT. Indofood Sukses Makmur Tbk
2	MYOR	PT. Mayora Indah Tbk

### B. Data Types and Sources

#### Data Type

In this study, the quantitative data is the result of the calculation of investment decisions, namely price earning ratio (PER) and firm value, namely price to book value (PBV).

#### Data Source

The data source uses secondary data in the form of the company's financial statements PT Indofood Sukses Makmur Tbk and PT. Mayora Indah Tbk obtained by downloading the company's financial statement data from the websites [www.bursaEfekIndonesia.co.id](http://www.bursaEfekIndonesia.co.id) and [www.idx.co.id](http://www.idx.co.id). which is the website of the Indonesia Stock Exchange.

#### Data Collection Technique

The data collection techniques and materials in the study were carried out by:

1. Documentation Research  
Sugiyono (2015) states that: "Documentation is a record of events that have passed". That is by obtaining data in the form of book notes, books, electronic media, print media and so on and studying documents related to research
2. Literature Research  
Sugiyono (2015) states that: Literature studies are related to theoretical studies and other references related to values, culture and norms that develop in the social situation being studied, besides that library research is very important in conducting research, this is because research cannot be separated from the literature.
3. Internet Study  
References are in the form of scientific journals, valid national and international news websites and other sites that are related to the problem being researched.

### C. Techniques of Analysis and Design of Hypothesis Testing

#### Data Analysis Technique

The data analysis technique used in this research is statistical test using multiple linear regression with the help of SPSS version 20 application.

### D. Descriptive Statistics

The descriptive statistics used include: mean, minimum, maximum, and standard deviation. The mean is the sum of the values of all data divided by the number of times, the minimum is the smallest value from a series of observations, the maximum is the largest value from a series of observations, and the standard deviation is the root of the sum of the squares of the difference between the data values and the average divided by the number of data.

*E. Classic Assumption Test*

The classical assumption test is used to see whether there are deviations in the regression model, so it is necessary to carry out an examination using the normality test, autocorrelation test, heteroscedasticity test, and multicollinearity test.

1. Normality Test

In this study, the normality test uses the Kolmogorov Smirnov method if the result of the significance number (Sig) is less than .05 then the data is not normally distributed (Ghozali, 2016). In this study the technique that can be used to see the normality of the data is by looking at the Normality Probability Plot Graph and the Kolmogorov Smirnov One Sample Test. The provisions used in making decisions using the Normality Probability Plot graph are:

- a. If the data spreads around the diagonal line and follows the direction of the diagonal line, the regression model fulfills the assumption of normality.
- b. If the data spreads far from the diagonal and/or does not follow the diagonal line, the regression model does not meet the assumption of normality.

The One Sample Kolmogorov Smirnov test is used to determine the distribution of the data, whether it follows a normal, Poisson, uniform, or exponential distribution. In this case, to find out whether the residual distribution is normally distributed or not (Priyatno, 2012).

2. Autocorrelation Test

The way that can be done to detect the presence or absence of autocorrelation is to perform a Run Test (Ghozali, 2016).

3. Heteroscedasticity Test

According to Ghozali (2016) Heteroscedasticity test is to test whether in the regression model there is an inequality of variance from the residual of one observation to another observation. If the variance of the residuals from one observation to another remains, it is called homoscedasticity and if it is different it is called heteroscedasticity. A good regression model is one with homoscedasticity or no heteroscedasticity. If the p value > 0.05 is not significant, it means that there is no heteroscedasticity, meaning that the regression model passes the heteroscedasticity test. A good regression model is one with homoscedasticity or no heteroscedasticity. Most cross-sectional data contain heteroscedasticity situations because this data collects data that represents various sizes.

4. Multicollinearity Test
